THE CAT SCALE GUARANTEE

The CAT Scale Company GUARANTEES that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company **GUARANTEES** that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
- 2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
- 3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company GUARANTEES that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company GUARANTEES that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company GUARANTEES that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

Table with columns: DATE, STEER AXLE, DRIVE AXLE, TRAILER AXLE, TOTAL WEIGHT. Values: 3-19-2010, 18820 lb, 41040 lb, 50520 lb, 110380 lb. Includes handwritten '41,440 Total'.

Response to Comment Letter dated February 12, 2014

Steve Teel, LHG
Site Manager, Toxics Cleanup Program
Ecology, Southwest Regional Office
PO Box 47775
Olympia, WA 98504

Dear Mr. Teel,

At your request, Brown and Caldwell has revised the Parcel 4/Parcel 5 Interim Action Report (IA Report) based on your comment letter dated February 12, 2014. We have compiled responses to your comments, provided below, and have included the revised report. Thank you for your review and comments on the Draft IA Report.

Response to Comments

- 1 C: The attached compact disk (CD) only contained an electronic copy of the appendices. Please include electronic copies of both the text and appendices with the next revision. Please also include two hard copies.

R: Both hard copies and electronic copies of the report have been generated. Please allow one to two weeks for delivery of the hard copies.

- 2 C: Appendix A is still incomplete. Both the original well report and the decommissioning well report need to be included for all of the wells. Appendix A contained both of these logs for MW-1 (well tag ID AKA425) and MW-3 (AKA427) but neither of these logs were present for MW-4 (AKA424) and the original well report needs to be added for MW-16 (APF874) and MW-23S (BAF400). Why was the decommissioning well report for BCN886 included? This well was apparently part of a separate project (LOTT VCP SW0933). Also, please label the well logs with the well designation (for example MW-1).

R: Upon final review of Appendix A and supporting documentation, the Appendix has been revised. The original completion log and decommissioning logs are provided for each well in Appendix A, with the exception of MW-4 (AKA424). Based on our review of the logs submitted by the site contractors, and Ecology's well log data base, we believe AKA424 is a non-unique well tag number. The site contractor that completed the abandonment work has included the abandonment log for BCN886 with the decommissioning logs provided for the site. Correspondence documented the delivery of the

BCN886 log, as well as the Ecology Well Log Database screenshot showing two AKA424 wells is provided in Appendix A.

- 3 C: Figure 4-1: The sample locations shown on this figure are at the incorrect scale. Please remove the sample location dots and instead show the excavation extent at the correct scale for each hotspot (such as how they are shown on Figure 2-1). Please show both the “CNF-“ hotspot designation and the original designation for the hotspots DP-21, DP-11, DP-18, DP-17, and TP-02). Please also add nearby monitoring well locations to this figure as previously requested in our comment letter. The size of the symbol for the monitoring well location should be reduced in size so that it is more proportionate to the scale of the figure and so they do not dwarf the extent of the hotspot excavations. For instance, Figure 2-3 shows the monitoring well location symbols at a scale of 21 feet in diameter, which seems a little larger than necessary for readability.

R: Figure 4-1 has been revised based on this comment.

- 4 C: Section 3.1. MW-17: This section states that MW-17 was not located but may be discovered during future work on Parcel 8. The Parcel 8 work has been completed now. Please update this section to indicate if MW-17 was discovered and/or decommissioned.

R: MW-17 was not located during the recent Parcel 8 work. The report text in Section 3.1 has been updated to reflect this information.

- 5 C: Parcel 4, Section 4.2.2 Soil Management, Last paragraph and Table 4-25: The text states that 5,600 tons were hauled off-site. However, Table 4-25 states that 8,686 tons were hauled off site for disposal. Please correct the text or table so that the amounts are consistent and accurate. What is the meaning of the Table 4-25 footnote that states that the Parcel 4 “Dig and Haul” amount of 8,060 tons is an “estimated” quantity by the LOTT construction manager? Why is this total estimated? Where are the weight tickets for this material? Please clarify in the report and make sure that all weight tickets are included in Appendix F. The text of Section 4.2.2 needs to include a discussion of the 291 tons of soil shown in Table 4-25 that were reused under the cap. Please also describe where on Parcel 4 this soil was placed.

R: We have reviewed the previously reported soils data and supporting documentation and have reorganized the data for this draft of the IA Report. The previously reported footnote for tables 4-25 indicating estimated quantities were based on tabulated data by LOTT construction manager has been revised based on our review of the supporting documentation for materials disposal. The value originally reported for Stockpile 4 removal (hot spot areas) was 626 tons. A review of the weight slips shows a value of 632 tons.

Rows have been added to this table to show disposal volumes per month. Table entries and footnotes have been revised accordingly.

- 6 C: Table 4-27 , Parcel 5 Soil Quantity Summary: Please explain the relationship between the value in the second line of the table (“Parcel 5 Reuse Under Cap”, 6,002 tons) and the third line in the table (“Parcel 5 Total Available Reuse” 4,581 tons. Shouldn’t the third line in the table be equal to the first line (Parcel 5 Unrestricted Reuse” 412 tons) plus the second line?
- R: As stated in our response to Comment 5 above, the soil quantity results have been reorganized and revised in the IA Report. Table 4-27 was revised to remove rows that contained no data. Previously we reported a total of 248 tons removed during November and December 2010, based on estimate quantities from the construction project manager. However, review of the final quantities and weight slips does not support these values. The value for disposal in January 2011 was originally reported as 275 tons, and has been updated to reflect the weight slip receipts totaling 279 tons. The March 2011 disposal was originally reported as 993 tons and has been revised to 988 tons based on final weight slip documentation.
- 7 C: Parcel 5, Section 4.3.2. Soil Management: Please include a summary of the amount of soil that was disposed and reused in the text instead of just referring the reader to Table 4-27.
- R: Additional text has been added to 4.3.2 in response to this comment.
- 8 C: Figure 4-5: The dioxin/furan toxicity equivalent concentrations shown in the figure are incorrect and do not match Table 4-5. Please correct the concentrations on the figure.
- R: Figure 4-5 has been revised accordingly.
- 9 C: Table 4-11: At the bottom of the table, please change “Interim Action Reporting Level” to “Interim Action Remediation Level.”
- R: The revised IA report has been revised based on this comment.
- 10 C: Appendix F, Material Weight Slips and Landfill Records: The load summaries for Parcels 4 and 5 are incomplete. Parcel 4 only has two load summaries for a combined total of 382.9 net tons for the time period March 7-16, 2012. According to Table 4-25, a total of 8,060 tons were disposed off site. For Parcel 5, only four load summaries are shown for a combined total of 1,049.3 net tons for the time period January 17, 2011 to March 11, 2011. According to Table 4-27, disposal events started in October 2010 and ended

March 2012 and a total of 2,127.9 tons were disposed off-site for Parcels 4 and 5.

R: See response to Comments 5, 6, and 7. Appendix F has been revised based on these comments.

11 C: Appendix G: As requested in our previous comment letter, please define what "SDG" means.

R: Laboratories batch process samples based on the batches they receive from clients and other batch-loads. SDG refers to the "Sample Delivery Group" and associates a set of samples with the laboratory QA/QC procedures for a given batch of samples analyzed. The introductory text in Appendix G will be updated to include a description of this acronym.

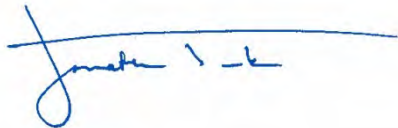

12 C: Appendix I, Site Photos: Captions for the photos need to be added.

R: Captions have been added to the site photos in Appendix I.

Brown and Caldwell appreciates Ecology's services in reviewing this site documentation. Should you have any questions, please do not hesitate to call me at 360-943-7525.

Very truly yours,

Brown and Caldwell

1. Introduction

This technical memorandum presents the results of the Interim Action (IA) for Parcel 4 and Parcel 5 of the East Bay Redevelopment (the Site). The Interim Action Work Plan (IAWP) (Brown and Caldwell, 2010) proposed a remedy for cleanup of a portion of the Site, specifically Parcels 4 and 5, and developed the alternative selected into a program of specific activities to implement the alternative. The IA facilitated construction of the Hands-On Children's Museum (HOCCM) on Parcel 5 by the City of Olympia (the City) and the Plaza on Parcel 4 by the LOTT Clean Water Alliance (LOTT). The IA for each parcel was implemented concurrently with development of each parcel.

The Site consists of eight public and commercial mixed-used development properties located on the Port of Olympia (Port) peninsula in Olympia, Washington. Parcels 4 and 5 are part of the Site. A map of the Site and the surrounding area is shown on Figure 1-1. Prior to short platting into eight parcels, the Site was a single, 13.3-acre property. Remedial activities at the Site are carried out under Agreed Order (AO) No. DE7830 between the Port, the City, LOTT, and the Washington State Department of Ecology (Ecology). The AO provides for completion of a Remedial Investigation/Feasibility Study (RI/FS) of the Site and the Parcel 4 and 5 IA. An RI work plan and an IA for Site infrastructure were completed under a previous AO between the Port and Ecology.

1.1 Regulatory Basis

The following section provides the regulatory basis for the IA, including its purpose, requirements, and relationship to the Cleanup Action.

1.1.1 Interim Action Purpose

According to Washington Administrative Code (WAC) 173-340-430(1), an IA is distinguished from a Cleanup Action in that an IA only partially addresses the cleanup of a site. An IA is one or more of the following:

- a remedial action that is technically necessary to reduce a threat to human health or the environment by eliminating or substantially reducing one or more pathways for exposure to a hazardous substance at a facility
- a remedial action that corrects a problem that may become substantially worse or cost substantially more to address if the remedial action is delayed
- a remedial action needed to provide for completion of a site hazard assessment, RI/FS, or design of a Cleanup Action

The IA proposed herein provides for the cleanup of a portion of the Site and reduces a threat to human health and the environment by addressing impacts to Parcel 4 and Parcel 5.

1.1.2 Interim Action General Requirements

General requirements of IAs are described in WAC 173-340-430(2). The IA implemented provided cleanup of a portion of the Site by eliminating or substantially reducing one or more pathways for exposure to a hazardous substance at or originating from Parcel 4 and Parcel 5.

1.1.3 Relationship to the Cleanup Action

The relationship of an IA to the final Cleanup Action is described in WAC 173-340-430(3). If the final Cleanup Action for a site is known, the IA must be consistent with the final Cleanup Action. If it is not known, the IA must not foreclose any reasonable cleanup alternatives.

The final Cleanup Action for the Site is not known. The IA described in this technical memorandum will not foreclose any reasonable alternatives for the final Cleanup Action.

1.2 Studies and Plans to Date

A number of studies and planning documents have been completed for the Site. These include:

- Phase I ESA, Port of Olympia East Bay Redevelopment. Prepared by GeoEngineers, Inc. for the Port of Olympia. March 14, 2007.
- RI/FS and Conceptual CAP (now known as the RI/FS IA), Port of Olympia East Bay Redevelopment, City Hall lot. Prepared by GeoEngineers, Inc. for The Rants Group. April 24, 2007.
- Supplemental Site Use History and Soil and Groundwater Sampling Clarifications, Port of Olympia East Bay Redevelopment. Prepared by GeoEngineers, Inc. for the Port of Olympia. August 3, 2007.
- Voluntary Cleanup Program (VCP) Draft Remedial Investigation and Feasibility Study and Conceptual Cleanup Action Plan, East Bay Redevelopment, Port of Olympia. Prepared by GeoEngineers Inc. for the Port of Olympia. December 20, 2007.
- Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia. Prepared by GeoEngineers, Inc, and Pioneer Technologies Corporation for the Port of Olympia. October 22, 2008, amended January 30, 2009.
- East Bay Remedial Investigation Phase 1 Summary. Prepared by Pioneer Technologies Corporation for the Port of Olympia. December 2008.
- Final Interim Action Work Plan, East Bay Redevelopment, Port of Olympia. Prepared by Pioneer Technologies Corporation for the Port of Olympia. May 2009.
- Draft Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the Port of Olympia's East Bay Redevelopment Site. Prepared by Pioneer Technologies Corporation for the Port of Olympia. February 2010. Ecology Comments issued by letter on April 16, 2010.
- Infrastructure Interim Action Report for East Bay Redevelopment Site. Prepared by Pioneer Technologies Corporation for the Port of Olympia. June 2010.
- Parcel 4/Parcel 5 Interim Action Work Plan. Prepared by Brown and Caldwell for the LOTT Clean Water Alliance and the City of Olympia. September 2010.
- Site Boundary Technical Memorandum for the East Bay Redevelopment Site. Prepared by Pioneer Technologies Corporation for the Port of Olympia. November 2010.
- Final Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the East Bay Redevelopment Site. Prepared by Pioneer Technologies Corporation for the Port of Olympia. May 2011.
- Data Gap Investigation Work Plan and Schedule, East Bay Redevelopment Site, Olympia, Washington. Prepared by Pioneer Technologies Corporation for the Port of Olympia. October 2011.
- Site Boundary, East Bay Redevelopment Site, Ecology Facility/Site No. 5785176, Agreed Order DE7830. Prepared by Pioneer Technologies Corporation for the Port of Olympia. December 2011.

1.3 East Bay Properties History

Parcels 4 and 5 lie within the original tideflat of Budd Inlet, and soils above the tideflat elevation are fill material. Fill operations on the Site began as early as the late 1800s and continued until as late as the 1970s. Much of the fill on the Site appears to be marine dredge spoils from dredging operations in the East and West Bays of Budd Inlet. In addition, fill has been found to contain wood debris, construction debris, and roadway fill.

Lumber milling operations were located on the Site as early as 1888 and operated until 1968. Various support facilities and services accompanied the lumber milling operations. Log booming operations also took place in the adjacent East Bay of Budd Inlet. Following cessation of lumber milling activities in 1968, the area was used for commercial and light industrial activities and warehousing. Warehousing and light industry ceased in 2008 as the Site was cleared of tenants and operators in preparation for redevelopment.

Historical shorelines, interpreted from aerial photography, were developed in the Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia (GeoEngineers/PIONEER, 2008, 2009) and included in the IAWP. Fill lithologies were classified, as follows, from oldest to youngest:

- Pre-1891: Dark-colored sand with pockets of wood debris and pockets of silt.
- 1891 to 1908: Dark brown to black coarse to fine sand. Based on historical records, this fill may have been sourced from a dredging operation to widen the Budd Inlet shipping channel.
- 1908 to 1948: Light colored sand with pockets of wood debris and pockets of gravel.
- 1948 to 1975: Light colored sand with pockets of gravel.

Underlying the fill layers are native silt and clay sediments.

A detailed historical review of fill horizons and the associated fill operation dates, as well as fill cross-sections developed based on boring and drilling observations, is presented in “Section 2.0 Site History” of the Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia (GeoEngineers/PIONEER, 2008, 2009). This review was revised with additional subsurface observations and aerial photographs and presented in the Site Boundary Technical Memorandum for the East Bay Redevelopment Site (Pioneer, 2010).

1.3.1 Historical Areas of Concern

Historical areas of concern were identified in the IAWP. The St. Paul and Tacoma Lumber Mill, in operation between 1942 and 1968, was the primary industrial operator on Parcels 4 and 5. Historical areas of concern associated with this mill include an oil house and engine room, tar dipping tanks, a boiler house, transformers, and a spray-painting shop. These areas of concern are identified on Figure 1-2. Chemicals typically associated with these types of operations include petroleum hydrocarbons for the oil house; petroleum hydrocarbons and carcinogenic polynuclear aromatic hydrocarbons (cPAHs) for the tar dipping tanks; petroleum hydrocarbons, PAHs, and dioxins/furans for the boiler house; petroleum hydrocarbons and polychlorinated biphenyls (PCBs) for the transformers; and metals and volatile organic compounds (VOCs) for the spray-painting shop.

1.4 IA Report

This IA Report includes the following:

- A review of the understanding of Site conditions under which the IAWP was developed.
- A review of the evaluation of IA alternatives and selection of the IA.
- A description of soil management activities, including a timeline and volumes of soil excavated, segregated, stockpiled, reused, and disposed of offsite. The narrative will include descriptions of locations onsite where excavated soils were reused.
- A description of engineering control implementation.
- A description of compliance monitoring sampling and results.
- A discussion of the quantitative sampling results from soil stockpile sampling and confirmation sampling.
- A discussion of quality assurance/quality control (QA/QC) review results per the procedures described in the Quality Assurance Project Plan (QAPP).
- A discussion of deviations from the IA Work Plan.

- Figures summarizing compliance monitoring sampling locations and results.
- Tables summarizing volumes of soil excavated, stockpiled, reused, and disposed of offsite.
- Tables summarizing stockpile sampling results and compliance monitoring results.
- Copies of daily reports and field notes (including field screening logs and sample data sheets).
- Copies of waste disposal documentation, including manifests, weight slips, and receipts.
- Copies of laboratory analytical results and chains-of-custody.

2. Site Conditions

The following section describes Site conditions, including land use, constituents of potential concern (COPCs), the conceptual Site contaminant transport model, the conceptual Site exposure model (CSEM), and Site subsurface conditions

2.1 Land Use

Parcels 4 and 5 were developed concurrently with implementation of the IA. A public-use plaza was constructed on Parcel 4. The original design of the Parcel 4 plaza discussed in the IAWP included a water feature running approximately east-west through the center of the parcel. This feature was eliminated from the design after the IAWP was issued, and the plaza as constructed does not include a water feature. The HOCM and landscape improvements were constructed on the southern portion of Parcel 5. The northern portion of Parcel 5 consists of a parking lot for the HOCM.

The landscaping on both parcels consists of a mix of hardscaped areas (areas surfaced with an impervious material such as concrete or brick paving) and planted areas. In addition to landscaping, portions of Parcel 5 are covered by the HOCM building and parking lot. Figure 2-1 includes the current planned configuration of softscape and hardscape areas at the Site.

2.2 Constituents of Potential Concern

The following COPCs for Parcel 4 and 5 were identified in the IAWP:

- arsenic
- cadmium
- lead
- copper
- nickel
- total cPAHs
- total dioxins/furans
- total naphthalenes
- diesel-range total petroleum hydrocarbons (TPH-D)
- heavy oil-range total petroleum hydrocarbons (TPH-HO)
- gasoline-range total petroleum hydrocarbons (TPH-G)
- benzene
- toluene
- ethylbenzene
- total xylenes

2.3 Conceptual Site Contaminant Transport Model

The Conceptual Site Contaminant Transport Model for the Site, which was developed in the *Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia* (GeoEngineers/PIONEER, 2008, 2009), shows potential historical sources of releases of COPCs, as well as potential routes of migration. This model was used as the basis for the IAWP. The Conceptual Site Contaminant Transport Model is shown on Figure 2-2. Potential sources and migration paths are discussed below.

Subsequent to the completion of the IAWP, the Port completed the *Final Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the East Bay Redevelopment Site* (Pioneer, 2011a). This report concluded that, with the possible exception of arsenic and TPH-D/TPH-HO, COPCs in soils at the Site are not being transported to groundwater. The transport of other COPCs, including metals in addition to arsenic, TPH-G, and VOCs were considered potential transport pathways at the time the IAWP was developed. They are therefore included on Figure 2-2 and in the discussion below. The transport of COPCs from soil to surface water via groundwater, with the exception of arsenic and TPH-D/TPH-HO, will not be included in future evaluations of contaminant transport at the Site.

1. **Direct discharge to ground surface:** Spills, leaks, or operational discharges from former industries onsite may have resulted in contaminants on the historical working surface. This contamination may have been covered by fill or seeped further into the ground. Potential sources include tanks, hog fuel or refuse piles, or transformers.
2. **Contaminated fill:** Dredge spoils or other material used as fill may be a source of contaminants.
3. **Buried debris:** Debris from former industrial operations at the Site may be buried at the Site.
4. **Leaching to groundwater:** Some contaminants may have leached to groundwater, and may be transported as dissolved chemicals in groundwater.
5. **Air deposition:** Contaminant containing airborne particulates from onsite or offsite smokestacks or burn piles may be deposited on the historical working surface. The contaminated surface would be buried under subsequent layers of fill.
6. **Groundwater flow:** Constituents may be transported through the movement of groundwater.
7. **Vertical groundwater gradients:** Artesian pressure in the area of the Site may result in upward gradients in the shallow groundwater unit.
8. **Historical artesian flow/leakage:** Artesian wells may have been historically located on the Site.

2.4 Conceptual Site Exposure Model

A conceptual Site exposure model (CSEM) was developed in “Section 6: Conceptual Site Exposure Model” in the *Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia* (GeoEngineers/PIONEER, 2008, 2009), and revised based on an Ecology comment in the *Final Interim Action Work Plan, East Bay Redevelopment, Port of Olympia* (PIONEER, 2009) prepared by Pioneer Technologies Corporation on behalf of the Port for the infrastructure IA. The CSEM is presented on Figure C-1 of the *Final Interim Action Work Plan, East Bay Redevelopment, Port of Olympia* (PIONEER, 2009) report. This CSEM was used as the basis for the IAWP.

Subsequent to the completion of the IAWP, the Port completed the *Final Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the East Bay Redevelopment Site* (Pioneer, 2011a). This report concluded that, with the possible exceptions of arsenic and TPH-D/TPH-HO, COPCs in soils at the Site are not being transported to groundwater. The report recommends that, with the exception of arsenic, TPH-D, and TPH-HO, exposure pathways with a soil-to-groundwater or groundwater-to-surface water transport component be considered incomplete.

2.5 Site Subsurface Conditions

The following conditions are summarized based on a series of studies evaluating subsurface conditions at the Site, including conditions at Parcel 4 and Parcel 5, as well as data collected during the IA.

2.5.1 Hydrogeologic Conditions

Subsurface hydrogeologic conditions at the Site are the result of decades of fill operations that elevated the ground surface and extended usable land seaward into Budd Inlet. The thick heterogeneous sequence of fill deposits beneath the Site extends from ground surface to elevations as deep as -10 feet. A detailed historical review of fill horizons and the associated fill operation dates, as well as fill cross-sections developed based on boring and drilling observations, is presented in “Section 2.0 Site History” of the *Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia* (GeoEngineers/PIONEER, 2008, 2009).

A network of groundwater monitoring wells was installed on the Site (including on Parcels 4 and 5) and on the adjacent Parcel 8 for the study of groundwater conditions. On Parcels 4 and 5 and the adjacent parcels, MW-01, MW-02, MW-03, MW-04, MW-16, MW-17 (Parcel 8), MW-18 (in the adjacent infrastructure corridor), and MW-19 (Parcel 7) were installed in 2007. MW-02R, MW-23S, and MW-21S (Parcel 7) were installed in 2009. Monitoring well locations are shown on Figure 2-3. Monitoring wells MW-01, MW-03, MW-23S, and MW-16 were abandoned during the IA. These are discussed in Section 4 below. Driller logs from well decommissioning are included as Appendix A.

The occurrence and flow of groundwater beneath the Site is predicated upon the various fill horizons and respective hydraulic properties. Localized groundwater gradients occur across the Site where zones of more permeable fill are bounded by less permeable materials. Additionally, water levels fluctuate throughout the course of the year as a result of seasonal fluctuations in atmospheric conditions. Groundwater levels at the Site are historically variable; the difference between the minimum and maximum elevations in a single well was as high as 5.9 feet. The average difference between the minimum and maximum elevations was 2.17 feet. While groundwater flow generally appears to be from the southwest to northeast across Parcels 4 and 5, there may be an artesian influence on the Site with upward gradients from deeper confined groundwater units.

Tidal influence at the Site was assessed by GeoEngineers in 2007 and Greylock Consulting, LLC, in 2008. The 2007 study concluded that groundwater monitoring well elevations in the Parcel 3 area were not strongly influenced by tidal fluctuations (GeoEngineers, 2007b), while the Greylock study concluded that tidal influence was limited to areas near the shoreline (GeoEngineers/PIONEER, 2008, 2009). Observations by Pioneer Technologies Corporation during groundwater monitoring events at the Site have indicated high salinity in MW-04, MW-12, MW-16, and MW-18, wells that are located near the Budd Inlet shoreline. Salinity measurements and anecdotal observations in construction trenches also suggest tidal influence in the area near the shoreline (PIONEER, 2010a).

2.5.2 Soil and Groundwater COPC Concentrations

Soil and groundwater COPC data from reports including the *Voluntary Cleanup Program (VCP) Draft Remedial Investigation and Feasibility Study and Conceptual Cleanup Action Plan, East Bay Redevelopment, Port of Olympia* (GeoEngineers, 2007), the *Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia* (GeoEngineers/PIONEER, 2008, 2009), the *East Bay Remedial Investigation Phase 1 Summary* (PIONEER, 2008), and the *Draft Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the Port of Olympia's East Bay Redevelopment Site* (PIONEER, 2010) were reviewed in the IAWP. Additionally, data from the second phase of the RI completed by the Port and data from a series of supplemental soil samples from Parcels 4 and 5 completed by LOTT and the City were reviewed. These data were discussed in detail in the IAWP.

Following completion of the IAWP, additional Site data were presented in the *Final Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the East Bay Redevelopment Site* (Pioneer, 2011a). A complete review of Site-wide data is outside the scope of this report.

2.5.3 Potential Transport of COPCs from Soil to Surface Water

The IAWP reviewed empirical data and evidence presented in the *Draft Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the Port of Olympia's East Bay Redevelopment Site* (PIONEER, 2010a). Data reviewed in this report suggested that an empirical demonstration in accordance with WAC 173-340-747(9) is complete for cadmium, cPAHs, dioxins/furans, and total naphthalenes.

Subsequent to the completion of the IAWP, the Port completed the *Final Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water via Groundwater at the East Bay Redevelopment Site* (Pioneer, 2011a). This report concluded that, with the possible exception of arsenic and TPH-D/TPH-HO, COPCs in soils at the Site are not being transported to groundwater.

3. Interim Action Work Plan Alternatives Evaluation and Selection

IA alternatives were screened in the IAWP to identify potential means to control the complete or potentially complete exposure pathways identified in Section 2.4 above. These alternatives were screened using the procedure described for final Cleanup Actions in WAC 173-340-360. Threshold criteria for Cleanup Actions (WAC 173-340-360(2)(a)) are as follows: the selected action must protect human health and the environment, must comply with cleanup standards, must comply with applicable state and federal laws, and must provide for compliance monitoring.

Alternatives meeting these threshold criteria were further evaluated based on the additional minimum criteria for Cleanup Actions (WAC 173-340-360(2)(b)): the use of permanent solutions to the maximum extent practicable, provision of a reasonable restoration time frame, and consideration of public concerns.

“Permanent” solutions are those that do not require future action to meet cleanup standards. By “maximum extent practicable,” it is meant that the incremental benefits of a particular alternative are not outweighed by the incremental costs. A basis for proposed alternatives, an evaluation of those alternatives, including a disproportionate cost analysis, are documented in the IAWP, and provided the foundation for implementing *Capping with Partial Excavation and Controls*. An generalized figure of the components of this alternative are provided as Figure 3-1.

3.1 Interim Action Activities

Specific activities necessary for completion of the IA for Parcels 4 and 5 were identified in the IAWP. These included the following:

- Control of Site access, including installation of a fence with a locking gate, implementation of traffic control measures, and Site control to ensure that only authorized personnel enter the Site during working hours.
- Well decommissioning, including decommissioning of MW-17 and decommissioning of wells where remediation activities present a risk of direct discharge or damage to wells. Alternatively, wells may be raised to the new Site grade. All work will be performed by a licensed driller. Monitoring wells MW-01, MW-03, MW-4, MW-23S, and MW-16 were abandoned during the IA. These are discussed in Section 4. Driller logs from well decommissioning are included as Appendix A. MW-17 was not located by the

contractors. The well was presumed to be buried or previously abandoned. Subsequent work on Parcel 8, for part of the LOTT Budd Inlet Treatment Plant expansion, included mass excavation in the area of MW-17. However, the MW-17 was not found during the excavation work and assumed previously decommissioned.

- Excavation, stockpiling, and screening of soils for COPCs. Screening included sampling for COPCs as described in the Sampling and Analysis Plan (SAP) included with the IAWP, as well as evaluation of the geotechnical properties of soil to ensure its suitability for use as fill. The SAP is included as Appendix B to this report. Excavation of known hot spots was completed as described in the SAP and summarized in Table 3-1. As noted below, additional analytical testing was performed on samples collected from the DP-11 hot spot at the request of Ecology. Interim Action Cleanup Levels (IACLs) and Interim Action Remediation Levels (IARLs) are provided in Table 3-2.
- Offsite disposal of soils that have COPC concentrations in excess of IARLs or are geotechnically unsuitable.
- Reuse of soils onsite. Soils with COPC concentrations below IACLs may be used as fill anywhere onsite, while soils with COPC concentrations in excess of IACLs but below IARLs may be reused only in capped areas.
- Capping of portions of the Site with impervious materials such as pavement or hardscape.
- Particulate (dust) control.
- Dewatering and stormwater control, including treatment in Baker tanks and filtration as necessary and discharge of treated stormwater/excavation groundwater to the LOTT Budd Inlet Treatment Plant.

The IAWP developed a number of supplementary documents for implementation of the IA, including the SAP, a QAPP, a Health and Safety Plan (HASP), and standard operating procedures (SOPs) for sample collection and handling. The SAP, QAPP, and HASP are included as Appendices B, C, and D to this report.

4. Interim Action Implementation

The following section describes implementation of the IA.

4.1 Implementation Summary

The IA was implemented in two stages. The first stage consisted of hot spot excavation on both Parcel 4 and Parcel 5, and partial excavation and capping on Parcel 5. This stage began in October 2010. Work was performed as part of the construction for the HOCCM building and property improvements. The second stage consisted of partial excavation and capping on Parcel 4. This stage began in September 2011. Work was performed as part of the construction for the public plaza property improvements.

Locations for confirmation (CNF) samples taken from hot spot excavations are shown on Figure 4-1, with Universal Transverse Mercator (UTM) coordinates for samples shown in Table 4-1. Confirmation sample results are summarized in Tables 4-2 through 4-8. Results from stockpile (SPL) samples are shown in Tables 4-9 through 4-23.

Complete laboratory reports are included as Appendix E.

4.2 Parcel 4

This section describes IA activities on Parcel 4.

4.2.1 Hot Spot Remediation

Parcel 4 hot spot remediation included the excavation and disposal of soil at hot spots DP-17, DP-18, and TP-02.

4.2.1.1 DP-18 (CNF-4)

DP-18 was initially completed on August 3, 2007. Soil sampling identified elevated levels of TPH-HO, cPAHs, and VOCs at depths between 10 and 12 feet bgs. DP-18 was excavated on November 8, 2010. Samples collected from this hot spot are designated as CNF-4.

The hot spot was excavated to dimensions of 20 x 20 x 15 feet (L x W x H). A total of 16 samples were collected from the excavation. Due to a later identified discrepancy in the IAWP/SAP, samples were analyzed for metals per the SAP, rather than the historically identified COCs (TPH, cPAH, VOCs). Sample locations are shown on Figure 4-3. Stockpile samples were later analyzed for the complete list of Site COCs.

Sample results were below IACLs for all COCs. Sample results are shown on Table 4-2. The excavation was backfilled with clean material sourced from offsite. Logs of the hot spot excavation are provided in Appendix H.

4.2.1.2 DP-17 (CNF-5)

DP-17 was initially completed on August 3, 2007. Soil sampling identified elevated levels of arsenic at depths between 10 and 12 feet bgs. Pursuant to the IAWP, the DP-17 hot spot was excavated on November 8, 2010. Samples collected from this hot spot are designated as CNF-5.

The hot spot was excavated to dimensions of 20 x 20 x 15 feet (L x W x H). A total of 13 samples were collected from the excavation. Due to a later identified discrepancy in the IAWP/SAP, samples were analyzed for TPH, and VOCs per the SAP, rather than the historically identified COCs (metals). Sample locations are shown on Figure 4-3.

Sample results were below IACLs for all COCs. Sample results are shown on Table 4-3. The excavation was backfilled with clean material sourced from offsite. Logs of the hot spot excavation are provided in Appendix H.

4.2.1.3 TP-02 (CNF-3, CNF-3A)

TP-02 was initially completed on October 4, 2007. Soil sampling identified elevated levels of dioxin at depths between 2 and 3 feet bgs. The hot spot excavation began on November 9, 2010. However, the hot spot was located adjacent to the eastern edge of Parcel 4, next to a sidewalk, irrigation lines, and the tree-lined Marine View Drive, with a portion of the hot spot falling outside of the ownership of the City. To minimize impacts to the sidewalk and other features, and avoid extending off the City's property onto Port land, Ecology approved a minor adjustment to the excavation dimensions. The excavation dimensions were reduced to 20 x 13 x 10 feet (L x W x H). At the direction of Ecology, additional sidewall samples were collected from the east face of the excavation, the direction in which the excavation was shortened. A total of 25 samples were collected. Sample locations are shown on Figure 4-4. Samples collected from this hot spot are designated as CNF-3.

Analysis of the samples resulted in one sample on the east face in excess of the IARL for dioxins/furans. Additionally, several samples exceeded the IACL for dioxins/furans. In accordance with the IAWP, the excavation was expanded to remove additional material.

On January 5, 2011, the excavation was expanded to the east by 7 feet, so that the overall surface dimensions of the excavation were 20 x 20 feet. With Ecology approval, the depth of the extension of the excavation was limited to 6.5 feet rather than the 10-foot depth of the original excavation. This depth was based on the sample results from the first round of excavation and sampling; concentrations in samples

below a depth of 6 feet in the first round of sampling were below the IACL with one exception, and all samples below 6 feet were below the IARL. A total of 11 additional samples were collected. Locations for additional samples are shown on Figure 4-5 and were designated as CNF-3A.

All samples from the second round of excavation and sampling showed dioxin/furan concentrations below the IARL. Based on these results, the excavation was backfilled on with clean material sourced from offsite. Sample results for the original hot spot excavation and expanded area are shown on Tables 4-4 and 4-5. Logs of the hot spot excavation are provided in Appendix H.

4.2.2 Soil Management

Soil management activities on Parcel 4 deviated from the work plan. Bulk excavation of softscaped areas on Parcel 5 preceded work on Parcel 4, with the exception of hot spot excavation and disposal. During the Parcel 5 work, it was observed that the majority of soils had COPC concentrations between IACLs and IARLs, making them suitable for reuse only in capped areas. While the development plans for Parcel 5 presented opportunities for the reuse of soil in capped areas, these opportunities were limited on Parcel 4. Additionally, a significant fraction of Parcel 5 soils were not geotechnically suitable for reuse.

The project management team determined that the cost savings resulting from reuse of soil were likely to be outweighed by the costs of stockpiling. Stockpile sampling would result in significant costs due to the full suite of analyses required. Additionally, stockpiling soils from Parcel 4 would have required a dedicated stockpiling area located across the street to the south of Parcel 4. This would have added temporary rental costs for the stockpiling area to the project cost, and would have generated frequent truck or equipment traffic transporting soils across the public right-of-way. The transportation of soils across the public right-of-way raised Site control issues for the potentially contaminated material.

With Ecology approval, the management team elected to load excavated soils directly into trucks for offsite disposal. Historical Site data were provided to the disposal facility for approved acceptance of the material. The 6-foot excavation depth in softscaped areas was not altered. Only material excavated from the Parcel 4 hot spots was stockpiled on site. A summary of stockpiles, including source, estimated volume, COPC concentrations, and geotechnical suitability is shown in Table 4-24.

A summary of Parcel 4 soils hauled for disposal is shown in Table 4-25. A total of 8,692 tons of soil were hauled offsite from Parcel 4 for disposal. Soils were hauled to the Weyerhaeuser Regional Landfill in Castle Rock, Washington, for disposal. Weight slips for disposed material are included in Appendix F. A total of 291 tons of soil from the Parcel 4 soils excavations was available for reuse under cap. A portion of this material was used to backfill utility trenching and footings under Parcel 4 hardscaped areas, while the remainder was emplaced under the Parcel 5 parking lot area.

4.2.3 Monitoring Well Decommissioning

Monitoring wells MW-23S and MW-16 were decommissioned during the construction phase of the Plaza. Driller decommissioning logs are provided in Appendix A.

4.2.4 Capping

Containment caps consisting of hardscape materials, pavement, or the HOCM building were constructed per the IAWP. Site land use/cover is shown in Figure 2-1. Soil available for reuse under cap was only placed under the parking lot area.

4.3 Parcel 5

This section describes IA activities on Parcel 5.

4.3.1 Hot Spot Remediation

Parcel 5 hot spot remediation included the excavation and disposal of soil at hot spots DP-11 and DP-21.

4.3.1.1 DP-11 (CNF-1)

DP-11 was initially completed on January 2, 2007. Soil sampling identified elevated levels of cPAHs at depths between 0 and 2 feet bgs and lead and cPAHs at depths between 8 and 10 feet bgs. The DP-11 excavation began on November 2, 2010. Excavation work was halted after the excavation became inundated with groundwater. Work resumed on November 3, 2010, after improvements to the dewatering system, and the excavation was completed the same day.

The hot spot was excavated to dimensions of 20 x 20 x 10 feet (L x W x H). A total of 12 samples were collected from the excavation. Samples were analyzed for metals per the SAP. At the direction of Ecology staff onsite during the excavation, TPH samples were also collected based on visual and olfactory observations. Sample locations are shown on Figure 4-6. Samples collected from this hot spot are designated as CNF-1.

Sample results were below IACs for all COPCs. Sample results are shown on Table 4-6. The excavation was backfilled with clean material sourced from offsite. Logs of the hot spot excavation are provided in Appendix H.

4.3.1.2 DP-21 (CNF-2, CNF2A)

DP-21 was initially completed on August 3, 2007. Soil sampling identified elevated levels of arsenic at depths between 6 and 8 feet bgs. DP-21 was excavated on January 10, 2011.

The hot spot was excavated to dimensions of 20 x 20 x 10 feet (L x W x H). A total of 15 samples were collected from the excavation. Samples were analyzed for metals per the SAP. Sample locations are shown on Figure 4-6. Samples collected from this hot spot are designated as CNF-2.

One confirmation sample exceeded IACs; the arsenic concentration in CNF-2-5-1.75 was 159 milligrams per kilogram (mg/kg), exceeding the IAC of 20 mg/kg. This sample was located on the north wall of the excavation at a depth of 1.75 feet. No other sample concentrations exceeded IACs or IARs.

On January 21, 2011, the excavation was expanded to the north by 20 feet per the IAWP, bringing the total dimensions of the excavation to 40 x 20 x 10 feet (L x W x H). Ten additional samples were collected from the east, west, and north sidewalls and floor of the expanded excavation. Samples were analyzed for metals per the SAP. Additional sample locations are shown on Figure 4-6. Samples from the additional excavation are designated as CNF-2A.

Sample results were below IACs for all COPCs. Sample results are shown on Table 4-7 and 4-8. The excavation was backfilled with clean material sourced from offsite. Logs of the hot spot excavation are provided in Appendix H.

4.3.2 Soil Management

Soil management for the handling of hot spot excavation soils and soils from the bulk excavation of softscaped areas followed the procedures in the IAWP. Excavated soils were stockpiled in designated areas of the Site. Visqueen was placed below and on top of stockpiles, with sheeting on top of the stockpiles secured with ropes and sandbags. Stockpiles were covered at all times unless material was actively being added to or removed from the stockpile. Visqueen-covered straw bales were set up around stockpile areas to prevent the run-on of water into the stockpile areas and the runoff of rainwater coming into contact with active piles. A placard system, described in the IAWP, was initially used to track the status of stockpiles. Information recorded on the placards included stockpile number, sampling status, date sampled, date of analytical results, and the suitability of soils for reuse (i.e., suitable for reuse in any location, suitable for

reuse in capped areas, not suitable for reuse). After wind storms repeatedly blew placards away, stockpile information was written directly on the visqueen covering the stockpiles using a grease pen or marking paint in lieu of the placard system to track stockpile information.

During excavation, materials were separated into stockpiles based on both soil type and location of the source excavation. Material from hot spot excavations was sorted into separate stockpiles from material from bulk excavation of softscaped areas. Additionally, material that appeared to be geotechnically suitable for reuse, such as sand and gravel, was stockpiled separately from silt or organic material.

Stockpiles were sampled according to the schedule included in the IAWP. Samples were collected from locations spatially distributed around the stockpile and at the approximate midpoint of the stockpile height. Sample locations were selected such that soil type sampled was representative of the material comprising the majority of the stockpile. Where stockpiles comprised large fractions of two or more soil types, at least one sample of each type was collected.

A summary of stockpiles, including source, estimated volume, COPC concentrations, and geotechnical suitability is shown in Table 4-26. Analytical results from stockpile samples are provided in Tables 4-9 through 4-23. The majority of soils excavated had COPC concentrations in excess of IACLs for one or more COPCs. However, the majority of soils excavated did not contain COPCs at concentrations exceeding IARLs. Lead concentrations exceeding 250 mg/kg were encountered in stockpile material sourced from two different hot spot excavations, and TPH-HO concentrations exceeding 2,000 mg/kg were encountered in two stockpiles, one sourced from a hot spot excavation and one sourced from a softscaped area excavation. Excavated soils were generally geotechnically suitable for reuse. Soils not suitable for reuse typically consisted of silt or of wood fragments and were encountered in deeper portions of hot spot excavations.

A summary of the total quantities from Parcel 5 is shown in Table 4-27. Note that the quantities shown in Table 4-27 are measured totals for the project. Reused soils were placed in the parking lot and building areas of the HOCM site. No soils were reused in softscaped areas. Soils removed from the Site for disposal were hauled to the Weyerhaeuser Regional Landfill in Castle Rock, Washington. Weight slips for material disposed of offsite are included in Appendix F.

The total quantity of soils removed from the Site for disposal includes some surplus soils that were reusable in capped locations. This surplus volume was due in part to the prevalence of IACL exceedances, resulting in a low volume of soils that were usable in uncapped areas. The surplus soil was also due in part to the delay imposed by stockpile sample turnaround times. In several instances, material was imported to backfill before stockpile sample results were available in order to avoid unacceptable project delays. A total of 6,002 tons were available for reuse under cap, most of which was emplaced beneath the parking lot on Parcel 5, with lesser quantities used to backfill footings and utility trenches beneath hardscaped areas. However, with limited under cap areas for reuse potential, 342 tons that fell within the reuse under cap disposition were ultimately sent off site with materials not suitable for reuse. A total of 1,879 tons were disposed of off site, including 342 tons that was available for reuse under cap.

4.3.3 Monitoring Well Decommissioning

Monitoring wells MW-01 and MW-03 were in the HOCM footprint and were decommissioned. MW-04 was protected temporarily during construction. However, when damage to the riser as a result of construction activities became apparent, the well was decommissioned. Well decommissioning logs are included in Appendix A. The contractor that provided decommissioning work for the project provided a decommissioning log for BCN886 rather than AKA424 (MW-4). Documentation of this, as well as dual entries in Ecology's well log database for AKA424 is included in Appendix A..

4.3.4 Capping

Containment caps consisting of hardscape materials, pavement, or the HOCM building were constructed per the IAWP. Site land use/cover is shown in Figure 2-1. Soil available for reuse under cap was only placed under the parking lot area.

4.4 Deviations from Interim Action Work Plan

Deviations from the IAWP include the following:

- reduced excavation volume of the TP-02 hot spot
- marked stockpile coverings rather than using a placard system for Parcel 5 soil management
- revised soil management plan for Parcel 4

These deviations are described in their respective sections above.

5. Data Quality Review

The following sections provide summaries of the data quality review for both field and analytical data collected during the IA.

5.1 Field Methods

Field methods and sample collection were completed in accordance with the project SAP and QAPP. Field-collected quality control samples consisted of field duplicates and trip blanks. Field duplicates were collected to assess the precision of all steps of the sample acquisition and analysis process. A total of 249 samples were collected during the IA work, with a total of 14 duplicate samples, resulting in a duplicate rate of 5.6 percent.

Trip blanks were used to determine potential cross-contamination issues during sample transportation, delivery, and storage. Trip blanks were included in each shipment of samples from the Site to the laboratory. A total of 17 trip blanks were collected during the IA.

5.2 Laboratory Data Assessment

A qualitative data usability review was performed on all analytical data collected from Parcels 4 and 5 during the IA. The review was performed in accordance with the general guidance provided by the National Functional Guideline for Data Review and with the project SAP and QAPP.

Overall, the data quality review found the data to be generally acceptable for the intended purposes. No data were rejected as a result of the review, and most data met the quality criteria for the parameters reviewed. Minor data quality issues with respect to field and laboratory duplicate precisions, matrix interferences, and laboratory control sample recovery were identified. Some of these issues resulted the following qualification of data:

- B: The analyte was detected in the method blank.
- J: The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ: The analyte was not detected above the sample reporting limit. The reporting limit is approximate.
- U: The analyte was tested, but was not detected above the sample reporting limit.

A complete data validation report is included as Appendix G.

6. Discussion and Conclusions

The following section provides a general summary of the IA work.

Hot spots identified as known areas of contamination were excavated with sidewall and bottom samples confirming that the volume of contaminated soils were removed. Each hot spot excavation was proposed to have an area of 20 x 20 feet, and a target depth identified by historically observed contamination depths. However, two hot spot excavations were slightly modified. To protect the integrity of infrastructure off the City of Olympia property, the TP-02 hot spot was initially excavated to dimensions of 20 x 13 x 10 feet (L x W x H) and sampled, with one sample from the eastern sidewall exceeding the IARL for dioxins/furans and other samples exceeding the IACL. After authorization from Ecology, the excavation was later expanded by 7 feet to the east, to a depth of 6.5 feet and additional sidewall sampling confirmed that the sidewall concentrations were below the IARLs. Hot spot DP-21 was initially excavated to dimensions of 20 x 20 x 10 feet; however, one sample from the northern sidewall exceeded the IACL for arsenic. As prescribed by the IAWP, the excavation was expanded an additional 20 feet to the north for final excavation dimensions of 40 x 20 x 10 feet. Sidewall sampling of the expanded excavation confirmed the removal of soil to sidewall concentrations below the IACLs for COPCs.

Areas of the Site proposed to have ground surface completed with landscaping or otherwise softscaped materials were excavated to a depth of 6 feet below finished Site grade, or the first contact with groundwater. As discussed above, to the greatest extent practicable, soil was tested and reused, according to its suitability. Based on analytical results, geotechnical suitability, and construction sequencing, this action resulted in the removal of approximately 5,600 tons of soil from Parcel 4 and 2,130 tons of soil from Parcel 5 for off-site disposal. In accordance with the IAWP, a geotextile fabric was used to line the softscape area excavations prior to backfilling. All other areas of the site were completed, or will be completed with a hardscape cap over the soil.

February, 2015

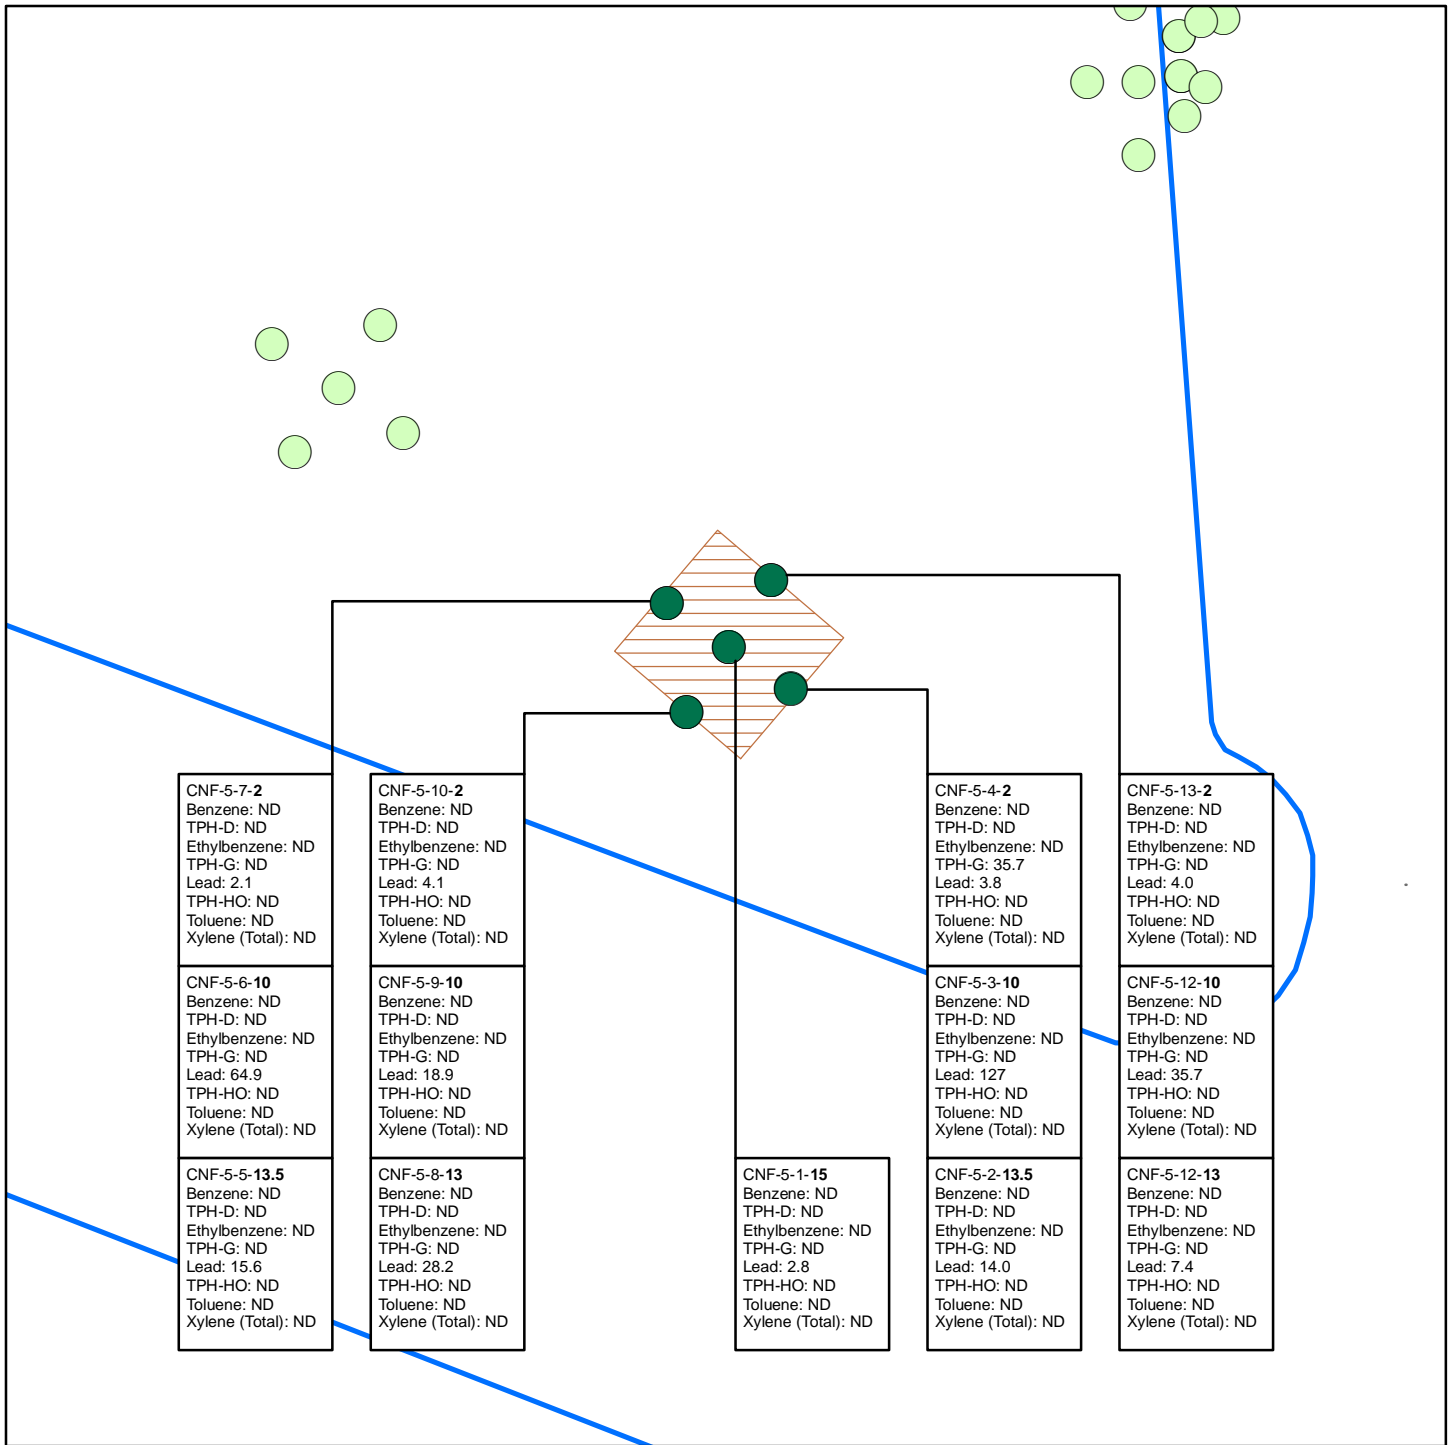

Constituent	Units	IACL	IARL
Arsenic	mg/kg	20	20
Copper	mg/kg	2,700	2,700
Lead	mg/kg	250	250
Nickel	mg/kg	1,400	1,400

- Notes
1. All results given as mg/kg.
 2. Samples named using the formula:
CNF- Hot Spot # - Sample Sequence # - **Sample Depth** (in bold).
 3. Analytical results given in bold exceed the IARL.
 4. Projection: Washington State Plane, South Zone, NAD 1983 datum (feet).

Tables

Table 3-1. Sample Locations and Analytical Constituents

Location	Sample type	Depth of contamination (feet)	Hotspot constituent	Initial excavation depth (feet)	Initial sidewall sample depths (feet)	Analytical constituents
TP-02 (CNF-3, CNF-3A)	Sidewall and Bottom Confirmation Samples	2	Dioxins/Furans	10	0-2, 2-3, 3-4, 7-8*	Dioxins/Furans
DP-11 (CNF-1)	Sidewall and Bottom Confirmation Samples	8-10	Lead	12	8-10*	Arsenic, Lead, Copper, Nickel, TPH-D, TPH-HO, TPH-G
DP-17 (CNF-5) ^a	Sidewall and Bottom Confirmation Samples	10-12	Arsenic	15	10-12*	Arsenic, Lead, Copper, and Nickel
DP-18 (CNF-4) ^a	Sidewall and Bottom Confirmation Samples	10-12	TPH-HO	15	10-12*	TPH-D, TPH-HO, BTEX, and lead
DP-21 (CNF-2, CNF-2A)	Sidewall and Bottom Confirmation Samples	6-8	Arsenic	10	6-8*	Arsenic, Lead, Copper, and Nickel
Stockpiles	Stockpile samples	NA	NA	NA	NA	All constituents of concern (See Table 3-2).

Notes:

* Samples will be collected from the depth interval shown and including each lithologic unit.

NA - Not Applicable

See Sampling and Analysis Plan Table 2-1 for quantity of stockpile samples.

Soil from the excavations of locations TP-02, DP-11, DP-17, and DP-21 will be field screened for the presence of TPH. Analyses for TPH (all ranges) and BTEX will be added if field screening indicates potential TPH presence.

(a) CNF-4/CNF-5 locations have been updated, please note that the IAWP and SAP incorrectly referenced the spatial locations of DP-17 and DP-18, originally assigned samples of the CNF-4 and CNF-5 series, respectively. Therefore, these locations were sampled for incorrect COCs. Subsequent explanation is provided.

Table 3-2. Interim Action Cleanup Levels (IACLs) and Interim Action Remediation Levels (IARLs)		
COPC	IACL (mg/Kg)	IARL (mg/Kg)
Arsenic	20 ⁽¹⁾	20 ⁽¹⁾
Cadmium	2 ⁽¹⁾	2 ⁽¹⁾
Lead	250 ⁽¹⁾	250 ⁽¹⁾
TPH-G	100 ⁽¹⁾	100 ⁽¹⁾
Benzene	0.22 ⁽²⁾	0.22 ⁽²⁾
Toluene	240 ⁽²⁾	240 ⁽²⁾
Ethylbenzene	43 ⁽²⁾	43 ⁽²⁾
Total Xylenes	23 ⁽²⁾	23 ⁽²⁾
TPH-D	2,000 ⁽¹⁾	2,000 ⁽¹⁾
TPH-HO	2,000 ⁽¹⁾	2,000 ⁽¹⁾
Total Naphthalenes	160 ⁽²⁾	160 ⁽²⁾
Total cPAH TEQ	0.10 ⁽¹⁾	1.4 ⁽³⁾
Total Dioxin/Furan TEQ	9.8E-6 ⁽⁴⁾	5.1E-4 ⁽⁵⁾

(1) Per MTCA Method A, WAC 173-340-900 Table 740-1.

(2) Level based on vapor intrusion. The vapor intrusion pathway was determined to be incomplete based on the soil sampling coverage for the property. However, levels based on vapor intrusion will be applied to ensure that the reuse of soil does not bring volatile constituents into proximity to buildable areas or off property structures. Calculations included in IAWP.

(3) Level based on marine surface water ARAR of 0.018 ug/L (human health, Clean Water Act §304) as calculated per MTCA Method B. Calculations included in IAWP.

(4) Level based on direct contact with soil for residents, recreators, and commercial workers as calculated per MTCA Method B. Calculations included in IAWP.

(5) Level based on direct contact with soil for utility workers as calculated per MTCA Method B. Calculations included in IAWP.

IACL/IARL exceedances in bold.

B = Less than 10x higher than method blank level

D = Results obtained from analysis of diluted sample

E = Exceeds calibration range

I = Interference present

J = Estimated value

P = PCDE Interference

R = Recovery outside target range

Y = Calculated using average of daily RFs

(a) TEQ per WAC 173-340-708(8). Calculated per Teel, 2010. For constituents detected on site, concentration = ½ reporting limit for results below reporting limit.

(b) Denotes sampled area that was removed during subsequent excavation efforts.

IACL/IARL exceedances in bold.

J – Estimated concentration based on data validation.

ND – None detected

(a) TEQ per WAC 173-340-708(8). Calculated per Teel, 2010. For constituents detected on site, concentration = ½ reporting limit for results below reporting limit.

Duplicate samples are shown in shaded rows.

Sample Location	Date	Dioxin/Furan TEC Conc^(a) (ng/Kg)
SPL-32-3	2/18/2011	26 J, P, E
Interim Action Cleanup Level		9.81
Interim Action Remediation Level		510

IACL/IARL exceedances in bold.

B = Less than 10x higher than method blank level

D = Results obtained from analysis of diluted sample

E = Exceeds calibration range

I = Interference present

J = Estimated value

P = PCDE Interference

R = Recovery outside target range

*(a) Y = Calculated using average of daily RFsTEQ per WAC 173-340-708(8). Calculated per Teel, 2010.
For constituents detected on site, concentration = ½ reporting limit for results below reporting limit.*

Duplicate samples are shown in shaded rows.

Table 4-24. Parcel 4 Stockpile Summary

Stockpile Number	Est. Size (CY)	Source area	Samples (including duplicates)	Sample Date	COPC Concentrations		Geotechnical Suitability	Designation
					Exceeding IACLS	Exceeding IARLs		
SPL-6	256	DP-17 ^a	5	11/22/2010	cPAHs, dioxins/furans	None	Not geotechnically suitable	Disposal only
SPL-7	191	DP-18 ^a	5	11/22/2010	cPAHs, lead, dioxins/furans	Lead	Not geotechnically suitable	Disposal only
SPL-8	50	TP-02	3	11/22/2010	Dioxins/furans	None	Suitable	Reuse - capped areas only
SPL-10	75	DP-17 / DP-18 ^a	3	11/16/2010	Dioxins/furans	None	Suitable	Reuse - capped areas only
SPL-11	82	TP-02	3	11/16/2010	Dioxins/furans	None	Suitable	Reuse - capped areas only
SPL-23	84	TP-02	3	2/7/2011	cPAHs, dioxins/furans	None	Suitable	Reuse - capped areas only

a Locations of DP-17 and DP-18 locations were transposed in the IAWP and SAP, this report has been includes reference to the historically correct locations.

Table 4-25. Soil Quantity Summary – Parcel 4 ¹		
Disposition/Month	Removal and disposal of soils	
	Ton	CY
Disposal January 2011 (hot spot areas)	632	451
Disposal August 2011	2,718	1,941
Disposal September 2011	3,596	2,569
Disposal October 2011	1,294	925
Disposal November 2011	215	153
Disposal December 2011	233	159
Disposal January 2012	14	10
Dig and haul total	8,060	5,757
Total for offsite disposal	8,692	6,209
Parcel 4 Unrestricted Reuse	0	0
Parcel 4 Reuse Under Cap	291	208
Parcel 4 Total Reuse	291	208

Assumes 1.4 tons/CY

SPL-28	87	Retaining wall	4	2/9/2011	cPAHs, dioxins/furans	None	Suitable	Reuse - capped areas only
SPL-29	718	Softscaped area	8	2/4/2011	Dioxins/furans	None	Suitable	Reuse - capped areas only

Table 4-26. Parcel 5 Stockpile Summary

Stockpile Number	Est. Size (CY)	Source area	Samples (including duplicates)	Sample Date	COPC Concentrations		Geotechnical Suitability	Designation
					Exceeding IACLS	Exceeding IARLs		
SPL-30	718	Softscaped area	7	2/3/2011	cPAHs	None	Suitable	Reuse - capped areas only
SPL-31	248	Softscaped area	6	2/18/2011	cPAHs, dioxins/furans	None	Not geotechnically suitable	Disposal only
SPL-32	133	Softscaped area	3	2/18/2011	TPH-HO, dioxins/furans	TPH-HO	Not geotechnically suitable	Disposal only

Table 4-27. Soil Quantity Summary – Parcel 5		
Disposition/Month	Removal and disposal of contaminated soils	
	Ton	CY
Disposal January 2011	279	199
Disposal March 2011	988	706
Disposal June 2011	229	164
Disposal March 2012	383	274
Total for Offsite Disposal	1,879	1,342
Unrestricted Reuse	412	294
Reuse Under Cap ^a	6,002 (5,660)	4,287 (4,043)
Total Parcel 5 Reuse^a	6,414 (6,072)	4,581 (4,337)

- a. Not all soil was reused under cap, and was disposed of with other disposal-only soil. Approximately 244 CY (342 tons) of available reuse under cap soil was sent off site for disposal. The total for offsite disposal includes this quantity. Total reuse under cap quantities are shown, with the total amount adjusted for off-site disposal quantity shown in parentheses.

Assumes 1.4 tons/CY

PARCEL 4 AND 5 INTERIM ACTION SAMPLING AND ANALYSIS PLAN

1. PROJECT MANAGEMENT

1.1 Monitoring Program Task Organization

Organization of the Project team for the Parcel 4 and 5 Interim Action and associated tasks are described in the following sections.

1.1.1 Involved Parties and Roles.

This Sampling and Analysis Plan (SAP) has been prepared for the Parcel 4 and 5 Interim Action. Within this SAP are descriptions of methods and functional activities employed to collect monitoring data collected for Parcel 4 and 5 Interim Action. Specific details regarding the quality assurance for data collected are not included herein, but are discussed separately in the Quality Assurance Project Plan. Together, these two documents serve to completely describe the data collection and quality assurance / quality control (QA/QC) program that will be implemented as part of the Interim Action.

Notes:

QA = Quality Assurance

BC = Brown and Caldwell

1.1.2 Project Manager Role

The project manager is assigned primary oversight for data collection.

The QA Officer is responsible for performing sample collection activities, coordinating sample analysis and data validation, performing sample data verification / validation, preparing draft, final draft, and final reports, ensuring that project work performed meets the requirements of the SAP, responding to requested deviations from the SAP, reporting on QA matters to the Client Project Manager and Ecology, obtaining approvals, as needed, for all phases of work, and communicating with the Client Project Manager on matters relating to the project. Key personnel assigned to the project will have reviewed the QAPP and SAP, and will be instructed by the Project Manager regarding the requirements of the data collection program. The Project Manager will work with the Client Project Manager and Department of Ecology to ensure that SAP objectives are being met and the team will continually assess the effectiveness of the data collection program and recommend modifications, as needed.

1.1.3 Persons Responsible for SAP Update and Maintenance

If necessary, the Project Manager, with concurrence from the Client Project Manager, may revise and update the SAP after presenting the evidence for such changes and obtaining the approval from

Department of Ecology. Revisions that occur after the original SAP is approved will be indicated on the SAP title page and will be distributed to all parties listed in Table 1-1.

1.2 Problem Definition

Samples will be collected to confirm the extent of contaminated areas and to classify stockpiled soils as suitable for general reuse, suitable for reuse in capped areas, or to designate soil from disposal. Sample results for soils designated for disposal will be communicated to the disposal facility.

1.3 Regulatory Agencies and Applicable Regulatory Limits

The project is under the oversight of the Washington State Department of Ecology. Cleanup Levels and Remediation Levels for the project are established under the Model Toxics Cleanup Act (MTCA) and defined in the Interim Action Work Plan.

1.4 Project Description

The project was designed to remove contaminated soil from the site and to classify soils remaining on the site as suitable for general reuse or suitable for reuse in capped areas. A detailed description of the constituents to be monitored and the information used to develop the list of constituents is discussed in the Interim Action Work Plan and the SAP.

1.5 Project Schedule

The anticipated schedule for tasks associated with Parcel 4 and 5 Interim Action is shown in Table 1-2 below. Specific project schedules will be described in the SAPs.

Task	Anticipated Date of Initiation	Anticipated Date of Completion	Deliverable
Draft IA Work Plan, SAP, and QAPP		6/9/2010	Draft SAP and QAPP
Final IA Work Plan, SAP and QAPP	7/6/2010	8/6/2010	Final SAP and QAPP
Implement Parcels 4 and 5 Interim Action	September 9, 2010	November 30, 2010	
Draft Parcels 4 and 5 Interim Action Report	September 9, 2010	Within 60 days after field work is completed	Draft Parcels 4 and 5 Interim Action Report
Incorporate Ecology's written comments on the Draft IA Report	Upon receipt of Ecology's written comments.	Within 30 days after receipt of Ecology's written comments on the draft report	Final IA Report

1.6 Sampling Constraints

Sampling constraints typically encountered during sampling include safety of sampling personnel and cost considerations.

Sampling results must be complete before major earth-moving activities (stockpile disposal, excavation backfill, etc.). Timing constraints or missed events are therefore not anticipated.

1.7 Sampling Objectives

Sampling activities at the site will consist of confirmation soil sampling and stockpile soil sampling. The objective of confirmation soil sampling will be to delineate the extent of contamination in areas suspected to exceed Interim Action Remediation Levels (IARLs). The objective of stockpile soil sampling will be to classify stockpiled material as suitable for general reuse, suitable for reuse in capped areas, or designated for disposal. Descriptions of sampling procedures are provided in Section 2. Constituents of Potential Concern (COPCs) and proposed sampling methods are summarized in Table 1-3.

Group	COPC	Proposed Methods	Reporting Limits
Metals	Arsenic	EPA 6020A	0.2 mg/Kg
	Cadmium	EPA 6020A	0.2 mg/Kg
	Lead	EPA 6020A	1 mg/Kg
	Copper	EPA 6020A	0.2 mg/Kg
	Nickel	EPA 6020A	0.5 mg/Kg
PAHs	cPAHs	EPA 8270C / EPA 8270C-SIM	0.01 mg/Kg
Dioxins / Furans	Dioxins / Furans	EPA 1613 / EPA 8290	3 pg/g
Petroleum Hydrocarbons	TPH-D	NWTPH-Dx	25 mg/Kg
	TPH-HO	NWTPH-Dx	25 mg/Kg
	TPH-G	NWTPH-Gx	10 mg/Kg
VOCs	Benzene	EPA 8260B	0.01 mg/Kg
	Toluene	EPA 8260B	0.01 mg/Kg
	Ethylbenzene	EPA 8260B	0.01 mg/Kg
	Total Xylenes	EPA 8260B	0.03 mg/Kg
SVOCs	Total Naphthalenes	EPA 8270C / EPA 8270C-SIM	0.3 mg/Kg

1.8 Quality Control Limits

Data Quality Objectives, project quality objectives, and the measurement performance criteria for sampling are provided in the QAPP.

1.9 Training and Certification

Field personnel that participate in sampling will have reviewed the QAPP and SAP for the specific Site project, and will be instructed by the Project Manager. Training will occur prior to the beginning of the program and semi-annually thereafter through QC sessions, where field procedures will be reviewed; new personnel will be trained prior to performing any work in the program. Field personnel will have been trained prior to the first sampling event in sample collection procedures (including QA/QC, grab sampling techniques, completing laboratory chain-of-custody forms, and proper handling of water samples), and field analysis (including instrument calibration, data recording procedures, and interpretation of collected data).

All laboratories utilized to perform analytical services will be certified by the NELAC. Laboratory personnel will be certified and trained as required by the laboratory's quality assurance manuals. The laboratory director of the primary analytical lab will be provided a copy of the QAPP.

Documentation of training for field staff will be maintained by Brown and Caldwell.

Documentation will include a record of the training topic, training date, name and title of instructor, whether the class was an initial training or a refresher course, and whether the course was completed satisfactorily.

1.10 Documents and Records

1.10.1 Project Documents, Records, and Electronic Files

The documents and records that will be generated during this project include the following:

Quality Assurance Project Plan: The QAPP (this document) contains details on the QA and QC procedures that will be implemented throughout the project.

Sampling and Analysis Plans: The SAPs contain information regarding sampling locations, frequencies, and sample collection methods.

Field Records. The Brown and Caldwell Project Manager or other designee will maintain all field records, including field data sheets documenting results of field analyses and QC samples, a logbook documenting equipment maintenance and calibration, and sample collection and handling documentation (copies of chain-of-custody forms, shipping receipts, etc.).

Laboratory Records. Analytical labs will maintain sample receipt and storage documentation, instrument calibration logs, raw data and QC sample records.

Data validation records. Field data sheets, field QC results, chain-of-custody forms, and lab reports from each sampling event will be reviewed by the QA Officer and a data validation record will be generated which summarizes the quality of the collected data.

Project database: The Brown and Caldwell Olympia, WA office will be used to store all laboratory and field data gathered during this project. The database will be continually updated and managed as described in Section 2.9. At the completion of the project, data may be electronically submitted to the City of Olympia and the LOTT Alliance upon request.

1.10.2 Retention of Project Documentation

The original data sheets, equipment maintenance/calibration logs, chain-of-custody forms, lab reports, field records, training documents and data validation records will be stored by Brown and Caldwell until the end of the project. All records will be maintained by Brown and Caldwell and analytical labs for five years after project completion.

1.10.3 Distribution of SAP Revisions

Revisions that occur after the original SAP is approved will be indicated on the SAP title page and will be distributed by the Project Manager to all parties listed in Table 1-1.

PARCEL 4 AND 5 INTERIM ACTION SAMPLING AND ANALYSIS PLAN

2. DATA GENERATION AND ACQUISITION

2.1 Sampling Process Design

The individual Site SAPs will provide a detailed description of the sampling approach and rationale that was used to select sampling locations, sampling frequencies, and constituents that will be analyzed.

2.2 Sampling Methods

Proper sample collection procedures are essential to ensure that representative and reliable data are being collected. Sample collection will be performed according to the SOP for Sample Collection, Documentation, and Delivery, included as Appendix I to the IA Work Plan. In general, the QA procedures that will be followed during sample collection include the following:

- Samples from depths less than 4 feet will be collected by hand directly from the sidewall of the excavation. Samples from depths greater than 4 feet will be collected by using the excavator bucket. .
- Sample collection will be performed in such a manner as to minimize disturbance of surrounding soils.
- Soil grab samples will be transferred to sample jars carefully to minimize exposure to external influences such as wind, dust, or rain.
- Sample jars will be labeled (e.g., date, time, location, method) immediately after collection.
- Sampling date and time and sampler's initials will be added to the chain of custody form immediately after sampling.
- If problems occur during sampling, the QA Officer will be notified. The source of the problem will be identified and the appropriate corrective action taken. These incidents will be documented in the project folder and filed with the appropriate data package. If the problem compromised the quality of collected data, the data will be flagged within the database.

2.3 Confirmation Sampling

Samples will be collected during excavation both to delineate excavated areas and to characterize excavated material stockpiled on-site. A total of five locations exceed IARLs and will be excavated: TP-02, DP-11, -17, -18, and -21. Table 2-1 shows planned sample depths and analytical constituents. Hotspots will be initially excavated in 20-foot by 20-foot excavation cells. The excavation cells may be made smaller with permission from Ecology, but not larger. The first

excavation cells will be centered at the coordinates of the samples with concentrations exceeding IARLS (DP-17 and DP-21 for arsenic, DP-11 for lead, DP-18 for TPH-HO, and TP-02 for dioxins/furans. After the first cell is excavated, adjacent 20-foot by 20-foot cells may be excavated based on field screening results. These excavations will constitute the first excavation round.

Confirmation samples will be collected during the first excavation round. Vertical sets of confirmation samples will be collected in each sidewall of each excavation cell at the depths shown in Table 2-1. A vertical set will include one sample from each lithologic layer. Samples from depths less than 4 feet will be collected by hand directly from the sidewall of the excavation. Samples from depths greater than 4 feet will be collected by using the excavator bucket. A floor sample in the center of each cell will also be collected by using the excavator bucket. Sample collection is shown schematically in Figure 2-1.

Table 2-1. Sample Locations and Analytical Constituents						
Location	Sample Type	Depth of Contamination (feet)	Hotspot Constituent	Initial Excavation Depth (feet)	Initial Sidewall Sample Depths (feet)	Analytical Constituents
TP-02	Sidewall and Bottom Confirmation Samples	2	Dioxins/Furans	10	0-2, 2-3, 3-4, 7-8*	Dioxins/Furans
DP-11	Sidewall and Bottom Confirmation Samples	8-10	Lead	12	8-10*	Arsenic, Lead, Copper, and Nickel
DP-17	Sidewall and Bottom Confirmation Samples	10-12	Arsenic	15	10-12*	Arsenic, Lead, Copper, and Nickel
DP-18	Sidewall and Bottom Confirmation Samples	10-12	TPH-HO	15	10-12*	TPH-D, TPH-HO, BTEX, and lead
DP-21	Sidewall and Bottom Confirmation Samples	6-8	Arsenic	10	6-8*	Arsenic, Lead, Copper, and Nickel
Stockpiles	Stockpile samples	NA	NA	NA	NA	All Constituents of Concern (See Table 3-2).

Notes:

* Samples will be collected from the depth interval shown and including each lithologic unit.

NA - Not Applicable

See Sampling and Analysis Plan Table 2-1 for quantity of stockpile samples.

Soil from the excavations of locations TP-02, DP-11, DP-17, and DP-21 will be field screened for the presence of TPH.

Analyses for TPH (all ranges) and BTEX will be added if field screening indicates potential TPH presence.

Adjacent cells may be excavated in a second excavation round following the first set of sample collection. An adjacent cell will be excavated if any sample from the adjoining wall exceeds IARLs.

If necessary, the City and LOTT will continue the excavation of areas known to exceed IARLs (as identified in Figures 3-4 and 3-7) beyond the property boundaries of Parcel 4 and 5. These areas will be excavated until COPC concentrations in confirmation samples collected per Table 2-1 are below the IARLs.

Figure 2-1: Compliance Sampling Plan

2.4 Stockpile Sampling

Separation of material into stockpiles will be directed by the BC PM or their designee. Stockpiles comprised of material from Parcel 4 will be kept distinct from stockpiles comprised of material from Parcel 5. The BC PM or their designee will segregate material into stockpiles based on field screening analysis methods, including PID headspace analysis, sheen testing, visual and olfactory observations, or other appropriate criteria. In addition, the BC PM or their designee will attempt, to the extent practicable, to segregate material so that distinct lithologic units are kept separate. Time constraints or site constraints may not always allow for separation by lithology.

Samples will be collected from stockpiles based on stockpile size. Stockpile dimensions will be measured and stockpile size estimated to facilitate both sample collection and measurement and payment during project implementation. The estimator will be a BC or contracted professional and will estimate stockpile size using current local, state, or national standard methods. The estimator will also conduct Proctor testing to estimate the dry density, optimum moisture, and maximum achievable compaction. The stockpile sampling schedule is summarized in Table 2-2. Stockpile samples will be analyzed for all of the constituents of concern (see Interim Action Work Plan Table 3-2).

Stockpile Size (Cubic Yards)	Sample Quantity
0 – 100	3
101 – 500	5
501 – 1000	7
1001 – 2000	10
> 2000	10 + 1 for each additional 500 CY soil

Samples will be collected such that they are spatially distributed around the stockpile. Samples will be collected from the dominant lithology in the stockpile. The BC PM or their designee may collect additional stockpile samples if, in the opinion of the BC PM or the Client, additional samples are warranted based on field conditions.

Stockpiles will be marked with a placard system to designate their usage. A separate placard color will denote unsampled stockpiles, stockpiles sampled and awaiting analytical results, stockpiles with no sample results exceeding IACLs (soils suitable for general reuse), stockpiles with sample results exceeding IACLs but no sample results exceeding IARLs (soils suitable for reuse in capped areas), and stockpiles with sample results exceeding IARLs (soils for off-site disposal). Newly excavated material may only be added to stockpiles that have not been sampled. Stockpile information will be recorded on the placards, including the stockpile number, the date(s) of excavation, stockpile size, the stockpile sample number(s), the date of sampling, the concentrations of any COPCs exceeding IACLs, the concentrations of any COPCs exceeding IARLs, the stockpile status, and the date that the stockpile is authorized for reuse or disposal.

2.5 Sample Designation and Labeling

Each sample collected will be identified by confirmation excavation or stockpile number, location number, and by depth in feet if appropriate. Confirmation sample numbers will begin with the “CNF” designation, while stockpile samples will begin with the “SPL” designation. Location numbers for each sample will be clearly recorded on sketches in the logbooks and sample data sheets.

For instance, a soil sample collected from Confirmation Excavation 1, location 1 at a depth of 7 feet would be identified as “CNF-1-1-7”. The fifth sample from stockpile one would be identified as “SPL-1-5”.

Each sample container will be individually labeled with the label affixed directly to the sample container. Information that will be included on the label in the field includes preservation, analysis

required, date and time of collection, location, and the sampler's initials. All of these data will be written with indelible waterproof ink. Any additional information regarding the sample collection will be noted in the field logbook; this additional information can include notations if the samples are composite samples or if preservatives were added in the field, for example.

PARCEL 4 AND 5 INTERIM ACTION SAMPLING AND ANALYSIS PLAN

3. SAMPLE HANDLING AND CUSTODY

3.1 Sample Handling

Once sample containers have been filled they will be labeled, placed in re-sealable plastic bags (e.g. *Ziploc*®), and stored in a cooler on ice to maintain a temperature of approximately 4° C. Identification information for each sample will be recorded in the field logbook when the sample is collected.

3.2 Sample Collection Documentation

The field logbooks used during sampling procedures will include the following information:

- initials of person making entry
- date and time of sample collection
- sampling location
- analyses to be performed
- preservation method
- field meter or screening information, if applicable
- general remarks (weather conditions, etc.)

All entries will be made in indelible ink with a ballpoint pen and will be written legibly. Entry errors will be crossed out with a single line, dated, and initialed by the person making the correction. Field logbooks will be reviewed periodically by the BC Project QA Officer, as appropriate. Additionally, a field sampling data sheet will be completed for each sample.

3.3 Custody

A chain-of-custody form will be completed at the time of sample collection and prior to sample shipment or release. The samples will be transported or shipped to the analytical lab in insulated containers within the appropriate holding time and will be accompanied by a chain-of-custody form that identifies the sample bottles, date and time of sample collection, and analyses requested. If shipment is needed, the samples will be packaged and shipped in accordance with U.S. Department of Transportation standards. The original chain-of-custody will be given to the lab with the samples and Brown and Caldwell will retain a copy for their records. Once received by the laboratory, a sample receipt and storage record will be generated. The recommended sample container type and volume, initial preservative and holding time for analytes that may be tested is shown in Table 3-1.

The turn around time for the analytical laboratory will typically be within ten days from the sampling date. After analyses, all samples will be disposed of in accordance with federal, state, and local requirements.

Table 3-1. Sample Handling and Custody					
Group	Parameter	Container ^a	Initial Preservative ^a	Max Allowable Holding Time	
				Extraction ^b	Analysis ^c
Metals	Arsenic	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Lead	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Cadmium	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Copper	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Nickel	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
Semi-Volatiles	cPAHs	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	14 days	40 days
	Total Naphthalenes	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	14 days	40 days
Dioxins / Furans	Dioxins / Furans	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	28 days	40 days
TPH	TPH-G	EnCore Sampler	Ice to 4° C, preserve w/ methanol w/ in 48 hours	---	14 days
	TPH-D	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	28 days
	TPH-HO	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	28 days
Volatiles	Benzene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days
	Toluene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days
	Ethylbenzene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days
	Total Xylenes	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days

^a Sample containers, volumes, and preservatives will be reevaluated once contract laboratories are chosen and may be changed based on recommendations from the lab(s).

^b Starting from the date of collection

^c Starting from the date of extraction; if no extraction, starting from the date of collection

3.4 Laboratory Chain-of-Custody Procedures

Laboratory COC procedures for sample receiving and log-in, sample storage, tracking during sample preparation and analysis, and storage of data will be described in the laboratory SOPs and laboratory Quality Manuals of the selected laboratory. Minimum requirements are described below.

On arrival at the laboratory, all samples will be inspected thoroughly to confirm that the integrity of the samples and containers has not been compromised. The cooler custody seals will be inspected to verify that they are still intact and were properly signed and dated by the field sampling team. The temperature of the cooler temperature blank will be determined and recorded. If the temperature of the cooler blank does not fall into the range of 4 ± 2 °C the Project Manager will be notified immediately. The exception to this will be if samples are delivered from the Site same-day to the laboratory. In this circumstance, the cooler temperature blank and samples may not have cooled during transport and elevated temperatures will be considered acceptable as long as ice is present in the cooler. The individual sample containers will be inspected to verify that each has a sample label. The condition of the samples will be noted on the COC form.

The sample containers will be checked against the accompanying COC to verify that the cooler contents are identical to the samples described on the COC documents. If discrepancies exist, they will be reported to the Laboratory QA Officer, who will immediately notify the BC PM. The problem will be resolved, in writing, before analytical work begins. After the Laboratory Sample Custodian has determined that the samples are in satisfactory condition and the documents are in order, a sample log-in sheet will be initiated and will serve as documentation of the condition of the samples upon receipt and their assigned laboratory numbers.

The sample log-in sheet will include information from field notes from the COC forms that reflect any special care or concerns that should be taken with the sample (e.g., the sampler suspects high concentration of an analyte due to field observations or historical concentration).

After the samples have been entered into the laboratory tracking system, copies of the log-in forms and COC records will be sent to the BC Project QA Officer, who will verify that the specified samples and parameters correspond to the samples and parameters identified in the SAP. The samples will be placed in a secured storage area, under the conditions called for by the analytical method, until removed for analysis.

Samples delivered on Saturday will be received by the Laboratory Sample Custodian and placed in a secure location until they can be logged in on the next business day.

3.5 Analytical Methods

Field measurements will be conducted by Brown and Caldwell staff using portable meters and field test kits that employ EPA-approved methods. Field measurements will be taken using the procedures recommended by the manufacturer of the meter or test kit and procedures discussed in the SOP for Field Data Collection, where applicable. Results of all field measurements will be recorded in field logbooks and on field data sheets.

Laboratory analyses will be conducted by NELAC-certified analytical laboratories using methods approved by the EPA and Washington State. Proposed analytical methods are provided in Table 1-

3. Alternative methods may be requested by the laboratories performing analyses. These alternative methods may be used only upon written approval from the QA Officer. Major laboratory equipment or instruments that will be utilized include a gas chromatography/mass spectrometer (GC/MS), inductively coupled plasma mass spectrometer (ICP-MS), high performance liquid chromatography (HPLC), automated colorimeter, ion chromatograph, and a carbon detector. If any instrument failures occur, the laboratory will take immediate corrective action and notify the QA Officer if the quality of sample results was compromised.

3.6 Sample Archival

Samples and sample extracts for all analyses will be held under custody at 4 ± 2 °C by the laboratory for a minimum of 60 days after the laboratory's final report is issued.

PARCEL 4 AND 5 INTERIM ACTION SAMPLING AND ANALYSIS PLAN

4. DOCUMENTATION, RECORDS, AND DATA PACKAGES

This section presents the procedures for documentation, records, and data management for the IA sampling.

4.1 Project Documentation and Records

Project documents will be controlled through an organized project filing system. Project and task numbers will be printed on each document. Analytical/technical files will include work products generated during the project. Field books, field observations, photographs, and other field related documents will be prepared and will also be placed in the project files. Laboratory sample results will be controlled, reviewed, and validated as required by the SAP. Original incoming documents will be date-stamped upon arrival and will be placed in the files.

The project manager will contact the analytical laboratories, subcontractor, or private sources prior to receiving the data report to review the report status. This will provide an opportunity to identify potential QA issues or potential delivery delays. This will also provide an opportunity to implement corrective actions when most appropriate.

Data received from the field, analytical laboratories, subcontractors, or private sources will be tabulated on a spreadsheet or database and will be subjected to QC procedures, including comparing raw data to the original source, verifying calculations, and confirming data summaries. Data distribution will not occur until data review has been completed.

Work products will be checked before final use. This includes checking calculations, reports, plans, etc. with various levels of review. The BC PM will be responsible for the review of work as an element of his project responsibilities and for the overall quality of the work. One or more discipline-specific Technical Director(s) may be assigned by the PM. Further, assignments may be made outside the project team, as needed, for QC purposes.

4.2 Laboratory Data Package Deliverables

The laboratory will provide one paper-copy original and one electronic copy (pdf format) of each laboratory data report to the BC PM. EDDs will also be required for the project database. Laboratory deliverables are required within 15 calendar days of receiving samples.

4.2.1 Paper Copy Data Package

The data package shall consist of the following, at a minimum:

Detailed Case Narrative:

- Date of issuance.

- Laboratory analyses performed, modifications to the methods, and impact on the data.
- Any deviations from intended analytical strategy.
- Laboratory batch number.
- Numbers of samples and respective matrices.
- QC procedures utilized and also references to the acceptance criteria.
- Laboratory report contents.
- Project name and number.
- Condition of samples ‘as-received’.
- Discussion of whether or not sample holding times were met, and if holding times were not met, a demonstration of the validity of the data.
- Discussion of technical problems or other observations which may have created analytical difficulties.
- Discussion of any laboratory QC checks which failed to meet project criteria and the effect on the data.
- Signature of the Laboratory QA Officer and/or Laboratory Director or designee.
- Description of laboratory data qualifiers used.
- Definitions of acronyms and qualifiers.

Chemistry Data Package:

- Report of analysis with units clearly labeled with supporting raw data and expressed to the appropriate number of significant figures.
- Results of method blanks with supporting raw data.
- Summary table showing relationship of field samples to QC samples.
- Surrogate recovery summaries.
- Laboratory control sample summary with supporting raw data.
- Matrix spike summary with supporting raw data.
- Laboratory duplicate summary with supporting raw data (where applicable).
- Matrix spike duplicate summary with supporting raw data (where applicable).
- Tune summary for gas chromatography/mass spectrometry.
- Initial calibration summary and supporting raw data.
- Continuing calibration summary and supporting raw data.
- Internal standard summary.
- Instrument sensitivity check (CRI or equivalent).
- Interference check sample summary.
- Run logs.
- Sample preparation logs.
- Laboratory method detection limits.
- ICP linear ranges.
- Laboratory acceptance limits for QC samples.
- Internal and external chains of custody.
- Sample raw data.

4.2.2 Electronic Data Deliverable (EDD)

The laboratory shall furnish an EDD for all analyses. The electronic deliverable shall be provided in a flat-file database table populated, but not limited to the following fields:

- FACILITY_ID
- LABNAME
- LAB_SAMP
- FIELD_SAMP
- MEDIUM
- SAMP_DATE
- SAMP_TIME
- PARAM
- CAS_NO
- DL_FLAG
- CONC
- UNITS
- QUAL
- DILUTION
- METH_ID
- MDL
- PQL
- PROJ_QL
- REC_DATE
- EXTR_DATE
- ANALY_DATE

The EDD should include both the results of samples collected in the field and the results of those performed as part of laboratory QA/QC including internal duplicates, check standards, internal spikes, and MS/MSD samples. Results in the EDD shall include surrogate recoveries for each sample expressed as percent (%) recovered. In accordance with WAC 173-340-840(5) and Ecology Toxics Cleanup Program Policy 840 (Data Submittal Requirements), data generated shall be submitted to Ecology in both a written and electronic format. All data collected for the Interim Action will be entered into Ecology's Environmental Information Management (EIM) database.

4.3 Data Tracking, Storage, and Control

The final project files will be maintained by the BC PM. The content of the project file will include, at a minimum, all relevant records, reports, correspondence, logs, field logbooks, laboratory sample preparation and analysis raw data, original laboratory data packages, pictures, subcontractor's reports including data validation reports, assessment reports, progress reports, and chain-of-custody (COC) records/forms. Specific data storage and control requirements are described in the QAPP.

PARCEL 4 AND 5 INTERIM ACTION SAMPLING AND ANALYSIS PLAN

5. LIMITATIONS

Report Limitations

This document was prepared solely for the City of Olympia and the LOTT Alliance in accordance with professional standards at the time the services were performed and in accordance with the contract between Brown and Caldwell and the City of Olympia dated September 4, 2009, and the contract between Brown and Caldwell and the LOTT Alliance dated June 18, 2008. This document is governed by the specific scope of work authorized by the City of Olympia and the LOTT Alliance; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by the the City of Olympia, the LOTT Alliance and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

LIST OF ACRONYMS

BC	Brown and Caldwell
°C	degrees Celsius
CCL	contaminant candidate list
COPC	constituent of potential concern
CRM	certified reference materials
DI	Deionized water
DO	dissolved oxygen
DOC	dissolved organic carbon
DRL	detection limits for purposes of reporting (Title 22)
DQO	data quality objective
EC	electrical conductivity
Ecology	Washington State Department of Ecology
EDD	electronic database deliverable
EDMS	environmental database management system
EPA	United States Environmental Protection Agency
GC/MS	gas chromatography/mass spectrometry
HPLC	high performance liquid chromatography
ICP/MS	inductively coupled plasma mass spectrometry
IS	internal standard
LCM	laboratory control material
LCS	laboratory control spike
LCSD	laboratory control spike duplicate
MCL	maximum contaminant levels
MDL	method detection limit
µg/L	micrograms per liter
µS/cm	microsiemens per centimeter
mg/L	milligrams per liter
MP	Monitoring Plan
MPN	most probable number
MS	matrix spike
MSD	matrix spike duplicate
N	nitrogen
NIST	National Institute of Standards and Technology
P	phosphorus
QA	quality assurance
QAPP	Quality Assurance Project Plan
QC	quality control
RPD	relative percent difference
SM	Standard Methods for the Examination of Water and Wastewater
SOP	standard operating procedure
SWAMP	Surface Water Ambient Monitoring Program
TOC	total organic carbon
TRL	target reporting limit
USEPA	United States Environmental Protection Agency
USGS	United States Geological Survey
WQ	water quality

PARCEL 4 AND 5 INTERIM ACTION QUALITY ASSURANCE PROJECT PLAN

1. PROJECT MANAGEMENT

1.1 Monitoring Program Task Organization

Organization of the Project team for the Parcel 4 and 5 Interim Action and associated tasks are described in the following sections.

1.1.1 Involved Parties and Roles.

This Quality Assurance Project Plan (QAPP) has been prepared for the Parcel 4 and 5 Interim Action. Within this QAPP are descriptions of methods that will be used to assure and control the quality of monitoring data collected for Parcel 4 and 5 Interim Action. Specific details regarding the sampling and analyses for specific Sites are not included in the QAPP, but are discussed separately in the Site specific Sampling and Analysis Plan (SAP). Together, these two documents serve to completely describe the quality assurance / quality control (QA/QC) program that will be implemented as part of the Interim Action.

Table 1-1 Staff			
Name	Affiliation	Title	Contact Information
Steve Teel	Washington State Department of Ecology	Site Manager	ph:(360) 407-6247 stee461@ecy.wa.gov

Notes:

QA = Quality Assurance

BC = Brown and Caldwell

1.1.2 Quality Assurance Officer Role

The QA Officer is responsible for monitoring and verifying implementation of the quality assurance and quality control (QA/QC) procedures found in this QAPP and its referenced Standard Operating Procedures (SOPs). The QA Officer is independent of the personnel that will generate data for this project. Key personnel assigned to the project will have reviewed the QAPP and SAP, and will be instructed by the QA Officer regarding the requirements of the QA/QC program. The QA Officer will work with the Client Project Manager and Department of Ecology to ensure that QAPP objectives are being met and the team will continually assess the effectiveness of the QA/QC program and recommend modifications, as needed.

1.1.3 Persons Responsible for QAPP Update and Maintenance

If necessary, the QA Officer, with concurrence from the Client Project Manager, may revise and update the QAPP after presenting the evidence for such changes and obtaining the approval from Department of Ecology. Revisions that occur after the original QAPP is approved will be indicated on the QAPP title page and will be distributed to all parties listed in Table 1-1.

1.2 Problem Definition

Samples will be collected to confirm the extent of contaminated areas and to classify stockpiled soils as suitable for general reuse, suitable for reuse in capped areas, or to designate soil from disposal. Sample results for soils designated for disposal will be communicated to the disposal facility.

1.3 Regulatory Agencies and Applicable Regulatory Limits

The project is under the oversight of the Washington State Department of Ecology. Cleanup Levels and Remediation Levels for the project are established under the Model Toxics Cleanup Act (MTCA) and defined in the Interim Action Work Plan.

1.4 Project Description

The project was designed to remove contaminated soil from the site and to classify soils remaining on the site as suitable for general reuse or suitable for reuse in capped areas. A detailed description of the constituents to be monitored and the information used to develop the list of constituents is discussed in the Interim Action Work Plan and the SAP.

1.5 Project Schedule

The anticipated schedule for tasks associated with Parcel 4 and 5 Interim Action is shown in Table 1-2 below. Specific project schedules will be described in the SAPs.

Task	Anticipated Date of Initiation	Anticipated Date of Completion	Deliverable
Draft IA Work Plan, SAP, and QAPP		6/9/2010	Draft SAP and QAPP
Final IA Work Plan, SAP and QAPP	7/6/2010	8/6/2010	Final SAP and QAPP
Interim IA Soil Sampling Report	TBD	TBD	Summary report, chain-of-custody forms, lab reports
Interim IA Soil Sampling Report	TBD	TBD	Summary report, chain-of-custody forms, lab reports
IA Report	TBD	TBD, within 60 days of completion of field work	Chapter in the report

1.6 Sampling Constraints

Sampling constraints typically encountered during sampling include safety of sampling personnel and cost considerations.

Sampling results must be complete before major earth-moving activities (stockpile disposal, excavation backfill, etc.). Timing constraints or missed events are therefore not anticipated.

1.7 Data Quality Objectives

DQOs have been selected for this project based on the expected data usage and are designed to ensure that accurate, precise, representative, and complete data are collected throughout the monitoring program. The DQOs are summarized in Table 1-3. Descriptions of how the DQOs will be assessed are provided in Section 1.7.

Table 1-3. Parcel 4 and 5 IA Quality Control Limits

Constituents	Proposed Methods	Reporting Limits	Accuracy Limits	Precision Limits (RPD)
Soil COPCs				
Arsenic	EPA 6020A	0.2 mg/Kg	± 30%	30%
Cadmium	EPA 6020A	0.2 mg/Kg	± 30%	30%
Lead	EPA 6020A	1 mg/Kg	± 30%	30%
Copper	EPA 6020A	0.2 mg/Kg	± 30%	30%
Nickel	EPA 6020A	0.5 mg/Kg	± 30%	30%
cPAHs	EPA 8270C / EPA 8270C-SIM	0.01 mg/Kg	± 30%	30%
Dioxins / Furans	EPA 1613 / EPA 8290	3 pg/g	± 30%	30%
TPH-D	NWTPH-Dx	25 mg/Kg	± 30%	30%
TPH-HO	NWTPH-Dx	25 mg/Kg	± 30%	30%
TPH-G	NWTPH-Gx	10 mg/Kg	± 30%	30%
Benzene	EPA 8260B	0.01 mg/Kg	± 30%	30%
Toluene	EPA 8260B	0.01 mg/Kg	± 30%	30%
Ethylbenzene	EPA 8260B	0.01 mg/Kg	± 30%	30%
Total Xylenes	EPA 8260B	0.03 mg/Kg	± 30%	30%
Total Naphthalenes	EPA 8270C / EPA 8270C-SIM	0.3 mg/Kg	± 30%	30%

1.7.1 Accuracy

Accuracy describes how close an analytical measurement is to its true value. Accuracy is typically measured by analyzing a sample of known concentration (prepared using analytical-grade standards) and comparing the analytical result with the known concentration. Accuracy objectives for all constituents are summarized in Table 1-3.

1.7.2 Precision

Precision describes how well repeated measurements agree. Precision is typically evaluated by comparing analytical results from duplicate (also called replicate) samples and calculating the relative percent difference (RPD), where RPD is defined as:

$$RPD = \left(\frac{|C_1 - C_2|}{\left(\frac{C_1 + C_2}{2} \right)} \right) \times 100, \text{ where } C_1 \text{ and } C_2 \text{ are the analytical results for both duplicates}$$

Precision will be measured using both field and laboratory duplicates in addition to duplicate laboratory control spikes.

1.7.3 Representativeness

The representativeness of the data is mainly dependent on the sampling locations (spatial), sampling frequency (temporal), sample collection procedures, and analytical constituents and methods. The sampling approach (described in detail within the individual Site SAPs) has been developed to ensure that all data collected during this project are representative to the extent possible.

1.7.4 Completeness

Completeness, which is expressed as a percentage, is calculated by subtracting the number of rejected and unreported results from the total planned results and dividing by the total number of planned results. Estimated results do not count against completeness because they are considered usable as long as any limitations are identified. Results rejected because of out-of-control analytical conditions, severe matrix effects, broken or spilled samples, or samples that could not be analyzed for any other reason are subtracted from the total planned number of results to calculate completeness. Though regulations currently do not require a specific percentage of data completeness, it is expected that the measurement techniques selected for use in this project are capable of generating data that is of 90 percent completeness for field and laboratory analyses.

1.7.5 Comparability

Comparability evaluates whether the reported data are comparable with similar data reported by other organizations. The use of approved analytical methods and certified laboratories will provide some level of comparability. Evaluation of performance evaluation samples is another measure of comparability. Certified laboratories are required to analyze performance evaluation samples on a regular basis to evaluate the comparability of their reported results.

1.8 Quality Control Limits

The quality control (QC) limits for precision and accuracy are provided in Table 1-3. These limits will be used to qualify data and alert the data users of any identified bias or uncertainty in results. Laboratories will follow method criteria and the laboratory's QA/QC manual and procedures for corrective action during sample analysis. Laboratories shall report detection limits based on current statistical detection limit studies and reporting limits based on the low standards in their calibration curves. Laboratory reporting limits should not exceed the maximum allowable reporting limits provided in Table 1-3. Proposed analytical methods shall be used unless written approval for alternative methods is given.

1.9 Training and Certification

Field personnel that participate in sampling will have reviewed the QAPP and SAP for the specific Site project, and will be instructed by the QA Officer. Training will occur prior to the beginning of the program and semi-annually thereafter through QC sessions, where QC procedures will be reviewed. Field personnel will have been trained prior to the first sampling event in sample collection procedures (including QA/QC, grab sampling techniques, completing laboratory chain-of-custody forms, and proper handling of water samples), and field analysis (including instrument calibration, data recording procedures, and interpretation of collected data).

All laboratories utilized to perform analytical services will be certified by NELAC. Laboratory personnel will be certified and trained as required by the laboratory's quality assurance manuals. The laboratory director of the primary analytical lab will be provided a copy of this QAPP.

Documentation of training for field staff will be maintained by Brown and Caldwell. Documentation will include a record of the training topic, training date, name and title of instructor, whether the class was an initial training or a refresher course, and whether the course was completed satisfactorily.

1.10 Documents and Records

1.10.1 Project Documents, Records, and Electronic Files

The documents and records that will be generated during this project include the following:

Quality Assurance Project Plan: The QAPP (this document) contains details on the QA and QC procedures that will be implemented throughout the project.

Sampling and Analysis Plans: The SAPs contain information regarding sampling locations, frequencies, and sample collection methods.

Field Records. The Brown and Caldwell Project Manager or other designee will maintain all field records, including field data sheets documenting results of field analyses and QC samples, a logbook documenting equipment maintenance and calibration, and sample collection and handling documentation (copies of chain-of-custody forms, shipping receipts, etc.).

Laboratory Records. Analytical labs will maintain sample receipt and storage documentation, instrument calibration logs, raw data and QC sample records.

Data validation records. Field data sheets, field QC results, chain-of-custody forms, and lab reports from each sampling event will be reviewed by the QA Officer and a data validation record will be generated which summarizes the quality of the collected data.

Project database: The Brown and Caldwell Olympia, WA office will be used to store all laboratory and field data gathered during this project. The database will be continually updated and managed as described in Section 2.9. At the completion of the project, data may be electronically submitted to the City of Olympia and the LOTT Alliance upon request.

1.10.2 Retention of Project Documentation

The original data sheets, equipment maintenance/calibration logs, chain-of-custody forms, lab reports, field records, training documents and data validation records will be stored by Brown and Caldwell until the end of the project. All records will be maintained by Brown and Caldwell and analytical labs for five years after project completion.

1.10.3 Distribution of QAPP Revisions

Revisions that occur after the original QAPP is approved will be indicated on the QAPP title page and will be distributed by the QA Officer to all parties listed in Table 1-1.

PARCEL 4 AND 5 INTERIM ACTION QUALITY ASSURANCE PROJECT PLAN

2. DATA GENERATION AND ACQUISITION

2.1 Sampling Process Design

The individual Site SAPs will provide a detailed description of the sampling approach and rationale that was used to select sampling locations, sampling frequencies, and constituents that will be analyzed.

2.2 Sampling Methods

Proper sample collection procedures are essential to ensure that representative and reliable data are being collected. Sample collection will be performed according to the SOP for Sample Collection, Documentation, and Delivery, included as Appendix I to the IA Work Plan. In general, the QA procedures that will be followed during sample collection include the following:

- Soil grab samples will be collected by hand or from the excavator bucket.
- Sample collection will be performed in such a manner as to minimize disturbance of surrounding soils.
- Soil grab samples will be transferred to sample jars carefully to minimize exposure to external influences such as wind, dust, or rain.
- Sample jars will be labeled (e.g., date, time, location, method) immediately after collection.
- Sampling date and time and sampler's initials will be added to the chain of custody form immediately after sampling.
- If problems occur during sampling, the QA Officer will be notified. The source of the problem will be identified and the appropriate corrective action taken. These incidents will be documented in the project folder and filed with the appropriate data package. If the problem compromised the quality of collected data, the data will be flagged within the database.

2.3 Sample Handling and Custody

Once sample containers have been filled they will be labeled, placed in re-sealable plastic bags (e.g. *Ziploc*®), and stored in a cooler on ice to maintain a temperature of approximately 4° C. Identification information for each sample will be recorded in the field logbook when the sample is collected. A chain-of-custody form will be completed at the time of sample collection and prior to sample shipment or release. The samples will be transported or shipped to the analytical lab in insulated containers within the appropriate holding time and will be accompanied by a chain-of-custody form that identifies the sample bottles, date and time of sample collection, and analyses requested. If shipment is needed, the samples will be packaged and shipped in accordance with U.S. Department of Transportation standards. The original chain-of-custody will be given to the lab with

the samples and Brown and Caldwell will retain a copy for their records. Once received by the laboratory, a sample receipt and storage record will be generated. The recommended sample container type and volume, initial preservative and holding time for analytes that may be tested is shown in Table 2-1. The turn around time for the analytical laboratory will typically be within ten days from the sampling date. After analyses, all samples will be disposed of in accordance with federal, state, and local requirements.

Table 2-1. Sample Handling and Custody

Group	Parameter	Container ^a	Initial Preservative ^a	Max Allowable Holding Time	
				Extraction ^b	Analysis ^c
Metals	Arsenic	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Lead	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Cadmium	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Copper	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
	Nickel	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	6 months
Semi-Volatiles	cPAHs	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	14 days	40 days
	Total Naphthalenes	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	14 days	40 days
Dioxins / Furans	Dioxins / Furans	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	28 days	40 days
TPH	TPH-G	EnCore Sampler	Ice to 4° C, preserve w/ methanol w/ in 48 hours	---	14 days
	TPH-D	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	28 days
	TPH-HO	4-oz glass jar w/ Teflon lined lid	Ice to 4° C	---	28 days
Volatiles	Benzene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days
	Toluene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days
	Ethylbenzene	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days

Group	Parameter	Container ^a	Initial Preservative ^a	Max Allowable Holding Time	
				Extraction ^b	Analysis ^c
	Total Xylenes	EnCore Sampler x 3, o-ring cap	Ice to 4° C, preserve w/ methanol or sodium bisulfate w/ in 48 hours	---	14 days

^a Sample containers, volumes, and preservatives will be reevaluated once contract laboratories are chosen and may be changed based on

recommendations from the lab(s).

^b Starting from the date of collection

^c Starting from the date of extraction; if no extraction, starting from the date of collection

2.4 Analytical Methods

Field measurements will be conducted by Brown and Caldwell staff using portable meters and field test kits that employ EPA-approved methods. Field measurements will be taken using the procedures recommended by the manufacturer of the meter or test kit and procedures discussed in the SOP for Field Data Collection, where applicable. Results of all field measurements will be recorded in field logbooks and on field data sheets.

Laboratory analyses will be conducted by NELAC-certified analytical laboratories using methods approved by the EPA and Washington State. Proposed analytical methods are provided in Table 1-3. Alternative methods may be requested by the laboratories performing analyses. These alternative methods may be used only upon written approval from the QA Officer. Major laboratory equipment or instruments that will be utilized include a gas chromatography/mass spectrometer (GC/MS), inductively coupled plasma mass spectrometer (ICP-MS), high performance liquid chromatography (HPLC), automated colorimeter, ion chromatograph, and a carbon detector. If any instrument failures occur, the laboratory will take immediate corrective action and notify the QA Officer if the quality of sample results was compromised.

2.5 Quality Control

QC samples will be collected and analyzed to ensure the accuracy and precision of both field and laboratory data. The following sections summarize the QC samples that will be collected for field and laboratory analysis.

2.5.1 Quality Control for Field Measurements

QC for field measurements will be assessed using the following methods:

- All field instruments will be inspected, maintained, and calibrated prior to each sampling event.
- Calibration-checks will be performed to verify accuracy within 24 hours before and 24 hours after each sampling day by analyzing a calibration standard.

- Triplicate measurements will be conducted on one sample per sampling event to evaluate precision.

Results of the QC tests will be recorded on a field data sheet.

In addition, QC sessions (a.k.a. inter-calibration exercises) will be held twice a year to verify the proper working order of equipment, refresh personnel in monitoring techniques and determine whether the data DQOs are being met. QC sessions will consist of a meeting with the QA Officer (or other qualified designee) and sampling personnel to review appropriate sample collection and field analysis SOPs, equipment maintenance/calibrations manuals, and the QAPP and SAP and discuss any questions or problems that may be occurring.

2.5.2 Quality Control for Laboratory Analyses

QC for laboratory analyses will be assessed using the results of both field-collected QC samples and laboratory-prepared QC samples, each of which is discussed below.

2.5.2.1 Field-collected QC samples

Field-collected QC samples will primarily consist of field duplicates and equipment blanks, which are described below.

Field Duplicates. Field duplicates will be collected at the same time and in the same manner as the primary soil samples and will be used to assess the precision of all steps after sample acquisition. Field duplicates will be collected and analyzed at a rate of at least five percent (5%).

Trip Blanks. Trip blanks will be used to determine whether sample cross-contamination has occurred during sample transportation, delivery, and storage when collecting samples that contain volatile organic compounds. Trip blanks consist of pre-filled bottles of laboratory certified water that are transported along with the collected samples in each cooler containing samples for volatiles analysis.

Equipment Blanks. Equipment blanks will be collected in the field once per sampling day to assess contamination from reusable sampling equipment and other external influences. A sample bottle will be filled with certified clean water from the laboratory, and passed through the pre-cleaned (triple-rinsed with distilled water) sample collection equipment, mimicking actual sampling, and captured again for laboratory analysis. If equipment blanks consistently indicate that contamination is not a concern for particular constituents and equipment cleaning procedures are adequate, the frequency of collection for these analytes may be reduced.

Other field-collected QC samples may be utilized as-needed throughout the program if analytical results indicate presence of QC error, such as unexplained contamination of equipment blanks, high RPDs between field duplicates, or low precision of analytical results. These additional QC samples that may be used include the following:

Field Split. Field splits may be used occasionally to assess the precision of the selected laboratory's analytical procedures and/or methods. A field split consists of a sample that is

collected and split into two different samples, one of which is shipped to the normal lab for analysis, while the other is shipped to a different lab for similar analysis using either the same or different methods, depending on what information is desired. If split samples are analyzed using the same method, then results from both labs can be compared to assess the precision of the method, whereas if they are analyzed using different methods, results can be compared to assess the accuracy of the methods.

Ambient Blank. Ambient blanks may be used to assess the potential sample contamination that could occur during field sampling and sample processing. Ambient blanks consist of a pre-filled bottle deionized (DI) or distilled water that is taken to the field, opened and exposed to the atmosphere and environment, preserved (if appropriate), and analyzed the same as the corresponding samples.

2.5.2.2 Laboratory-prepared QC Samples

Several additional samples will be prepared and analyzed in the laboratories to evaluate precision, accuracy, and the potential for laboratory contamination. Each laboratory will set its own warning limit criteria for QC samples based on the method requirements and the laboratories QA Manual. The QA Manuals for selected laboratories will be included in the project file once lab(s) are selected, and will be reviewed by the project QA Officer for compliance with the project requirements. Descriptions of some of the laboratory-prepared QC samples that will be analyzed are included below. At a minimum, the frequency for analysis of matrix spikes (MS), duplicates, and blanks will meet method requirements.

Method Blanks. Method blanks (also called extraction blanks, procedural blanks, or preparation blanks) are used to assess laboratory contamination during all stages of sample preparation and analysis. Method blanks are prepared by the laboratory from reagent grade water and are processed through the entire analytical procedure in a manner identical to that of the samples. At a minimum, the laboratory should report method blanks at a frequency of one method blank for each batch of up to 20 samples. If the laboratory method blank indicates presence of contamination, all impacted samples in the analytical batch should be flagged. Subtracting method blank results from sample results is not permitted.

Matrix Spike (MS). MS and will be used to evaluate the effect of the sample matrix on the recovery of the compound(s) of interest. To prepare a MS, a field sample is first homogenized and then split into two subsamples. One of the subsamples is fortified with the MS solution and one subsample is analyzed to provide a background concentration for each analyte of interest. Recovery is the accuracy of an analytical test measured against a known analyte addition to a sample, and is calculated as follows:

$$\text{Recovery} = \left(\frac{C_{\text{matrix+spike}} - C_{\text{matrix}}}{C_{\text{spike(Exptected)}}} \right) * 100 \quad \text{Where } C \text{ is the measured concentration}$$

Recovery data for the fortified compound ultimately will provide a basis for determining the accuracy of the measurement and the prevalence of matrix effects in the samples analyzed during the project. Analysis of MS duplicates (MSD) is also useful for assessing laboratory precision.

Laboratory Control Spike (LCS). Laboratory control spikes are prepared by adding a known amount of target analyte(s) to reagent-grade water. When compared to the method blank, LCSs can be used to evaluate the accuracy (recovery) of the target analytes excluding any matrix effects.

Replicate Samples. Replicate (also called duplicates) samples are prepared by splitting a sample into two or more aliquots after delivery to the lab, but prior to sample preparation. Analysis of replicates is used to assess precision of an analytical method. Replicates that are typically utilized include:

- Laboratory replicates: These are replicates of the raw material that is extracted and analyzed in the same manner as the original sample to measure laboratory precision.
- MSD: These are used to assess both laboratory precision and accuracy within the sample matrix.
- Laboratory Control Spike Duplicate (LCSD): These are useful for assessing the accuracy and precision of the method, excluding matrix effects.

Internal Standards. Internal standards (IS) are used for organic analyses by GC/MS, some GC analyses, and some metals analyses using ICP/MS. An IS is an analyte included in each standard and added to each sample or extracted just before analysis. ISs should mimic the analytes of interest but not interfere with the analysis. ISs are used to monitor retention time, calculate relative response, and quantify the analytes of interest in each sample or extract.

Surrogates. Surrogates are compounds chosen to simulate the analytes of interest in organic analyses. Surrogates are used to estimate analyte losses during the extraction and cleanup process and must be added to each sample, including QA/QC samples, before extraction. The surrogate recovery data will be carefully monitored; each laboratory must report the percent recovery of the surrogate(s) along with the target analyte data for each sample. If possible, isotopically-labeled analogs of the analytes will be used as surrogates.

2.5.3 Additional Laboratory Quality Control Requirements

All laboratories providing analytical support for this project will have the appropriate facilities to store, prepare, and process samples and appropriate instrumentation and staff to provide data of the required quality within the time period dictated by the project. Laboratories shall be able to provide information documenting their ability to conduct the analyses with the required level of data quality. Such information may include results from inter-laboratory performance evaluation studies, control charts, and summary data from internal QA/QC checks, and results from analyses of Certified Reference Materials (CRM).

2.5.4 Assessing Data Quality Objectives using QC Samples

The QC samples described above will be used to evaluate the DQOs specified in Section 1.6. The following sections describe how the DQOs may be evaluated.

2.5.4.1 Accuracy

The accuracy of field chemical measurements will be checked daily by using standard solutions purchased from chemical or scientific supply companies. Accuracy measurements will be recorded on a field data sheet.

Accuracy of laboratory measurements will be determined by recoveries of spiked samples (matrix and LCS and/or through analysis of CRM, continuing calibration checks, or analysis of other similar standard solutions, the results of which will be summarized as part of each data package.

2.5.4.2 Precision

Precision will be evaluated in the field by conducting triplicate field measurements of all instrument parameters at least once during each sampling event. Precision measurements will be recorded on a field data sheet. If the measurements do not fall within the precision ranges described in Tables 3-1, the instrument will be recalibrated in the field if possible. After the sampling event, the instrument will again be recalibrated, tested, and examined to determine whether replacement is necessary.

Precision of laboratory measurements will be evaluated by comparing results from various duplicate samples listed below, where available:

- Field sample and field duplicate
- Field sample and laboratory replicate
- LCS and LCSD
- MS and MSD

2.5.4.3 Representativeness

Representativeness will be reviewed throughout the program by the Project Manager and QA Officer. If the team determines that representativeness should and can be improved, additional samples, or constituents may be considered, or sampling and analytical methods may be altered.

2.5.4.4 Completeness

Percent completeness will be checked by comparing the number of collected samples with the number of samples from which useable data were generated, as described in Section 1.6.4.

2.5.4.5 Comparability

Comparability will be addressed by the use of approved drinking water methods and certified laboratories. If the comparability of laboratory results is questioned, split samples and/or performance evaluation samples may be analyzed.

2.6 Instrument and Equipment Testing, Inspection, and Maintenance

2.6.1 Field Equipment

Inspection and preventive maintenance will be performed for all field equipment in accordance with the manufacturer's specifications prior to each sampling event. This includes battery checks, routine replacement of membranes, and cleaning of conductivity electrodes, among other tasks. Equipment will be re-inspected between each sampling site and after each sampling event. If problems occur and/or repair is needed during the sampling event, the field data sheet will be used to document the corrective action taken. If significant damage or equipment malfunctions are noted, the instrument(s) will be sent to the manufacturer for immediate repair. A maintenance/calibration log will be kept by the Monitoring Coordinator or other designee, which details the dates of instrument and sampling gear inspection, calibrations performed in the lab or field, battery replacement, dates reagents and standards are replaced, and any problems noted with instruments, samplers, or reagents. The logbook will also be used to document corrective action that was taken if equipment deficiencies were noted during an inspection. A small inventory of critical spare parts for field equipment will be kept at the Brown and Caldwell main office and also brought in the field if needed; however, perishable supplies or expensive parts may not be kept on hand, and will need to be ordered when needed. All spare parts and supplies will be obtained through the equipment manufacturer or other reputable sources.

2.6.2 Laboratory Equipment

All laboratories providing support for this project will maintain analytical equipment in accordance with relevant SOPs, which include those specified by the manufacturer and those specified by the method. The laboratories will maintain a log book documenting equipment inspections, and preventive and corrective maintenance.

2.7 Instrument/Equipment Calibration and Frequency

2.7.1 Field Instruments

Field instruments will be calibrated according to the schedule presented in Table 2-2. Standards will be purchased from a chemical supply company or prepared by (or with the assistance of) a professional laboratory. Calibration records will be kept in the maintenance/calibration log at the Brown and Caldwell main office where it can be easily accessed before and after equipment use. Calibrations that are performed by personnel in the field may also be recorded on the field data sheets to indicate which samples were analyzed pre- and post-calibration for the specific sampling event. If calibration is not successful or other issues pertaining to calibration arise, the equipment manufacturer will be contacted to determine the appropriate corrective action; the problem and corrective action will be documented in the maintenance/calibration logbook.

Table 2-2. Field Instrument Calibration and Frequency

Instrument	Parameter	Calibration Frequency	Standard or Calibration Instrument Used
PID	Gas concentration	Every sampling day	100 ppm isobutylene calibration gas

2.7.2 Laboratory Instruments

The contract laboratory maintains calibration practices and calibration-checks as part of the method SOPs. The QA Officer will review these practices and confirm that they are in compliance with project requirements.

2.8 Inspection/Acceptance of Supplies and Consumables

The Project Manager will ensure that the inspection/testing specifications and acceptance criteria are met. Upon receipt supplies will be inspected by the Project Manager or other designee for broken, leaking, or missing parts glasswear, seals, labels, preservatives, or other supplies. Sealed supplies, such as EnCore samplers, will be visually inspected to ensure seals are intact.

2.9 Non-Direct Measurements (Existing Data)

A review of existing data for each individual Site will be included as part of the Site specific SAPs.

2.10 Data Management

The Data Management Coordinator will be primarily responsible for maintaining a project database.

2.10.1 Field Data

Field data will be documented in logbooks or on field data sheets. One sheet will be used at each monitoring site, and field staff will complete all necessary sections of the data sheet during the sampling event. Field data will be collected and entered into the project database.

2.10.2 Analytical Data

Analytical laboratories will provide reports in both hard copy and electronic formats. Requirements for electronic database deliverables (EDD) will be provided to selected analytical laboratories.

2.10.3 Database Maintenance

The Data Management Coordinator will be responsible for overseeing management of the project database. Additional responsibilities of the Data Management Coordinator include QA of data collected prior to input to the project database.

2.10.4 Data Submittal

Lab reports summarizing analytical results and QC results will be provided to the Brown and Caldwell Data Management Coordinator as a hard copy and electronically in the agreed upon format. The information contained within and the format of the hard-copy data report package will be determined during the initial

negotiations with the lab and will include at a minimum the sample ID, sampling date/time, test method, extraction date/time, analysis date/time, analytical results, QA sample results, instrument and equipment calibration summary information, and a description of any corrective action taken to resolve data quality issues.

In accordance with WAC 173-340-840(5) and Ecology Toxics Cleanup Program Policy 840 (Data Submittal Requirements), data generated shall be submitted to Ecology in both a written and electronic format. All data collected for the Interim Action will be entered into Ecology's Environmental Information Management (EIM) database.

PARCEL 4 AND 5 INTERIM ACTION QUALITY ASSURANCE PROJECT PLAN

3. ASSESSMENT AND OVERSIGHT

3.1 Assessments and Response Actions

Periodic assessments will be conducted to ensure that data collection is conducted according to requirements presented in this QAPP. The QA Officer, whose responsibilities are described in Section 1.1, will have the primary responsibility for assessing compliance with the QAPP and SAP requirements pertaining to sample collection and handling procedures, field analytical procedures, and laboratory analytical procedures (DQOs), as detailed in the SAP. In addition, the QA Officer is also responsible for assessing compliance with Standard Operations Procedures outlined in IA Work Plan Appendix I. The QA Officer will review field sampling and analysis procedures at the beginning of the project. Laboratory analyses will be continually assessed through evaluating results of QC samples and compliance with DQOs.

If an audit discovers any discrepancy, the QA Officer will discuss the observed discrepancy with the appropriate person responsible for the activity to determine whether the information collected can still be considered accurate, what the cause(s) were leading to the deviation, how the deviation might impact data quality, and what corrective actions might be considered. The QA Officer will then follow up to ensure that corrective actions have been implemented.

The QA Officer has the power to halt all sampling and analytical work by both sampling personnel and contract laboratories if the discrepancies noted are considered detrimental to data quality.

3.2 Deliverables and Reporting

Interim and final reports will be issued by Brown and Caldwell to the City of Olympia, the LOTT Alliance, and the Department of Ecology according to Table 3-1.

Type of Report	Frequency	Projected Delivery Dates(s)	Report Recipients
Draft QAPP and SAP	One time	June 2010	City, LOTT, Ecology
Final QAPP and SAP	One time	August 2010	City, LOTT, Ecology
Interim Soil Sampling Report, Parcel 5	One time	TBD	City, LOTT, Ecology
Interim Soil Sampling Report, Parcel 4	One Time	TBD	City, LOTT, Ecology
Interim Action Report	One time	TBD	City, LOTT, Ecology

PARCEL 4 AND 5 INTERIM ACTION QUALITY ASSURANCE PROJECT PLAN

4. DATA VALIDATION AND USABILITY

4.1 Data Review, Verification, and Validation Requirements

Data verification and validation are integral steps in the transition between data collection (via sampling and analysis) and data use and interpretation. The EPA has developed a comprehensive guidance document entitled *Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)* (USEPA 2002). The purpose of this guidance is to explain how to implement data verification and data validation, to offer practical advice, and to provide references.

Although data verification and data validation are commonly used terms, they are defined and applied differently in various organizations and quality systems. For the purposes of this project, the terms will be generally defined as follows:

- **Data Verification** is confirmation by examination and provision of objective evidence that specified requirements have been fulfilled. Data verification is the process of evaluating the completeness, correctness, and conformance/compliance of a specific data set against the method, procedural, or contractual requirements. This is done to determine if everything that was agreed upon was actually done.
- **Data Validation** is confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled. Data validation is an analyte- and sample-specific process that extends the evaluation of data beyond method, procedural, or contractual compliance (i.e., data verification) to determine the analytical quality of a specific data set. In other words, what is the quality of this specific data set?

Data generated by project activities will be reviewed against the DQOs cited in Section 1.6 and flagged if the objectives are unmet. Data will also be assessed to determine whether the QC practices were in place during data collection. If data were collected without the stated QC practices in place, the data will be set aside until the impact of the QC failure on data quality can be determined. If the impact of the QC failure on data quality is minimal, the data will be flagged and included within the database. Data that does not meet the DQOs listed in Section 1.6 will be evaluated to determine the cause of the problem, and whether corrective actions can be implemented so that DQOs are met in the future.

4.2 Verification and Validation Methods

Laboratory data will be validated in accordance with the EPA's National Functional Guidelines for Organic and Inorganic Data Review (EPA 1999, 2004). These documents will serve as the equivalent of an SOP for data review and validation.

Data verification/validation will be performed by the QA Officer and designated reviewers/validators. Data reviewers will be responsible for reviewing field data sheets, chain-of-

custody forms, and analytical lab reports from each sampling event to determine whether collected data meets the contractual requirements. The data validators will add to the data review, by also checking field equipment calibration records, QC results, assessing whether DQOs have been achieved, and flagging data that did not meet specific requirements. Data qualifiers will be added to the database to alert data users of data limitations and uncertainties. A Data Quality Assessment will be completed to summarize the results of the review and validation.

If corrective action is necessary based on the data verification/validation process, the QA Officer will be responsible for communicating the nonconformance and the corresponding corrective actions to the laboratory, the Project Manager, or other designee. A Data Quality Assessment section summarizing all qualified results and including any corrective actions will be reported in the final report.

4.3 Reconciliation with User Requirements

To fulfill the identified data needs, it is important that the data collected during this project meet the data quality objectives. If data do not meet the project's specifications, the results will be flagged in the database to alert the data user of the data limitations and the following actions will be taken. First, the QA Officer and Project Manager or other designee will review the errors and determine if the problem is equipment failure, calibration/maintenance techniques, or monitoring/sampling techniques. They will suggest corrective action. If the problem cannot be corrected by training, revision of techniques, or replacement of supplies/equipment, then the technical advisor will review the DQOs and determine if the DQOs are feasible. If the specific DQOs are not achievable, they will determine whether the specific DQO can be relaxed, or if the parameter should be eliminated from the monitoring program. Any revisions to DQOs will be reviewed by the project team prior to approval and QAPP revision.

At the completion of the sampling program, Brown and Caldwell will continue to maintain the database.

PARCEL 4 AND 5 INTERIM ACTION QUALITY ASSURANCE PROJECT PLAN

5. LIMITATIONS

Report Limitations

This document was prepared solely for the City of Olympia and the LOTT Alliance in accordance with professional standards at the time the services were performed and in accordance with the contract between Brown and Caldwell and the City of Olympia dated September 4, 2009, and the contract between Brown and Caldwell and the LOTT Alliance dated June 18, 2008. This document is governed by the specific scope of work authorized by the City of Olympia and the LOTT Alliance; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by the the City of Olympia, the LOTT Alliance and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

EMERGENCY FIRST AID PROCEDURES

THE RESPONDER SHOULD HAVE APPROPRIATE TRAINING TO ADMINISTER FIRST AID OR CPR

1. Survey the situation. Do not endanger your own life. **DO NOT ENTER A CONFINED SPACE TO RESCUE SOMEONE WHO HAS BEEN OVERCOME.** ENSURE ALL PROTOCOLS ARE FOLLOWED INCLUDING THAT A STANDBY PERSON IS PRESENT. IF APPLICABLE, REVIEW MSDSs TO EVALUATE RESPONSE ACTIONS FOR CHEMICAL EXPOSURES.
2. Call 911 (if available) or the fire department **IMMEDIATELY.** Explain the physical injury, chemical exposure, fire, or release.
3. Decontaminate the victim if it can be done without delaying life-saving procedures or causing further injury to the victim.
4. If the victim's condition appears to be non-critical, but seems to be more severe than minor cuts, he/she should be transported to the nearest hospital by the SSO or designated personnel: let the doctor assume the responsibility for determining the severity and extent of the injury. If the condition is obviously serious, contact emergency medical services (EMS) for transport or appropriate actions.

Notify the PM and Regional Safety Unit Manager immediately and complete the appropriate incident investigation reports as soon as possible.

STOP BLEEDING AND CPR GUIDELINES	
To Stop Bleeding	CPR
<ol style="list-style-type: none"> 1. Give medical statement by indicating you are trained in 1st Aid. 2. Assure: airway, breathing and circulation. 3. Use DIRECT PRESSURE over the wound with clean dressing or your hand (use non-permeable gloves). Direct pressure will control most bleeding. 4. Bleeding from an artery or several injury sites may require DIRECT PRESSURE on a PRESSURE POINT. Use pressure points for 30 -60 seconds to help control severe bleeding. 5. Continue primary care and seek medical aid as needed. 	<ol style="list-style-type: none"> 1. Give medical statement by indicating you are trained in CPR. 2. Arousal: Check for consciousness. 3. Call out for help, either call 911 yourself or instruct someone else to do so. It is very important to call for emergency assistance prior to initiating CPR. 4. Open airway with chin-lift. 5. Look, listen and feel for breathing. 6. If breathing is absent, give 2 slow, full rescue breaths. 7. Look, listen and feel for breathing. 8. If breathing is absent, initiate CPR; 30 compressions for each two breaths. 9. If an automated external defibrillator (AED) is available, use it in accordance with the AED instructions.

HEALTH AND SAFETY PLAN

1. INTRODUCTION

Brown and Caldwell (BC) has prepared this Health and Safety Plan (HASP) for use during the [soil remediation](#) activities to be conducted at [Parcel 4 and 5](#) located at [305 Jefferson Street NE, Olympia, WA](#) (“the Site”). Activities conducted under BC’s direction at the Site will be in compliance with applicable Occupational Safety and Health Administration (OSHA) regulations, particularly those in Title 29 of the Code of Federal Regulations, Part 1910.120 (29 CFR 1910.120), and other applicable federal, state, and local laws, regulations, and statutes. A copy of this HASP will be kept on site during scheduled field activities.

This HASP addresses the identified hazards associated with planned field activities at the Site. It presents the minimum health and safety requirements for establishing and maintaining a safe working environment during the course of work. In the event of conflicting requirements, the procedures or practices that provide the highest degree of personnel protection will be implemented. If scheduled activities change or if site conditions encountered during the course of the work are found to differ substantially from those anticipated, the Regional Safety Unit Manager and Project Manager will be informed immediately upon discovery, and appropriate changes will be made to this HASP.

BC’s health and safety programs and procedures, including medical monitoring, respiratory protection, injury and illness prevention, hazard communication, and personal protective equipment (PPE), are documented in the BC Health & Safety Manual. The Health & Safety Manual is readily accessible to BC employees via the BC Pipeline. These health and safety procedures are incorporated herein by reference, and BC employees will adhere to the procedures specified in the manual.

BC’s HASP has been prepared specifically for this project and is intended to address health and safety issues solely with respect to the activities of BC’s own employees at the site. A copy of BC’s HASP may be provided to subcontractors in an effort to help them identify expected conditions at the site and general site hazards. The subcontractor shall remain responsible for identifying and evaluating hazards at the site as they pertain to their activities and for taking appropriate precautions. For example, BC’s HASP does not address specific hazards associated with tasks and equipment that are particular to the subcontractor’s scope of work and site activities (e.g., operation of a drill rig, excavator, crane or other equipment). Subcontractors are not to rely on BC’s HASP to identify all hazards that may be present at the Site.

Subcontractors are responsible for developing, maintaining, and implementing their own health and safety programs, policies, procedures and equipment as necessary to protect their workers, and others, from their activities. Subcontractors shall operate equipment in accordance with their standard operating procedures as well as manufacturer’s specifications. Any project monitoring activities conducted by BC at the Site shall not in any way relieve subcontractors of their critical obligation to monitor their operations and employees for the determination of exposure to hazards that may be present at the Site and to provide required guidance and protection. If requested,

subcontractors will provide BC with a copy of their own HASP for this project or other health and safety program documents for review.

1.1 Site History

The areas within the Parcel 4 and 5 boundaries lie within the original tideflat of Budd Inlet, and are situated on fill material. Fill operations on the Site began as early as the late 1800s and continued until as late as the 1970s. Much of the fill on the site appears to be marine dredge spoils from dredging operations in the East and West Bays of Budd Inlet. In addition, fill has been found to contain wood debris, construction debris, and roadway fill.

Lumber milling operations were located on the Site as early as 1888 and operated until 1968. Various support facilities and services accompanied the lumber milling operations. Log booming operations also took place in the adjacent East Bay of Budd Inlet. Following cessation of lumber milling activities in 1968, the area was used for commercial and light industrial activities and warehousing. Warehousing and light industry ceased in 2008 as the Site was cleared of tenants and operators in preparation for redevelopment.

1.2 Site Description

The site is presently undeveloped.

1.3 Scope of Work

Work includes the excavation, stockpiling, testing, and disposal of potentially contaminated soil. Work will also include confirmational sampling of soil excavations.

HEALTH AND SAFETY PLAN

2. KEY BC PROJECT PERSONNEL AND RESPONSIBILITIES

[Josh Johnson](#) is the Project Manager (PM). [Jim Bucha](#) is the Regional Safety Unit Manager (RSUM). [Jon Turk](#) has been designated as the BC Site Safety Officer (SSO) for this project. The BC project field staff have completed 40 hours of comprehensive health and safety training, which meets the requirements of 29 CFR 1910.120.

The responsibilities of key BC project personnel are presented below.

2.1 Project Manager

The PM is responsible for evaluating hazards anticipated at the Site and working with designated field staff and the RSUM to prepare this HASP to address the identified hazards. The PM is also responsible for the following.

- Informing project participants of safety and health hazards identified at the Site.
- Providing a copy of this HASP to BC project participants and a copy to each BC subcontractor prior to the start of field activities.
- Ensuring that the BC project team is adequately trained and perform safety briefings in accordance with this HASP.
- Providing the resources necessary for maintaining a safe and healthy work environment for BC personnel.
- Communicating project safety concerns to the RSUM for determining corrective actions.

2.2 Site Safety Officer

The SSO has on-Site responsibility for verifying that BC team members, including subcontractors, comply with the provisions of this HASP. The SSO has the authority to monitor and correct health and safety issues as noted on-Site. The SSO is responsible for the following.

- Reporting unforeseen or unsafe conditions or work practices at the Site to the PM or RSUM.
- Stopping operations that threaten the health and safety of BC field team or members of the surrounding community.
- Monitoring the safety performance of Site personnel to evaluate the effectiveness of health and safety procedures.
- Performing air monitoring, as necessary, as prescribed in this HASP.
- Documenting field team compliance with this HASP by completing the appropriate BC forms contained in the Appendices of this document.
- Conducting daily tailgate safety meetings and assuring that project personnel understand the requirements of this HASP (as documented by each BC field team member's signature on the Signature Page).

- Limiting access to BC work areas on the Site to BC field team members and authorized personnel.
- Enforcing the “buddy system” as appropriate for Site activities.
- Performing periodic inspections to evaluate safety practices at the Site.
- Identifying the location and route to nearby medical facility and emergency contact information and coordinating appropriate responses in the event of emergency.

2.3 Regional Safety Unit Manager

The RSUM is responsible for final review and modification of this HASP. Modifications to this HASP that result in less protective measures than those specified may not be employed by the PM or SSO without the approval of the RSUM. In addition, the RSUM has the following responsibilities.

- Developing and coordinating the overall BC health and safety program.
- Advising the PM and SSO on matters relating to health and safety on this project.
- Recommending appropriate safeguards and procedures.
- Modifying this HASP, if necessary, and approving changes in health and safety procedures at the Site.

2.4 BC Team Members

BC employees and subcontractors are responsible for familiarizing themselves with health and safety aspects of the project and for conducting their activities in a safe manner. This includes attending site briefings, communicating health and safety observations and concerns to the SSO, maintaining current medical and training status and maintaining and using proper tools, equipment and PPE. Proper work practices are part of ensuring a safe and healthful working environment. Safe work practices are essential and it is the responsibility of BC employees and team members to follow safe work practices when conducting scheduled activities. Safe work practices to be employed during the entire duration of fieldwork include, but are not limited to, the following.

- Following the provisions of this HASP, company health and safety procedures and regulatory requirements.
- Reviewing safety-related information from other parties (i.e., client or contractors) as it relates to BC’s activities.
- Inspecting personal protective equipment (PPE) before on-site use, using only intact protective clothing and related gear, and changing suits, gloves, etc. if they are damaged or beyond their useful service life.
- Set up, assemble, and check out all equipment and tools for integrity and proper function before starting work activities.
- Assisting in and evaluating the effectiveness of Site procedures (including decontamination) for personnel, protective equipment, sampling equipment and containers, and heavy equipment and vehicles.
- Practice the “buddy system” as appropriate for site activities.

- Do not use faulty or suspect equipment.
- Do not use hands to wipe sweat away from face. Use a clean towel or paper towels.
- Practice contamination avoidance whenever possible.
- Do not smoke, eat, drink, or apply cosmetics while in chemically-affected areas of the site or before proper decontamination.
- Wash hands, face and arms before taking rest and lunch breaks and before leaving the site and the end of the workday.
- Check in and out with the SSO upon arrival and departure from the site.
- Perform decontamination procedures as specified in this HASP.
- Notify the SSO immediately if there is an incident that causes an injury, illness or property loss. Incidents that could have resulted in injury, illness or property loss (close call) will also be reported to the SSO.
- Do not approach or enter an area where a hazardous environment (i.e., oxygen deficiency, toxic or explosive) may exist without employing necessary engineering controls, proper PPE and appropriate support personnel.
- Use respirators correctly and as required for the Site; check the fit of the respirator with a negative or positive pressure test; do not wear respirator with facial hair or other conditions that prevent a face-to-facepiece seal.
- Confined spaces will not be entered without appropriate evaluation, equipment, training and support personnel.

2.5 Subcontractors

Subcontractor personnel are expected to comply fully with subcontractor's HASP and to observe the minimum safety guidelines applicable to their activities which may be identified in the BC HASP. Failure to do so may result in the removal of the subcontractor or any of the subcontractor's workers from the job site.

HEALTH AND SAFETY PLAN

3. HAZARD ANALYSIS

Hazards at the Site may include physical hazards, chemical hazards or biological hazards. Each type of identified hazard is addressed in the following sections. Hazards that are the specialty of a subcontractor (i.e., operation of a drill rig or excavator) are not addressed in this HASP. Subcontractors are responsible for identifying potential hazards associated with their activities and implementing proper controls.

3.1 Chemical Hazards

Exposure pathways of concern for chemical compounds that may be present at the Site are inhalation of airborne contaminants, direct skin contact with contaminated materials, and incidental ingestion of affected media. Wearing protective equipment and following decontamination procedures listed in Section 7 can minimize dermal contact and incidental ingestion. To minimize inhalation hazards, dust or vapor control measures will be implemented, where necessary, and action levels will be observed during scheduled activities. Site-specific action levels and air monitoring requirements are presented in Section 5.

Known or Suspected Compounds	Source (soil/water/sludge, etc.)	Known Concentration Range (ppm, mg/kg, mg/l)	
		Lowest	Highest
Arsenic	Soil / Groundwater	ND	84 mg/Kg (soil), 10.3 ug/L (groundwater)
Lead	Soil / Groundwater	ND	2.4 mg/Kg (soil), 9.3 ug/L (groundwater)
Cadmium	Soil / Groundwater	ND	2500 mg/Kg (soil), 2 ug/L (groundwater)
Copper	Soil / Groundwater	ND	NA (soil), 8.4 ug/L (groundwater)
Nickel	Soil / Groundwater	ND	NA (soil), 5.6 ug/L (groundwater)
cPAHs	Soil / Groundwater	ND	624 ug/Kg (soil), 0.36 ug/L (groundwater)
Dioxins / Furans	Soil / Groundwater	ND	646 pg/g (soil), NA (groundwater)
PCBs	Soil / Groundwater	ND	3.29 mg/Kg (soil), 3.6 ug/L (groundwater)
TPH-G	Soil / Groundwater	ND	100 mg/Kg (soil), 500 ug/L (groundwater)
TPH-HO	Soil / Groundwater	ND	4600 mg/Kg (soil), 500 ug/L (groundwater)
TPH-D	Soil / Groundwater	ND	1160 mg/Kg (soil), 250 ug/L (groundwater)
Benzene	Soil / Groundwater	ND	140 ug/Kg (soil), 1 ug/L (groundwater)
Toluene	Soil / Groundwater	ND	720 ug/Kg (soil), 1 ug/L (groundwater)
Ethylbenzene	Soil / Groundwater	ND	720 ug/Kg (soil), 1 ug/L (groundwater)
Xylenes	Soil / Groundwater	ND	1440 ug/Kg (soil), 3 ug/L (groundwater)
Naphthalenes	Soil / Groundwater	ND	1600 ug/Kg (soil), 1.1 ug/L (groundwater)

Chemical descriptions of chemicals of concern, including health effects and exposure limits, are presented in the following paragraphs. Each chemical description includes physical and odor recognition characteristics, the health effects associated with exposure, and exposure limits expressed as an 8-hour time-weighted average (TWA). Provided are federal OSHA (OSHA)

permissible exposure limits (PELs; located in 29 CFR 1910.1000); California OSHA (Cal/OSHA) PELs (located in 8 CCR 5155); and the American Conference of Governmental Industrial Hygienists (ACGIH) threshold limit values (TLVs). For sites outside California, Cal/OSHA PELs are included as an additional reference.

ARSENIC

Metallic arsenic is most commonly a gray, brittle, crystalline solid. It can also be in a black or yellow amorphous form. Arsenic is also commonly found in its volatile white trioxide form. Arsenic is used in several insecticides, herbicides, defoliants, desiccants, and rodenticides and appears in a variety of forms. It is also used in tanning, pigment production, glass manufacturing, wood preservation, and anti-fouling coatings. Arsenic is classified as a known carcinogen.

Short-term exposure to arsenic can cause marked irritation of the stomach and intestines with nausea, vomiting, and diarrhea. In severe cases the vomiting and stools are bloody and the exposed individual goes into collapse and shock with weak, rapid pulse, cold sweats, coma, and death. Inorganic arsenicals are more toxic than organic arsenicals, and the trivalent form is more toxic than the pentavalent form. Acute arsenic poisoning usually results from ingestion exposures. Blood cell changes, blood vessel damage, and impaired nerve function can also result from chronic arsenic ingestion. Other effects include skin changes, irritation of the throat, increased risk of cancer of the liver, bladder, kidney, and lung.

- The OSHA PEL is listed as 0.01 mg/m³ for inorganic forms of arsenic and 0.5 mg/m³ for organic forms.
- The Cal/OSHA PEL is listed as 0.01 mg/m³ for inorganic forms of arsenic and 0.2 mg/m³ for organic forms.
- The TLV is listed as 0.01 mg/m³ for arsenic and inorganic arsenic compounds.

WARNING: This chemical is known to the State of California to cause cancer.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

LEAD

Lead (inorganic) is a bluish-white, silver or gray odorless solid. Short-term exposure to lead can cause decreased appetite, insomnia, headache, muscle and joint pain, colic, and constipation. Considerable data exist on the effects of lead exposure in humans. It is a poison by ingestion and a suspected human carcinogen of the lungs and kidneys. There are data to suggest that lead is a mutagen and can cause reproductive effects. Human systemic effects by ingestion and inhalation (the two routes of absorption) include loss of appetite, anemia, malaise, insomnia, headache, irritability, muscle and joint pains, tremors, flaccid

paralysis without anesthesia, hallucinations and distorted perceptions, muscle weakness, gastritis, and liver changes. Recent experimental evidence suggests that blood levels of lead below 10 µg/dl (micrograms per deciliter) can have the effect of diminishing the IQ scores of children.

- The OSHA PEL is listed as 0.05 mg/m³ and the OSHA PEL for tetraethyl lead and tetramethyl lead is listed as 0.075 mg/m³.
- The Cal/OSHA PEL for elemental lead is listed as 0.05 mg/m³ and the Cal/OSHA PEL for tetraethyl lead and tetramethyl lead is listed as 0.075 mg/m³.
- The TLV for elemental lead is listed as 0.05 mg/m³, the TLV for tetraethyl lead is 0.1 mg/m³ and the TLV for tetramethyl lead is 0.15 mg/m³.

Note: Published exposure limits designate a skin notation indicating that dermal contact (to organic forms) can contribute to the overall exposure.

WARNING: This chemical is known to the State of California to cause cancer.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

CADMIUM

Cadmium dust is an odorless gray powder. Short-term exposure to cadmium dust can cause irritation of the nose and throat, cough, chest pain, sweating, chills, shortness of breath, and weakness. Inhalation of cadmium compounds has been shown to cause lung cancer in humans. Fatal concentrations may be breathed without sufficient discomfort to warn a worker to leave the area. Ingestion of cadmium dust may cause nausea, vomiting, diarrhea, and abdominal cramps.

- The OSHA PEL is listed as 0.005 mg/m³.
- The Cal/OSHA PEL is listed as 0.005 mg/m³.
- The TLV is listed as 0.01 mg/m³ for dust (total) and 0.002 mg/m³ for the respirable dust fraction.

WARNING: This chemical is known to the State of California to cause cancer.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

COPPER

In its elemental form, copper is a common metal with a distinct reddish color. Human systemic effects by ingestion include nausea and vomiting. In animals, inhalation of copper dust has caused hemolysis of the red blood cells, deposition of hemofuscin in the liver and pancreas, and injury to the lung cells. Short-term exposure to copper dust can cause a feeling

of illness similar to the common cold with sensations of chills and stuffiness of the head. Small copper particles may enter the eye and cause irritation, discoloration, and damage.

- The OSHA PEL is listed as 0.1 mg/m³ for copper as a fume, and 1.0 mg/m³ for dust.
- The Cal/OSHA PEL is listed as 0.1 mg/m³ for copper as a fume, and 1.0 mg/m³ for dust.
- The TLV is listed as 0.2 mg/m³ for copper as a fume, and 1.0 mg/m³ for dust (a value of 0.1 mg/m³ for elemental metal/and copper oxides, and 0.05 mg/m³ for soluble compounds is proposed).

NICKEL

Nickel is a silvery gray, metallic, odorless metal. It is a confirmed carcinogen with experimental carcinogenic, neoplastigenic, tumorigenic, and teratogenic data. Nickel is a poison by ingestion, subcutaneous, and intravenous routes. Hypersensitivity to nickel is common and can cause allergic contact dermatitis, pulmonary asthma, and conjunctivitis. Exposure to nickel can cause pneumonitis. Nickel and its compounds have also been reported to cause cancer of the lungs and sinuses. Nickel itself is not very toxic if swallowed.

- The OSHA PEL is listed as 1.0 mg/m³ for elemental, insoluble and soluble compounds, as Ni.
- The Cal/OSHA PEL is listed as 1.0 mg/m³ for metal and insoluble compounds (as Ni), and 0.1 mg/m³ for soluble compounds.
- The TLV is listed as 1.5 mg/m³ for elemental compounds, 0.2 mg/m³ for insoluble compounds, and 0.1 mg/m³ for soluble inorganic compounds and nickel subsulfide, as Ni.

WARNING: This chemical is known to the State of California to cause cancer.

POLYNUCLEAR AROMATIC HYDROCARBONS (PAHS)

PAHs constitute a class of materials of which benzo[a]pyrene (BaP) is one of the most common and also the most hazardous. In general, PAHs can be formed in any hydrocarbon combustion process. The less efficient the combustion process, the higher the PAH emission factor is likely to be. The major sources are stationary sources, such as heat and power generation, refuse burning, industrial activity, such as coke ovens, and coal refuse heaps. PAHs may also be released from oil spills. Because of the large number of sources, people are exposed to very low levels of PAHs every day.

Certain PAHs, such as the more common BaP, have been demonstrated to be carcinogenic at relatively high exposure levels in laboratory animals. BaP is a yellowish crystalline solid that consists of five benzene rings joined together. It is highly soluble in fat tissue and has been shown to produce tumors in the stomachs of laboratory mice. In addition, skin cancers

have been induced in a variety of animals at very low levels and unspecified lengths of application.

It is important to recognize the PAHs' ability to adhere to soil and other particulates. Therefore, good particulate emission controls and the use of air purifying respirators with particulate filters are required for protection against airborne PAH hazards.

- The OSHA PEL is listed as 0.2 mg/m³ (as coal tar pitch volatiles).
- The Cal/OSHA PEL is listed as 0.2 mg/m³ (as coal tar pitch volatiles).
- The TLV is listed as 0.2 mg/m³ (coal tar pitch volatiles, as benzene soluble aerosol).

POLYCHLORINATED BIPHENYLS (PCBs)

PCBs are a series of technical mixtures consisting of many isomers and compounds that vary from mobile oil liquids to white crystalline solids and hard non-crystalline resins. Technical products vary in composition, in the degree of chlorination, and possibly according to batch. Generally, they are moderately toxic by ingestion, and some are poisons by other routes. Most are suspect human carcinogens and experimental tumorigens, and exhibit experimental reproductive effects. They have two distinct actions on the body: a skin effect (chloracne) and a toxic action on the liver. The higher the chlorine content, the more toxic the PCBs tend to be.

- The OSHA PEL is listed as 0.5 mg/m³ for 54% chlorine content (as a PCB) and 1.0 mg/m³ for 42% chlorine content (as a PCB).
- The Cal/OSHA PEL is listed as 0.5 mg/m³ for 54% chlorine content (as a PCB) and 1.0 mg/m³ for 42% chlorine content (as a PCB).
- The TLV is listed as 0.5 mg/m³ for 54% chlorine content (as a PCB) and 1.0 mg/m³ for 42% chlorine content (as a PCB).

Note: Published exposure limits designate a skin notation indicating that dermal contact can contribute to the overall exposure.

WARNING: This chemical is known to the State of California to cause cancer.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

DIOXINS

“Dioxin” is a general term that describes a group of hundreds of chemicals that are highly persistent in the environment. The most toxic compound is 2,3,7,8-tetrachlorodibenzo-p-dioxin or TCDD. The toxicity of other dioxins and chemicals like PCBs that act like dioxins are measured in relation to TCDD. Dioxins are formed as unintentional by-products of

many industrial processes involving chlorine such as waste incineration, chemical and pesticide manufacturing, and pulp and paper bleaching.

Dioxins are formed by burning chlorine-based chemical compounds with hydrocarbons. The major source of dioxins in the environment (95%) comes from incinerators burning chlorinated wastes. Dioxins are confirmed human carcinogens and can also cause severe reproductive and developmental problems (at levels 100 times lower than those associated with their cancer-causing effects). Dioxins can also cause immune system damage and interfere with regulatory hormones.

WARNING: These chemicals are known to the State of California to cause cancer.

GASOLINE

Gasoline is produced from the light distillates during petroleum fractionation. Its major components include paraffins, olefins, naphthenes, aromatics, and recently ethanol. Gasoline also contains various functional additives as required for different uses, such as antiknock fluids, antioxidants, metal deactivators, corrosion inhibitors, anti-icing agents, preignition preventers, upper-cylinder lubricants, dyes, and decolorizers. Lead additives in particular were widely used in gasoline until the introduction of vehicle catalytic converters.

Mild cases of gasoline ingestion can cause inebriation, vomiting, vertigo, drowsiness, confusion, and fever. Aspiration into the lungs and secondary pneumonia may occur unless prevented. Gasoline can cause hyperemia of the conjunctiva and other eye disturbances. Gasoline is a skin irritant and a possible allergen. Repeated or chronic dermal contact can result in drying of the skin, lesions, and other dermatologic conditions.

- No OSHA PEL is listed for gasoline.
- The Cal/OSHA PEL is listed as 300 ppm.
- The TLV is listed as 300 ppm.

WARNING: The exhaust from this chemical is known to the State of California to cause cancer.

DIESEL FUEL

Diesel fuel is a gas oil fraction available in various grades as required by different engines. Composition of diesel varies in ratios of predominantly aliphatic, olefinic, cycloparaffinic, aromatic hydrocarbons, and additives.

It is a severe skin irritant and ingestion of diesel can lead to systemic effects such as gastrointestinal irritation, vomiting, diarrhea, and, in severe cases, drowsiness and central nervous system depression, progressing to coma and death. Absorption of diesel fuel can cause hemorrhaging and pulmonary edema, progressing to pneumonitis and renal

involvement. It is combustible when exposed to heat or flame, and can react with strong oxidizing materials.

- No OSHA PEL or Cal/OSHA PEL is listed for diesel.
- The TLV is listed as 100 mg/m³ as total hydrocarbons (vapor and aerosol).

Note: Published exposure limits designate a skin notation indicating that dermal contact can contribute to the overall exposure.

WARNING: The exhaust from this chemical is known to the State of California to cause cancer.

MOTOR OIL

Motor oil is a dark viscous liquid. It is composed of aliphatic, olefinic, naphthenic (cycloparaffinic), and aromatic hydrocarbons, as well as additives depending on specific uses. Motor oil has a burning lubricating oil odor. Short-term exposure via dermal contact with motor oil can cause irritation to the skin and dermatitis. Inhalation of motor oil can cause aspiration. Target organs are the upper respiratory system and the skin.

- No OSHA PEL, Cal/OSHA PEL, or ACGIH TLV is listed for motor oil.

BENZENE

Benzene is a clear, volatile liquid. It is colorless, highly flammable, and toxic, with a characteristic odor. It is a severe eye and moderate skin irritant. Human effects by inhalation and ingestion include euphoria, changes in sleep and motor activity, nausea and vomiting, other blood effects, dermatitis, and fever. In industry, inhalation is the primary route of chronic benzene poisoning. If the liquid is aspirated into the lung it may cause pulmonary edema. Poisoning by skin contact has also been reported. Exposure to high concentrations (3,000 ppm) may result in acute poisoning, which is characterized by the narcotic action of benzene on the central nervous system. Chronic poisoning occurs most commonly through inhalation and dermal absorption. Benzene is a known human carcinogen that can cause leukemia.

- The OSHA PEL is listed as 1 ppm.
- The Cal/OSHA PEL is listed as 1 ppm.
- The TLV is listed as 0.5 ppm.

Note: Published exposure limits designate a skin notation indicating that dermal contact can contribute to the overall exposure.

WARNING: This chemical is known to the State of California to cause cancer.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

TOLUENE

Toluene is a colorless liquid with a benzol-like odor. Human systemic effects of exposure to toluene include central nervous system changes, hallucinations or distorted perceptions, motor activity changes, psychophysiological changes, and bone marrow changes. It is a severe eye irritant and an experimental teratogen. Inhalation of high vapor concentrations may cause impairment of coordination and reaction time, headaches, nausea, eye irritation, loss of appetite, a bad taste in the mouth, and lassitude.

- The OSHA PEL is listed as 200 ppm.
- The Cal/OSHA PEL is listed as 50 ppm.
- The TLV is listed as 50 ppm (a value of 20 ppm is proposed).

Note: Published exposure limits designate a skin notation indicating that dermal contact can contribute to the overall exposure.

WARNING: This chemical is known to the State of California to cause birth defects or other reproductive harm.

ETHYLBENZENE

Ethylbenzene is a clear, colorless liquid. It is mildly toxic by inhalation and skin contact. Inhalation can cause eye, sleep, and pulmonary changes. It is an eye and skin irritant at levels as low as 0.1% (1,000 ppm) of the vapor in air. At higher concentrations, it is extremely irritating at first, then can cause dizziness, irritation of the nose and throat, and a sense of constriction in the chest. Exposure to high concentrations of ethylbenzene vapor may result in irritation of the skin and mucous membranes, dizziness, irritation of the nose and throat, and a sense of constriction of the chest.

- The OSHA PEL is listed as 100 ppm.
- The Cal/OSHA PEL is listed as 100 ppm.
- The TLV is listed as 100 ppm.

XYLENE

Xylene is a clear, colorless liquid. It exhibits the general chlorinated hydrocarbon central nervous system effects, olfactory (smell) changes, eye irritation and pulmonary changes. It is a severe skin irritant. There are three isomers: ortho, meta, and para. Exposure to high concentrations of xylene vapor may result in eye and skin irritation. Eye irritation may occur at concentrations of about 200 ppm.

- The OSHA PEL is listed as 100 ppm.
- The Cal/OSHA PEL is listed as 100 ppm.
- The TLV is listed as 100 ppm.

NAPHTHALENE

Naphthalene is a colorless to brown solid with an odor of mothballs. Poisoning may occur by inhalation, ingestion, or skin absorption. Naphthalene can cause nausea, headache, fever, anemia, liver damage, vomiting, convulsions, and coma. It is an experimental teratogen and a questionable carcinogen.

Naphthalene is flammable when exposed to heat or flame and reacts with oxidizing materials. It is explosive in the form of vapor or dust when exposed to heat or flame. When heated to decomposition, it emits acrid smoke and irritating fumes.

- The OSHA PEL is listed as 10 ppm.
- The Cal/OSHA PEL is listed as 10 ppm.
- The TLV is listed as 10 ppm.

Note: Published exposure limits designate a skin notation indicating that dermal contact can contribute to the overall exposure.

3.2 Hazard Communication

In accordance with the Hazard Communication standard, material safety data sheets (MSDSs) will be maintained on site for chemical products used by BC personnel at the Site (i.e., spray paint, PVC cement, etc.). Subcontractors will be responsible for maintaining MSDSs for chemical products they bring on Site. In addition, containers will be clearly labeled in English to indicate their contents and appropriate hazard warnings. Please note that labeling containers includes, but is not limited to, any waste, used PPE, and/or decontamination materials collected.

3.3 Physical Hazards

The following physical hazards, as marked below, have been identified and may be encountered during scheduled field activities.

- | | |
|--|---|
| <input checked="" type="checkbox"/> Slips, Trips and Falls | <input checked="" type="checkbox"/> Housekeeping |
| <input checked="" type="checkbox"/> Heavy Equipment | <input type="checkbox"/> Materials and Equipment Handling - Lifting |
| <input checked="" type="checkbox"/> Excavations | <input type="checkbox"/> Drilling |
| <input checked="" type="checkbox"/> Noise | <input checked="" type="checkbox"/> Underground Utilities |
| <input type="checkbox"/> Overhead Utilities | <input type="checkbox"/> Equipment Refueling |
| <input type="checkbox"/> Electrical Equipment | <input type="checkbox"/> Lockout/Tagout |

- | | |
|--|---|
| <input type="checkbox"/> Confined Spaces | <input type="checkbox"/> Fire |
| <input type="checkbox"/> Sharp Objects/Cutting | <input type="checkbox"/> Cutting Acetate Sleeves |
| <input type="checkbox"/> Elevated Platforms | <input type="checkbox"/> Ladder Use |
| <input type="checkbox"/> Traffic | <input checked="" type="checkbox"/> Driving |
| <input type="checkbox"/> Arc Flash Protection | <input type="checkbox"/> Boating Safety |
| <input type="checkbox"/> Building Collapse | <input checked="" type="checkbox"/> Personal Safety – Urban Setting |

Actions to be taken to protect against the hazards identified are provided in the sections below.

3.3.1 Slip, Trips and Falls

Slipping hazards may exist due to uneven terrain, wet or slick surfaces, leaks or spills. Tripping hazards may be present from elevation changes, debris, poor housekeeping or tools and equipment. Some specific hazards may include: climbing/descending ladders, scaffolding, berms or curbing. Collectively, these types of injuries account for nearly 50 percent of all occupational injuries and accepted disabling claims. Prevention requires attention and alertness on the part of each worker, following and enforcing proper procedures, including good housekeeping practices, and wearing appropriate protective equipment.

3.3.2 Housekeeping

Personnel shall maintain a clean and orderly work environment. Make sure that all materials stored in tiers are stacked, racked, blocked, interlocked, or secured to prevent sliding, falling, collapse, or overturning. Keep aisles and passageways clear and in good repair to provide for free and safe movement of employees and material-handling equipment. Do not allow materials to accumulate to a degree that it creates a safety or fire hazard.

During construction activities, scrap and form lumber with protruding nails and other items shall be kept clear from work areas, passageways, and stairs. Combustible scrap and debris shall be removed at regular intervals. Safe means must be provided to facilitate removal of debris.

Containers must be provided for collecting and separating waste, used rags and other debris. Containers used for garbage and other oily flammable or hazardous waste such as caustics, acids, harmless dusts, etc., must be separated and equipped with covers. Garbage and other waste shall be disposed of at frequent and regular intervals.

3.3.3 Heavy Equipment

Equipment, including earth-moving equipment, drill rigs, or other heavy machinery, will be operated in compliance with the manufacturer's instructions, specifications, and limitations, as well as any applicable regulations. The operator is responsible for inspecting the equipment prior to use each work shift to verify that it is functioning properly and safely.

The following precautions should be observed whenever heavy equipment is in use.

- PPE, including steel-toed boots, safety glasses, high visibility vests, and hard hats must be worn.

- Personnel must be aware of the location and operation of heavy equipment and take precautions to avoid getting in the way of its operation. Workers must never assume that the equipment operator sees them; eye contact and hand signals should be used to inform the operator of the worker's intent.
- Personnel should not walk directly in back of, or to the side of, heavy equipment without the operator's knowledge. Workers should avoid entering the swing radius of equipment and be aware of potential pinch points.
- Nonessential personnel will be kept out of the work area.

3.3.4 Excavations

A competent person who is capable of identifying existing and predictable hazards in the surroundings, or working conditions that are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them, will be present during excavation activities.

The atmosphere will be tested in excavations, before employees are permitted to enter and begin work, greater than 4 feet in depth or where oxygen deficiency or toxic or flammable gases are likely to be present. The atmosphere shall be ventilated and re-tested until flammable gas concentrations less than 5 percent of the lower explosive limit (LEL) and site-specific action levels are obtained. Worker entry will not be allowed if the oxygen concentration is less than 20 percent. In addition, a safe means of access and egress (i.e., a ladder, stairs or ramp) must be provided so that no more than 25 feet of lateral travel is required by employees.

Workers will not enter unstable excavations or excavations greater than 5 feet in depth without appropriate protective systems such as benching, sloping, or shoring. If shoring or shielding systems are not used, side slopes will not be steeper than 1½:1 without written confirmation from the competent person that slope is safe for the soil conditions. Excavations will be constructed in accordance with the OSHA Excavation Safety Standard (29CFR1926 Subpart P).

The competent person will inspect excavations daily. If there is evidence that a cave-in or slide is possible, work will cease until the necessary safeguards have been taken. Excavated material will be placed far enough from the edge of the excavation (a minimum of 2 feet) so that it does not fall back into the opening or affect the integrity of the sidewall. At the end of each day's activities, open excavations will be clearly marked and secured to prevent nearby workers or unauthorized personnel from entering them. Remote sampling techniques will be the preferred method of sample collection in excavations.

3.3.5 Noise

Noise may result primarily from the operation of heavy equipment, process machinery or other mechanical equipment. Hearing protection with the appropriate noise reduction rating (NRR) shall be worn in areas with high noise levels. A good rule of thumb to determine if hearing protection is needed is the inability to have a conversation at arms length without raising voice levels. If loud noise is present or normal conversation becomes difficult, hearing protection in the form of ear plugs, or equivalent, will be required.

3.3.6 Underground Utilities

Reasonable efforts will be made to identify the location(s) of underground utilities (e.g., pipes, electrical conductors, fuel lines, and water and sewer lines) before intrusive soil work is performed. The state underground utility notification authority (e.g., USA, Dig Alert, Blue Stake, etc.) will be contacted prior to the start of intrusive field activities in accordance with local notification requirements. In areas not evaluated or serviced by the underground utility notification authority, and a reasonable potential for underground utilities exists, one or more of the following techniques will be employed to determine the location of subsurface structures.

- Contracting the services of a qualified private utility locator.
- Having a survey of the subject area conducted by staff trained in the use of subsurface utility locating equipment.
- Subsurface testing (i.e., hand digging or potholing) to the expected depth of probable utilities (not less than 5 feet).

If utilities cannot be located or if unlocated utilities are suspected to be present, subsurface activities (i.e., borings, excavation) should not be conducted before the location(s) or absence of underground utilities is confirmed.

Typical subsurface location marks are as follows:

- Red – electrical,
- Yellow – gas/oil/steam,
- Blue – water,
- Green – sanitary/storm drains/culverts,
- Orange – communications, and
- White – proposed excavation or boring.

Intrusive work should be limited to the area 3.3 feet (1 meter) on either side of the location marks. In some special cases such as fiber optics and high-pressure pipelines this area should be expanded to 16.5 feet (5 meters) on either side of the utility.

3.3.7 Driving

A lot of driving is required to get to, from, and between project Sites. Safe vehicle maintenance and operation must be a priority. It requires knowledge of directions to (and conditions of) the Site in advance, careful exiting and merging into traffic, anticipating the unexpected, remaining alert to one's physical and mental condition, resisting distractions such as cell phone use, other car activities and contacting assistance when needed. Report all vehicle accidents/incidents to BC's Risk Manager.

3.3.8 Personal Safety - Urban Setting

Working in a distressed neighborhood may present hazards associated with street violence or other crime. In these situations, mental preparation before going to the Site and awareness while on Site are of key importance. If in doubt, always ask Site or client personnel about the safety of a

neighborhood. Forethought should be given to arranging to work during daylight hours if possible. Take advantage of any Site security measures (monitoring cameras, security guards) and investigate such measures prior to the field work. Once in the field, work in parties of two or more and stay within view of the general public. Keep a charged cell phone nearby or on your person at all times. Become familiar with your location so you can effectively communicate it over the phone.

In addition to these basic principals, the following is a list of common personal safety rules that apply not only to work at the Site, but to general safety practices while in the field and also between work shifts.

- If at all possible, work/travel in groups. Do not venture out alone.
- Be alert. Notice who passes you and who's behind you. Maintain distance between yourself and strangers. Know where you are, and note potential exit paths.
- If work has paused do not appear slack or distracted. Do not sit in a vehicle with the doors unlocked.
- Walk in well-lighted areas. Don't walk close to bushes, alleys, and so on. In dark or deserted neighborhoods, walk down the middle of the street (be alert to vehicle traffic).
- If a car pulls up slowly, or the occupants of the vehicle bother you, cross the street and walk or run in the other direction. If you are pursued, dial 911.
- If you feel someone is following you, turn around and check. Proceed to the nearest lighted house or place of business.
- Don't overburden yourself with bags or packages, which might impede running or taking care of yourself.
- Be aware of loose clothing, packs/purses and hair. These give an assailant an easier method of grabbing and controlling you. Wear unrestrictive clothing for ease of movement (but not overly loose).
- Carry a non-weapon personal safety device (such as a whistle, panic button, or key light) - anything that could visually or audibly draw attention to your location.
- What you carry in your hand(s) is important. Valuables make you a potential target. Items such as a hand auger or tool may help you be perceived as a less-than-inviting victim.
- Carry as little cash as possible.
- Hold your purse tightly, close to your body. Keep your wallet in a front or in a buttoned, hip pocket. When at a fixed location, lock your valuable items away and out of site (i.e., in a trunk).
- Be careful when people stop you for directions or information. Always reply from a distance; never get too close to a stranger's car.
- If you feel that you are in danger, don't be afraid to scream and run.
 - Toss wallet/keys away from direction of escape.
 - Don't attach car keys to house keys.
 - Leave large valuables (purse, laptop) locked and hidden in the vehicle.

3.4 Natural Phenomena

Natural phenomena such as weather-related emergencies and acts of nature can affect employees' safety. Natural phenomena can occur with little or no warning. If an emergency situation arises as a result of natural phenomena, adhere to the contingency procedures outlined in Section 10. The following natural phenomena have been identified and may be encountered during scheduled field activities.

- | | |
|---|---|
| <input checked="" type="checkbox"/> Sunburn | <input checked="" type="checkbox"/> Heat Stress |
| <input checked="" type="checkbox"/> Cold Stress | <input type="checkbox"/> Lightning/Electrical Storms |
| <input type="checkbox"/> Hurricanes | <input type="checkbox"/> Tornadoes and Strong/Straight Line Winds |
| <input checked="" type="checkbox"/> Earthquakes | |

3.4.1 Sunburn

Working outdoors with the skin unprotected for extended periods of time can cause sunburn to the skin. Excessive exposure to sunlight is associated with the development of skin cancer. Field staff should take precautions to prevent sunburn by using sunscreen lotion and/or wearing hats and long-sleeved garments.

3.4.2 Heat Stress

Adverse climate conditions, primarily heat, are important considerations in planning and conducting site operations. Heat-related illnesses range from heat fatigue to heat stroke, with heat stroke being the most serious condition. The effects of ambient temperature can cause physical discomfort, loss of efficiency, and personal injury, and can increase the probability of accidents. In particular, protective clothing that decreases the body's ventilation can be an important factor leading to heat-related illnesses.

To reduce the possibility of heat-related illness, workers should drink plenty of fluids and establish a work schedule that will provide sufficient rest periods for cooling down. Personnel shall maintain an adequate supply of non-caffeinated drinking fluids on site for personal hydration. Workers should be aware of signs and symptoms of heat-related illnesses, as well as first aid for these conditions. These are summarized in the table below.

Condition	Signs	Symptoms	Response
Heat Rash or Prickly Heat	Red rash on skin.	Intense itching and inflammation.	Increase fluid intake and observe affected worker.
Heat Cramps	Heavy sweating, lack of muscle coordination.	Muscle spasms, and pain in hands, feet, or abdomen.	Increase fluid uptake and rest periods. Closely observe affected worker for more serious symptoms.

Condition	Signs	Symptoms	Response
Heat Exhaustion	Heavy sweating; pale, cool, moist skin; lack of coordination; fainting.	Weakness, headache, dizziness, nausea.	Remove worker to a cool, shady area. Administer fluids and allow worker to rest until fully recovered. Increase rest periods and closely observe worker for additional signs of heat exhaustion. If symptoms of heat exhaustion recur, treat as above and release worker from the day's activities after he/she has fully recovered.
Heat Stroke	Red, hot, dry skin; disorientation; unconsciousness	Lack of or reduced perspiration; nausea; dizziness and confusion; strong, rapid pulse.	Immediately contact emergency medical services by dialing emergency medical services. Remove the victim to a cool, shady location and observe for signs of shock. Attempt to comfort and cool the victim by administering small amounts of cool water (if conscious), loosening clothing, and placing cool compresses at locations where major arteries occur close to the body's surface (neck, underarms, and groin areas). Carefully follow instructions given by emergency medical services until help arrives.

3.4.3 Cold Stress

Workers performing activities during winter and spring months may encounter extremely cold temperatures, as well as conditions of snow and ice, making activities in the field difficult. Adequate cold weather gear, especially head and foot wear, is required under these conditions. Workers should be aware of signs and symptoms of hypothermia and frostbite, as well as first aid for these conditions. These are summarized in the table below.

Condition	Signs	Symptoms	Response
Hypothermia	Confusion, slurred speech, slow movement.	Sleepiness, confusion, warm feeling.	Remove subject to a non-exposed, warm area, such as truck cab; give warm fluids; warm body core; remove outer and wet clothing and wrap torso in blankets with hot water bottle or other heat source. Get medical attention immediately.
Frostbite	Reddish area on skin, frozen skin.	Numbness or lack of feeling on exposed skin.	Place affected extremity in warm, not hot, water, or wrap in warm towels. Get medical attention.
Trench Foot	Swelling and/or blisters of the feet	Tingling/itching sensation; burning; pain in the feet	Remove wet/constrictive clothing and shoes. Gently dry and warm feet with slight elevation. Seek medical attention.

3.4.4 Earthquakes

Earthquakes strike suddenly, violently, and without warning. If your project is located near a fault line, earthquakes are an unpredictable possibility. For long term projects with temporary or permanent office area, keep an emergency preparedness kit consisting of, but not limited to:

- Current project/office contacts list - how to reach folks in an emergency,
- Blankets,
- Flashlights,
- Radio (operated by batteries),
- Batteries for flashlight and radio (note: batteries should be replaced as needed to assure freshness),

- Water (unless there is a water bubbler that can be used with no electricity), and
- Snack crackers, dried fruit, etc. - a source of food that won't go bad.

This kit is meant to serve as overnight survival in the event that it becomes unsafe to leave the project site. The kit's contents should be suited to meet the size and needs of your project.

If you feel the earth shaking, consider the following tips:

- Drop down; take cover under a desk or table and hold on.
- Stay indoors until the shaking stops and you are sure it is safe to exit.
- Stay away from bookcases, shelves, or anything that could fall on you.
- Stay away from windows.
- If inside a building, expect fire alarms and sprinklers to go off during the quake.
- If you are outdoors, find a clear spot away from buildings, trees, and power lines. Drop to the ground and cover your head.

If you are in a car, slow down and drive to a clear place, preferably away from power lines. Stay in the car until the shaking stops.

3.5 Biological Hazards

The following biological hazards have been identified and may be encountered during scheduled field activities.

- Bloodborne Pathogens/Sanitary Waste
- Rodents and Mammals
- Reptiles/Snakes
- Venomous Insects
- Mosquitoes
- Fire Ants
- Spiders/Scorpions
- Ticks
- Poisonous Plants

If any biological hazards are identified at the Site, workers in the area will immediately notify the SSO and nearby personnel.

4. PERSONAL PROTECTIVE EQUIPMENT

The purpose of PPE is to protect employees from hazards and potential hazards they are likely to encounter during site activities. The amount and type of PPE used will be based on the nature of the hazard encountered or anticipated. Respiratory protection will be utilized when an airborne hazard has been identified using real-time air monitoring devices, or as a precautionary measure in areas designated by the RSUM or SSO.

Dermal protection, primarily in the form of chemical-resistant gloves and coveralls, will be worn whenever contact with chemically affected materials (e.g., soil, groundwater, sludge) is anticipated, without regard to the level of respiratory protection required.

On the basis of the hazards identified for this project, the following levels of personal protective equipment (PPE) will be required and used. Changes to the specified levels of PPE will not be made without the approval of the SSO after consultation with the RSUM.

4.1 Conditions Requiring Level D Protection

In general, site activities will commence in Level D PPE unless otherwise specified, or if the SSO determines on site that a higher level of PPE is required. Air monitoring of employee breathing zones will be routinely conducted using real-time air monitoring devices to determine if upgrading to Level C PPE is necessary. Level D PPE will be permitted as long as air monitoring data indicate that airborne concentrations of chemicals of concern are maintained below the site-specific action levels defined in Section 5.2. Level A or B PPE is not anticipated and is therefore not addressed in this plan. If Level A or B PPE is necessary, this HASP will be revised to reflect changes as appropriate.

It is important to note that dermal protection is required whenever contact with chemically-affected materials is anticipated. The following equipment is specified as the minimum PPE required to conduct activities at the Site:

- Work shirt and long pants,
- ANSI- or ASTM-approved steel-toed boots or safety shoes,
- ANSI-approved safety glasses, and
- ANSI-approved hard hat.

Other personal protection readily available for use, if necessary, includes the following items.

- Outer nitrile gloves (11 mil or thicker) and inner nitrile surgical gloves when direct contact with chemically affected soils or groundwater is anticipated (nitrile surgical gloves may be used for collecting or classifying samples as long as they are removed and disposed of immediately after each sampling event).
- Chemical-resistant clothing (e.g., Tyvek or polycoated Tyvek coveralls) when contact with chemically affected soils or groundwater is anticipated.

- Safety shoes/boots with protective overboots or knee-high PVC polyblend boots when direct contact with chemically affected soils is anticipated.
- Hearing protection.
- Sturdy work gloves.
- High-visibility traffic safety vest.

Work will cease and PPE upgraded if action levels specified in Section 5.2 are exceeded. The RSUM will be notified whenever PPE is upgraded or downgraded.

4.2 Conditions Requiring Level C Protection

If air monitoring indicates that the site-specific action levels defined in Section 5.2 are exceeded, workers in the affected area(s) will upgrade PPE to Level C. In addition to the protective equipment specified for Level D, Level C also includes the following items.

- NIOSH-approved half- or full-face air-purifying respirator (APR) equipped with appropriate cartridges (reference Section 5.2). Note: safety glasses are not required when wearing a full-face APR.
- Outer nitrile gloves (11 mil or thicker) and inner nitrile surgical gloves when direct contact with chemically affected soils or groundwater is anticipated (nitrile surgical gloves may be used for collecting or classifying samples as long as they are removed and disposed of immediately after each sampling event).
- Chemical-resistant clothing (e.g., Tyvek or polycoated Tyvek coveralls) when contact with chemically affected soils or groundwater is anticipated.
- Safety shoes/boots with protective overboots or knee-high PVC polyblend boots when direct contact with chemically affected soils is anticipated.
- Hearing protection.
- Sturdy work gloves.

Respirators will be stored in clean containers (i.e., self-sealing bag) when not in use. Respirator cartridges will be replaced in accordance with the following change-out schedule.

Type of Cartridge	Cartridge Change-out Schedule
Particulate (i.e., HEPA)	At least weekly or sooner the employee detects an increase in breathing resistance. This will occur as the filter becomes loaded with particulate matter.
Sorbent (i.e., organic vapor)	At the end of each day's use or sooner if the employee detects an abnormal odor or other indicator.

Personnel who wear air-purifying respirators must be trained in their use and must have successfully passed either a qualitative or quantitative respirator fit test, and medical evaluation within the last 12 months in accordance with and 29 CFR 1910.134.

4.3 Stop Work Conditions

If air monitoring indicates that the site-specific action levels defined in Section 5.2 are exceeded, activities will cease, and personnel must evacuate the designated Exclusion Zone. The PM and RSUM will be contacted immediately.

Work will also cease if unanticipated conditions or materials are encountered or if an imminent danger is identified. The SSO will immediately contact the RSUM for consultation.

HEALTH AND SAFETY PLAN

5. AIR MONITORING PLAN

Real-time air monitoring devices will be used to analyze airborne contaminant concentrations approximately every 15 minutes in the workers' breathing zones while workers are in the designated Exclusion Zone, or when task or exposure conditions change (whichever frequency is less). If elevated concentrations are indicated, the monitoring frequency will be increased, as appropriate.

Background concentrations will be determined at the beginning of each work shift by collecting several instrument readings upwind of the scheduled activities. Alternatively, background levels can be determined by collecting readings from a nearby (upwind) area that can reasonably be considered unaffected by Site activities.

Real-time measurements will be made as near as feasible to the breathing zone of the worker with the greatest exposure potential in each active work area. If authorized by the RSUM, real time measurements may cease being taken when enough historical data is generated to warrant its cessation. Air monitoring will be reinstated if potential exposure conditions change.

The equipment will be calibrated daily, and the results will be recorded on BC's Air Monitoring Form. The results of air monitoring will also be recorded on the Air Monitoring Form and will be retained in the project files following completion of field activities. A copy of the Air Monitoring Form is located in Appendix A.

5.1 Monitoring Instruments

On-site worker exposure to airborne contaminants will be monitored during intrusive site activities. A calibrated photoionization detector (PID) with a lamp strength of 10.6 eV or flame ionization detector (FID) will be used to monitor changes in personnel exposure to volatile organic compounds (VOCs). The SSO, or designee, will perform routine monitoring during site operations to evaluate concentrations of VOCs in employee breathing zones. If VOCs are detected above predetermined action levels specified in Section 5.2, the procedures found in Section 4 of this HASP will be followed.

5.2 Site Specific Action Levels

The following action levels were developed for exposure monitoring with real-time air monitoring instruments. Air monitoring data will determine the required respiratory protection levels at the Site during scheduled intrusive activities. The action levels are based on sustained readings indicated by the instrument(s). Air monitoring will be performed and recorded at up to 15-minute intervals.

If elevated concentrations are indicated, the monitoring frequency will be increased, as appropriate. If during this time, sustained measurements are observed, the following actions will be instituted, and the PM and RSUM will be notified. For purposes of this HASP, sustained readings are defined as the average airborne concentration maintained for a period of one (1) minute above established background levels.

Activity	Action Level	Level of Respiratory Protection
Soil Remediation	< 5 ppm above background	Level D: No respiratory protection required.
Soil Remediation	5 to 25 ppm	Level C: Half- or full-face air-purifying respirator fitted with organic vapor filter cartridges.
Soil Remediation	> 25 ppm	Cease operations and evacuate work area. Contact RSUM and PM immediately.

HEALTH AND SAFETY PLAN

6. SITE CONTROL MEASURES

The SSO will conduct a safety inspection of the work site before each day's activities begin to verify compliance with the requirements of the HASP. Results of the first day's inspection will be documented on the Site Safety Checklist. A copy of the checklist is included in Appendix B. Thereafter, the SSO should document unsafe conditions or acts, along with corrective action, in the project field log book.

Procedures must be followed to maintain site control so that persons who may be unaware of site conditions are not exposed to hazards. The work area will be barricaded by tape, warning signs, or other appropriate means. Site equipment or machinery will be secured and stored safely.

Access to the specified work area will be limited to authorized personnel. Only BC employees and designated BC subcontracted personnel, as well as designated employees of the client, will be admitted to the work site. Personnel entering the work area are required to sign the signature page of this HASP, indicating they have read and accepted the health and safety practices outlined in this plan.

In some instances it may be necessary to define established work zones: an Exclusion Zone, a Contamination Reduction Zone, and a Support Zone. Work zones may be established based on the extent of anticipated contamination, projected work activities, and the presence or absence of non-project personnel. The physical dimensions and applicability of work zones will be determined for each area based on the nature of job activity and hazards present. Within these zones, prescribed operations will commence using appropriate PPE. Movement between zones will be controlled at checkpoints.

Considerable judgment is needed to maintain a safe working area for each zone, balanced against practical work considerations. Physical and topographical barriers may constrain ideal locations. Field measurements combined with climatic conditions may, in part, determine the control zone distances. Even when work is performed in an area that does not require the use of chemical-resistant clothing, work zone procedures may still be necessary to limit the movement of personnel and retain adequate site control.

Personnel entering the designated Exclusion Zone should exit at the same location. There must be an alternate exit established for emergency situations. In all instances, worker safety will take precedence over decontamination procedures. If decontamination of personnel is necessary, exiting the Site will include the decontamination procedures described in the following section.

HEALTH AND SAFETY PLAN

7. DECONTAMINATION PROCEDURES

Decontamination will take place in the decontamination area identified on-Site. Workers, PPE, sampling equipment, and heavy equipment leaving the exclusion area will be inspected to determine the level of decontamination necessary to prevent the spread of potentially hazardous materials. Unnecessary equipment and support vehicles are to be left outside the designated Exclusion Zone so that decontamination will not be necessary.

Despite protective procedures, personnel may come in contact with potentially hazardous compounds while performing work tasks. If so, decontamination needs to take place using an Alconox or TSP wash, followed by a rinse with clean water. Standard decontamination procedures for levels C and D are as follows.

- equipment drop,
- boot cover and outer glove wash and rinse,
- boot cover and outer glove removal,
- suit removal,
- safety boot wash and rinse,
- inner glove wash and rinse,
- respirator removal,
- inner glove removal, and
- field wash of hands and face.

Site workers should employ only applicable steps in accordance with level of PPE worn and extent of contamination present. The SSO shall maintain adequate quantities of clean water to be used for personal decontamination (i.e., field wash of hands and face) whenever a suitable washing facility is not located in the immediate vicinity of the work area.

Disposable items will be disposed of in an appropriate container. Wash and rinse water generated from decontamination activities will be handled and disposed of properly. Non-disposable items (i.e., respirators) may need to be cleaned or sanitized before reuse. Each site worker is responsible for the maintenance, decontamination, and sanitizing of their own PPE.

Used equipment may be decontaminated as follows.

- Remove adhered materials (i.e., dirt or mud) to increase the effectiveness of the decontamination process.
- An Alconox or TSP and water solution may be used to wash the equipment.
- The equipment will then be rinsed with clean water until it is determined clean.

Each person must follow these procedures to reduce the potential for transferring chemically affected materials off site.

8. TRAINING REQUIREMENTS

BC Site personnel, including subcontractors and visitors conducting work in controlled areas of the Site, must have completed the appropriate training as required by 29 CFR 1910.120. In addition, the SSO will have completed the 8-hour Site Supervisor course, have current training in first aid and CPR, and any additional training appropriate to the level of site hazards. Further site-specific training will be conducted by the SSO prior to the initiation of project activities. This training will include, but will not necessarily be limited to, emergency procedures, site control, personnel responsibilities, and the provisions of this HASP. Each employee will document that they have been briefed on the hazards identified at the site and that they have read and understand the requirements of this HASP by signing the H&S Plan Acknowledgement Form attached as Appendix C.

A daily morning briefing to cover safety procedures and contingency plans in the event of an emergency is to be included with a discussion of the day's activities. These daily meetings will be recorded on the Daily Tailgate Safety Meeting Form. A copy of the Daily Tailgate Safety Meeting Form is included in Appendix D.

9. MEDICAL SURVEILLANCE REQUIREMENTS

BC Site personnel, including subcontractors and site visitors, who will or may work in an area designated as an exclusion zone must have fulfilled the appropriate medical monitoring requirements in accordance with 29 CFR 1910.120(f). Each individual entering an exclusion zone must have successfully completed an annual surveillance examination and/or an initial baseline examination within the last 12 months.

Medical surveillance is conducted as a routine program for BC field staff in accordance with the requirements of 29 CFR 1910.120(f). There will not be any special medical tests or examinations required for staff involved in this project.

A Hepatitis B vaccination will be offered to BC personnel before the person participates in a task where direct exposure to potentially infectious materials is a possibility (i.e., first aid or CPR). For personnel who have potential exposure to sanitary wastes, a current tetanus/diphtheria inoculation or booster is recommended.

HEALTH AND SAFETY PLAN

10. CONTINGENCY PROCEDURES

Minimum emergency equipment maintained on site will include a fully charged ABC dry chemical fire extinguisher, an adequately stocked first aid kit, and an emergency eyewash station (when corrosive chemicals are present). In addition, employees will consider maintaining the personal emergency supply items listed in Section 3: Natural Phenomena, as appropriate.

In the event of an emergency, site personnel will signal distress with three blasts of a horn (a vehicle horn will be sufficient), or other predetermined signal. Communication signals, such as hand signals, must be established where communication equipment is not feasible or in areas of loud noise.

It is the SSO's duty to evaluate the seriousness of the situation and to notify appropriate authorities. The first part of this plan contains emergency telephone numbers as well as directions to the hospital. Nearby telephone access must be identified and available to communicate with local authorities. If a nearby telephone is not available, a cellular telephone will be maintained on site during work activities. The operation of the cellular phone will be verified to ensure that a signal can be achieved at the work location.

The SSO, or designee, should contact local emergency services in the event of an emergency. After emergency services are notified, the PM and RSUM will be notified of the situation as soon as possible. If personal injury, property damage or equipment damage occurs, the PM and BC Risk Manager will be contacted as soon as practicable. An Accident/Incident Investigation Report will be completed within 24 hours by the SSO, or other designated person. A copy of the Accident/Incident Investigation Report is included in Appendix E.

MSHA Immediate Notification Rule:

At projects conducted at mining facilities, incident reporting requirements differ from OSHA standards. Site-specific MSHA reporting requirements must be addressed in conjunction with the RSUM and PM.

In order to comply with the MSHA Immediate Notification rule (50.10), Brown and Caldwell has developed the 'MSHA Immediately Reportable Accident/Injury Notification Procedure'. Note that incidents meeting the definition of "immediately reportable" must be reported to MSHA within 15 minutes of occurrence.

http://search.bc.com/health_safety/documents/BC_MSHANotificationProcedure.doc

This new procedure can be accessed by clicking the link above and includes a decision flowchart and accompanying instructions to help guide field personnel in the event of a reportable accident/injury at a mining site.

10.1 Injury or Illness

If an exposure or injury occurs, work will be temporarily halted until an assessment can be made to determine it is safe to continue work. The SSO, in consultation with the RSUM, will make the decision regarding the safety of continuing work. The SSO will conduct an investigation to determine the cause of the incident and steps to be taken to prevent recurrence.

In the event of an injury, the extent and nature of the victim's injuries will be assessed and first aid/CPR will be rendered as appropriate. If necessary, emergency services will be contacted or the individual may be transported to the nearby medical center. The mode of transportation and the eventual destination will be based on the nature and extent of the injury. A hospital route map is presented at the front of this HASP.

In the event of a life-threatening emergency, the injured person will be given immediate first aid and emergency medical services will be contacted by dialing the number listed in the Critical Project Information section at the beginning of this plan. The individual rendering first aid will follow directions given by emergency medical personnel via telephone.

10.2 Vehicle Collision or Property Damage

If a vehicle collision or property damage event occurs, the SSO, or designee, will contact the BC Risk Manager for appropriate action.

10.3 Fire

In the event of fire, the alarm will be sounded and Site personnel will evacuate to a safe location (preferably upwind). The SSO, or designee, should contact the local fire department immediately by dialing 911. When the fire department arrives, the SSO, or designated representative, will advise the commanding officer of the location and nature of the fire nature, and identification of hazardous materials on site. Only trained, experienced fire fighters should attempt to extinguish substantial fires at the Site. Site personnel should not attempt to fight fires, unless properly trained and equipped to do so. Site personnel should not attempt to fight a fire if it poses a risk to their personal safety.

Note that smoking is not permitted in controlled areas (i.e., exclusion or contamination reduction zones), near flammable or combustible materials, or in areas designated by the facility as non-smoking areas.

10.4 Underground Utilities

In the event that an underground conduit is damaged during subsurface work, mechanized equipment will immediately be shut off and personnel will evacuate the area until the nature of the piping can be determined. Depending on the nature of the broken conduit (e.g., natural gas, water, or electricity), the appropriate local utility will be contacted.

10.5 Site Evacuation

The SSO will designate evacuation routes and refuge areas to be used in the event of a Site emergency. Site personnel will stay upwind from vapors or smoke and upgradient from spills. If workers are in an Exclusion or Contamination Reduction Zone at the start of an emergency, they should exit through the established decontamination corridors, if possible. If evacuation cannot be done through an established decontamination area, site personnel will go to the nearest safe location and remove chemically-affected clothing there or, if possible, leave it near the Exclusion Zone. Personnel will assemble at the predetermined refuge following evacuation and decontamination. The SSO, or designated representative, will count and identify site personnel to verify that all have been evacuated safely.

10.6 Spill of Hazardous Materials

If a hazardous material spill occurs, site personnel should locate the source of the spill and determine the hazard to the health and safety of site workers and the public. Attempts to stop or reduce the flow should only be performed if it can be done without risk to personnel.

Isolate the spill area and do not allow entry by unauthorized personnel. De-energize sources of ignition within 100 feet of the spill, including vehicle engines. Should a spill be of the nature or extent that it cannot be safely contained, or poses an imminent threat to human health or the environment, an emergency cleanup contractor will be called out as soon as possible. Spill containment measures listed below are examples of responses to spills.

- Right or rotate containers to stop the flow of liquids. This step may be accomplished as soon as the spill or leak occurs, providing it is safe to do so.
- Sorbent pads, booms, or adjacent soil may be used to dike or berm materials, subject to flow, and to solidify liquids.
- Sorbent pads, soil, or booms, if used, must be placed in appropriate containers after use, pending disposal.
- Contaminated tools and equipment shall be collected for subsequent cleaning or disposal.

HEALTH AND SAFETY PLAN

11. DOCUMENTATION

The implementation of the HASP must be documented on the appropriate forms (see appendices) to verify employee participation and protection. In addition, the regulatory requirements must be met for recordkeeping on training, medical surveillance, injuries and illnesses, exposure monitoring, health risk information, and respirator fit-tests. Documentation of each BC employee's health and safety records is maintained by the Health and Safety Data Manager in Walnut Creek, California.

Health and safety documentation and forms completed, as specified by this plan, are to be retained in the project file.

Other relevant project-specific health and safety documents, such as MSDSs or client-specified procedures, will be attached to this HASP in Appendix F.

Name of Project/Site:	Project No:
Project/Site Location:	
Employee Performing Briefing: (Print and Sign):	Date:

Employee Acknowledgement:

The following signatures indicate that these personnel have read and/or been briefed on this Health and Safety (H&S) Plan and understand the potential hazards/controls for the work to be performed.

Important Notice to Subcontractor(s):

Subcontractors are responsible for developing, maintaining, and implementing their own health and safety programs, policies, procedures and equipment as necessary to protect their workers, and others, from their activities. Subcontractors shall operate equipment in accordance with their standard operating procedures as well as manufacturer's specifications. Any project monitoring activities conducted by BC at the Site shall not in any way relieve subcontractors of their critical obligation to monitor their operations and employees for the determination of exposure to hazards that may be present at the Site and to provide required guidance and protection. If requested, subcontractors will provide BC with a copy of their own H&S Plan for this project or other health and safety program documents for review.

BC's Health and Safety Plan has been prepared specifically for this project and is intended to address health and safety issues solely with respect to the activities of BC's own employees at the site. A copy of BC's H&S Plan may be provided to subcontractors in an effort to help them identify expected conditions at the site and general site hazards. The subcontractor shall remain responsible for identifying and evaluating hazards at the site as they pertain to their activities and for taking appropriate precautions. For example, BC's H&S Plan does not address specific hazards associated with tasks and equipment that are particular to the subcontractor's scope of work and site activities. (e.g., operation of a drill rig, excavator, crane or other equipment). Subcontractors are not to rely on BC's H&S Plan to identify all hazards that may be present at the Site. Subcontractor personnel are expected to comply fully with subcontractor's Health and Safety Plan and to observe the minimum safety guidelines applicable to their activities which may be identified in the BC H&S Plan. Failure to do so may result in the removal of the subcontractor or any of the subcontractor's workers from the job site.

Potential Hazards and Topics Discussed

(Describe the potential hazards and controls that may be associated with planned activities)

Electrical Chemical Biological Physical Other (specify):

Incident Investigation Report

Instructions:

If an accident or incident occurs, complete all applicable information in this form, make a copy for your records, and immediately forward the original to the office Health and Safety Coordinator (HSC). If fields are not applicable, indicate with "N/A". Use separate sheet(s) if necessary and attach sketches, photographs, or other information that may be helpful in understanding how the accident/incident occurred.
 HSC – Review and enter report into the BC Online Safety Observation and Incident Reporting System within 3 workdays of receipt. File original in appropriate office health and safety file.

NOTE:

This report is important – please take the time necessary to properly complete it. Incomplete reports will be forwarded to appropriate management for review and action.

General Information

Date of Accident/Incident	Time of Accident/Incident:	Date Accident/Incident Reported:	To Whom:
Exact Location of Accident/Incident (Street, City, State):			BC Office:
Name Project:			Project Number:
Employee Completing the Investigation (Print and Sign):			Date:

Injured/Ill Employee/Property Damage Information

Employee Name:	Employee No.	Department:	Phone Number:
Job Title:		Manager's Name and Phone Number:	
Nature of Injury/Illness (laceration, contusion, strain, etc.):		Body Part Affected (arm, leg, head, hand, etc.):	
Describe Property Damage and Estimate Loss :			

Description of Accident/Incident

Describe the accident sequentially, beginning with the initiating event, and followed by secondary and tertiary events. End with the nature and extent of injury/damage. Name any object or substance and tell how they were included. Examples: 1) Employee was pulling utility cart that was loaded with wastepaper from office area to hallway. Wheel of utility cart caught against door casing. Bags of heavy wastepaper that were in cart fell to end of cart. Cart tipped over onto foot of employee. Right foot was crushed between utility cart and door casing, resulting in severe contusion to right foot of employee. 2) Employee was driving rental car from office to project site. Car struck icy section of road. Employee lost control of vehicle, which skidded across road into concrete abutment on side of road. Accident resulted in damage to right fender, tire, headlight, and grill.

Analysis of Accident Causes

Immediate Causes - Substandard Actions

What substandard actions caused or could have caused the accident/incident? State the actions on the part of the employee or others that contributed to the occurrence of the accident/incident. Examples: 1) Employee overloaded the utility cart with wastepaper. 2) Employee exceeded safe speed on icy road, and was inattentive to hazard.

Codes (check all that apply)

| <input type="checkbox"/> 1. Operating equipment without authority | <input type="checkbox"/> 5. Making safety devices inoperable | <input type="checkbox"/> 9. Failure to use PPE properly | <input type="checkbox"/> 13. Improper position for task |
| <input type="checkbox"/> 2. Failure to warn | <input type="checkbox"/> 6. Removing safety devices | <input type="checkbox"/> 10. Improper loading | <input type="checkbox"/> 14. Servicing equipment in operation |
| <input type="checkbox"/> 3. Failure to secure | <input type="checkbox"/> 7. Using defective equipment | <input type="checkbox"/> 11. Improper placement | <input type="checkbox"/> 15. Horseplay |
| <input type="checkbox"/> 4. Operating at improper speed | <input type="checkbox"/> 8. Using equipment improperly | <input type="checkbox"/> 12. Improper lifting | <input type="checkbox"/> 16. Alcohol or drug influence |
| <input type="checkbox"/> 17. Other (specify) | | | |

Immediate Causes - Substandard Conditions

What substandard conditions caused or could have caused the accident/incident? State the conditions that existed at the time of the accident (the specific control factors that were or may have been the direct or immediate cause or causes of the accident). Examples: 1) Wheel of utility cart was worn and would not roll properly; utility cart was overloaded with wastepaper. 2) Road was covered with icy spots; weather was foggy.

Codes (check all that apply)

| <input type="checkbox"/> 1. Inadequate guards or barriers | <input type="checkbox"/> 4. Congestion or restricted action | <input type="checkbox"/> 7. Poor housekeeping | <input type="checkbox"/> 10. High or low temperature exposures |
| <input type="checkbox"/> 2. Inadequate or improper PPE | <input type="checkbox"/> 5. Inadequate earning system | <input type="checkbox"/> 8. Noise exposures | <input type="checkbox"/> 11. Inadequate or excess illumination |
| <input type="checkbox"/> 3. Defective tools, equipment, or materials | <input type="checkbox"/> 6. Fire and explosion hazards | <input type="checkbox"/> 9. Radiation exposures | <input type="checkbox"/> 12. Inadequate ventilation |
| <input type="checkbox"/> 13. Hazardous environ. conditions (vapors, dusts, etc.) | | | |
| <input type="checkbox"/> 14. Other (specify) | | | |

Basic Causes - Personal and Job Factors

What personal and/or job factors caused or could have caused the accident/incident? State the influencing factors or underlying causes, either conditions or actions or both, that contributed to the accident/incident. Examples: 1) Employee had not been instructed in overloading hazards. 2) Employee had not been trained in driving under winter conditions; company has no driver training program.

Codes (check all that apply)

Personal Factors

1. Inadequate capability 2. Lack of knowledge 3. Lack of skill 4. Improper motivation
 5. Other (specify): _____

Job Factors

1. Inadequate leadership/supervision 2. Inadequate engineering 3. Inadequate purchasing 4. Inadequate maintenance 5. Inadequate tools/equipment
 6. Inadequate work standards/procedures 7. Inadequate Wear and tear 8. Abuse or misuse
 9. Other (specify): _____

Remedial Actions

Describe the actions taken or planned to prevent recurrence of accident/incident - provide the implementation date and person responsible for any planned corrective action.. Examples: 1) Wheels of utility cart were replaced with larger size wheels; all carts were inspected for safe operation; employees were instructed in overloading hazards. 2) All project personnel were instructed at the safety training meeting on driving under hazardous conditions; driver training program will be implemented.

Codes (check all that apply)

Job Factors

1. Reinstruction of personnel involved 2. Reprimand of personnel involved 3. Temporary/permanent reassignment of personnel 4. Action to improve clean-up
 5. Equipment repair or replacement 6. Improve design 7. Improve construction 8. Improve PPE 9. Install of safety guard or device 10. Work method change
 11. Order use of safer materials 12. Regional Safety Unit Manager Review
 13. Other (specify): _____

RE: Project: Olympia Soils
Pace Project No.: 255662

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 09, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: Olympia Soils

Pace Project No.: 255662

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

D6 The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on one sample submitted by a representative of Pace Analytical Services, Inc. The sample was analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extract ranged from 48-87%. With the exception of one low value, which was flagged "R" on the results table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. The levels reported for the affected congeners in the field sample were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field sample.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 91-129%, with relative percent differences of 0.2-9.7%. These results indicate high degrees of accuracy and precision for these determinations.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs

Total HpCDD	12.00	----	0.290			
OCDF	9.90	----	0.270 J			
OCDD	71.00	----	0.290			

Conc = Concentration (Totals include 2,3,7,8-substituted isomers).
EMPC = Estimated Maximum Possible Concentration
EDL = Estimated Detection Limit

ND = Not Detected
NA = Not Applicable
NC = Not Calculated

Results reported on a dry weight basis and are valid to no more than 2 significant figures.
J = Estimated value
P = PCDE Interference

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on eleven samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 45-104%. With the exception of one low value, which was flagged "R" on the results table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Concentrations above the calibration range were flagged "E" and should be regarded as estimates. Selected values reported for the field samples were obtained from analyses of dilutions of the sample extracts; the affected values were flagged "N2" on the results tables.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show the blanks to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory spike samples were also prepared with the sample batches using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 91-129%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batches using sample materials from separate projects; results from these analyses will be provided upon request.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on twenty-five samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 33-158%. With the exceptions of thirteen values, which were flagged "R" on the results tables, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show the blanks to contain background levels of selected congeners. With the exception of one non-2,3,7,8-substituted TCDF congener in Blank-26969, these were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 98-128%, with relative percent differences of 0.4-14.4%. These results indicate high degrees of accuracy and precision for these determinations. Matrix spikes were prepared with the 11/15/2010 sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: HOCM 138130
Pace Project No.: 256348

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on January 22, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALITY CONTROL DATA

Project: HOCM 138130

Pace Project No.: 256348

QC Batch: MPRP/24448

Analysis Method: % Moisture

QC Batch Method: % Moisture

Analysis Description: Dry Weight/Percent Moisture

Associated Lab Samples: 256348001, 256348002, 256348003, 256348004, 256348005, 256348006, 256348007, 256348008, 256348009, 256348010, 256348011

SAMPLE DUPLICATE: 922140

Parameter	Units	10147825001 Result	Dup Result	RPD	Qualifiers
Percent Moisture	%	13.4	13.9	4	

SAMPLE DUPLICATE: 922141

Parameter	Units	256323005 Result	Dup Result	RPD	Qualifiers
Percent Moisture	%	10.6	9.9	6	

QUALIFIERS

Project: HOCM 138130

Pace Project No.: 256348

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256210

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on January 11, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

ANALYTICAL RESULTS

Project: East Bay Redevelopment 138130

Pace Project No.: 256210

Sample: CNF-2-1-10 **Lab ID: 256210001** Collected: 01/10/11 10:45 Received: 01/11/11 10:12 Matrix: Solid

Results reported on a "dry-weight" basis

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual
6020 MET ICPMS Analytical Method: EPA 6020								
Arsenic	3.5	mg/kg	2.8	20	01/11/11 16:02	01/13/11 12:52	7440-38-2	
Copper	18.9	mg/kg	2.8	20	01/11/11 16:02	01/13/11 12:52	7440-50-8	
Lead	5.5	mg/kg	2.8	20	01/11/11 16:02	01/13/11 12:52	7439-92-1	
Nickel	7.8	mg/kg	2.8	20	01/11/11 16:02	01/13/11 12:52	7440-02-0	

Dry Weight Analytical Method: % Moisture

Percent Moisture **84.9 %** 0.10 1 01/14/11 00:00

Sample: CNF-2-2-7 **Lab ID: 256210002** Collected: 01/10/11 10:55 Received: 01/11/11 10:12 Matrix: Solid

Results reported on a "dry-weight" basis

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256210

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255583

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 03, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

Client added Diesel with Silica Gel cleanup to 255583 005 (CNF-1-5-9) on 11/10/10.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Regina SteMarie for
Jennifer Gross

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc..

ANALYTICAL RESULTS

Project: East Bay Redevelopment 138130

Sample Project No.: 255583

Sample: CNF-1-1-9 **Lab ID: 255583001** Collected: 11/03/10 12:04 Received: 11/03/10 19:30 Matrix: Solid

Results reported on a "dry-weight" basis

Parameters	Results	Units	PQL	MDL	DF	Prepared	Analyzed	CAS No.	Qual

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255583

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255574

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 02, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Melanie Miller for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255574

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on six samples submitted by a representative of Pace Analytical Services, Inc - Seattle. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The isotopically-labeled PCDD/PCDF internal standards in the sample extracts were recovered at 43-88%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native congeners was based on isotope dilution and internal standard methodology, the data were automatically corrected for recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected PCDD/PCDF congeners. With the exception of a non-2,3,7,8-substituted TCDF congener, these levels were below the calibration range of the method. The field sample extracts contained selected analytes at levels within ten times those seen in the method blank. The affected congeners were flagged "B" on the results tables and should be considered to have originated, at least partially, in the laboratory. In general, levels less than ten times the background are not considered statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample material that had been fortified with native standards. The results show that the spiked native compounds were recovered at 99-143%, with relative percent differences of 0.0-10.6%. These results indicate generally high degrees of accuracy and precision for these determinations. The laboratory spike exhibited an elevated recovery for OCDF and is flagged "R" on the results table. This could indicate a high bias for the OCDF results. While the method does not specify a recovery range for matrix spikes, several analytes in the matrix spikes were recovered at levels above the target range utilized by Pace Analytical. The affected analytes were flagged "R" on the matrix spike tables (based on the background subtracted results) and could indicate a high bias for these analytes.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255590

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 03, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255590

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

R1 RPD value was outside control limits.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on nine samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 41-96%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain background levels of selected congeners. With the exception of one non-2,3,7,8-substituted TCDF congener, these were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 100-128%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255812

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 24, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255812

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on twelve samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 49-107%. With the exception of one low value in the associated method blank, which was flagged "R" on the result table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected value were flagged "I" where incorrect isotope ratios were obtained.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show the blanks to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batches using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 96-128%, with relative percent differences of 0.1-11.0%. These results indicate generally high degrees of accuracy and precision for these determinations. The background-subtracted recovery values obtained for OCDD in the matrix spike samples were above the 70-130% target range and may indicate a high bias for this congener in these determinations.

Note: Whenever there is a discrepancy affecting North Carolina compliance samples, a copy of this form will be sent to the North Carolina SEMMA, Inc. F-L213Rev.00, 05Aug2009 1700 Elm Street SE, Suite 200, Minneapolis, MN 55414

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255986

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on December 11, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

No sample jars were received for dry weight correction. Per client previous results from the same sampling points (reported on work order 255812) can be used for the dry weight correction.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

jennifer.gross@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc..

ANALYTICAL RESULTS

Project: East Bay Redevelopment 138130

Project No.: 255986

Sample: SPL-6-1 **Lab ID: 255986001** Collected: 12/10/10 10:30 Received: 12/11/10 09:26 Matrix: Solid

Results reported on a "dry-weight" basis

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual
NWTPH-Gx GCV		Analytical Method: NWTPH-Gx Preparation Method: NWTPH-Gx						
Gasoline Range Organics	ND	mg/kg	44.7	1	12/15/10 10:00	12/15/10 23:54

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255986

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

L3 Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

S0 Surrogate recovery outside laboratory control limits.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255818

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 24, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255818

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

**REPORT OF
LABORATORY
ANALYSIS FOR
PCDD/PCDF**

Report Prepared Date:

December 9, 2010

Report Information:

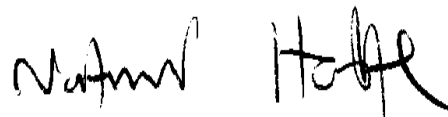

Pace Project #: 10144251
Sample Receipt Date: 12/01/2010
Client Project #: 255818 Brown & Caldwell
Client Sub PO #: N/A
State Cert #: C755

Invoicing & Reporting Options:

The report provided has been invoiced as a Level 2 PCDD/PCDF Report. If an upgrade of this report package is requested, an additional charge may be applied.

Please review the attached invoice for accuracy and forward any questions to Nate Habte, your Pace Project Manager.

This report has been reviewed by:

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on four samples submitted by a representative of PASI Seattle. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 50-99%. With the exception of one low value in the method blank, which was flagged "R" on the result table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In one case, an interfering substance impacted the determination of a PCDF congener. The affected value was flagged "I" due to an incorrect isotope ratio.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 98-124%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

RE: Project: Olympia Soils
Pace Project No.: 255764

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 18, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: Olympia Soils

Pace Project No.: 255764

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

- 1n All samples associated with this method blank were re-extracted for confirmation of results due to failing surrogate.
- 2n Results for all target analytes were confirmed by the analysis of of an out-of-hold re-extract sample, associated with good batch QC and acceptable surrogate recoveries.
- S0 Surrogate recovery outside laboratory control limits.
- S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on six samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 42-94%. All of the labeled internal standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. The OCDD concentration reported for sample SPL-11-2 was above the calibration range; the value was flagged "E" and should be regarded as an estimate.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. With the exception of the Total TCDF, these were below the calibration range of the method. The levels reported for the affected congeners in the field samples were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 92-117%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: Olympia Soils
Pace Project No.: 255708

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on November 12, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: Olympia Soils

Pace Project No.: 255708

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

D6 The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on seven samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 57-96%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 87-126%, with relative percent differences (RPDs) of 4.2-26.4%. These results indicate generally high degrees of accuracy and precision for these determinations. Somewhat variable background-subtracted recovery (153-252%) and RPD (26.4%) results were obtained for OCDD in the matrix spike samples, possibly due to sample inhomogeneity; these values were above the 70-130% target recovery range and the 0-20% target RPD range. The RPD results may indicate an elevated degree of precision for OCDD in these determinations.

Field Data Required? Y / N

Person Contacted: Jenny Gross Date/Time: 11/12/10 @ 15:52

Comments/ Resolution: - Done 11/30/10 Jan 9 down rd ash TAT per Scott's 11/12/10 @ 16:00 e-mail, despite note on COC

Project Manager Review: MALH

Date: 11/16/10

Note: Whenever there is a discrepancy affecting North Carolina compliance samples, a copy of this form will be sent to the North Carolina DENR, Inc. F-L213Rev.00, 05Aug2009 1700 Elm Street SE, Suite 200, Minneapolis, MN 55417

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255893

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on December 03, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255893

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on seven samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 43-89%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected value were flagged "I" where incorrect isotope ratios were obtained. Concentrations above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show the blanks to contain trace levels of selected congeners. These were below the calibration range of the method. The levels reported for the affected congeners in the field samples were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

Laboratory spike samples were also prepared with the sample batches using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 91-121%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the extraction batches using sample materials from separate projects; results from these analyses will be provided upon request.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

Olympia, WA 98501

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255892

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on December 03, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255892

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on five samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 32-89%. With the exceptions of four low values, which were flagged "R" on the results tables, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected value were flagged "I" where incorrect isotope ratios were obtained.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to be free of PCDDs and PCDFs at the reporting limits, with the exception of a trace level of OCDD. This was below the calibration range of the method. The OCDD levels reported for the field samples were higher than the OCDD level in the blank by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 86-121%, with relative percent differences of 0.1-14.7%. These results indicate generally high degrees of accuracy and precision for these determinations. The background-subtracted recovery value obtained for OCDD in the matrix spike duplicate sample was above the 70-130% target range and may indicate a high bias for this congener in these determinations.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 255985

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on December 11, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 255985

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M3 Matrix spike recovery was outside laboratory control limits due to matrix interferences.

R1 RPD value was outside control limits.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on three samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 63-96%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. The levels reported for the affected congeners in the field samples were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 104-128%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256519

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 08, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256519

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on ten samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 41-139%. With the exception of one low value, which was flagged "R" on the results table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain a trace level of OCDD. This was below the calibration range of the method. The OCDD levels reported for the field samples were higher than the OCDD level in the blank by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 89-118%, with relative percent differences (RPDs) generally from 0.0-16.9%. The background-subtracted recovery values obtained for HpCDD and OCDD in the matrix spike and/or matrix spike duplicate samples were outside the 70-130% target range. Also, the RPD value for OCDD in the matrix spike samples was above the 20% target upper limit; this may indicate an elevated degree of variability for this congener in these determinations.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256520

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 08, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256520

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256548

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 10, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256548

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on nine samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 45-109%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to be free of PCDDs and PCDFs at the reporting limits. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 85-107%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256550

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 10, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256550

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

S2 Surrogate recovery outside laboratory control limits due to matrix interferences (confirmed by similar results from sample re-analysis).

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256547

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 10, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256547

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on nine samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 60-112%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to be free of PCDDs and PCDFs at the reporting limits. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 85-127%, with relative percent differences (RPDs) generally from 2.1-17.3%. The background-subtracted recovery values obtained for most of the hepta and octa-chlorinated congeners in the matrix spike samples were outside the 70-130% target range. Also, the RPD values for HpCDD, OCDF, and OCDD in the matrix spike samples were above the 20% target upper limit; these results may indicate elevated degrees of variability for these congeners in these determinations.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256549

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 10, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Andy Brownfield for
Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256549

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256490

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 05, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256490

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on eight samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 45-91%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show Blank-27836 to contain a trace level of OCDD. This was below the calibration range of the method. The OCDD levels reported for the associated field samples were higher than the OCDD level in the blank by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with each sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 87-113%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batches using sample materials from separate projects; results from these analyses will be provided upon request.

The amount of the labeled cleanup standard used in the preparation of the extracts for samples SPL-29-6, SPL-29-7, and the associated quality control blank and spike was twice the amount specified in our procedures. The actual spike amounts were used in the calculations, and accurate recovery values were reported. It should be noted that the accuracy of the native congener determinations was not impacted by this deviation.

February 18, 2011

Joshua Johnson
Brown & Caldwell
724 Columbia St. NW#420
Olympia, WA 98501

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256498

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 05, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

jennifer.gross@pacelabs.com

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256498

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256491

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 05, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256491

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on seven samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 27-93%. With the exceptions of four low values, which were flagged "R" on the results tables, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain a trace level of OCDD. This was below the calibration range of the method. The OCDD levels reported for the field samples were higher than the OCDD level in the blank by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 98-113%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Containers intact:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	10.
Filtered volume received for Dissolved tests	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	11.
Sample Labels match COC:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	12.
-Includes date/time/ID/Analysis Matrix: <u>SL</u>		
All containers needing acid/base preservation have been checked. Noncompliance are noted in 13.	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	13.
All containers needing preservation are found to be in compliance with EPA recommendation.	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	
Exceptions: VOA, Coliform, TOC, Oil and Grease, WI-DRO (water): <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No		
Samples checked for dechlorination:	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	14.
Headspace in VOA Vials (>5mm):	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	15.
Trip Blank Present:	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	16.
Trip Blank Custody Seals Present	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	
Pace Trip Blank Lot # (if purchased):		

Client Notification/ Resolution: _____ Field Data Required? Y / N
Person Contacted: Jenni Gross Date/Time: 2/7/11 @ 11:07
Comments/ Resolution: confirmed due 2/18, despite note on inv.

Project Manager Review: [Signature] Date: 2/7/11

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256499

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 05, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256499

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256690

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 18, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256690

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

D6 The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

Report of Laboratory Analysis

This report should not be reproduced, except in full, without the written consent of Pace Analytical Services, Inc.

The results relate only to the samples included in this report.

DISCUSSION

This report presents the results from the analyses performed on nine samples submitted by a representative of Pace Analytical Services, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 58-97%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; the affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. The levels reported for the affected congeners in the field samples were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 90-127%, with relative percent differences (RPDs) generally from 0.4-12.4%. The background-subtracted recovery values obtained for most of the hepta and octa-chlorinated congeners in the matrix spike samples were outside the 70-130% target range. Also, the RPD values for 1,2,3,4,6,7,8-HpCDF, HpCDD, OCDF, and OCDD in the matrix spike samples were above the 20% target upper limit; these results may indicate elevated degrees of variability for these congeners in these determinations.

Reporting Flags

- A = Reporting Limit based on signal to noise
- B = Less than 10x higher than method blank level
- C = Result obtained from confirmation analysis
- D = Result obtained from analysis of diluted sample
- E = Exceeds calibration range
- I = Interference present
- J = Estimated value
- Nn = Value obtained from additional analysis
- P = PCDE Interference
- R = Recovery outside target range
- S = Peak saturated
- U = Analyte not detected
- V = Result verified by confirmation analysis
- X = %D Exceeds limits
- Y = Calculated using average of daily RFs
- * = See Discussion

RE: Project: East Bay Redevelopment 138130
Pace Project No.: 256691

Dear Joshua Johnson:

Enclosed are the analytical results for sample(s) received by the laboratory on February 18, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

jennifer.gross@pacelabs.com

QUALIFIERS

Project: East Bay Redevelopment 138130

Pace Project No.: 256691

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

THE CAT SCALE GUARANTEE

The CAT Scale Company **GUARANTEES** that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.®

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
- 2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
- 3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

**THANK YOU FOR
WEIGHING
ON
CAT
SCALE!**

stockpile #7

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. **AXLE WEIGHTS CAN NOT BE CERTIFIED** and are **NOT LEGAL FOR TRADE**, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company GUARANTEES that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. AXLE WEIGHTS CAN NOT BE CERTIFIED and are NOT LEGAL FOR TRADE, however, CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.

THE CAT SCALE GUARANTEE

The CAT Scale Company **GUARANTEES** that our scales will give an accurate weight. What makes us different from other scale companies is that we back up our guarantee with cash.®

IF YOU SHOULD GET AN OVERWEIGHT FINE, YOU SHOULD DO THE FOLLOWING TO GET THE PROBLEM RESOLVED:

- 1) Post bond and request a court date.
- 2) Call CAT Scale Company direct 24 hours a day at 1-877-CAT-SCALE (toll free).
- 3) IMMEDIATELY send a copy of the citation, CAT Scale ticket, your name, company, address, and phone number to CAT Scale Company Attn: Operations Manager.

THANK YOU FOR WEIGHING ON CAT SCALE!

The four weights shown below are separate weights. The TOTAL WEIGHT was weighed on a full length platform scale. **AXLE WEIGHTS CAN NOT BE CERTIFIED** and are **NOT LEGAL FOR TRADE**, however, **CAT SCALE COMPANY GUARANTEES THESE WEIGHTS TO BE CORRECT.**

Appendix G: Data Validation Report

Technical Memorandum

950 West Bannock Street, Suite 250
Boise, Idaho 83702
Tel: 208-389-7700
Fax: 208-389-7750

Prepared for: The City of Olympia and the Lott Alliance

Project Title: Parcel 4 and 5 Interim Action

Project No: 138130

Technical Memorandum

Subject: Data Quality Assessment—Pace Analytical

Date: June 21, 2012

To: Project File

From: Annika Deutsch

Copy to: Jon Turk

Prepared by: 
Annika Deutsch

Limitations:

This document was prepared solely for the City of Olympia and the LOTT Alliance in accordance with professional standards at the time the services were performed and in accordance with the contract between the City of Olympia and the LOTT Alliance and Brown and Caldwell. This document is governed by the specific scope of work authorized by the City of Olympia and the LOTT Alliance; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by the City of Olympia and the LOTT Alliance and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

Executive Summary

A Qualitative Data Usability Review was performed on all analytical data for Sample Delivery Groups (SDGs) listed in Table 1 (see Sample Summary section below) analyzed by Pace Analytical (Pace) of Seattle, Washington. The samples were collected at the Parcels 4 and 5 Site in Olympia, Washington. This review was performed with the general guidance provided by the National Functional Guidelines for Data Review and the project quality assurance project plan.

The following were reviewed for the analysis in this report:

Table E-1. Review Item Summary	
Review Item	Review Summary
COCs	Samples were analyzed for all methods requested on the COCs.
Case narratives	No discrepancies were noted in the data that were not also mentioned in the case narratives.
Analysis data sheets	All requested results were present and accounted for.
Holding time and sample preservation	Some samples were received by Pace outside the recommended temperature.
Laboratory control sample results	All laboratory control sample results were within the laboratory control limits.
Matrix spike results	Some metal and cPAH matrix spike results were outside laboratory control limits.
Laboratory duplicate results	One motor oil laboratory duplicate result was outside laboratory control limits.
Surrogate recoveries	All surrogate recoveries were within the laboratory control limits.
Field duplicate precision	Some field duplicate imprecision was identified. Dioxin/furan TEQ calculation field duplicate results, rather than individual dioxin/furan field duplicate results, were reviewed for precision.
Blank contamination	Some dioxins/furans were detected in method blanks at levels that may bias the sample results.

Overall, the data are acceptable for the intended purposes. No results were rejected as a result of this review. In addition to Pace-applied qualifiers, some results were qualified as estimated due to LCS recoveries, MS/MSD recoveries, and field duplicate imprecision as described in the sections below. Samples have been assessed within and among the sample delivery groups (SDGs), or lab batches.

Sample Summary

Data from the following samples were reviewed as part of this data quality assessment.

A Qualitative Data Usability Review was performed on all analytical data for SDGs listed in Table 1 (above) analyzed by Pace Analytical (Pace) of Seattle, Washington. The samples were collected at the Parcels 4 and 5 Site in Olympia, Washington. The following table outlines the analytical methods uses to analyze the samples:

Table 2. Analytical Methods		
Matrix	Analysis	Method
Confirmation Samples (Soil)*	Metals	EPA 6020A**
	TPH-D, -HO	NWTPH-Dx
	TPH-Gx and BTEX	NWTPH-Gx and EPA 8260B
	Dioxins/Furans	EPA 1613
Stockpiles Samples (Soil)	Metals	EPA 6020A
	cPAHs	EPA 8270C
	TPH-D, -HO	NWTPH-Dx
	TPH-Gx and BTEX	NWTPH-Gx and EPA 8260B
	Dioxins/Furans	EPA 1613

*One or more of the following analyses were requested on the chain-of-custody for the confirmation samples.

**Some samples were analyzed using EPA 6010.

The samples were analyzed for all methods requested on the chains-of-custody (COCs). This review was performed in accordance with the general guidance provided by the National Functional Guidelines for Data Review and the project quality assurance project plan.

Review Items

The following were reviewed for the analysis in this report:

- COCs
- Case narratives
- Analysis data sheets
- Holding time and sample preservation
- Laboratory control sample (LCS)/LCS duplicate (LCS D) recoveries and relative percent differences (RPDs)
- Matrix spike (MS)/MS duplicate (MS D) recoveries and RPDs
- Laboratory duplicate sample RPDs
- Surrogate recoveries
- Field duplicate precision
- Blank contamination

COCs

The COCs were reviewed for completeness and accuracy. There were no discrepancies noted, and all requested analyses were performed.

Case Narratives

The case narratives were reviewed for completeness and accuracy. There were no discrepancies noted in the data that were not also mentioned in the case narratives.

Analysis Data Sheets

The analysis data sheets were reviewed for completeness and accuracy. All requested results were present and accounted for.

Holding Time and Sample Preservation

All samples were properly preserved and no analysis holding times were violated, with the exceptions noted below.

- Samples in SDGs 256323 and 256324 were received by Pace at a cooler temperature of 9.6 degrees Celsius, and samples in SDGs 256690 and 256991 were received by Pace at a cooler temperature of 9.9 degrees Celsius. This may result in a low bias for semivolatiles and volatiles. Based on a discussion with the project manager, no data were qualified based on this temperature exceedance.

LCS/LCSD Recoveries and RPDs

All LCS/LCSD recoveries and RPDs were within the laboratory control limits.

MS/MSD Recoveries and RPDs

All MS/MSD recoveries and RPDs were within the laboratory control limits, with the exceptions noted below.

Table 3. Qualified Data Based on Matrix Spike Recoveries			
WO	Lab ID	Sample ID	Analytes qualified as "J" (estimated)
256210	256210011	CNF-2-11-5	Copper and Nickel
255662	255662011	CNF-4-11-2	Arsenic, Copper, and Lead
255662	255662017	CNF-5-1-15	Lead
255574	255574001	SPL-1-1	cPAHs: anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorine, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene
255818	255818001	SPL-7-1	Copper, Lead, and Nickel
255812	255812011	SPL-8-1	Lead and Nickel
255708	255708001	SPL-12-1	Arsenic, Copper, Lead, Nickel
255893	255893007	SPL-13-7	Copper and Nickel
255892	255892001	SPL-14-1	Copper and Nickel and cPAHs: anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene
256084	256084001	SPL-16-1	cPAHs: anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene
256083	256083003	SPL-16-3	Lead and Nickel

Table 3. Qualified Data Based on Matrix Spike Recoveries			
WO	Lab ID	Sample ID	Analytes qualified as "J" (estimated)
256178	256178008	SPL-17-2	Copper and Lead
256261	256261006	SPL-19-6	Copper and Nickel
256323	256323001	SPL-20-1	Copper, Lead, and Nickel
256324	256324001	SPL-20-1	cPAHs:benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene,, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene
256323	256323011	SPL-21-5	Copper, Lead, and Nickel
256519	256519001	SPL-22-1	Copper
256548	256548002	SPL-25-2	Copper
256547	256547001	SPL-27-1	Copper and Nickel
256549	256549001	SPL-27-1	cPAHs: anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene
256490	256490001	SPL-29-1	Nickel
256491	256491001	SPL-30-1	Copper, Lead, and Nickel
256690	256690001	SPL-31-1	Arsenic and Copper
256691	256691001	SPL-31-1	cPAHs: benzo(a)anthracene, fluoranthene, phenanthrene, and pyrene

Laboratory Duplicate

All laboratory duplicate RPDs were within the laboratory control limits, with the exceptions noted below.

Table 4. Qualified Data Based on Laboratory Duplicate RPDs			
WO	Lab ID	Sample ID	Analytes qualified as "J" (estimated)
255590	255590002	SPL-4-2	Motor Oil

Surrogate Recoveries

All surrogate recoveries were within the laboratory control limits.

Field Duplicate Precision

All field duplicate RPDs were below the project-specific goals of 30 percent for soil samples, with the exceptions noted below. Individual dioxin/furan analytes were not reviewed for this assessment; rather, the Pace-calculated TEQ RPD was analyzed.

Table 4. Qualified Data Based on Field Duplicate Imprecision		
Parent Sample	Duplicate Sample	Analyte with RPD>30%
CNF-2-8-1.75	CNF-2-9-1.75	Arsenic
		Lead
SPL-16-1	SPL-16-7	Copper
		Nickel
		Acenaphthene
		Benzo(a)anthracene

Table 4. Qualified Data Based on Field Duplicate Imprecision		
Parent Sample	Duplicate Sample	Analyte with RPD>30%
SPL-16-1 (cont.)	SPL-16-7 (cont.)	Benzo(a)pyrene
		Benzo(b)fluoranthene
		Benzo(g,h,i)perylene
		Benzo(k)fluoranthene
		Chrysene
		Dibenz(a,h)anthracene
		Fluoranthene
		Fluorene
		Indeno(1,2,3-cd)pyrene
		Phenanthrene
		Pyrene
		Diesel Range SG
		Dioxin/Furan TEQ
SPL-16-2	SPL-16-6	Benzo(k)fluoranthene
		Naphthalene
		Phenanthrene
		Dioxin/Furan TEQ
SPL-18-1	SPL-18-2	Arsenic
SPL-20-4	SPL-20-3	Lead
		Benzo(g,h,i)perylene
SPL-21-1	SPL-21-6	Arsenic
		Anthracene
		Benzo(a)anthracene
		Benzo(a)pyrene
		Benzo(b)fluoranthene
		Benzo(g,h,i)perylene
		Benzo(k)fluoranthene
		Chrysene
		Fluoranthene
		Indeno(1,2,3-cd)pyrene
		Phenanthrene
		Pyrene
		Dioxin/Furan TEQ
SPL-24-2	SPL-24-3	Arsenic
		1-Methylnaphthalene
		2-Methylnaphthalene
		Acenaphthene

Table 4. Qualified Data Based on Field Duplicate Imprecision		
Parent Sample	Duplicate Sample	Analyte with RPD>30%
SPL-24-2 (cont.)	SPL-24-3 (cont.)	Acenaphthylene
		Benzo(a)anthracene
		Benzo(a)pyrene
		Benzo(b)fluoranthene
		Benzo(g,h,i)perylene
		Benzo(k)fluoranthene
		Chrysene
		Dibenz(a,h)anthracene
		Indeno(1,2,3-cd)pyrene
		Pyrene
		Diesel Range SG
		Motor Oil Range SG
		SPL-26-3
Lead		
Anthracene		
Fluoranthene		
Phenanthrene		
SPL-28-1	SPL-28-4	Pyrene
		Arsenic
		Acenaphthene
SPL-29-5	SPL-29-4	Benzo(k)fluoranthene
		Dioxin/Furan TEQ
SPL-31-2	SPL-31-4	Arsenic
		Cadmium
		Lead
		Nickel
		Acenaphthylene
		Benzo(a)pyrene
		Benzo(b)fluoranthene
		Benzo(g,h,i)perylene
		Benzo(k)fluoranthene
		Chrysene
		Indeno(1,2,3-cd)pyrene
		Naphthalene
		Dioxin/Furan TEQ

Blank Contamination

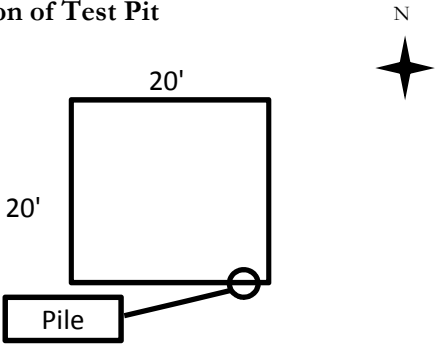

All blanks were non-detect for all compounds, with the exceptions noted below.

- Diesel in the method blank associated with CNF-1-5-9 (255583005); however, the sample result was more than five times the concentration detected in the method blank. Therefore, no data were qualified based on this blank contamination.
- Several dioxin/furan analytes were detected in associated samples. The Pace qualifiers were applied to the TEQ calculated concentrations per the project manager.

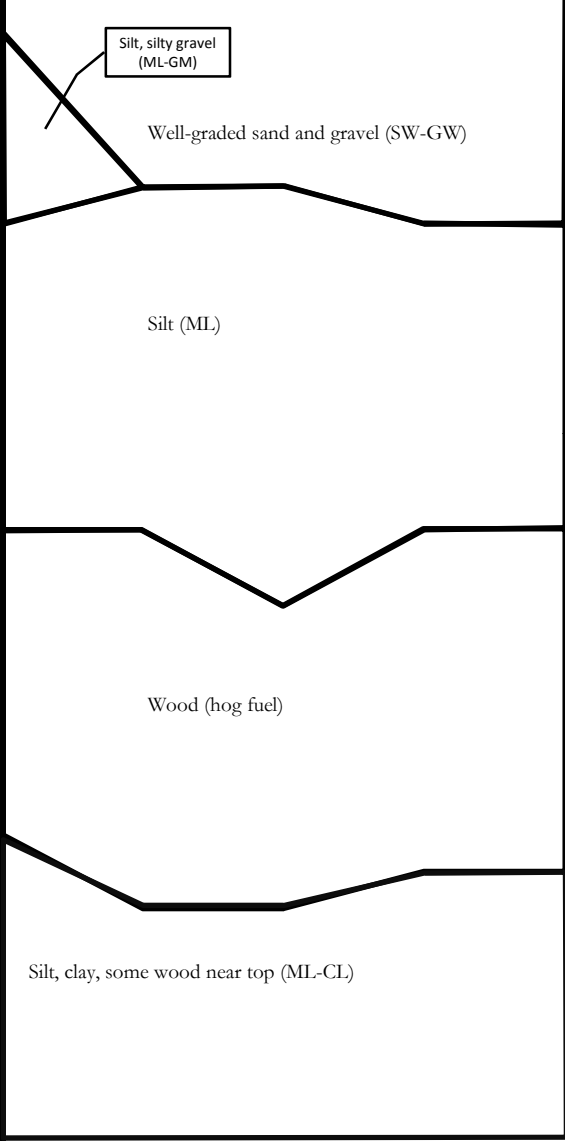

Summary Evaluation of Data and Potential Usability Issues

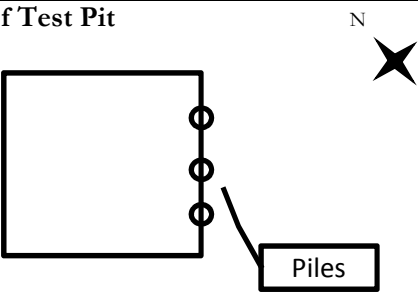

Overall, the data are acceptable for the intended purposes. No results were rejected as a result of this review. In addition to Pace-applied qualifiers, some results were qualified as estimated due to LCS recoveries, MS/MSD recoveries, and field duplicate imprecision as described in the sections above.

Appendix H: Excavation Logs

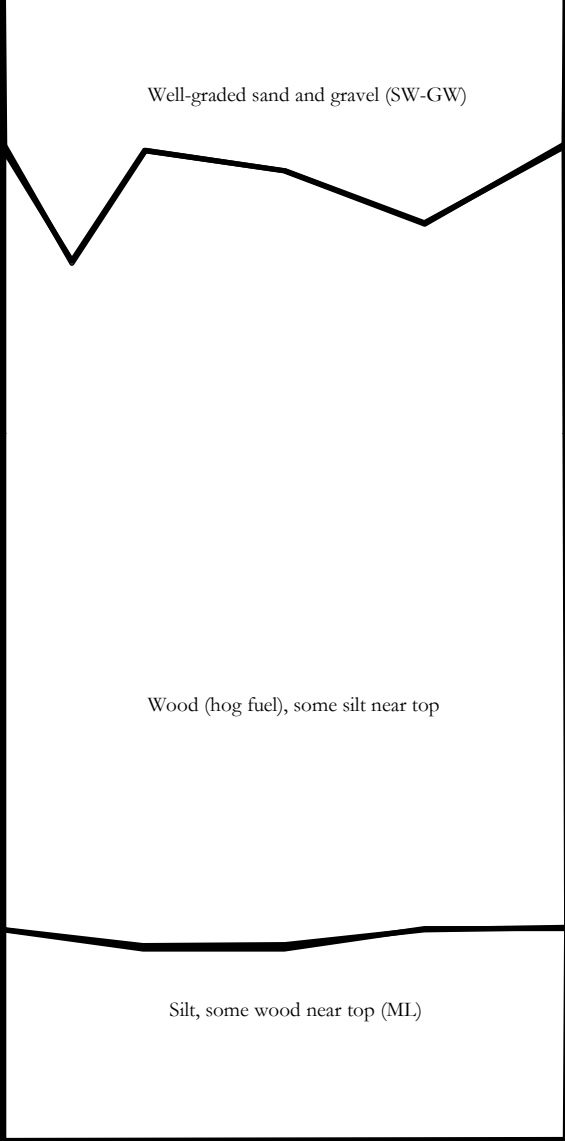

Location of Test Pit 	Client:	City of Olympia
	Location:	HOCM
	Project Name:	Parcel 4 and 5
	Contractor:	Cecanti
	Purpose:	Excavation of hot spot DP-17
	Sampling/Screening:	PID Screening, Samples for As, Pb, Cu, Ni
	Start Date/Time:	11/8/2010, 08:15
End Date/Time:	11/8/2010, 10:30	

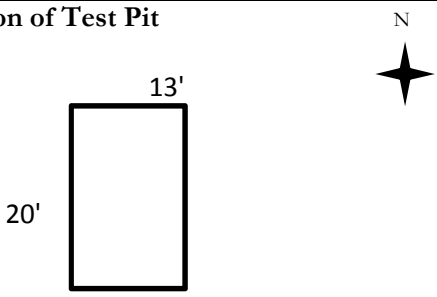

Site Conditions: Temperature in the 40s, cloudy, bare soil at ground surface
