CSID 4564

WORKSHEET 1 Summary Score Sheet

SITE INFORMATION:

Name: Naches Valley Intermediate School

Address: 101 Shafer Ave.

City: Naches County: Yakima

Zip: 98937 State: WA Section/Township/Range: S3/T14N/R17E

Longitude: 120° 41' 40" W Latitude: 46° 43' 48" N

TCP ID #: 2161643

Site scored/ranked for the February 2006 update.

SITE DESCRIPTION (management areas, substances of concern, and quantities):

Naches Valley Intermediate School consists of approximately 14 acres which, according to a 1947 aerial photograph, may have previously been orchard land. The school is located on the east side of Naches near residential properties and orchard land.

This site was included in an area-wide lead and arsenic sampling program which involved collecting samples from schools suspected of having a history of past pesticide use. Prior to the mid-1940s, lead arsenate was the most widely used chemical used to control cottling moths on fruit trees. Lead (Pb) and arsenic (As) are known to be very stable in soil and tend to stay near the surface. Because of this historical background, it was suspected that the soil in the school playground might be contaminated with Pb and As. The Washington Department of Ecology (Ecology) obtained permission from Naches School District to sample and test the soils for lead and arsenic from all of the Naches Valley Intermediate School grounds.

The soils throughout the property were sampled by the Department of Ecology on July 28 and 29, 2005. Samples were taken from the top six inches using a core sampler. The samples were analyzed for lead and arsenic using X-Ray Fluorescence Spectroscopy.

Sampling results at Naches Valley Intermediate School indicate that contaminant levels in soil exceed the Model Toxics Control Act Method A cleanup levels for lead (250 ppm) and/or arsenic (20 ppm) in 20 of 31 soil samples. The highest levels of arsenic and lead detected at the site were 105.2 ppm and 669.8 ppm, respectively. These concentrations require the site be scored and ranked under the Washington Ranking Method (WARM).

SPECIAL CONSIDERATIONS (include limitations in site file data or data which cannot be accommodated in the model, but which are important in evaluating the risk associated with the site, or any other factor(s) over-riding a decision of no further action for the site):

Due to the nature of metals in soil, it is assumed that lead and arsenic are likely not present at high concentrations at depths greater than four feet. This has been documented at several sites and seems consistent for sites where lead arsenate pesticide was used. Samples were collected at a depth of six inches; however, for the purposes of this assessment, it is assumed that contamination extends to a depth of three feet.

Because of the presence of children at the school grounds, ingestion of contaminated soil is of concern and is considered the greatest risk to children. WARM scoring does not consider ingestion as an exposure route. However, the use of school grounds by children and their incidental ingestion of lead and arsenic contaminated soil are being addressed by Ecology through remediation efforts and by the State Department of Health through education.

ROUTE SCORES:

Surface Water/Human Health:7	7.4	Surface Water/Environmental.:	16.3
Air/Human Health: 8	3.3	Air/Environmental:	NS
Groundwater/Human Health: 3'	7.8		
		OVERALL RANK:	5

WORKSHEET 2 Route Documentation

1. SURFACE WATER ROUTE

a. List those substances to be considered for scoring:

Source: 1

Lead and arsenic

b. Explain basis for choice of substance(s) to be used in scoring.

Analytical results from soil sampling indicate the presence of these hazardous substances at levels which exceed our current Method A cleanup levels.

c. List those management units to be considered for scoring:

Source 1

Surface and subsurface soils

d. Explain basis for choice of unit to be used in scoring:

Spills/discharges caused soil contamination

2. AIR ROUTE

a. List those substances to be considered for scoring:

Source: 1

Lead and arsenic

b. Explain basis for choice of substance(s) to be <u>used</u> in scoring:

Analytical results from soil sampling indicate the presence of these hazardous substances at levels which exceed our current Method A cleanup levels.

c. List those management units to be <u>considered</u> for scoring:

Source: 1

Surface and subsurface soils

d. Explain basis for choice of unit to be used in scoring:

Spills/discharges caused soil contamination

3. GROUNDWATER ROUTE

a. List those substances to be considered for scoring:

Source: 1

Lead and arsenic

b. Explain basis for choice of substance(s) to be used in scoring:

Analytical results from soil sampling indicate the presence of these hazardous substances at levels which exceed our current Method A cleanup levels.

c. List those management units to be considered for scoring:

Source: 1

Surface and subsurface soils

d. Explain basis for choice of unit to be used in scoring:

Spills/discharges caused soil contamination

WORKSHEET 4 Surface Water Route

1.0 SUBSTANCE CHARACTERISTICS

		Drinking		Acute		Chronic		Carcino	genicity

1= K > 1.0 = 2		1=			
2= K is 0.1 to 1.0 = 3		2=			

Source: 3

Value: $\frac{3}{3}$ (Max = 3)

1.3 Substance Quantity (volume):	
Explain basis: One sample was collected from each randomly selected square in a 50° * 50° grid. Twenty-one samples exceeded MTCA cleanup levels. Therefore, by calculating 20 * 2500 sq. ft, 50000 sq. feet can be estimated as contaminated. Based on previous sampling sessions where lead/arsenic has been detected to depths up to 4°, Ecology has determined that is likely that contaminated soil extends to a depth of 3° bgs. Therefore the estimated volume of contamination is calculated as follows. 50000° * 3° = 150000 ft³ or ~5556 yd³	Source: 1, 3 Value: 5 (Max=10)

2.0 MIGRATION POTENTIAL

-		Source	Value
2.1	Containment (explain basis): While a portion of the site is capped (parking lots, buildings, etc), soil samples were collected from only uncapped areas (i.e. in bare soil or beneath grass) at a depth of six inches.	3	10 (Max = 10)
2.2	Net precipitation: 4.7 " -3 " $= 1.7$ "	4	1 (Max = 5)
2.3	Subsurface hydraulic conductivity: the site consists of loam	3	3 (Max = 4)
2.4	Vertical depth to groundwater: water well reports nearby indicate groundwater is approximately 40 feet below ground surface	3,5	6 (Max = 8)

3.0 TARGETS

		Source	Value
3.1	Groundwater usage: Public supply, but alternate sources available with minimum hookup requirements	3	4 (Max = 10)
3.2	Distance to nearest drinking water well: ~1800 feet	3, 5	3 (Max = 5)
3.3	Population served within 2 miles: $\sqrt{\text{pop.}} = \sqrt{1127} = 33.6$	3, 7	34 (Max = 100)
3.4	Area irrigated by (groundwater) wells within 2 miles: $(0.75)*\sqrt{\# \text{ acres }} = \underline{0.75}*\sqrt{63} = \underline{5.9}$	3, 6	6 (Max = 50)

4.0 RELEASE

	Source	Value	
Explain basis for scoring a release to groundwater: Not documented		0 (Max = 5)
