Marysville, Ohio 43041

**RE: Limited Phase II Subsurface Investigation
Former Pacific Coast Feather Facility
14524 40th Avenue NE
Marysville, Snohomish County, Washington**

Dear Mr. Greenway:

Partners Environmental Consulting, Inc. ("Partners") was contracted by The Scotts Company, LLC (User/Client) to conduct a Limited Phase II Subsurface Investigation at the former Pacific Coast Feather facility located at 14524 40th Avenue NE, Marysville, Washington ("Property"). **Figure 1** is presented as a Property Location Map. **Figure 2** is presented as a Soil Boring and Sample Location Map.

1.0 PROJECT BACKGROUND

In April 2013, Partners conducted a Phase I Environmental Site Assessment ("ESA") of the Property. The findings of the Phase I ESA were presented in a report titled *Phase I Environmental Site Assessment, Former Pacific Coast Feather Facility, 14524 40th Avenue NE, Marysville, Snohomish County, Washington* and dated April 17, 2013. The Phase I ESA revealed no evidence of Recognized Environmental Conditions ("RECs") in connection with the Property, except for the following:

Property

- **Historic Boat Manufacturing Operations:** The Property was developed and utilized for fiberglass boat fabrication, generally on the central portion of the Property, from the late 1960s to the late 1980s. Areas of concern associated with this operation at the Property included drum storage areas, resin tanks, an acetone underground storage tank ("UST") and oil/water separators. Previous environmental reports completed for the Property, as discussed in the Phase I report, found that styrene was detected in soil at elevated concentrations. Site observations by Partners indicated that two (2) oil/water separators are still present at the Property. Snohomish County Health Department ("SCHD") records indicate that the Property was previously serviced by a supply well and septic system. In addition, the Property was formerly identified as a generator of hazardous waste. Based on Partners' experience, hazardous substances and/or petroleum products may have been used in fiberglass boat fabrication operations, which had the potential to adversely impact the Property.
- **Historic Feather Processing Operations:** The central portion of the Property was developed and utilized for feather processing from the late 1980s to approximately 2008. Previous environmental reports completed for the Property found that historic feather processing operations had the potential to adversely impact the Property. Areas of concern identified at the Property included drum storage areas, oil spillage and oil/water separators. The Property was identified in the Resource Conservation and Recovery Act ("RCRA") database as a generator of hazardous waste. Based on Partners' experience, hazardous substances and/or petroleum products may

Partners Environmental Consulting, Inc.

Corporate Office: 31100 Solon Road, Suite G • Solon, Ohio 44139 • phone: (440) 248.6005 • fax: (440) 248.6374

have been used in feather processing operations, which had the potential to adversely impact the Property.

- **Historic Engine Recycling Operations:** The central portion of the Property was utilized for engine recycling purposes in the early 1990s. Previous environmental reports completed for the Property found that these operations had the potential to adversely impact the Property. Areas of concern identified at the Property included drum storage areas with oil spillage, an engine dismantling area with oil spillage and burn piles, and an engine storage area with an oily sheen on standing water. Based on Partners' experience, hazardous substances and/or petroleum products may have been used in engine recycling operations, which had the potential to adversely impact the Property.

Adjacent and Surrounding Sites

- **Northend Truck Equipment, Inc., 14919 40th Avenue NE:** This facility adjoins the Property to the northeast across 40th Avenue NE and is hydraulically upgradient to crossgradient in the inferred direction of groundwater flow from the Property. The facility is identified as a RCRA - Conditionally Exempt Small Quantity Generator ("CESQG"). Seven (7) written informal enforcement actions have been issued to this facility from 2007 to 2011, which resulted in seven (7) on-site compliance evaluation inspections. Hazardous waste identified at the facility included ignitable waste, methyl ethyl ketone and spent non-halogenated solvents. Based on the proximity and location relative to the Property (hydraulically upgradient to crossgradient), there is a potential that a release (if any) at this facility has adversely impacted the Property.

2.0 LIMITED SUBSURFACE INVESTIGATION ACTIVITIES

Partners advanced 21 soil borings (B-1 through B-21) and obtained soil samples from the Property on April 30 through May 2, 2013. A total of 10 groundwater samples were collected from temporary sample points installed at borings B-1, B-3, B-6, B-8, B-10, B-11, B-15, B-17, B-19 and B-20. In addition, three (3) concrete samples were obtained from areas of the interior building floor slab at borings B-12, B-13 and B-15. Soil boring, groundwater and concrete sample locations and analyses are summarized in **Table 1**. Soil boring and sample locations are presented on **Figure 2**.

2.1 Soil Boring Installation and Sampling

Soil borings were advanced using a track-mounted, direct push technology (Geoprobe™) sampling system. The borings were sampled continuously from the ground surface or below concrete floors to depths of 10 feet below ground surface ("bgs"). The Geoprobe™ drives a two (2)-inch outside diameter, stainless steel tube containing a new disposable acetate liner into the subsurface to continuously obtain soil samples. The soil is forced into the liner at continuous five (5)-foot intervals, and is then retrieved to the surface. Each five (5)-foot soil sample was visually observed, sampled, logged, and classified according to the Unified Soil Classification System ("USCS") by a member of Partners' field staff. All boring installation work was performed by a Washington-bonded and licensed monitoring well contractor. The borings were completed in accordance with the Washington Administrative Code ("WAC") for the Minimum Standards for Construction and Maintenance of Wells (WAC Chapter 173-160) and General Requirements for Resource Protection Well Construction and Geotechnical Soil Borings (WAC Chapter 173-160-400).

Soil samples were divided into two (2) portions. One (1) portion was collected in new two (2)-ounce or four (4)-ounce, pre-cleaned glass jars with Teflon® septums, and the second portion was placed in a new re-sealable plastic bag for field screening purposes. Samples collected in the glass jars were labeled and placed in a cooler containing ice, pending submission to a qualified analytical laboratory for chemical analysis.

New disposable nitrile gloves were worn and changed between each sample to prevent possible cross-contamination. The stainless steel sampling equipment was decontaminated between boring with an Alconox® detergent rinse and power washer. The location of each boring is depicted on **Figure 2** and soil boring logs are provided in **Attachment A**.

Soil samples were field screened with a MiniRAE 3000 Photoionization Detector ("PID"), manufactured by RAE Systems, for the presence of organic vapors. The detector was calibrated prior to field activities using a known concentration of a gas standard in accordance with the manufacturers' specifications. Soil sample PID readings are included on the soil boring logs in **Attachment A**.

Borings were abandoned at the completion of field activities by filling each boring to grade with bentonite chips, which were subsequently hydrated. The surface at each boring location was patched with a like surfacing material (e.g., concrete or soil). Excess soil cuttings were placed in one (1) 55-gallon drum and temporarily staged on-site pending waste characterization results.

Select soil samples were submitted to the laboratory based on visual observations, odors, the specific area being assessed, the depth, and PID readings. The soil samples were analyzed for one (1) or more of the following parameters:

- Volatile Organic Compounds ("VOCs") by United States Environmental Protection Agency ("EPA") Method 8260, (21 samples),
- Semi-Volatile Organic Compounds ("SVOCs") by EPA Method 8270 (eight [8] samples),
- Polynuclear Aromatic Hydrocarbons ("PAHs") by EPA Method 8270 (12 samples),
- Resource Conservation and Recovery Act ("RCRA") 8 Metals EPA Methods 6010/7470 (nine [9] samples),
- Polychlorinated Biphenyls ("PCBs") EPA Method 8082 (three [3] samples), and
- Total Petroleum Hydrocarbons ("TPH") by Method NWTPHGX (C₆-C₁₀) and NWTPHDX (C₁₀-C₂₀, C₂₀-C₄₀) (seven [7] samples).

Soil samples were submitted for analysis in a cooler containing ice, under appropriate chain-of-custody control, to Environmental Sciences Corporation ("ESC" – Laboratory ID C847) located in Mt. Juliet, Tennessee. The laboratory analytical report is included in **Attachment B**. Soil analytical results are summarized in **Table 2** through **Table 4**.

2.2 Groundwater Sampling and Analyses

A total of 10 groundwater samples were collected from borings B-1, B-3, B-6, B-8, B-10, B-11, B-15, B-17, B-19 and B-20. Groundwater samples were obtained from a temporary, four (4) foot long, stainless steel well point with a 10-slot screen. The temporary well point was lowered approximately three and a half (3.5) feet into the saturated zone leaving the top of the well screen above groundwater. Groundwater was then collected from the temporary well point utilizing a peristaltic pump and disposable polyethylene tubing. Approximately one (1) to two (2) gallons of water were purged from each location prior to sampling. During sampling, Partners observed that the groundwater was initially turbid; however, the groundwater appeared visually clear after purging was completed, prior to sampling. After collecting the groundwater samples, the temporary well point was removed and the boreholes were filled to grade with bentonite chips, which were subsequently hydrated. Purged groundwater was placed in one (1) 55-gallon drum and temporarily staged on-site pending waste characterization results.

Each groundwater sample was collected into two (2) 40-milliliter amber glass vials with hydrochloric acid preservative, two (2) 100-milliliter amber glass jars (no preservative), two (2) 40-milliliter amber glass vials (no preservative), and/or one (1) 500-milliliter plastic bottle with nitric acid preservative. Each sample bottle was immediately sealed, inspected to ensure it was intact (and that no headspace existed, where applicable), labeled, and placed into a cooler containing ice.

The groundwater samples were submitted for laboratory analyses of the following parameters:

- VOCs by EPA Method 8260 (10 samples),
- SVOCs by EPA Method 8270 (four [4] samples),
- PAHs by EPA Method 8270 (six [6] samples), and
- RCRA 8 Metals by EPA Methods 6010/6020/7470 (four [4] samples).

Although the groundwater samples appeared to be clear at the time of sampling, the RCRA 8 metals samples were filtered in the field utilizing a 0.45 micron inline filter to remove potential suspended solids that may cause false positive results.

The groundwater samples were submitted for analysis in a cooler containing ice, under appropriate chain-of-custody control, to ESC located in Mt. Juliet, TN. The laboratory analytical report is included in **Attachment B**. Groundwater analytical results are summarized in **Table 5** through **Table 7**.

2.3 Concrete Sampling and Analyses

Three (3) concrete samples were obtained from the interior building floor slab of Building H at the B-12, B-13 and B-15 boring locations. The concrete star bit utilized by the Geoprobe™ drill rig was used to drill into the concrete floor to a depth of approximately two (2) inches. The concrete powder was collected using a putty knife and placed directly into laboratory supplied glass sample jars with Teflon® lids. The concrete samples were submitted to ESC under chain-of-custody control to be analyzed for PCBs by EPA Method 8082. All concrete sampling equipment was decontaminated between sample locations.

Concrete analytical results are summarized in **Table 8**. The laboratory analytical report is included in **Attachment B**.

3.0 POTENTIALLY APPLICABLE REGULATORY PROGRAMS OR GUIDANCE DOCUMENTATION

3.1 State of Washington Department of Ecology

The soil and groundwater analytical results were compared to appropriate cleanup levels established by the Washington State Department of Ecology ("DOE"), Toxics Cleanup Program. As indicated in the attached analytical summary tables, some detected constituents do not have cleanup standards established by the DOE.

Model Toxics Control Act (MTCA)

Initially, the results of soil and groundwater testing were compared to Method A Cleanup Levels as published in the document titled *Model Toxics Control Act Statute and Regulation* (Washington DOE Publication No. 94-06, Revised November 2007). Cleanup standards were established per Method A in accordance with the Model Toxics Control Act ("MTCA") Cleanup Regulation (Chapter 173-340 WAC). According to the MTCA document, Method A provides tables of cleanup levels that are protective of human health for 25 to 30 of the most common hazardous substances found in soil and groundwater (drinking water). This method is typically used at smaller sites where detailed site studies and site specific risk assessments are not warranted.

The results of soil analytical testing were compared to Table 740-1 Method A Soil Cleanup Levels (Unrestricted) and Table 745-1 Method A Soil Cleanup Levels (Industrial). The results of groundwater analytical testing were compared to Table 720-1 Method A Cleanup Levels for Groundwater.

Cleanup Levels and Risk Calculations (CLARC)

Where no Method A Cleanup Levels were available, analytical results were compared to DOE Cleanup Levels and Risk Calculations ("CLARC"). According to the DOE website, CLARC is a web-based compendium of technical information related to the calculation of cleanup levels under the MTCA program. The DOE has compiled and calculated this technical information to assist in the development of cleanup levels. The formula values pre-calculated under standard Method B and provided in CLARC are not cleanup values and are used for comparison purposes only.

Background Metals Concentrations

Metals are naturally occurring in all soils. Therefore, to determine if the metals in soils are from releases or the result of naturally occurring conditions, samples from the Property can be compared to site-specific or regional background concentrations. Because chromium was detected in the soil at the Property in excess of the Method A Cleanup Levels, a comparison to regional background conditions was conducted to provide a weight of evidence demonstration that the concentrations of chromium are naturally occurring and do not pose an increased health risk at the Property.

Therefore, metals concentrations in soil (specifically chromium) were also compared to background levels published in the DOE document titled *Natural Background Soil Metals Concentrations in Washington State* (Washington DOE Publication No. 94-115, October 1994). According to this document, the naturally-occurring levels of chromium present in soils in the Puget Sound Region, which includes Snohomish County, is 48 milligrams per kilogram ("mg/kg").

3.2 Toxic Substances Control Act (TSCA)

The EPA regulates the manufacture, processing, distribution in commerce, use, cleanup, storage and disposal of PCBs. The PCB regulations are promulgated under the Toxic Substances Control Act ("TSCA") and are titled *Disposal of Polychlorinated Biphenyls (PCBs); Final Rule*, effective August 28, 1998. These regulations are commonly referred to as the "PCB Mega-Rule", and are codified as 40 Code of Federal Regulations (CFR) Parts 750 and 761.

Although the Property does not appear to be subject to TSCA regulations, the PCB analytical results of concrete testing were compared to the EPA action levels set forth in 40 CFR 761. According to the regulations, materials that contain PCB concentrations greater than 50 mg/kg must be properly disposed if removed. Materials containing PCB concentrations greater than 50 ppm that were spilled prior to July 1979 and were cleaned up more than 72 hours later must be remediated to a concentration of less than one (1) mg/kg for high occupancy areas, or 25 mg/kg for low occupancy areas. If the origin (time and PCB concentration in the spilled material) is not known, these standards do not apply, but are useful for comparison purposes.

4.0 FINDINGS

4.1 Subsurface Conditions

The ground surface was typically covered with up to five (5) inches of gravel, asphalt or concrete with sporadic base layers consisting of three (3) to six (6) inches of gravel. The subsurface profile may be generalized as consisting of thin layers of fill underlain by undisturbed deposits primarily consisting of interbedded layers of silty sand and sand to depths of 10 feet bgs. Bedrock was not encountered at any of the boring locations. Soil boring logs are provided in **Attachment A**.

Fill material described as brown silty clay and gravel was encountered at borings B-1 through B-5 to depths up to two and one-half (2.5) feet bgs. Fill material consisting of brown silty fine sand and/or brown fine to medium sand was encountered at B-9 and B-17 to a depth of less than one (1) foot bgs. No apparent fill was encountered at the remaining boring locations.

The undisturbed soils generally consisted of interbedded brown silty fine sand, brown or gray fine sand and brown fine to coarse sand with varying amounts of gravel extending to depths ranging from four (4) to eight (8) feet bgs, followed by gray fine to coarse sand with varying amounts of gravel and white quartz fragments to the terminal depth (10 feet bgs) of the borings. Brown clayey sand seams up to one (1) foot thick were encountered at B-2, B-9, B-11, B-14, B-15 and B-19 at depths ranging from three (3) to four (4) feet bgs. No odors or staining indicative of chemical or petroleum compounds were observed. PID readings were predominantly less than one (1) part per million (ppm) with a high of 8.6 ppm.

Groundwater was present at all boring locations at depths ranging from two (2) to four (4) feet bgs.

4.2 Soil Analytical Results

A summary of analytical results for the soil testing is presented in **Tables 2** through **4**. The laboratory analytical report is provided in **Attachment B**.

VOCs: Analytical testing indicates that five (5) VOC analytes including acetone, benzene, 2-butanone (MEK), ethylbenzene and tetrachloroethene were present in the soil at concentrations above laboratory practical quantitation limits ("PQLs"). However, the detected concentrations were below their respective Method A Cleanup Levels (where applicable) and/or CLARC comparison values. The PQLs for VOC analytical testing were below the cited comparison standards, where applicable. The VOC analytical results are summarized in **Table 2**.

SVOCs: One (1) SVOC analyte (dimethyl phthalate) was present in soil samples from B-6 (0-2 feet) and B-18 (2-4 feet) at concentrations above PQLs. No Method A Cleanup Levels or CLARC values have been established for this analyte. No SVOCs were present at concentrations above PQLs in any of the remaining samples submitted for analytical testing. The PQLs for SVOC analytical testing were below the cited comparison standards, where applicable. The SVOC analytical results are summarized in **Table 3**.

PAHs: The results of analytical testing indicate that no PAH analytes were present in the soil samples submitted for analytical testing at concentrations above the PQLs. The PQLs for PAH analyses were below the cited comparison standards. The results of soil PAH testing are summarized in **Table 4**.

RCRA 8 Metals: All RCRA 8 metals analytes including arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver were detected at concentrations above laboratory PQLs in one (1) or more of the soil samples tested for metals. With the exception of chromium (total), all detected concentrations were below their respective Method A Cleanup Levels (where applicable) and/or CLARC comparison values.

Total chromium was present in soil samples from B-1, B-3, B-6, B-10, B-11 and B-17 at concentrations ranging from 32 to 43 mg/kg and exceeded the chromium VI Method A Cleanup Level of 19 mg/kg. However, the detected concentrations are below the naturally-occurring background level for chromium (48.15 mg/kg) in the Puget Sound Region, which includes the area of the Property.

The laboratory PQLs for the RCRA 8 Metals soil analyses were below the cited comparison standards. The results of soil RCRA 8 Metals testing are summarized in **Table 4**.

TPH: The results of analytical testing indicate that no gasoline-range [NWTPHGX (C₆-C₁₀)] petroleum hydrocarbons were present in the soil samples submitted for analytical testing at concentrations above the PQLs. Diesel-range [NWTPHDX (C₁₀-C₂₀)] and oil-range [NWTPHDX (C₂₀-C₄₀)] petroleum hydrocarbons were present in the soil at one (1) location at concentrations above laboratory PQLs. However, the detected concentrations were below their respective Method A Cleanup Levels. The PQLs for TPH testing were below the Method A Cleanup Levels. The results of soil TPH testing are summarized in **Table 4**.

PCBs: PCBs were not present in any of the soil samples at concentrations above laboratory PQLs. The PQLs for PCB analyses were below the Method A Cleanup Levels. The soil PCB testing results are summarized in **Table 4**.

4.3 Groundwater Analytical Results

A summary of analytical results for the groundwater testing is presented in **Tables 5** through **7**. The laboratory analytical report is provided in **Attachment B**.

VOCs: The results of analytical testing indicate that one (1) VOC analyte (tetrachloroethene) was present in a groundwater sample at a concentration above the laboratory PQLs. No other VOCs were present in any groundwater sample at concentrations above laboratory PQLs. Tetrachloroethene was present in the groundwater sample collected from boring B-8 at a concentration of 8.6 micrograms per liter (ug/l). The detected tetrachloroethene concentration slightly exceeds the Method A Cleanup Level of 5 ug/l, but was below the CLARC standard formula Method B comparison value of 20.8 ug/l.

The PQLs for 1,2-dibromoethane and vinyl chloride were above the respective Method A Cleanup Levels. The PQLs for several additional VOC analytes were above their respective CLARC comparison values.

The results of groundwater VOC testing are summarized in **Table 5**.

SVOCs: The results of analytical testing indicate that one (1) SVOC analyte (bis[2-ethylhexyl]phthalate) was present in a groundwater sample at a concentration above PQLs. No other SVOC analytes were present in any groundwater sample at concentrations above laboratory PQLs. Bis[2-ethylhexyl]phthalate was present in the groundwater sample collected from boring B-6 at a concentration of 4.9 ug/l, but was below the CLARC standard formula Method B comparison value of 6.25 ug/l.

The PQL for benzo(a)pyrene was above the respective Method A Cleanup Level. The PQLs for several additional SVOC analytes were above their respective CLARC comparison values.

The results of groundwater SVOC testing are summarized in **Table 6**.

PAHs: The analytical results indicate that no PAH analytes were present in the groundwater samples submitted for analytical testing at concentrations above the laboratory PQLs. The PQLs for two (2) PAH analytes were above their respective CLARC Method B comparison values. The results of groundwater PAH testing are summarized in **Table 7**.

RCRA 8 Metals: Three (3) RCRA 8 metals (arsenic, barium and silver) were present in the groundwater at concentrations above laboratory PQLs. The detected concentrations of barium and silver were below their respective CLARC Method B values cited for comparison. The concentration of arsenic in the groundwater sample collected from boring B-15 (15 ug/l) exceeds the Method A Cleanup Level of 5 ug/l.

All PQLs were equal to or below the cited comparison values. The results of groundwater RCRA 8 Metals testing are summarized on **Table 7**.

4.4 Concrete Analytical Results

A summary of analytical results for the concrete testing is presented on **Table 8**. The laboratory analytical report is provided in **Attachment B**.

PCBs: The results of analytical testing indicate that no PCBs were present in the concrete samples submitted for analytical testing at concentrations above the PQLs or the cited comparison standards.

5.0 LIMITATIONS AND EXCEPTIONS TO THIS INVESTIGATION

The analytical results and conclusions presented in this letter report are based on the installation of 21 soil borings, collection of 10 groundwater samples and collection of three (3) concrete samples. Although the results presented above provide a reasonable indication of subsurface conditions in the areas evaluated, they may not be indicative of soil or groundwater conditions in areas of the Property not evaluated by Partners.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the Limited Phase II Subsurface Investigation activities and information contained in this letter report, Partners presents the following conclusions and recommendations regarding the Property.

6.1 Soil

The results of soil analytical testing indicate that no VOCs, SVOCs, PAHs, RCRA 8 metals, TPH or PCBs were present in the soil at concentrations above the cited comparison values or background values, where applicable.

One (1) SVOC analyte, dimethyl phthalate, was detected in two (2) soil samples at concentrations above laboratory PQLs; however, no Method A Cleanup Levels or CLARC values have been established for this analyte. Dimethyl phthalate may be utilized as an ectoparasiticide which are used to kill parasites that live on the body surface. This compound may also be used in insect repellants. It is possible that this compound may be present in the soil due to the historic feather cleaning operations conducted on the Property. The low levels of dimethyl phthalate present in the soil do not appear to pose a concern to the Property.

6.2 Groundwater

The results of groundwater analytical indicate that SVOCs and PAHs were not detected at concentrations above laboratory PQLs and/or above the cited comparison values.

Groundwater analytical results indicate that one (1) VOC analyte and one (1) RCRA 8 metals analyte were detected above the Method A Cleanup Levels in the following locations:

- Tetrachloroethene was present in the groundwater at the B-8 sample location at a concentration slightly above the Method A Cleanup Level, but was below the CLARC standard formula Method B comparison value.
- Arsenic was present in the groundwater at B-15 at a concentration above the Method A Cleanup Level. No CLARC Method B comparison value exists for arsenic in groundwater.

May 31, 2013

Although concentrations of tetrachloroethene and arsenic were elevated in specific groundwater samples collected at the Property, groundwater at the Property is not used as a drinking water source. Potable water at the Property is provided by the City of Marysville. Based on this and the fact that the presence of these compounds at concentrations exceeding Method A Cleanup Levels appears to be of limited extent at the Property, further assessment is not warranted at this time.

6.3 PCBs

PCBs were not present in the concrete at concentrations above laboratory PQLs. Based on this limited sampling and analytical testing, the Property has not been impacted by PCBs and would not be subject to TSCA regulation.

6.4 Recommendations

Based on the results of this limited subsurface investigation, no further assessment appears to be warranted at this time and reporting to the DOE for review is not required. However, if in the future the Property was subject to DOE regulatory review and/or closure, additional assessment (e.g. delineation of arsenic and tetrachloroethene in groundwater and groundwater monitoring) would likely be required.

7.0 CLOSING

Thank you for the opportunity to serve your needs. Please call us at (440) 248-6005 if you have any questions or if we can be of any further assistance.

Sincerely,

Notes

1. µg/l = Milligrams per liter - parts per billion (ppb)
2. Cleanup levels determined by Washington Model Toxics Control Act (MTCA), WAC 173-340-900 - Table 720-1 Method A Cleanup Levels for Groundwater.
3. Comparison value derived from Washington Cleanup Levels and Risk Calculations (CLARC) standard Method B pre-calculated formula values for Groundwater.

NE = No standard established.

RND = "Researched-No Data" means research has been conducted and no data exists in the database for this parameter.

NR = "Not Researched" means research has not been conducted and no value exists in the database for this parameter.

Bold numbers indicate a concentration above laboratory detection limits.

Notes

1. µg/l = Milligrams per liter - parts per billion (ppb)

2. Cleanup levels determined by Washington Model Toxics Control Act (MTCA), WAC 173-340-900 - Table 720-1 Method A Cleanup Levels for Groundwater.

3. Comparison value derived from Washington Cleanup Levels and Risk Calculations (CLARC) standard Method B pre-calculated formula values for Groundwater.

NE = No standard established.

NA = Not applicable.

RND = "Researched-No Data" -research has been conducted; no data exists in the database for this parameter.

NR = "Not Researched" -research has not been conducted and no value exists in the database for this parameter.

- = Sample not tested for analytical method.

Bold numbers indicate a concentration above laboratory detection limits.

Bold and highlighted number indicates a concentration above a comparison standard.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low
0	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.
