1 Introduction

The Former Walker Chevrolet (Site) is located at 633 Division Avenue in Tacoma, Washington and is enrolled in the Voluntary Cleanup Program (VCP) with the Washington State Department of Ecology (Ecology) as VCP No. SW1040. Aspect Consulting, LLC (Aspect) submitted a Focused Feasibility Study (FFS) (Aspect, 2014a) for the Site to Ecology for review on May 16, 2014, and Ecology provided an opinion on November 17, 2014. Aspect subsequently met with the Ecology site manager on December 18, 2014 to discuss Ecology's concerns and to develop a plan to identify the remaining investigation data gaps and to identify the path necessary for Ecology to provide property-specific no further action (NFA) determinations for the Site.

This Focused Feasibility Study (FFS) Addendum defines the Site boundary, describes the Site characterization data gaps identified by Ecology, and describes the investigation to address these data gaps. The additional characterization data provided in this FFS Addendum do not impact the development and evaluation of the cleanup action alternatives, the disproportionate cost analysis, and selection of the preferred cleanup alternative presented in the FFS (Aspect, 2014a). Section 4 reviews the preferred cleanup alternative, reevaluates the cleanup action objectives, and describes the components of the preferred cleanup action alternative.

1.1 Site Definition

The Former Walker Chevrolet Site is formally distinguished from the adjacent Morrell's Dry Cleaners Site (VCP No. SW1039) located at 608 North First Street in Tacoma, Washington, as determined by Ecology (Ecology, 2014). The Former Walker Chevrolet Site consists of the following two tax parcels shown in Figure 1.

- Tax Parcel No. (TPN) 2031-13-0025: This 13,491 square foot parcel is owned by Stadium District Properties, LLC. This parcel is currently developed as a parking lot and is used primarily by the Stadium Thriftway grocery store. The north gas station operated on this parcel during the 1940s through circa 1960, and the abandoned underground storage tanks (USTs), product lines, and impacted soil were removed in 1994 (Bison, 1994b). Ecology (2014) determined that TPN 2031-13-0025 could be eligible for an unencumbered, property-specific NFA determination.
- TPN 2030-12-0032: This 29,730 square foot parcel is owned by Stadium District Properties, LLC. This parcel contains a two-story, split-level building that occupies most of the parcel. Stadium Thriftway operates a grocery store on the lower level on the north side of the parcel, CARSTAR Auto Body operates a collision repair service business on the lower level on the south side of the parcel, and Titus-Will Service and Tire operates a tire service center on the upper level of the building. Approximately 1,000 square feet of a parking lot is located at the south end of the parcel, and the remaining, approximately 800 square feet of the parking lot is located in the City of Tacoma right-of-way (ROW). Ecology (2014)

determined that additional Site characterization was necessary for the former south gas station and former paint booth on this parcel. This FFS Addendum includes additional Site characterization on this parcel. We intend to record an environmental covenant for this parcel in concurrence with a NFA determination from Ecology.

1.2 Ecology's Opinions and Objectives of FFS Addendum

This section summarizes Ecology's (2014) opinions and the investigation data gaps.

1.2.1 North Gas Station

Ecology (2014) determined that the total petroleum hydrocarbon (TPH) soil contamination on the former north gas station has been fully delineated and that the contamination was removed in 1994. Ecology concluded that the source of contamination originated on and was limited to this parcel and is not associated with contamination on the nearby parcels. The groundwater table was not encountered in MW-3 on the parcel and Ecology concluded that contamination would have been unlikely to impact groundwater. Ecology (2014) determined that TPN 2031-13-0025 could be eligible for an unencumbered, property-specific NFA separate from the other parcels.

The FFS (Aspect, 2014a) summarizes the remediation and characterization of the former north gas station, and sketches of the remediation area, features, and sample locations are summarized in that report's Appendix A; and retained as Appendix A in this report. This FFS Addendum incorporates TPN 2031-13-0025 into the Site; however, no additional investigation activities were performed for this parcel.

1.2.2 South Gas Station

The south gas station operated in the parking lot on the south side of TPN 2030-12-0032 from around 1925 until sometime in the 1940s. Figure 2 shows the locations of the former USTs, pump islands, and the soil sampling locations. Seven USTs, the pump island, and associated piping were removed in July and August 1994, and the impacted soil was characterized and removed to below the current Method A soil cleanup levels (CULs) (Bison, 1994a). Seven soil borings were sampled in the parking lot on August 31, 2006 during due-diligence sampling. Gasoline-range TPH (TPH-G) were detected above the Method A soil CUL in the 15 and 16 foot below ground surface (bgs) intervals of borings S-1 and S-7 that are respectively in the southeast and southwest corners of the parking lot in the City of Tacoma ROW. In December 2013, Aspect sampled deep soil boring AB-1 near the former pump island and detected TPH-G slightly above the Method A soil CUL at 15 feet bgs and confirmed that TPH contamination attenuates to below the detection limits in the unsaturated till.

Ecology (2014) determined that the full horizontal and vertical extent of petroleum contaminated soil (PCS) was not delineated. In the December 18, 2014 meeting, Ecology agreed that the PCS could be delineated by sampling additional soil borings on the southeast and southwest corners of the parking lot in the City of Tacoma ROW and by sampling an additional soil boring in the triangular median in the street approximately 30 feet south of the parking lot. Ecology agreed that the borings could be advanced to 15 feet deep to evaluate the presence of contamination within the standard point of compliance for the direct contact exposure pathway.

Ecology (2014) determined that groundwater has not been impacted by PCS at the south gas station based on seven rounds of groundwater sampling in MW-1 from August 2007 to January 2014. Ecology (2014) determined that although tetrachloroethylene (PCE) was detected only once, at a concentration below the Method A groundwater CUL in August 2007, and trichloroethylene (TCE) was detected only once, at a concentration below the Method A groundwater CUL in January 2014, chlorinated ethylenes were not detected in soil at the south gas station.

Section 2 of the FFS Addendum describes the additional investigation at the south gas station and Section 4 provides recommendations for well decommissioning and for an NFA with environmental covenant for the residual contamination.

1.2.3 Former Paint Booth

Ecology requested that a detailed map be developed that reconciles the location of the former paint booth, former drains, and former heating oil UST with the current site features, and historical and recent sampling locations. Figure 3 shows the location of the former paint booth and monitoring well MW-11 within the building, and Figure 4 provides greater detail of the current features, former paint booth, and sampling locations.

Ecology (2014) concluded that the soil vapor intrusion exposure pathway was inadequately characterized for the building. Ecology recommended that sub-slab vapor and indoor air be evaluated near floor drains in the produce preparation area on the north side of the produce cooler near the former paint booth. In the December 2014 meeting, the Ecology site manager agreed that the sub-slab vapor and indoor air concentrations should be compared with both Method B and Method C screening levels, and that the Method C screening levels may be appropriate with the current commercial use of the building.

Ecology (2014) determined that monitoring well MW-11 had been sampled three times and recommended that a fourth groundwater sample be collected to conclude Stage 2 monitoring. Ecology (2014) stated that the groundwater sample from MW-11 should be analyzed for gasoline-, diesel-, and oil-range TPH; chlorinated volatile organic compounds (VOCs); ethylene dibromide (EDB); and total metals. Additionally, Ecology (2014) requested that the groundwater sample from MW-11 be evaluated for 1,4-dioxane.

Section 3 of the FFS Addendum describes the additional air and groundwater sampling near the former paint booth, and Section 4 provides recommendations for well decommissioning and for an NFA with environmental covenant for the residual contamination.

1.2.4 Sub-Slab Vapor Intrusion Exposure Pathway near Entry on North End of Building

Although Ecology (2014) referenced the sub-slab vapor intrusion exposure pathway on the north side of the building, the Ecology site manager agreed that this pathway does not need to be further evaluated for the Walker Chevrolet Site. Soil vapor beneath the parking lot on the Morrell's Dry Cleaner site was evaluated by a Gore Survey in February 2010 (Aspect, 2011). The Gore Survey measured the mass of individual VOCs that were absorbed in a resin that was placed beneath the surface and sealed for 7 days. The Gore

Survey showed that VOC contamination in soil and soil vapor attenuates on the Morrell's Dry Cleaners site, and did not extend to the Former Walker Chevrolet Site. Additionally, a soil vapor extraction (SVE) system began removing accessible VOC contamination from beneath the Morrell's Dry Cleaners building and near the source of chlorinated ethylenes in October 2014 (Aspect, 2014b). Based on the December meeting with Ecology, this FFS Addendum does not include any additional evaluation of the sub-slab vapor intrusion exposure pathway on the north side of the building due to contamination on the adjoining Morrell's Dry Cleaners site.

2 South Gas Station

Aspect sampled soil borings AB-1 to AB-4 to delineate the extent of soil contamination at the south gas station. Figures 1 and 2 show the locations of the borings and the boring logs are provided in Appendix B. Soil samples were submitted for the analysis of the potential chemicals of concern for petroleum releases listed in Table 830-1 of the Model Toxics Control Act (MTCA) regulations. The analytical results are summarized in Table 2-1 and the analytical reports are provided in Appendix C. Table 2-1 also summarizes the sample locations and analytical results from the 1994 cleanup action (Bison, 1994a) and the 2006 due-diligence sampling (Aspect, 2009), and compares the analytical results to Method A soil CULs. Figure 2 shows the locations of the former USTs and pump island, excavation confirmation samples S1 to S15 and S17 to S25, due diligence samples S-1 to S-7, and soil borings AB-1 to AB-4. Sample S22 was reported to have been collected from 2 feet bgs beneath the pump island and then over-excavated, and the location was not shown in the report (Bison, 1994a).

The Aspect soil borings were placed in locations where TPH was previously detected above the Method A soil CULs. During the 1994 cleanup action TPH was detected at 39 mg/kg beneath Tank 3 at 10 feet bgs (sample S5) and at 570 mg/kg beneath the former pump island at 2 feet bgs (sample S22). Soil was then excavated to 5 feet bgs beneath the former pump island. TPH was not detected in the three final confirmation samples (S23 to S25) beneath the former pump island.

Stemen Environmental, Inc. (Stemen) sampled soil borings S-1 to S-7 on August 31, 2006 during due-diligence sampling. The analytical results are summarized and compared with Method A soil CULs in Table 2-1. TPH was detected above the Method A soil CUL at 15 feet bgs in S-1 in the southeast corner of the parking lot and at 16 feet bgs in S-7 in the southwest corner of the parking lot. Soil boring logs were not provided to evaluate the presence of contamination above 15 feet bgs. Benzene and xylenes were also detected above the Method A soil CULs at 15 feet bgs in S-1.

Boring AB-1 was advanced within the excavation footprint beneath the former pump island and soil samples were collected from 15, 25, 45, and 61 feet bgs in December 2013. Slightly gravelly sand was encountered from the surface to 15 feet bgs; silty, gravelly, sand was encountered from 15 to 40 feet bgs; and slightly gravelly sand was encountered from 40 to 61 feet bgs. The glacial till and advance outwash intervals are consistent with the monitoring wells at the Former Walker Chevrolet and Morrell's Dry Cleaners site. Although AB-1 was advanced through the excavation footprint beneath the former pump island, backfill could not be distinguished from native soil. Soil samples were collected every 5 feet in AB-1 and screened with a photoionization detector (PID). The PID detected VOCs at 15, 20, and 25 feet bgs. Soil samples submitted for laboratory analysis contained 37 mg/kg of TPH-G in the 15 feet bgs interval and 3 mg/kg of TPH-G in the 25 feet bgs interval. Contamination was not detected in the top 15 feet and was not detected below 25 feet bgs. The water table at nearby MW-1 is about 53 feet bgs. As summarized in Section 1.2.2, Ecology (2014) determined that groundwater was not impacted by petroleum releases.

Aspect sampled boring AB-2 adjacent to former boring S-1 and boring AB-3 adjacent to former boring S-7. The former boring locations were confirmed by the presence of grout in the asphalt surface. The boring logs for AB-2 and AB-3 are consistent with AB-1 and the analytical results are consistent with samples from S-1 and S-7. Soil samples were collected every 2.5 feet and screened with a PID. The PID did not elicit a response in AB-2 or AB-3 until 15 feet bgs, and the highest responses were between 16 and 16.5 feet bgs. Soil samples were collected from 16.5 feet bgs and submitted for analysis. TPH-G was detected at 1,900 mg/kg at 16.5 feet bgs in AB-2, which is comparable to the 920 mg/kg detected in the 15 foot bgs interval of S-1. Similarly, TPH-G was detected at 520 mg/kg at 16.5 feet bgs in AB-3, which is comparable to the 360 mg/kg detected in the 15 foot bgs interval of S-7. The concentration of benzene was below the detection limit in both samples, and ethylbenzene, xylenes, and naphthalene were detected below the Method A soil CULs.

Aspect sampled boring AB-4 in the triangular median south of the parking lot to further delineate the extent of soil contamination. AB-4 was advanced to 16.5 feet bgs and encountered similar lithology as AB-1 to AB-3. No contamination was identified by the PID and no petroleum hydrocarbons were detected in the soil sample collected at 16.5 feet bgs.

3 Former Paint Booth

Aspect collected additional sub-slab and indoor air samples and additional groundwater samples to characterize the former paint booth. Figure 3 shows the location of the former paint booth and MW-11 in the building. Figure 4 shows the location of the former paint booth and decommissioned drains and heating oil UST in the current grocery store and shows the locations of assessment soil borings from 1994, sub-slab vapor samples from 2008, and sub-slab vapor and indoor air samples from 2013 and 2014.

3.1 Soil Contamination

The extent of soil contamination was delineated in 1994, and no additional soil samples have been collected. Table 3-1 summarizes the soil analytical results and compares the results with Method A soil CULs. Samples D-1 and D-2 were collected from drains, and the contents were removed prior to decommissioning the drains by filling them with concrete slurry. Thus, samples D-1 and D-2 were collected from former source contamination. Sample D-1 was collected from the north drain, which received drainage from the paint booth. Several compounds were detected above Method A soil CULs in sample D-1, including benzene, toluene, ehtylbenzene, and xylene (BTEX) compounds, PCE, lead, and cadmium. Sample D-2 was collected from the south drain, which was a 4-foot-deep concrete vault above the heating oil UST. The concentrations of organic compounds were low in D2, but methylene chloride was detected above the Method A soil CUL. Lead and cadmium were detected above the Method A soil CUL in sample D2, but at much lower concentrations than in sample D1.

Soil samples were collected from borings B1 to B4 on August 3, 1994, and additional soil samples were then collected from borings B5 to B9 on September 6, 1994 to delineate the extent of soil contamination. Soil samples were collected from the 5, 7.5, 9, and 10 foot bgs intervals of boring B5. The concentration of TPH attenuated to below the Method A soil CUL at 10 feet bgs, and the TPH appears to be oil-range TPH associated with heating oil. The concentration of PCE was below the detection limit at 5 feet bgs and was 0.053 mg/kg at 10 feet bgs, which slightly exceeds the 0.05 mg/kg Method A soil CUL.

The lateral extent of contamination was delineated by soil borings B2, B3, and B6 to B9. The concentrations of TPH in borings B2 and B3 exceeded the 30 mg/kg Method A soil CUL for TPH-G, but were below the likely applicable 2,000 mg/kg Method A soil CUL for diesel- and oil-range TPH. In boring B5, the concentration of TPH-G and toluene were detected slightly above the Method A soil CULs at 5 feet bgs, but all compounds were well below the Method A soil CULs at 8 feet bgs. No organic compounds were detected in borings B8 and B9.

3.2 Soil Vapor Intrusion Exposure Pathway

The soil vapor intrusion exposure pathway was evaluated during due-diligence sampling in May 2008, during the FFS investigation in January 2014, and for this FFS Addendum in March 2015. Figure 4 shows the locations of the 2014 and 2015 sub-slab vapor and indoor air samples and shows estimated locations of due diligence sub-slab vapor samples GV-1 to GV-3. Additionally, Figure 1 shows the location of the ambient air

sample that was collected on the opposing side of North First Street in the Stadium Thriftway parking lot. Table 3-2 summarizes the indoor air and sub-slab vapor samples and compares the analytical results with Method B and Method C air screening levels, and applicable sub-slab vapor screening levels that are consistent Ecology (2009) guidance. Appendix D contains the analytical results for air sampling performed in March 2015.

The 2008 due diligence sub-slab vapor sampling performed by Stemen is poorly documented and is included in Appendix C of the Site Conditions Summary report (Aspect, 2009). The locations of GV-1 to GV-3 are recorded in an aerial photograph and analytical results are provided in a table. Aspect collected sub-slab vapor samples beneath the sidewalk adjacent to the former paint booth in January 2014, and beneath the slab foundation in the produce preparation area near a floor drain in March 2015.

PCE was detected above the 96.2 $\mu g/m^3$ Method B sub-slab screening level in GV-1 to GV-3 and the sub-slab sample collected beneath the sidewalk, but PCE was not detected beneath the slab in the produce preparation area. PCE only exceeded the 400 $\mu g/m^3$ Method C sub-slab screening level in GV-2. PCE in indoor air was detected at a concentration of 0.61 $\mu g/m^3$ in the produce cooler in January 2014 and at a concentration of 2.78 $\mu g/m^3$ in the produce preparation area in March 2015. These concentrations are below the Method B screening level of 9.62 $\mu g/m^3$ and the Method C screening level of 40 $\mu g/m^3$.

BTEX compounds and aliphatic- and aromatic-range hydrocarbons were detected in sub-slab and indoor air samples collected from the produce preparation area. Benzene exceeded the Method B indoor air screening level, but was below the Method C indoor air screening level. The concentrations of heavier aliphatic (EC9-12) and aromatic (EC9-10) hydrocarbons exceeded the Method C indoor air screening levels. The concentrations of these compounds were lower beneath the sub-slab, which indicates that the petroleum contamination may be due to sources inside the building. The cleanup standards for air quality (173-340-750, WAC) only apply to air originating from contaminated media on the Site. Although BTEX compounds and hydrocarbons were detected beneath the sub-slab, the concentrations did not exceed the Method B sub-slab screening levels. The heavier-range hydrocarbon compounds inside the produce preparation area may be released from cleaning and packaging compounds in the store; however, these products were not inventoried or evaluated.

The sub-slab vapor sample results show that PCE has been present below the slab at concentrations above the Method B and Method C screening levels, but that the indoor air samples are below the Method B and Method C screening levels. Although benzene exceeds the Method B indoor air screening level and aliphatic (EC9-12) and aromatic (EC9-10) hydrocarbons exceed the Method C indoor air screening levels, the concentrations of these compounds are lower beneath the sub-slab and do not exceed Method B sub-slab screening levels.

3.3 Groundwater Contamination

Aspect constructed MW-11 in the former paint booth area of the Site on May 12, 2009 to assess potential impacts to groundwater. The depth to groundwater is about 52 feet bgs at the former paint booth. Samples were collected from MW-11 in May 2009, December 2010, January 2014, and March 2015 and submitted for analysis of VOCs. The January 2014 and March 2015 samples were also analyzed for gasoline- and diesel-range TPH, polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and lead. Additionally, the March 2015 sample was analyzed for 1,4-dioxane and Resource Conservation and Recovery Act (RCRA) metals, as requested by Ecology (2014). In response to Ecology's opinion (2014), Aspect requested the laboratory to prepare a supplemental analytical report for the January 2014 sample to report the concentration of 1,4-dioxane. An additional sample was collected in April 2015 to reevaluate the concentration of arsenic; samples were analyzed for total and dissolved RCRA metals. Table 3-3 summarizes the historical water-level measurements at the Former Walker Chevrolet and Morrell's Dry Cleaners sites, Table 3-4 summarizes the historical concentrations of VOCs in monitoring wells at the sites, and Table 3-5 summarizes the historical analytical results for MW-11. Appendix E provides the groundwater analytical data for the FFS Addendum.

No petroleum-related BTEX compounds were detected in MW-11. TCE was detected at concentrations ranging from 1.4 to 4.6 µg/L, which are below the 5 µg/L Method A groundwater CUL. Carbon tetrachloride was detected at a maximum concentration of 2.8 µg/L and chloroform was detected at a maximum concentration of 2 µg/L; Method A groundwater CULs are not established for these constituents, but all concentrations were below the 5 µg/L federal maximum contaminant level (MCL) for carbon tetrachloride and 80 µg/L federal MCL for chloroform. No TPH, PAH, or PCB compounds were detected in the January 2014 and March 2015 samples; and the concentrations of total lead ranged from 2.44 to 6.2 µg/L, which is well below the 15 µg/L Method A groundwater CUL. The concentrations of total arsenic were 5.15 µg/L and 6.29 µg/L in March and April 2015, respectively. However, arsenic was not detected when filtered through a 0.45 micron filter; thus, the concentration of dissolved arsenic was less than 1 µg/L. Although the concentration of total arsenic was detected slightly above the 5 µg/L Method A groundwater CUL, this slight exceedance is consistent with background conditions in the Puget Sound area. The former paint booth is not a source of arsenic, and arsenic was not detected in the sediment samples collected from the former drains in the paint booth or from soil boring B1 adjacent to the decommissioned heating oil UST.

4 Preferred Cleanup Alternative

The FFS (Aspect, 2014a) identified the cleanup action objectives, developed and evaluated cleanup alternatives, and performed a disproportionate cost analysis to recommend the preferred cleanup alternative. The preferred alternative included:

- Soil removal and UST closure actions completed to date;
- Decommissioning MW-1 and MW-11; and
- Institutional controls consisting of an environmental covenant to require maintenance of the existing building and parking lot surface cover as a cap, restrict future disturbance or residual impacted soil, and provide notification requirements to Ecology.

4.1 Reevaluation of Cleanup Action Objectives

4.1.1 Soil

The residual soil contamination beneath the former paint booth and south gas station is currently capped to prevent direct contact exposure and contamination does not pose a threat to groundwater.

Residual soil contamination beneath the former paint booth is limited to an area of less than 100 square feet and the contamination is limited to the top 10 feet. Soil contamination is beneath the slab foundation of the current grocery store and infiltration is limited by impervious cover. Approximately 30 feet of low-permeability till is present between the soil contamination and groundwater at 52 feet bgs. Removal of the residual soil contamination is impracticable and the residual contamination in the till is not readily amenable to soil vapor extraction.

Residual contamination at the south gas station is limited to the TPH contamination that was detected about 15 feet bgs in soil borings AB-1, AB-2, AB-3, S-1, and S-7. No contamination was identified in the 15-foot direct contact exposure pathway based on 23 excavation confirmation samples, 7 due diligence soil borings, and 4 FFS soil borings. Approximately 25 feet of low-permeability unsaturated till is present below the lowest detected depth of contamination, and petroleum contamination has not been detected in groundwater at about 53 feet bgs. The south gas station ceased operations in the 1940s, the residual contamination has effectively adsorbed to the unsaturated till and does not pose a threat to groundwater quality.

4.1.2 Groundwater

Ecology (2014) determined that groundwater had not been impacted by soil contamination at the south gas station and requested that a fourth groundwater sample be collected from MW-11 to confirm that soil contamination has not impacted groundwater beneath the former paint booth. Additionally, Ecology (2014) requested that 1,4-dioxane be evaluated as a chemical of concern and that metals be evaluated. 1,4-dioxane was not detected in the two groundwater samples evaluated. Total arsenic was detected at concentrations of 5.15 µg/L in March 2015 and 6.29 µg/L in April 2015, which slightly exceeded the 5 µg/L Method A groundwater CUL, but dissolved arsenic was not detected

in the April 2015 sample when filtered. Arsenic was not detected in sediment from the decommissioned drains or adjacent to the decommissioned heating oil UST and arsenic is not a chemical of concern for the former paint booth. The low concentrations of arsenic in groundwater are typical of background conditions and are not associated with source contamination.

4.1.3 Indoor Air

The cleanup action objective is to prevent sub-slab vapor from intruding into the building and causing the chemicals of concern in indoor air to exceed screening levels for the current building use.

As shown in Figure 4, the former paint booth was located in the current produce and meat preparation areas and in the produce cooler. The decommissioned drain and cleanout for the former paint booth are in the meat preparation area, and the decommissioned heating oil UST is beneath the meat preparation area. PCE was detected above the Method B sub-slab screening level in three of five sub-slab vapor samples, and above the Method C sub-slab screening level in one sample. No other compounds were detected above the sub-slab screening levels.

The point of compliance is the indoor air within the grocery store, and MTCA regulations only apply to air originating from contaminated media on the Site (i.e., sub-slab soil vapor originating from contamination in soil and groundwater). PCE was detected at concentrations of 0.61 and 2.78 $\mu g/m^3$ in the two indoor air samples, which is below the 9.62 $\mu g/m^3$ Method B screening level and the 40 $\mu g/m^3$ Method C screening level. Although benzene was detected above Method B screening levels and aliphatic (EC9-12) and aromatic (EC9-10) hydrocarbons were detected above Method C screening levels, the concentrations of these compounds were higher in indoor air than in collocated sub-slab vapor. The hydrocarbon compounds inside the produce preparation area may have been released from cleaning and packaging compounds in the store.

4.2 Preferred Cleanup Alternative Components

The new findings in the FFS Addendum do not impact the evaluation or recommendation of the preferred cleanup alternative identified in the FFS. The preferred cleanup alternative includes:

- Previous cleanup actions performed at the south gas station (Bison, 1994a), north gas station (Bison, 1994b), and former paint booth (Bison, 1994c and Bison, 1994d), as summarized in the FFS (Aspect, 2014a).
- Decommissioning of MW-1 and MW-11.
- An environmental covenant, consistent with Section 173-340-440(9), Washington Administrative Code (WAC), will be recorded for TPN 2030-12-0032, in coordination with a NFA determination from Ecology. The covenant will include provisions to:
    - Prohibit activities that may result in the release of hazardous substances that are contained by the foundation above the former paint booth or the

asphalt surface at the south end of the parcel near the former south gas station.

- Require the land owner to restrict leases to commercial uses and activities consistent with the covenant and to notify all lessees of the restrictions on the use of the property.
- Require notification to and approval from Ecology for any change in Site use. Should the property owner redevelop the property for other uses (e.g., mixed-use development), the covenant will require that the design engineer be informed of the locations of residual soil contamination and the potential need to include soil vapor intrusion controls into the redevelopment design.
- Require notification to Ecology of the owner's intent to convey any interest of the parcel.
- Grant access to Ecology to inspect the environmental controls and to collect samples.

- Notify the City of Tacoma Department of Real Property Services of residual soil contamination in the City ROW.
- An environmental covenant is not necessary for Ecology to provide a NFA determination for TPN 2031-13-0025.

Limitations

Work for this project was performed for David Shaw, Successor to Walker Chevrolet (Client), and this report was prepared in accordance with generally accepted professional practices for the nature and conditions of work completed in the same or similar localities, at the time the work was performed. This report does not represent a legal opinion. No other warranty, expressed or implied, is made.

All reports prepared by Aspect Consulting for the Client apply only to the services described in the Agreement(s) with the Client. Any use or reuse by any party other than the Client is at the sole risk of that party, and without liability to Aspect Consulting. Aspect Consulting's original files/reports shall govern in the event of any dispute regarding the content of electronic documents furnished to others.

TABLES

Table 2-1 - Soil Sample Results at South Gas Station

Project No. 080190-004-14, Former Walker Chevrolet Site (VCP No. SW1040)
633 Division Avenue, Tacoma, Washington

Description/Chemical Name	Soil, MTCA Method A, Unrestricted Land Use, Table Value (mg/kg)	AB-1-15 12/20/2013	AB-1-25 12/20/2013	AB-1-45 12/20/2013	AB-1-61.5 12/20/2013	AB-2-16.5 4/6/2015	AB-3-16.5 4/6/2015	AB-4-16.5 4/6/2015	S-1 8/31/2006	S-2 8/31/2006	S-3 8/31/2006	S-4 8/31/2006	S-5 8/31/2006	S-6 8/31/2006	S-7 8/31/2006
Location		Middle of parking lot (Near former pump island)				SE corner of parking lot (5 ft from S-1)	SW corner of parking lot (1 ft from S-7)	Triangular medium south of parking lot	SE corner of parking lot (Near former Tank 5)	East boundary of parking lot (Near former Tank 7)	NE boundary of parking lot (Near former Tank 4)	West boundary of parking lot (Near former Tanks 1-4)	West boundary of parking lot (Near former Tank 1)	Middle of parking lot (Near former pump island)	SW corner of parking lot (Nearest former pump island)
Sample Depth		15 ft	25 ft	45 ft	61.5 ft	16.5 ft	16.5 ft	16.5 ft	15 ft	15 ft	15 ft	15 ft	13 ft	8 ft	16 ft

PCB mixtures (mg/kg)	1								ND						

Notes:

Bold highlighted font indicates exceedance of most conservative screening level.

Potential chemicals of concern include gasoline-range organics from Table 830-1 in Model Toxics Control Act.

ft = feet

mg/kg = milligrams per kilogram

MTCA = Model Toxics Control Act

NR = not reported

U = analyte was not detected at or above the reported result.

NWTPH = Northwest total petroleum hydrocarbon method

WTPH = Washington total petroleum hydrocarbon method

HCID = hydrocarbon identification analysis

Notes:

Bold highlighted font indicates exceedance of most conservative screening level.

Potential chemicals of concern include gasoline-range organics from Table 830-1 in Model Toxics Control Act.

Sediment samples from drains D1 and D2 were removed in 1994. Samples results provide an indication of source contamination.

Blank cell indicate that compound was not analyzed.

ft = feet

HCID = Hydrocarbon identification

mg/kg = milligrams per kilogram

MTCA = Model Toxics Control Act

NR = not reported

TPH = total petroleum hydrocarbon

U = analyte was not detected at or above the reported result.

		3/20/15	<1	3	<1	<1	<1	<0.2	1.2	1.1	<1	<1

Notes:
BOLD Highlighted signifies exceedance of Proposed Groundwater CUL (most stringent of MTCA Method A, Table Value and Federal and State MCL).
All values are in units of milligrams per liter (ug/L).
1,1-DCE = 1,1-dichloroethylene
bgs = below ground surface
cis-1,2-DCE = cis-1,2-dichloroethylene
MCL = maximum contaminant level
MTCA = Model Toxics Control Act
ND = not determined
PCE = tetrachloroethylene
TCE = trichloroethylene
trans-1,2-DCE = trans-1,2-dichloroethylene

Table 3-4 - Groundwater Volatile Organic Compound Sample Results

All values are in units of milligrams per liter (ug/L).
1,1-DCE = 1,1-dichloroethylene
bgs = below ground surface
cis-1,2-DCE = cis-1,2-dichloroethylene
MCL = maximum contaminant level
MTCA = Model Toxics Control Act
ND = not determined
PCE = tetrachloroethylene
TCE = trichloroethylene
trans-1,2-DCE = trans-1,2-dichloroethylene

Table 3-5 - Groundwater Sample Results for Chemicals of Potential Concern and Natural Attenuation Parameters

Project No. 080190, Former Walker Chevrolet Site (VCP No. SW1040)
633 Division Avenue, Tacoma, Washington

Chemical Name	Groundwater, Method A, Table Value (µg/L)	Federal and State Maximum Contaminant Level (µg/L)	MW-11 5/12/2009	MW-11 12/22/2010	MW-11 1/23/2014	MW-11 3/20/2015	MW-11 4/28/2015
Site Name			**Former Walker Chevrolet**				
Location Description			**Former Paint Booth Area**				
Total Petroleum Hydrocarbons							
Gasoline-Range Hydrocarbons (µg/L) (no detectable benzene)	1,000				100 U	100 U	
Diesel-Range Hydrocarbons (µg/L)	500				50 U	82 X	
Oil-Range Hydrocarbons (µg/L)	500				250 U	250 U	
Volatile Organic Compounds (COPCs and Other Detected Compounds)							
Benzene (µg/L)	5	5	1 U	0.35 U	0.35 U	0.35 U	
Toluene (µg/L)	1,000	1,000	1 U	1 U	1 U	1 U	
Ethylbenzene (µg/L)	700	700	1 U	1 U	1 U	1 U	
Xylenes, total (µg/L)	1,000	10,000	3 U	3 U	3 U	3 U	
Tetrachloroethylene (µg/L)	5	5	1 U	1 U	1 U	1 U	
Trichloroethylene (µg/L)	5	5	2.3	4.6	1.4	3	
cis-1,2-Dichloroethylene (µg/L)		70	1 U	1 U	1 U	1 U	
trans-1,2-Dichloroethylene (µg/L)		100	1 U	1 U	1 U	1 U	
1,1-Dichloroethylene (µg/L)		7	1 U	1 U	1 U	1 U	
Vinyl Chloride (µg/L)	0.2	2	0.2 U	0.2 U	0.2 U	0.2 U	
Carbon Tetrachloride (µg/L)		5	1.4	2.8	1 U	1.2	
Chloroform (µg/L)		80	1.9	2	1 U	1.1	
1,4-Dioxane					10 U	0.4 U	
Polycyclic Aromatic Hydrocarbons							
Benz(a)anthracene (µg/L)					0.05 U		
Benzo(a)pyrene (µg/L)	0.1	0.2			0.05 U		
Benzo(b)fluoranthene (µg/L)					0.05 U		
Benzo(k)fluoranthene (µg/L)					0.05 U		
Chrysene (µg/L)					0.05 U		
Dibenzo(a,h)anthracene (µg/L)					0.05 U		
Indeno(1,2,3-cd)pyrene (µg/L)					0.05 U		
Total cPAHs TEQ (µg/L; calculated)	0.1				ND		
Naphthalene (µg/L)	160		1 U	1 U	0.15	1 U	
Fuel Additives & RCRA Metals							
1,2-Dibromethane (EDB) (µg/L)	0.01					0.01 U	
Arsenic (µg/L), total	5					**5.15**	**6.29**
Arsenic (µg/L), dissolved	5						1 U
Barium (µg/L), total						57.9	73.2
Barium (µg/L), dissolved							12.5
Cadmium (µg/L), total	5					1 U	1 U
Cadmium (µg/L), dissolved	5						1 U
Chromium (µg/L), total	50					24	26.1
Chromium (µg/L), dissolved	50						1.76
Lead (µg/L), total	15	15			2.44	4.99	6.2
Lead (µg/L), dissolved	15						1 U
Mercury (µg/L), total	2					1 U	1 U
Mercury (µg/L), dissolved	2						1 U
Selenium (µg/L), total						1 U	1 U
Selenium (µg/L), dissolved							1 U
Silver (µg/L), total						1 U	1 U
Silver (µg/L), dissolved							1 U
Polychlorinated Biphenyls (PCBs)							
PCB Mixtures (µg/L)	0.1	0.5			0.1 U		
Natural Attenuation Parameters							
Dissolved oxygen (mg/L)					2.3	2.6	
Oxidation-reduction potential (mV)					73	125	
Nitrate (mg/L)		10					
Nitrite (mg/L)		1					
Sulfate (mg/L)							
Iron, total (mg/L)							
Total organic carbon (TOC; mg/L)							

Notes:
Blank cell = indicate not sampled or no standard exists
COPC = chemical of potential concern
CPAH = carcinogenic polycyclic aromatic hydrocarbon
mg/L = milligrams per liter
MTCA = Model Toxics Control Act
mV = millivolts
TEQ = toxic equivalent quotient
U = analyte was not detected at or above the reported result.
µg/L = micrograms per liter
Dissolved metals were filtered through 0.45 micron filter

NOTES TO SAMPLE LOG

1) ppm denotes parts per million
2) B, T, E, and X denote benzene, toluene, ethylbenzene, and xylenes, respectively
3) VOCs denote volatile organic compounds
4) ND denotes none detected. Refer to laboratory reports for detection limits.
5) HCID - analysis for petroleum hydrocarbons by WTPH-HCID method. Refer to laboratory reports for other methods used during this project.
6) Unless indicated by asterix, cleanup levels are "Method A" values as specified in the Model Toxics Control Act (MTCA), WAC 173-340. Asterix indicates MTCA Method B value.

NOTES:

+ Compound also appeared in laboratory blank, suggesting cross-contamination in laboratory.
1) ppm indicates parts per million.
2) ppb indicates parts per billion.
3) TPH indicates total petroleum hydrocarbons. The 418.1 analysis is designed for heavy oils, but also reports lighter hydrocarbon fractions.
4) ND denotes none detected. Refer to laboratory reports for detection limits.
5) Unless indicated by asterix, cleanup levels are "Method A" values as specified in the Model Toxics Control Act (MTCA), WAC 173-340. Asterix indicates MTCA Method B value.
6) NA indicates a published MTCA cleanup level for this compound is not currently available.

Sample contains gasoline and heavier than diesel range hydrocarbons.

Total Metals, mg/Kg

Arsenic	(As)	<5
Barium	(Ba)	2,000
Cadmium	(Cd)	4.2
Chromium	(Cr)	927
Lead	(Pb)	918
Mercury	(Hg)	<3
Selenium	(Se)	<8
Silver	(Ag)	<0.7

Total Metals testing performed by EPA Method 6010

SPECTRA LABORATORIES, INC.

Steven G. Hibbs, Chemist

Boring logs are presented below. Depth measurements should be considered accurate to the nearest 0.5 foot.

Boring 1

Date: 08-03-94
Location: West of South Drain and UST
No groundwater encountered

Depth (feet)	Soils	Comments
0-1	8" concrete slab, +/- 6" gravel fill	
1-5.5	Light brown, fine-grained sand, moist	Solvent-like odors and black staining, 3-5.5 feet
Auger refusal at 6 feet		Hard object or dense gravel at 6 feet

Boring 2

Date: 08-03-94
Location: Northwest of South Drain and UST
No groundwater encountered

Depth (feet)	Soils	Comments
0-1	8" concrete slab, +/- 6" gravel fill	
1-5.5	Light brown, fine-grained sand, moist	No odors or staining noted
Auger refusal at 6 feet		Hard object or dense gravel at 6 feet

Boring 3

Date: 08-03-94
Location: South of North Drain
No groundwater encountered

Depth (feet)	Soils	Comments
0-1	8" concrete slab, +/- 6" gravel fill	
1-3	Light brown, fine-grained sand with pieces of brick, moist	No odors or staining noted
Boring terminated at 3 feet		

Boring 4

Date: 08-03-94
Location: North of South Drain
No groundwater encountered

Depth (feet)	Soils	Comments
0-1	8" concrete slab, +/- 6" gravel fill	
1-3	Light brown, fine-grained sand, moist	Faint solvent-like odor noted 1-3 feet
Boring terminated at 3 feet

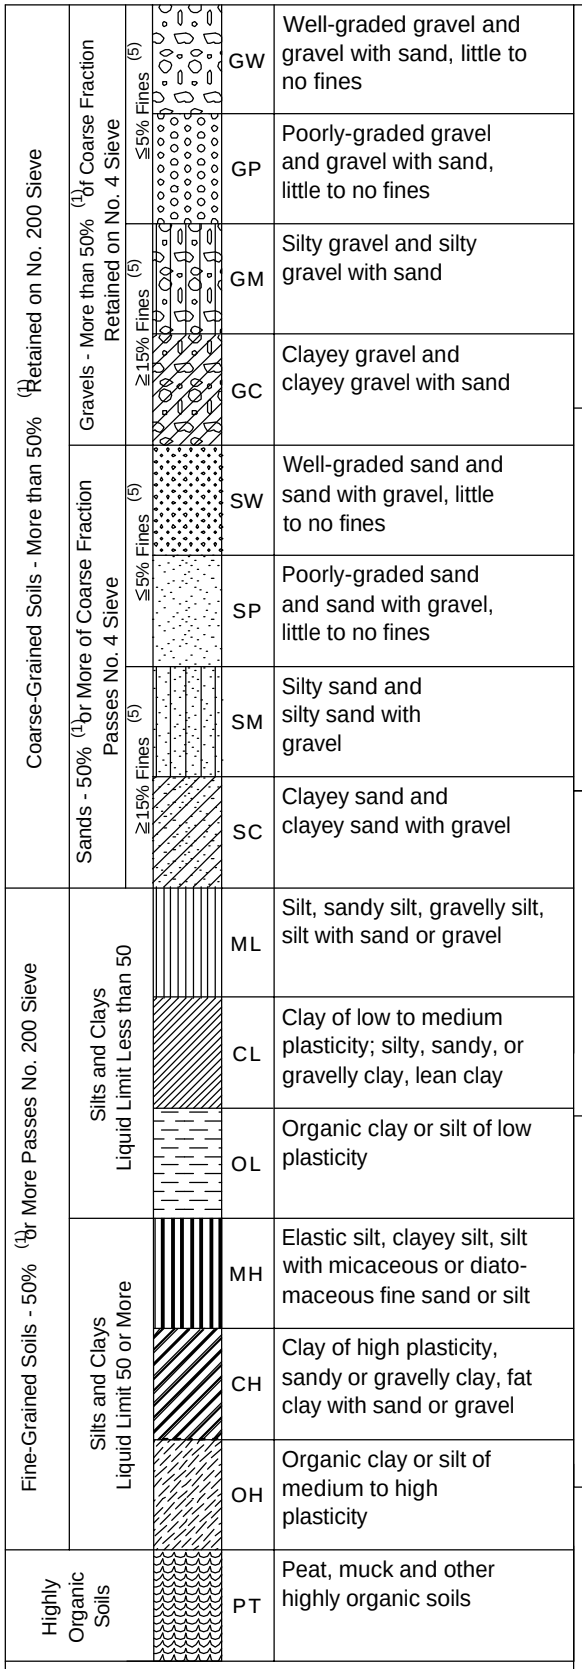
APPENDIX B

Soil Boring Logs from South Gas Station



Terms Describing Relative Density and Consistency

	Density	SPT (2) blows/foot
Coarse-Grained Soils	Very Loose	0 to 4
	Loose	4 to 10
	Medium Dense	10 to 30
	Dense	30 to 50
	Very Dense	>50

	Consistency	SPT (2) blows/foot
Fine-Grained Soils	Very Soft	0 to 2
	Soft	2 to 4
	Medium Stiff	4 to 8
	Stiff	8 to 15
	Very Stiff	15 to 30
	Hard	>30

Test Symbols

FC = Fines Content
G = Grain Size
M = Moisture Content
A = Atterberg Limits
C = Consolidation
DD = Dry Density
K = Permeability
Str = Shear Strength
Env = Environmental
PiD = Photoionization Detector

Component Definitions

Descriptive Term	Size Range and Sieve Number
Boulders	Larger than 12"
Cobbles	3" to 12"
Gravel	3" to No. 4 (4.75 mm)
Coarse Gravel	3" to 3/4"
Fine Gravel	3/4" to No. 4 (4.75 mm)
Sand	No. 4 (4.75 mm) to No. 200 (0.075 mm)
Coarse Sand	No. 4 (4.75 mm) to No. 10 (2.00 mm)
Medium Sand	No. 10 (2.00 mm) to No. 40 (0.425 mm)
Fine Sand	No. 40 (0.425 mm) to No. 200 (0.075 mm)
Silt and Clay	Smaller than No. 200 (0.075 mm)

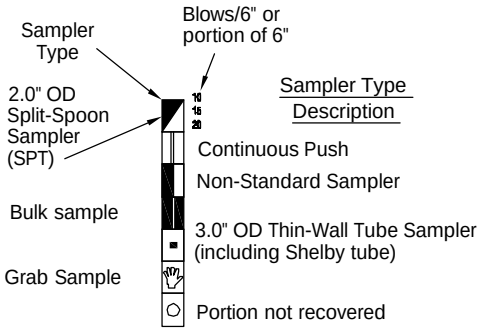
(3) Estimated Percentage

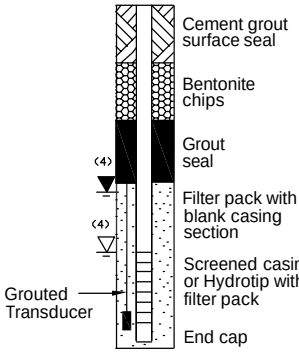
Percentage by Weight	Modifier
<5	Trace
5 to 15	Slightly (sandy, silty, clayey, gravelly)
15 to 30	Sandy, silty, clayey, gravelly)
30 to 49	Very (sandy, silty, clayey, gravelly)

Moisture Content

Dry - Absence of moisture, dusty, dry to the touch
Slightly Moist - Perceptible moisture
Moist - Damp but no visible water
Very Moist - Water visible but not free draining
Wet - Visible free water, usually from below water table

Symbols





(1) Percentage by dry weight
(2) (SPT) Standard Penetration Test (ASTM D-1586)
(3) In General Accordance with Standard Practice for Description and Identification of Soils (ASTM D-2488)
(4) Depth of groundwater — ATD = At time of drilling; Static water level (date); BGS = below ground surface
(5) Combined USCS symbols used for fines between 5% and 15% as estimated in General Accordance with Standard Practice for Description and Identification of Soils (ASTM D-2488)

Classifications of soils in this report are based on visual field and/or laboratory observations, which include density/consistency, moisture condition, grain size, and plasticity estimates and should not be construed to imply field or laboratory testing unless presented herein. Visual-manual and/or laboratory classification methods of ASTM D-2487 and D-2488 were used as an identification guide for the Unified Soil Classification System.

Alan Noell, Project Manager
Aspect Consulting, LLC
401 2nd Ave S, Suite 201
Seattle, WA 98104

Dear Mr. Noell:

Included are the results from the testing of material submitted on April 7, 2015 from the Walker Chevrolet PO 080190, F&BI 504119 project. There are 23 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on April 7, 2015 by Friedman & Bruya, Inc. from the Aspect Consulting, LLC Walker Chevrolet PO 080190, F&BI 504119 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Aspect Consulting, LLC
504119 -01	AB-2-16.5
504119 -02	AB-3-16.5
504119 -03	AB-4-16.5

All quality control requirements were acceptable.

Date of Report: 04/14/15
Date Received: 04/07/15
Project: Walker Chevrolet PO 080190, F&BI 504119
Date Extracted: 04/07/15
Date Analyzed: 04/07/15

**RESULTS FROM THE ANALYSIS OF SOIL SAMPLES
FOR TOTAL PETROLEUM HYDROCARBONS AS GASOLINE
USING METHOD NWTPH-Gx**

Results Reported on a Dry Weight Basis
Results Reported as mg/kg (ppm)

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The compound is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

RE: Walker Chevrolet
Lab ID: 1503256

April 23, 2015

Attention Alan Noell:

Fremont Analytical, Inc. received 2 sample(s) on 3/24/2015 for the analyses presented in the following report.

Helium by GC/TCD
Petroleum Fractionation by EPA Method TO-15
Volatile Organic Compounds by EPA Method TO-15
Volatile Organic Compounds-EPA Method TO-15 (SIM)

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Mike Ridgeway
President

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1503256-001	SS-FPB-032015	03/20/2015 7:00 AM	03/24/2015 11:18 AM
1503256-002	IA-FPB-032315	03/23/2015 2:00 PM	03/24/2015 11:18 AM

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

Case Narrative

WO#: **1503256**
Date: **4/23/2015**

CLIENT: Aspect Consulting
Project: Walker Chevrolet

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Air samples are reported in ppbv and ug/m3.

The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Standard temperature and pressure assumes 24.45 = (25C and 1 atm).

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below LOQ
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

Alan Noell, Project Manager
Aspect Consulting, LLC
401 2nd Ave S, Suite 201
Seattle, WA 98104

Dear Mr. Noell:

Included are the results from the testing of material submitted on March 20, 2015 from the Walker Chevrolet 080190, F&BI 503392 project. There are 18 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 20, 2015 by Friedman & Bruya, Inc. from the Aspect Consulting, LLC Walker Chevrolet 080190, F&BI 503392 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Aspect Consulting, LLC
503392 -01	MW-11-032015

Chromium in the 200.8 matrix spike and the associated relative percent difference exceeded the acceptance criteria. The laboratory control sample passed the acceptance criteria, therefore the results are likely due to matrix effect.

All other quality control requirements were acceptable.

Date of Report: 04/03/15
Date Received: 03/20/15
Project: Walker Chevrolet 080190, F&BI 503392

QUALITY ASSURANCE RESULTS FROM THE ANALYSIS OF WATER SAMPLES FOR 1,2-DIBROMOETHANE BY EPA METHOD 8011 MODIFIED

Laboratory Code: 503392-01 (Duplicate)

Analyte	Reporting Units	Sample Result	Duplicate Result	RPD (Limit 10)
1,2-Dibromoethane	ug/L (ppb)	<0.01	<0.01	nm

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Acceptance Criteria
1,2-Dibromoethane	ug/L (ppb)	0.10	98	70-130

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The compound is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dear Mr. Noell:

Included are the additional results from the testing of material submitted on January 23, 2014 from the Walker Chevrolet 080190-004-11, F&BI 401273 project. There are 5 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

Dear Mr. Noell:

Included are the results from the testing of material submitted on April 30, 2015 from the Walker Chevrolet, PO 080190, F&BI 504573 project. There are 8 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The compound is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.
