**Re: DRAFT Upland Data Gap Assessment
JELD-WEN, inc. Former Nord Door Site,
300 West Marine View Drive, Everett, Washington**

Dear Ms. Keith,

SLR International Corporation is pleased to present this report summarizing the findings of the upland data gap assessment which was completed to evaluate the approximate depth of creosote/total petroleum hydrocarbon (TPH) impacts at the JELD-WEN inc. former Nord Door Site located at 300 West Marine View Drive in Everett, Washington (Site). The Site location is shown on Figure 1.

BACKGROUND

The initial Remedial Investigation (RI) of the Site was completed between May and October 2009 and was performed in conformance with the Washington Department of Ecology (Ecology) approved 2008 RI Work Plan. The work was conducted under an Agreed Order with Ecology for RI/FS Study and Draft CAP, dated January 2, 2008. The Interim Draft RI/FS (Remedial Investigation/Feasibility Study) was submitted to Ecology on December 31, 2013. During the preparation of the Interim Draft RI/FS report, the evaluation of the vertical extent of the soil and groundwater impacts in the creosote/TPH area (former pole treating and former fuel oil storage area) was identified as a data gap. Additional evaluation of the vertical extent of this impacted area was considered needed to adequately evaluate the remediation technologies, remedy alternatives, and costs analysis under the RI/FS report.

SCOPE OF WORK

To address the identified data gap, three Geoprobe borings were completed in the creosote/TPH area on December 18, 2013 at the locations presented on Figure 2. The boring locations were selected to be at or near areas where the highest creosote/TPH concentrations had been identified in soil and/or groundwater. Borings GP-605 and GP-607 were moved slightly to the south and west of their preferred locations due to the presence of underground utilities (GP-605) and subsurface obstructions (GP-607). Soil and groundwater samples collected from each of the three the borings were submitted for evaluation of TPH by NWTPH methods and for polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270-SIM.

FIELD ACTIVITIES

On December 18, 2013, SLR met with ESN-NW (Geoprobe subcontractor) for the completion of the borings. Prior to the initiation of field activities, the Washington public utility notification center was contacted to clear the proposed boring locations for any suspected publically-owned underground utilities. In addition, a private utility locating subcontractor was contacted to clear the proposed boring locations for any suspected privately-owned underground utilities. The methods and procedures described in the upland sampling and analysis plan (SAP) for soil and groundwater sample collection were utilized during the completed sampling. Sampling equipment was decontaminated between each sample location using the procedures described in the SAP. All soil and groundwater samples were collected during a single sampling event. A photoionization detector (PID) was used to screen the soil samples for the presence of volatile compounds. Boring logs showing lithology, PID measurements, and sample collection depths are included as Attachment 1.

Boring GP-605 was completed to a depth of 35 feet below ground surface (bgs) proximate to borings GP-9, GP-10, and GP-202 which had the highest identified concentrations of both TPH and PAHs in soil and groundwater during prior investigations. Groundwater was encountered at approximately 2.5 feet bgs in boring GP-605. Soils in boring GP-605 consisted of a surface layer of organics (sod) from approximately 0 to 0.5 feet bgs, sand from approximately 0.5 to 1.5 feet bgs, a thin layer of clay from approximately 1.5 to 2.5 feet bgs, underlain by sand from approximately 2.5 to 6 feet bgs. A moderate creosote odor was noted on the sand layer beginning at approximately 4.5 feet bgs. Beneath the sand was a gravel layer from approximately 6 to 11 feet bgs. The creosote-like odor became stronger in the gravel layer and, at approximately 9 feet bgs, the odor was strong and creosote was observed to be coating the gravel collected from the boring. A silt layer was encountered between approximately 11 and 13 feet bgs, beneath which the creosote odor was noticeably diminished. Beneath the silt layer was sand extending to a depth of 35 feet bgs. A soil sample (GP-605-13.5) was collected from sand just below the silt layer. At approximately 33 feet the creosote-like odor became strong again, creosote-type product was observed coating the soil, and a sheen was noted on the water from the assessment boring. At approximately 35 feet bgs what appeared to be a confining layer of silt was encountered which showed no field-evidence of impacts. The boring was not extended through the confining layer. One soil sample (GP-605-34.5) was collected just above the silt confining layer. A groundwater sample (GP-605-GW) was collected from a temporary well screen placed between 30 and 35 feet bgs, at the bottom of the boring.

Boring GP-606 was completed to a depth of 15 feet bgs near the loading dock to the north of GP-9, GP-10, and GP-202. Groundwater was encountered at approximately 4 feet bgs in boring GP-605. Soils in boring GP-606 consisted of a surface layer of organics (sod) from approximately 0 to 0.5 feet bgs, silty sand from approximately 0.5 to 1.5 feet bgs, gravelly sand from approximately 1.5 to 2.5 feet bgs, a silt layer from approximately 2.5 to 3 feet bgs, sandy silt from 3 to 4 feet bgs, sand from 4 to 7.5 feet bgs, and silty sand from 7.5 to 15 feet bgs. No odors or staining was observed on soil or groundwater in the boring; therefore this boring was discontinued at 15 feet bgs. One soil sample was collected from 14.5 feet bgs in the boring (GP-606-14.5). A groundwater sample (GP-606-GW) was collected from a temporary well screen placed between 10 and 15 feet bgs, at the bottom of the boring.

February 25, 2014
Ms. Diane Keith
Page 3

Boring GP-607 was completed to a depth of 25 feet bgs to the south of the office building, south of former borings GP-9, GP-10, and GP-202. Groundwater was encountered at approximately 4.5 feet bgs in boring GP-607. The boring consisted of asphalt to 0.4 feet bgs, pea gravel from 0.4 to 1 foot bgs, concrete from 1 to 1.5 feet bgs, gravelly sand from 1.5 to 3.5 feet bgs, and silty sand from 3.5 to the terminus of the boring at 25 feet bgs. No staining or odors were observed in soil or groundwater in the boring until a depth of approximately 8.5 feet bgs, at which point a creosote-like odor was encountered and a sheen was evident on soil collected from the assessment boring. At approximately 13 feet bgs the creosote-like odors became less noticeable to field personnel. One soil sample was collected from 24.5 feet bgs in the boring (GP-607-24.5). A groundwater sample (GP-607-GW) was collected from a temporary well screen placed between 20 and 25 feet bgs, at the bottom of the boring.

LABORATORY ANALYTICAL RESULTS

The results of the laboratory analyses are summarized on the attached Tables 1 through Table 4 and copies of the laboratory analytical report are included as Attachment 2.

Soil Sampling Results

Soil samples from borings GP-605 at 13.5 feet bgs, GP-606 at 14.5 feet bgs, and boring GP-607 at 24.5 feet bgs identified no TPH in the diesel or heavy oil ranges above laboratory method reporting limits (MRLs). The soil sample from boring GP-605 at 34.5 feet bgs, which had a creosote-like odor, identified a TPH in the diesel range at a concentration of 810 milligrams per kilogram (mg/kg), below the Interim Draft RI/FS Preliminary Cleanup Levels (PCLs) of 2,000 mg/kg (Table 1).

The PAH concentrations in soil samples from borings GP-605 at 34.5 feet bgs, GP-606 at 14.5 feet bgs, and GP-607 at 24.5 feet did not identify concentrations of PAHs (including carcinogenic PAHs [cPAHs]) at concentrations above PCLs. The soil sample from boring GP-605 at 13.5 feet bgs identified cPAHs at a concentration of 3.7 mg/kg, above the PCL of 0.140 mg/kg. With the exception of naphthalene, no non-carcinogenic PAHs were identified above PCLs in sample GP-605-13. Naphthalene was identified at a concentration of 82 mg/kg, below the PCL of 1,600 mg/kg (Table 2).

Groundwater Sampling Results

The groundwater sample collected from boring GP-605 contained TPH in the gasoline, diesel, and heavy oil ranges at concentrations of 1,000 micrograms per liter ($\mu\text{g}/\text{L}$), 19,000 $\mu\text{g}/\text{L}$, and 810 $\mu\text{g}/\text{L}$, respectively. These concentrations equal or exceed the PCL of 1,000 $\mu\text{g}/\text{L}$ for TPH in the gasoline range and 500 $\mu\text{g}/\text{L}$ for TPH in the diesel and heavy oil ranges (Table 3). A cPAHs concentration of 49.6 $\mu\text{g}/\text{L}$ was reported in sample GP-605, above the PCL of 0.05 $\mu\text{g}/\text{L}$. With the exception of naphthalene, none of the non-carcinogenic PAHs were identified above PCLs. Naphthalene was identified at a concentration of 2,800 $\mu\text{g}/\text{L}$ in groundwater sample GP-605-GW, above the PCL of 160 $\mu\text{g}/\text{L}$ (Table 4).

The groundwater sample collected from boring GP-606 contained TPH in the gasoline, diesel, and heavy oil ranges at concentrations of 150 $\mu\text{g}/\text{L}$, 770 $\mu\text{g}/\text{L}$, and 150 $\mu\text{g}/\text{L}$, respectively (Table

February 25, 2014
Ms. Diane Keith
Page 4

3). Of these, only TPH in the diesel range exceeded the PCL. A cPAH concentration of 0.22 µg/L was reported in sample GP-606-GW, above the PCL of 0.05 µg/L. None of the non-carcinogenic PAHs were identified above PCLs in groundwater sample GP-606-GW (Table 4).

The groundwater sample collected from boring GP-607 contained TPH in the diesel and heavy oil ranges at concentrations of 240 µg/L and 86 µg/L, neither of which exceeded PCLs. TPH in the gasoline range was not identified at concentrations above laboratory MRLs (Table 3). A cPAHs concentration of 3.11 µg/L was reported in sample GP-607, above the PCL of 0.05 µg/L. None of the non-carcinogenic PAHs were identified above PCLs in groundwater sample GP-607-GW (Table 4).

CONCLUSIONS

The findings of the data gap assessment supported the soil assumptions presented in the Interim Draft RI/FS report; specifically that soil impacts above PCLs associated with creosote/TPH releases are generally found at depths between 5 and 15 feet bgs. TPH or PAH concentrations in soil at depths greater than 15 feet bgs were below the PCLs, even when field evidence of creosote-like impacts were identified.

The groundwater sampling found that TPH, cPAHs, and naphthalene are present at concentrations above PCLs at deeper depths of 35 feet bgs, above what appears to be a confining layer of silt. The groundwater samples were collected from Geoprobe borings which have the tendency to be biased high. As has been shown in monitoring well MW-5, located near the center of the identified creosote/TPH plume area, the concentrations of these constituents have been found to be much lower (below PCLs) when groundwater samples are collected from constructed wells. Consistent with recommendations provided in the Interim Draft RI/FS, the installation of additional groundwater monitoring wells, including wells screened at deeper depths, may be warranted around the creosote/TPH release plume.

Sincerely,
SLR International Corporation

Report Summary

Thursday January 02, 2014

Report Number: L675535

Samples Received: 12/23/13

Client Project: 108.00228.00048

Description: Nord Door Project - Everett, WA

The analytical results in this report are based upon information supplied by you, the client, and are for your exclusive use. If you have any questions regarding this data package, please do not hesitate to call.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.
