#### **1.0 INTRODUCTION**

This report describes soil assessment activities conducted at the Wenatchee Cemetery site located at 1804 North Western Avenue in Wenatchee, Washington (herein referred to as "site"). The approximate site location is shown in the attached Vicinity Map, Figure 1.

Site environmental activities are managed by the Washington State Department of Ecology (Ecology). This report describes field activities, observations and chemical analytical results associated with soil samples collected at the site. The purpose of the assessment activities described herein was to identify if remnant soil contamination associated with former underground storage tank (UST) operation was present beneath the site. Ecology will use the assessment results to conduct a Site Hazard Assessment (SHA), if necessary, or close the site.

#### 2.0 SITE DESCRIPTION AND BACKGROUND

The site is located on the Wenatchee Cemetery's western side, as shown in Figure 1. The site includes a metal storage building and a paved parking area. The site is located west of North Western Avenue and is bounded by residential properties to the south, a field on the north and an undeveloped field to the west.

On June 10, 1999, a 300-gallon diesel UST, located on the storage building's southwest corner, and a 300-gallon gasoline UST, located on the storage building's northeast corner, were decommissioned and removed. Approximate UST locations are shown in Site Plan, Figure 2. Soil samples collected at a depth of about 6 feet below ground surface (bgs) from beneath the diesel tank contained diesel-range petroleum hydrocarbons (DRPH) at concentrations (5,630 and 6,920 milligrams per kilogram [mg/kg]) that exceeded the Model Toxics Control Act (MTCA) Method A cleanup level (2,000 mg/kg). Remedial actions to address the soil contamination have not been conducted. Soil contamination was not detected beneath the gasoline tank.

#### **3.0 SCOPE OF SERVICES**

The scope of services included the following:

- 1. Prepared a Master Work Plan that included a Sampling and Analysis Plan (SAP), Quality Assurance Project Plan (QAPP), and Health and Safety Plan (HASP).
- 2. Coordinated underground utility locating using the one-call system and Utilities Plus, a private utility locator. Per state regulations, the proposed boring locations were marked prior to initiating the locate request.
- 3. Coordinated subcontractors (drillers, locators and waste disposal contractors) and provided project management services.
- 4. Conducted field assessment activities including the following:
  - a. Observing Environmental West Explorations, Inc. (Environmental West) drill three soil borings (B-1 through B-3) using direct-push drilling techniques. Continuous soil samples were collected using 4-foot long acrylic slip-sleeve samplers.

- b. Observing and documenting subsurface soil conditions. At least one slip-sleeve soil sample was retained for field screening and potential chemical analysis. Field screening consisted of photo-ionization detector (PID) screening, visual observation and water-sheen testing.
- c. Drumming and labeling investigation-derived waste (IDW).
- 5. Submitting one soil sample from each boring to TestAmerica Laboratories, Inc. (TestAmerica) for chemical analysis. Soil samples were submitted for analysis of DRPH and oil-range petroleum hydrocarbons (ORPH) using Northwest Method NWTPH-Dx.
- 6. Entering analytical data into Ecology's Environmental Information Management (EIM) database.
- 7. Preparing this report.

#### 4.0 FIELD ACTIVITIES

#### 4.1. General

Field assessment activities were conducted on November 2, 2016. Site utilities, located near the boring locations, were identified and marked by Utilities Plus prior to drilling. Environmental West advanced three borings (B-1 through B-3) near the former UST excavation using air rotary drilling methods. The boring locations are summarized by the following:

- Soil boring B-1 was drilled southwest of the former diesel UST excavation to the planned 12-foot maximum depth. Soil samples were obtained from the 3½-, 6- and 8½-foot-depth intervals for potential chemical analysis.
- Soil boring B-2 was drilled southeast of the former diesel UST excavation to the planned maximum depth of 12 feet bgs. Soil samples were collected from the 3<sup>1</sup>/<sub>2</sub>-, 6- and 9-foot-depth intervals for potential chemical analysis.
- Soil boring B-3 was drilled northwest of the former diesel UST excavation to the planned maximum depth of 12 feet bgs. Soil samples were collected from the 2-, 5- and 10<sup>1</sup>/<sub>2</sub>-foot-depth intervals for potential chemical analysis.

Environmental West backfilled each boring with bentonite. Excess soil cuttings were placed in a 55-gallon steel drum, labeled and placed at a location approved by the site employees (depicted on Figure 2). Boring logs associated with the borings are included in Appendix A.

#### 4.2. Subsurface Conditions

Observed soil conditions were consistent in the borings with fine to coarse sand with silt, gravel and brick debris; fine to medium sand; and sandy silt observed. Groundwater was not encountered during drilling operations.

#### 4.3. Field Screening and Sampling

Soil samples from each boring were field-screened for the potential presence of petroleum contamination by PID, visual examination and water-sheen testing. PID headspace vapor measurements were not measured above 1 part per million (ppm). Field screening procedures are further described in Appendix A.

Contaminated soil field screening indicators were not observed in collected soil samples. Soil samples from the three borings were collected in laboratory-supplied containers for chemical analysis.

#### 5.0 CHEMICAL ANALYTICAL RESULTS

#### **5.1. Soil Chemical Analytical Results**

Three soil samples were submitted to TestAmerica for the chemical analyses described in "Section 3.0 Scope of Services." The samples were submitted from boring B-1, B-2 and B-3 depth intervals of 8½, 6 and 10½ feet bgs, respectively. Evidence of field screening contamination was not observed in soil samples collected from each boring. TestAmerica's laboratory report is included in Appendix B; chemical analytical results are summarized and compared to MTCA Method A cleanup levels for unrestricted land use in Summary of Chemical Analytical Results – Soil, Table 1.

DRPH and ORPH were not detected greater than the laboratory method reporting limit in the three samples submitted.

Sample Identification	Date Samples	DRPH <sup>1</sup> (mg/kg)	ORPH <sup>1</sup> (mg/kg)
Site-7: B-1 (8.5-9)	11/02/16	<14	<36
Site-7: B-2 (6-6.5)	11/02/16	<11	<27
Site-7: B-3 (10.5-11)	11/02/16	<10	<26
MTCA Method A CUL <sup>2</sup>		2,000	2,000

Notes:

<sup>1</sup>DRPH and ORPH analyzed using Northwest Method NWTPH-Dx

<sup>2</sup>MTCA Method A CUL - Washington State Model Toxics Control Act Method A unrestricted land use cleanup level

#### 6.0 SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Soil assessment activities were conducted November 2, 2016, at the Wenatchee Cemetery site located at 1804 North Western Avenue in Wenatchee, Washington. Three soil borings (B-1 through B-3) were each advanced to a depth of about 12 feet bgs. Observed soil consisted of fine to coarse sand with silt, gravel and brick debris, fine to medium sand, and sandy silt. Groundwater was not encountered in the borings.

One soil sample from each boring was submitted for DRPH and ORPH analysis. DRPH and ORPH were not detected in the submitted samples. Based on the chemical analytical results, in our opinion, a SHA ranking is unnecessary and we recommend a No Further Action designation for the site.

Based on the chemical analytical results, IDW concentrations do not exceed MTCA Method A unrestricted land use cleanup levels and can therefore be reused onsite or disposed as solid waste. The accumulated IDW amounted to less than ¼ of a drum. Alternatively, a contractor can be retained to pick up, transport and dispose the IDW at an appropriate facility.

#### **7.0 LIMITATIONS**

We have prepared this report for the exclusive use of Ecology and their authorized agents.

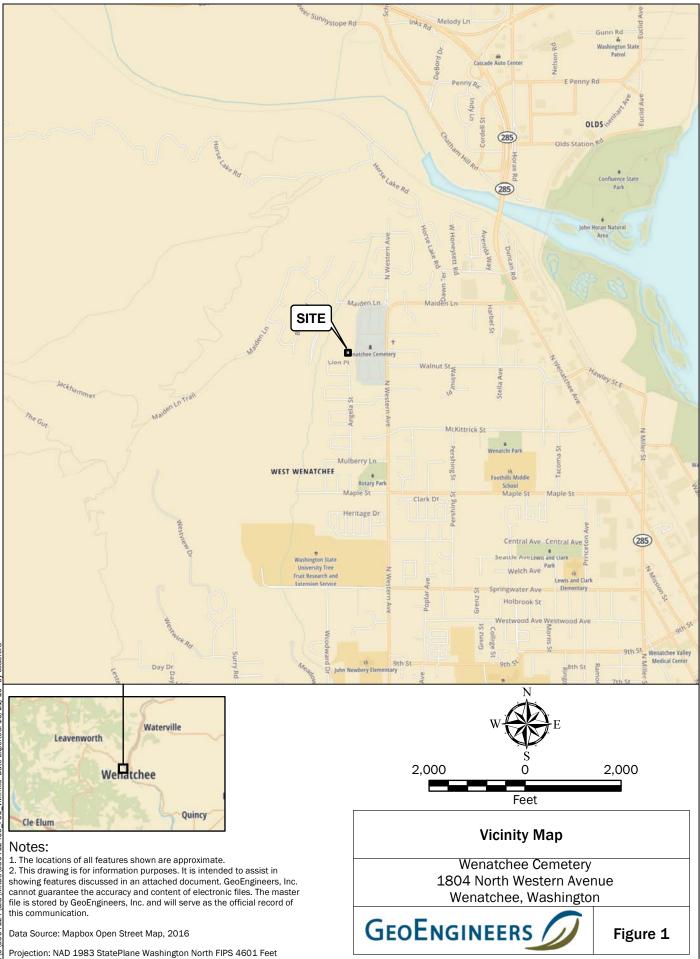

Within the limitations of scope, schedule and budget, our services have been executed in accordance with generally accepted environmental science practices in this area at the time this report was prepared. The conclusions and opinions presented in this report are based on our professional knowledge, judgment and experience. No warranty or other conditions, express or implied, should be understood.

Any electronic form, facsimile or hard copy of the original document (email, text, table and/or figure), if provided, and any attachments should be considered a copy of the original document. The original document is stored by GeoEngineers, Inc. and will serve as the official document of record.

Please refer to "Report Limitations and Guidelines for Use," Appendix C, for additional information pertaining to use of this report.

# APPENDIX A Field Procedures and Boring Logs

#### APPENDIX A FIELD PROCEDURES AND BORING LOGS

#### General

Subsurface conditions at the Wenatchee Cemetery site were explored on November 2, 2016, by advancing three direct-push borings at the approximate locations shown on Figure 2. The borings were each advanced to about 12 feet below existing site grade using an direct push drill rig. Boring locations were established in the field using a site plan and measurements from onsite structures. Consequently, exploration locations should be considered accurate to the degree implied by the method used.

Field methods generally were performed in compliance with the project Master Work Plan assessment procedures.

#### **Soil Sample Collection**

Soil samples were removed from the slip-sleeve sampler using clean nitrile gloves, and transferred into a laboratory prepared container, labeled with a waterproof pen, and placed on wet ice in a clean plastic-lined cooler.

Direct push drilling operations were observed by GeoEngineers staff who examined and classified the soil encountered, obtained soil samples, and maintained a continuous exploration log. Soil encountered in the borings was classified in general accordance with ASTM International (ASTM) D 2488 and the classification chart listed in Key to Exploration Logs, Figure A-1. Boring logs are presented in Figures A-2 through A-4. The logs are based on field data interpretation and indicate the depth at which subsurface materials or their characteristics change, although these changes might actually be gradual.

#### Field Screening of Soil Samples

GeoEngineers' field representative performed field-screening tests on soil samples obtained from the borings. Field screening results were used as a general guideline to assess areas of possible petroleum-related contamination. The field screening methods used include: (1) PID screening; (2) visual screening; and (3) water-sheen screening.

PID screening involves placing soil in a container and after agitating or warming, measuring total volatile organic compounds in the available head space. Visual screening consists of observing soil for stains indicative of metal- or petroleum-related contamination. Water-sheen screening involved placing soil in a pan of water and observing the water surface for signs of sheen. Sheen screening may detect both volatile and nonvolatile petroleum hydrocarbons. Sheens observed are classified as follows:

No Sheen (NS)	No visible sheen on the water surface.
Slight Sheen (SS)	Light, colorless, dull sheen; spread is irregular, not rapid; sheen dissipates rapidly. Natural organic matter in the soil may produce a slight sheen.
Moderate Sheen (MS)	Light to heavy sheen; may have some color/iridescence; spread is irregular to flowing, may be rapid; few remaining areas of no sheen on the water surface.
Heavy Sheen (HS)	Heavy sheen with color/iridescence; spread is rapid; entire water surface may be covered with sheen.

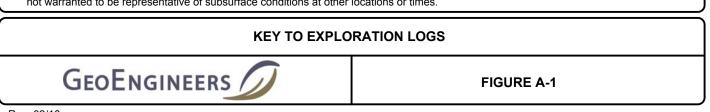

Field screening results can be site specific. The effectiveness of field screening can vary with temperature, moisture content, organic content, soil type, and contaminant type and age.

# **APPENDIX B** Chemical Analytical Laboratory Reports

#### APPENDIX B CHEMICAL ANALYTICAL LABORATORY REPORTS

#### Samples

Chain-of-custody procedures were followed during the transport of the field samples to TestAmerica located in Spokane, Washington. The samples were held in cold storage pending extraction and/or analysis. The analytical results and quality control records are included in this appendix.

#### **Analytical Data Review**

The laboratory maintains an internal quality assurance/quality control (QA/QC) program as documented in its laboratory quality assurance manual. The laboratory uses a combination of blanks, surrogate recoveries, duplicates, matrix spike recoveries, matrix spike duplicate recoveries, blank spike recoveries and blank spike duplicate recoveries to evaluate the analytical results. The laboratory also uses data quality goals for individual chemicals or groups of chemicals based on the long-term performance of the test methods. The data quality goals were included in the laboratory report dated November 14, 2016.

#### **Analytical Data Review Summary**

We reviewed the laboratory internal QA/QC in the context of data quality goals. Based on our review, in our opinion, the quality of the analytical data is acceptable for the intended use.

# **APPENDIX C** Report Limitations and Guidelines for Use

#### APPENDIX C REPORT LIMITATIONS AND GUIDELINES FOR USE<sup>1</sup>

This Appendix provides information to help you manage your risks with respect to the use of this report.

#### **Environmental Services Are Performed for Specific Purposes, Persons and Projects**

This report has been prepared for the exclusive use of the Washington State Department of Ecology (Ecology). This report is not intended for use by others, and the information contained herein is not applicable to other sites.

GeoEngineers structures our services to meet the specific needs of our clients. For example, an environmental site assessment study conducted for a property owner may not fulfill the needs of a prospective purchaser of the same property. Because each environmental study is unique, each environmental report is unique, prepared solely for the specific client and project site. No one except Ecology should rely on this environmental report without first conferring with GeoEngineers. This report should not be applied for any purpose or project except the one originally contemplated.

#### This Environmental Report is Based on a Unique Set of Project-Specific Factors

This report has been prepared for the Wenatchee Cemetery site located at 1804 North Western Avenue in Wenatchee, Washington. GeoEngineers considered a number of unique, project-specific factors when establishing the scope of services for this project and report. Unless GeoEngineers specifically indicates otherwise, do not rely on this report if it was:

- not prepared for you,
- not prepared for your project,
- not prepared for the specific site explored, or
- completed before important project changes were made.

If important changes are made after the date of this report, GeoEngineers should be given the opportunity to review our interpretations and recommendations and provide written modifications or confirmation, as appropriate.

#### **Reliance Conditions for Third Parties**

Our report was prepared for the exclusive use of Ecology. No other party may rely on the product of our services unless we agree in advance to such reliance in writing. This is to provide our firm and Ecology with reasonable protection against open-ended liability claims by third parties with whom there would otherwise be no contractual limits to their actions. Within the limitations of scope, schedule and budget, our services have been executed in accordance with our Agreement with Ecology and generally accepted environmental practices in this area at the time this report was prepared.

<sup>&</sup>lt;sup>1</sup> Developed based on material provided by ASFE, Professional Firms Practicing in the Geosciences; www.asfe.org.

#### **Environmental Regulations are Always Evolving**

Some substances may be present in the site vicinity in quantities or under conditions that may have led, or may lead, to contamination of the subject site, but are not included in current local, state or federal regulatory definitions of hazardous substances or do not otherwise present current potential liability. GeoEngineers cannot be responsible if the standards for appropriate inquiry, or regulatory definitions of hazardous substance, change or if more stringent environmental standards are developed in the future.

#### **Uncertainty May Remain Even After This Phase II ESA is Completed**

No ESA can wholly eliminate uncertainty regarding the potential for contamination in connection with a property. Our interpretation of subsurface conditions in this study is based on field observations and chemical analytical data from widely-spaced sampling locations. It is always possible that contamination exists in areas that were not explored, sampled or analyzed.

#### **Subsurface Conditions Can Change**

This environmental report is based on conditions that existed at the time the study was performed. The findings and conclusions of this report may be affected by the passage of time, by manmade events such as construction on or adjacent to the site, by new releases of hazardous substances, or by natural events such as floods, earthquakes, slope instability or groundwater fluctuations. Always contact GeoEngineers before applying this report to determine if it is still applicable.

#### **Most Environmental Findings are Professional Opinions**

Our interpretations of subsurface conditions are based on field observations and chemical analytical data from widely spaced sampling locations at the site. Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted or samples are taken. GeoEngineers reviewed field and laboratory data and then applied our professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ – sometimes significantly – from those indicated in this report. Our report, conclusions and interpretations should not be construed as a warranty of the subsurface conditions.

#### **Do Not Redraw the Exploration Logs**

Environmental scientists prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in an environmental report should never be redrawn for inclusion in other design drawings. Only photographic or electronic reproductions are acceptable, but recognize that separating logs from the report can elevate risk.

#### **Read These Provisions Closely**

Some clients, design professionals and contractors may not recognize that the geoscience practices (geotechnical engineering, geology and environmental science) are far less exact than other engineering and natural science disciplines. This lack of understanding can create unrealistic expectations that could lead to disappointments, claims and disputes. GeoEngineers includes these explanatory "limitations" provisions in our reports to help reduce such risks. Please confer with GeoEngineers if you are unclear how these "Report Limitations and Guidelines for Use" apply to your project or site.

#### Geotechnical, Geologic and Geoenvironmental Reports Should Not be Interchanged

The equipment, techniques and personnel used to perform an environmental study differ significantly from those used to perform a geotechnical or geologic study and vice versa. For that reason, a geotechnical engineering or geologic report does not usually relate any environmental findings, conclusions or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. Similarly, environmental reports are not used to address geotechnical or geologic concerns regarding a specific project.

#### **Biological Pollutants**

GeoEngineers' Scope of Work specifically excludes the investigation, detection, prevention or assessment of the presence of Biological Pollutants. Accordingly, this report does not include any interpretations, recommendations, findings, or conclusions regarding the detecting, assessing, preventing or abating of Biological Pollutants and no conclusions or inferences should be drawn regarding Biological Pollutants, as they may relate to this project. The term "Biological Pollutants" includes, but is not limited to, molds, fungi, spores, bacteria, and viruses, and/or any of their byproducts.

If Ecology desires these specialized services, they should be obtained from a consultant who offers services in this specialized field.
