Re: Additional Phase II Environmental Site Assessment Letter Report
Safeway Store 1477 Proposed Fueling Center
Former Al's Auto Supply
5314 15th Avenue Northwest, Seattle, Washington

EPI Project No. 082165.1

Dear Mr. Johnson:

Environmental Partners, Inc. (EPI) is pleased to provide this letter report presenting the results of a recently completed Additional Phase II Environmental Site Assessment (ESA) for the property located at 5314 15th Avenue Northwest in Seattle (Ballard), Washington (subject property). The general location of the subject property is shown on Figure 1.

This Additional Phase II ESA focused on continued investigation of the environmental impacts identified during our original Phase II ESA (dated November 29, 2001):

EPI also previously prepared a Phase I ESA of the subject property (dated November 29, 2001) which identified the following potential environmental liabilities:

- EPI reviewed an August 2001 Letter Report prepared by Geo Group Northwest, Inc. that describes the results of exploratory soil borings on the subject property. Gasoline-range petroleum hydrocarbons (GRPH), benzene, ethylbenzene, and total xylenes were detected in soil samples at depths to 12 feet on the western edge of the property. Petroleum hydrocarbon impacts were also detected in shallow soil samples on the eastern edge of the property. No information on ground water conditions was presented in that letter report.
- EPI's historical investigation determined that there was a fueling station located on the western portion of the subject property. EPI reviewed documents that indicated that USTs would be removed during demolition of the fueling station, however no documentation was found indicating that the USTs had actually been removed. EPI has requested additional documentation from counsel for the property owner but the documents have not been provided.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

- Chlorinated solvents [i.e., Perchloroethene (PCE) and environmental degradation products] were detected in ground water samples on The Tux Shop site northwest of the subject property and appear to have migrated off-site onto the Wendy's site to the west of the subject property. The extent of those impacts has not been characterized, but as much as 12,000 micrograms/liter ($\mu\text{g}/\text{L}$) of PCE was detected in ground water just northwest (i.e., up-gradient) of the subject property.
- Reports for site 5479, at the same address as The Tux Shop site, indicate that GRPH, BTEX compounds, and Halogenated Volatile Organic Compounds (VOCs) were detected in ground water samples at the location of the former Unocal Service Station 5479. Separate-phase hydrocarbons were detected in 3 of the monitoring wells in 1993 and 4,000 tons of petroleum-contaminated soil (PCS) were excavated and removed. Following soil removal, samples from several on-site wells continued to contain gasoline-related contaminants above MTCA Method A Ground Water Cleanup Levels.
- Petroleum-contaminated soil was reported to exist at the Seattle Fire Station 18 site located northwest of the subject property. Approximately 270 tons of PCS were removed, but the vertical extent of soil contamination and potential ground water impacts were not characterized.

EPI subsequent Phase II ESA of the subject property (dated November 29, 2001) presented the following general conclusions:

- Ground water was encountered at depths ranging from 13 feet below grade to 21 feet below grade and ground water was generally shallower in the eastern portion of the subject property than in the western portion.
- The analytical data collected to date suggest that there is a substantial volume of PCS at the subject property impacted with both GRPH and diesel-range petroleum hydrocarbons (DRPH). The currently available data indicate that there may be greater than 3,000 cubic yards of PCS at the subject property with GRPH and DRPH at concentrations exceeding the MTCA Method A Soil Cleanup Level for Unrestricted Land Use. Additional investigation is necessary to more clearly characterize the limits and volumes of contaminated soils.
- As noted above, in order to further constrain the volume of PCS at the subject property it will be necessary to collect additional soil samples, some of which will need to be collected from beneath the on-site building. This can best be performed by using a limited access direct-push technology (DPT) sampling rig inside the building. This type of DPT rig can be bolted to the floor and should be capable of collecting samples from as deep as about 15 feet below grade. This depth is generally equivalent to the maximum depth of the fill material. Advancing and sampling three to six DPT borings down to a depth of about 15 feet inside the building should be adequate for estimating the volume of PCS beneath the on-site building.
- The analytical data indicate that contaminants of concern (COCs) at the subject property that will drive soil remediation activities include total naphthalenes and cPAHs, as well as GRPH and DRPH. Benzene may also drive the extent of soil remediation in some areas.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

- Ground water at the subject property is impacted with GRPH, DRPH, PCE, and TCE at concentrations above MTCA Method A Ground Water Cleanup Levels. In addition, cis 1,2-Dichloroethene (DCE) was detected in ground water at concentrations very near the MTCA Method B Ground Water Cleanup Level.
- The apparent source for the GRPH and DRPH detected in ground water is the historic on-site gasoline station operation. The apparent age and degree of weathering of the GRPH suggest that these compounds are from a historic release.
- The relative concentrations of PCE, TCE, and cis 1,2-DCE suggest that the TCE and cis 1,2-DCE may be present as environmental degradation products of the PCE. The most likely source for the PCE is the historic up-gradient and off-site dry cleaners. The observed concentrations are consistent with the on-site migration of an off-site release of PCE and the attendant environmental weathering of the initial PCE release(s).
- The current level of environmental investigation at the subject property has not positively characterized the exact source area(s) for the observed impacts or the horizontal extent of those impacts to either soil or ground water. However, the data do indicate that the extent of ground water impacts at the subject property most likely extend beyond the property boundary. It is also possible that the impacts to soil from on-site petroleum hydrocarbon releases may extend beyond the western and southern property boundaries.
- It is EPI's opinion that the environmental conditions observed at the subject property represent a condition that requires reporting to the Washington Department of Ecology (Ecology), Toxics Cleanup Program. The responsibility for reporting the observed conditions generally lies with the property owner or operator. EPI recommends that Safeway seek the advice of counsel regarding reporting responsibilities and options.

Based on the previously collected data, EPI made the following recommendations for this Additional Phase II ESA:

- Perform additional soil sampling both inside and outside the on-site building. Soil borings and samples outside the building should be sited to constrain the limits of GRPH and DRPH that exceed the MTCA Method A Soil Cleanup Levels for Unrestricted Land Use
- Performing ground water sampling and analysis for petroleum hydrocarbons and VOCs in about six of the soil sampling locations.
- Installation and sampling of at least three shallow ground water monitoring wells. The locations of these wells should be based on the data collected during the earlier phases of investigation with the objective of characterizing the local ground water flow direction and establishing a repeatable and defensible methodology for sampling ground water quality.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI-Project No. 082165.1
May 2, 2002

- Developing a fueling center layout that places the UST installation excavation in the far eastern portion of the subject property, which appears to be outside the area of greatest soil impacts.

The work described herein was performed in general accordance with the basic scope of work described in EPI's proposal to Safeway dated April 16, 2001. Modifications to this agreed upon scope of work included:

- The advancement of 6 soil borings within the store building using Direct-Push Technology (DPT) and the installation of 3 ground water monitoring wells in the parking lot using a Hollow Stem Auger (HSA), based on the recommendations made in the Phase II ESA.
- Analysis of additional soil samples necessary to characterize the vertical extent of impacts to soil,
- The addition of laboratory analyses for VOCs, naphthalenes and polycyclic aromatic hydrocarbons (PAHs).

OBJECTIVES

As stated above, this Additional Phase II ESA focused on better characterizing the extent of soil and ground water contamination on the subject property. The general objectives of this Additional Phase II ESA included:

- Further delineating the vertical and horizontal extent of petroleum hydrocarbon impacts to soil and ground water beneath the subject property, especially underneath the existing building,
- Further investigating potential impacts to ground water beneath the subject property that may have resulted from an off-site release,
- Installing ground water monitoring wells to better determine hydrogeologic conditions and ground water quality, and
- Investigating the likelihood that petroleum hydrocarbons originating on-site have contaminated off-site soil and/or ground water.

SCOPE OF WORK

Work on the Additional Phase II was completed in two phases. During the initial phase, EPI advanced a total of 6 soil borings using direct-push technology (DPT) sampling techniques inside the AI's Auto Supply building. The second phase involved installing three ground water monitoring wells in the parking lot of the property using standard hollow stem auger (HSA) drilling and well installation techniques. Figure 2 presents a representation of the subject property with sampling locations and the proposed UST pit and fueling island locations.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

Five of the six DPT borings, and all three monitoring well borings, were advanced to a depth of about 15 to 20 feet, approximately 5 to 10 feet below the upper surface of the water table aquifer. Boring BSB10A hit refusal at approximately 1 foot due to either a cobble or sewer pipe. Boring BSB10B was then advanced to a depth of about 18 feet in a location approximately 4 feet to the north of BSB10A.

During probing, soil samples were collected continuously and screened for the presence of volatile compounds using a photoionization detector (PID) and for separate-phase hydrocarbons using sheen testing. During the well drilling, soil samples were collected using a split-spoon sampler at 5 foot intervals and were also field screened using a PID and sheen testing. The soil conditions encountered during drilling were described using the Unified Soil Classification System (USCS) visual-manual procedures (ASTM 2488D). The results of field screening and the soil conditions encountered during drilling are presented on soil borings logs in Attachment A.

The same soil sampling methods were used during the well drilling, except that soil samples were collected using a split-spoon sampler at 5 foot intervals.

Soil samples were selected for laboratory analysis based upon the results of field screening. A total of 18 soil samples were submitted for the analyses presented on Table 1.

Each monitoring well was constructed of 2-inch diameter Schedule 40 PVC and was completed at the surface with a traffic-rated flush mounted monument. The screened interval of each well is 0.010 factory machine slotted PVC, which is surrounded by an annular filter pack of clean washed silica sand. Each well has a bentonite and concrete seal to the surface. All wells were installed by a Washington-licensed well driller in accordance with the Minimum Standards for Construction and Maintenance of Wells (WAC 173-160). The well completion logs are presented in Attachment A.

Upon completion, each of the 3 monitoring wells was developed to remove drilling fines from within the well casing. In general, a maximum of 10 wetted casing volumes of development water was removed from these wells during development.

After completion, the vertical elevation of each of the wells was surveyed relative to an assumed on-site datum, assumed to be 100.00 feet above mean sea level. The northernmost point of the PVC casing of each well was surveyed to a precision of 0.01 feet using optical rod and level techniques.

Ground water was encountered in all of the boring and probe locations at depths ranging from 8 to 15 feet below grade. Ground water grab samples were collected from the boring locations using a peristaltic pump and dedicated tubing. For the monitoring wells, ground water samples were collected using a peristaltic pump and dedicated tubing following well development. All sampling was performed by reducing the pump flow rate to about 100 milliliters/minute and collecting a sample directly from the pump discharge tubing. Ground water samples were placed in laboratory-supplied containers appropriate for the intended analyses. At the completion of sampling at a particular location, all of the used tubing was discarded and no portion of that tubing was re-used at any other locations.

Ground water samples were submitted for the analyses presented on Table 2.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

Immediately upon collection, all soil and ground water samples were labeled and placed in an iced cooler pending submittal to the analytical laboratory. All samples were handled and transported under standard chain-of-custody protocols.

FINDINGS

Subsurface Conditions

The general soil profile at the subject property consisted of asphalt underlain by base rock at the surface in the parking lot area. Inside the building, concrete underlain by Poorly Graded Sand was found at the surface. The general soil profile consisted of an apparent fill material or reworked native soil which was logged as a Silty Sand or Sandy Silt with Gravel. Below this upper material the soils generally consisted of a Well-Graded to Poorly-Graded Sand with varying percentages of silt and gravel. This material was consistent in appearance and composition with the native glacial till common in the area of the subject property. There was an apparent contact between the upper material and the underlying native glacial till soils. The exact depth of this contact is difficult to discern but appeared to be about 5 feet deep in the western portion of the subject property and as deep as 8 to 10 feet below grade in the eastern portion of the subject property.

Field screening results are also indicated on the boring logs. Substantially higher PID readings were observed in samples from BSB7 and BSB9 than from soil samples from the other borings. Using the PID as an indicator of gross soil impacts suggests that a zone of impacts exists from near the surface to a depth of at least 15 to 18 feet below grade in BSB7 and BSB9. This finding is consistent with the resulting analytical data discussed below. PID readings were less prominent in the other borings but analytical data indicate that soil in other areas of the subject property also exceeds MTCA Method A Soil Cleanup Levels for Unrestricted Land Use.

Saturated conditions were generally first encountered at depths of 13 to 15 feet below grade and the static water level eventually stabilized at a depth of about 8 to 11 feet below grade. The investigation was performed in late January and this water level likely represents a near seasonal high elevation for the local water table. Based on measured water levels within the monitoring wells, the average hydraulic gradient appears to be about 0.026 feet per foot to the southeast. This hydraulic gradient direction is generally consistent with the topography of the area and the reported gradient direction for nearby sites. Figure 3 presents the ground water table elevations and contours.

Detailed descriptions of the soil types encountered at each boring location and the results of field screening are presented on the boring logs in Attachment A.

Analytical Results

Soil Samples

A total of 18 soil samples were submitted for a range of laboratory analyses during this Additional Phase II ESA. The analytical results for these soil sample analytical results are summarized in Tables 3, 4, and 5. Final laboratory analytical reports are presented in Attachment B.

GRPH were detected in 2 soil samples from borings BSB10B and BSB11. The detected concentrations ranged from 3 milligrams/kilogram (mg/kg) to 6 mg/kg and were both below the applicable MTCA Method A Soil Cleanup Level of 30 mg/kg.

DRPH were detected in 8 soil samples from borings BSB7, BSB9, BSB10B, and BSB11. The detected concentrations ranged from 90 milligrams/kilogram (mg/kg) to 14,000 mg/kg and exceeded the MTCA Method A Soil Cleanup Level of 2,000 mg/kg in samples BSB10B:14.5' and BSB11:14.5'.

Oil-range petroleum hydrocarbons (ORPH) were detected in 1 soil sample at a concentration of .50 mg/kg, below the MTCA Method A Soil Cleanup Level for Unrestricted Land Use of 2,000 mg/kg for ORPH.

Benzene was not detected in any soil samples at a concentration exceeding the detection limit (i.e., 0.01 to 0.20 mg/kg) of the method used. Toluene was detected in two soil samples, BSB9:10' and BSB10B:14.5' at concentrations of 0.28 and 0.2 mg/kg respectively. Ethylbenzene was detected in seven soil samples at concentrations ranging from 0.13 mg/kg to 5.8 mg/kg. Total xylenes were detected in these same seven soil samples at concentrations ranging from 1.36 mg/kg to 42 mg/kg. Only in samples BSB7:10' and BSB9:10' were detected concentrations of total xylenes greater than the MTCA Method A Soil Cleanup Level for Unrestricted Land Use of 9 mg/kg. In no cases were detected concentrations of toluene or ethylbenzene at a concentration greater than the MTCA Method A Soil Cleanup Level for Unrestricted Land Use for these compounds.

The detected concentrations of BTEX compounds indicate that the appropriate MTCA Method A Soil Cleanup Level for GRPH at the subject property will be 30 mg/kg. The 30 mg/kg soil cleanup level is to be used when either benzene is present or the total concentration of toluene, ethylbenzene, and total xylenes exceeds one percent of the total GRPH concentration. This condition was met in 7 of the samples during this round of sampling. This condition was also previously met in soil sample BSB1.

Other VOCs detected in the soil samples include n-Propyl Benzene, 1,3,5-Trimethylbenzene, 1,2,3-Trimethylbenzene, s-Butylbenzene, p-Isopropyltoluene, n-Butylbenzene, naphthalene, and PCE. Of these VOCs, only naphthalenes and PCE have MTCA Method A Soil Cleanup Levels for Unrestricted Land Use. The other detected VOCs are regulated under MTCA Method A as constituents of GRPH. Naphthalenes are discussed in further detail later in the results section. PCE was detected in BSB7 at a depth of 14.5' at a concentration of 1.1 mg/kg, above the Method A Soil Cleanup Level for Unrestricted Land Use of 0.05 mg/kg.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

Based upon the analytical results from the previous investigations, all soil samples collected during this Additional Phase II Investigation were also submitted for analysis of naphthalenes and cPAHs.

Total naphthalenes (i.e., naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) were detected in 8 of the samples and the results are summarized in Table 4. The sum of detected total naphthalenes concentrations ranged from 0.05 mg/kg to 57 mg/kg. The MTCA Method A Soil Cleanup Level for Unrestricted Land Use for total naphthalenes is 5.0 mg/kg. Six of the samples, from borings BSB7, BSB9, BSB10B, and BSB11, exceeded this cleanup level. In previous sampling, both soil samples from BSB1 which were submitted for this analysis exceeded the MTCA Method A Soil Cleanup Level.

Table 4 also summarizes the analytical results for cPAHs. There are seven cPAHs and at least one of these compounds was detected in four of the samples. As with naphthalenes, cPAHs are regulated as the sum total of all the cPAHs. However, cPAH concentrations are normalized, through the use of Toxicity Equivalency Factors (TEFs), to the toxicity of benzo(a)pyrene before summing. Using this approach only the cPAH concentration in sample BSB7 at 2.5 feet below grade and BSB10B at 5 feet below grade (i.e., 0.208 and 0.401 mg/kg respectively) exceeded the MTCA Method A Soil Cleanup Level for Unrestricted Land Use for total cPAHs of 0.10 mg/kg. In previous sampling, the cPAH concentration in BSB3 at 5 feet was also above this cleanup level.

The spatial distribution of GRPH and DRPH analytical results, for samples collected during both this Additional Phase II ESA and the previous investigations, is presented on Figure 4. Figure 4 also presents a reasonable estimate of the lateral extent of PCS that contains GRPH and DRPH at concentrations above the MTCA Method A Soil Cleanup Levels for Unrestricted Land Use. GRPH contaminated soil appears to extend from near the western edge of the property to just east of the eastern edge of the building. Because the practical quantitation limit (PQL) for GRPH for many of the samples beneath the building exceeded 30 milligrams/kilograms but GRPH was not detected, it is not possible to conclude that GRPH contamination does not extend beyond the south property line. DRPH contamination of soil above the MTCA Method A Soil Cleanup Level for Unrestricted Land Use appears to exist north of the eastern portion of the building and extends underneath the eastern portion of the building, and most likely beyond the south property line. Up to 3,000 cubic yards of impacted soil will require excavation in order to establish on-site compliance with the contaminants of concern for soil. The volume of off-site soil potentially impacted from historic on-site releases is not currently known.

Ground Water Samples

As noted above, a total of eight ground water samples were submitted for a range of laboratory analyses indicated in Table 2. The analytical results for these ground water samples are summarized in Tables 6, 7, and 8.

GRPH were detected in four of the eight ground water samples at concentrations ranging from 460 µg/L to 60,000 µg/L. Three of these samples (BSB7, BSB9, and BSB10) exceeded the MTCA Method A Ground Water Cleanup Level of 800 µg/L. This 800 µg/L cleanup level is used if benzene is detected in ground water, which was the case in BSB9 and BSB10 (see below). In addition, the PQL for BSB11

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 - Proposed Fuelling Center
EPI Project No. 082165.1
May 2, 2002

exceeded the MTCA Method A Ground Water Cleanup Level. Previously, GRPH was detected in BSB1 above the MTCA Method A Ground Water Cleanup Level.

DRPH were detected in three of the eight ground water samples (i.e. BSB9, BSB10, BSB11) at concentrations ranging from 430 µg/L to 390,000 µg/L. In samples BSB10 and BSB11, the detected concentrations of DRPH exceeded the MTCA Method A Ground Water Cleanup Level of 500 µg/L. Previously, DRPH had been detected in the sample from BSB5 at a concentration exceeding the MTCA Method A Ground Water Cleanup Level.

The elevated concentrations of GRPH and DRPH detected in samples BSB7 and BSB9 through BSB11 are strongly suggestive of the presence of separate-phase hydrocarbons. The spatial distribution of petroleum-range hydrocarbons in ground water is presented in Figures 5 and 6. GRPH impacted ground water appears to extend from near the western edge of the property to the southeast, possibly extending beyond the south property line. DRPH impacted ground water appears to extend from near the northeast corner of the building to the south, likely extending beyond the south property line.

Benzene was detected in two ground water samples, BSB9 and BSB10, at concentrations of 780 µg/L and 3,300 µg/L respectively. These concentrations are well above the MTCA Method A Ground Water Cleanup Level for benzene of 5 µg/L. Toluene was also detected in these same ground water samples at concentrations of 5,700 µg/L and 3,700 µg/L, above the MTCA Method A Ground Water Cleanup Level of 1,000 µg/L. Ethylbenzene was detected in the samples from BSB7, BSB9, BSB10, and BSB11 at concentrations ranging from 100 µg/L to 5,300 µg/L. The MTCA Method A Ground Water Cleanup Level for ethylbenzene is 700 µg/L and was exceeded in the samples from BSB7, BSB9, and BSB11. Total xylenes were detected at concentrations ranging from 89 µg/L to 27,500 µg/L in samples BSB7, BSB9, BSB10, and BSB11. The MTCA Method A Ground Water Cleanup level for total xylenes is 1,000 µg/L and was exceeded in samples BSB7, BSB9, and BSB10.

Methyl tertiary butyl ether (MTBE) was not detected in any of the ground water samples at concentrations above the detection limit of the method used.

The ground water samples were submitted for analysis of VOCs. These data are summarized in Table 6.

Aside from the BTEX compounds, a total of 12 other VOCs were detected in the samples submitted for VOC. Seven of these 12 VOCs are fuel-related compounds and are common components of gasolines. The seven fuel related compounds detected in ground water are:

- Naphthalene,
- 1,3,5-Trimethylbenzene,
- 1,2,4-Trimethylbenzene,
- Isopropyl benzene,
- n-Propyl benzene,
- n-Butylbenzene, and
- s-Butylbenzene.

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

With the exception of naphthalene and isopropyl benzene these compounds are regulated under MTCA as components of GRPH. The detected naphthalene concentrations (i.e. BSB7, BSB9, BSB10, and BSB11) were all above the MTCA Method A Ground Water Cleanup Level of 160 µg/L. Naphthalene results are discussed further below. Isopropyl benzene was detected in samples from BSB7, BSB9, and BSB11 at concentrations ranging from 52 µg/L to 490 µg/L, below the MTCA Method B Ground Water Cleanup Level of 1,600 µg/L.

The five other VOCs detected in ground water at the subject property are chlorinated compounds and include:

- Tetrachloroethene (PCE),
- Trichloroethene (TCE),
- Cis-1,2-Dichloroethene (DCE),
- Trans-1,2-Dichloroethene, and
- Vinyl Chloride.

PCE was detected in six of the samples (i.e. BSB7, BSB8, BSB9, MW-1, MW-2, and MW-3) at concentrations ranging from 440 µg/L to 4,500 µg/L. Each of these concentrations exceeds the MTCA Method A Ground Water Cleanup Level of 5.0 µg/L. The two samples (i.e. BSB10 and BSB11) that did not have detected concentrations of PCE had PQL's above the MTCA Method A Ground Water Cleanup level. PCE had previously been detected, above MTCA Method A Ground Water Cleanup Levels, in samples BSB1, BSB2, and BSB5.

TCE was detected in the same six samples as PCE at concentrations ranging from 3 µg/L to 680 µg/L. The detected concentrations in samples from BSB7, BSB9, MW-1, MW-2, and MW-3 exceed or equal the MTCA Method A Ground Water Cleanup Level of 5.0 µg/L. TCE was previously detected in BSB1, BSB2, and BSB5 above the MTCA Method A Ground Water Cleanup Level.

The same six samples, (i.e. BSB7, BSB9, BSB11, MW-1, MW-2, and MW-3) had detected concentrations of cis-1,2-DCE ranging from 12 µg/L to 4,400 µg/L. The detected concentrations in samples from BSB7, BSB9, and BSB11 were above the MTCA Method B Ground Water Cleanup Level of 80 µg/L. Cis-1,2-DCE was previously detected in three samples (BSB1, BSB2, and BSB5), but at levels below the MTCA Method B Ground Water Cleanup Level. Trans-1,2-Dichloroethene was detected in the sample from MW-1 at a concentration of 3 µg/L, below the MTCA Method B Ground Water Cleanup Level of 1,600 µg/L. Vinyl Chloride was detected in three samples (i.e. BSB10, MW-1, and MW-3) at concentrations ranging from 3 µg/L to 220 µg/L, all above the MTCA Method A Ground Water Cleanup Level of 0.2 µg/L.

The spatial distribution of these chlorinated compounds in ground water is presented on Figure 7. PCE impacted ground water appears to extend from beyond the up-gradient (western) property boundary to beyond the southern property boundary and perhaps the eastern property boundary.

Total naphthalenes (i.e., naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) were detected in all 8 of the ground water samples submitted. The sum of detected total naphthalenes concentrations ranged from 0.11 µg/L to 5,640 µg/L. Analytical results are summarized in Table 7. The MTCA Method

Mr. Mitch Johnson, Safeway Inc.
Store No. 1477 – Proposed Fueling Center
EPI Project No. 082165.1
May 2, 2002

A Ground Water Cleanup Level for Unrestricted Land Use for total naphthalenes is 160 µg/L. Three of the samples, from borings BSB7, BSB9, BSB10B, and BSB11, exceeded this cleanup level.

Table 7 also summarizes the analytical results for cPAHs, which were not detected in any of the ground water samples at concentrations greater than the detection limits of the method used.

CONCLUSIONS

The findings of this Additional Phase II ESA have resulted in conclusions that, in some respects, differ from the conclusions of the earlier Phase II ESA. The conclusion presented herein build upon the data collected during the earlier investigation and both refine and supercede earlier conclusions. The following conclusions are supported by the sum total of EPI's investigative data for the subject property:

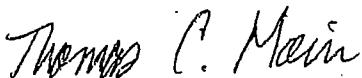

- The static ground water at the subject property appears to be between 8 and 11 feet below grade. The ground water table gradient appears to be southeasterly with a slope of about 0.026 feet per foot. The ground water gradient direction is similar to those reported for nearby sites. This finding suggests that it may be necessary to perform some dewatering during underground storage tank (UST) installation. The discharge and disposal of dewatering liquids is regulated by King County Industrial Waste if the water is placed into the sanitary sewer and by the Washington Department of Ecology (Ecology) and EPA if it is placed into the storm drains, applied to land, or reinjected into the subsurface.
- The analytical data indicate that contaminants of concern (COCs) at the subject property that will drive soil remediation activities include GRPH, DRPH, total naphthalenes, cPAHs and total xylenes.
- The analytical data collected to date suggest that there is a substantial volume of soil at the subject property that exceeds the MTCA Method A Soil Cleanup Level for Unrestricted Land Use for the identified COCs. This volume of impacted soils may exceed 3,000 cubic yards. It is possible that off-site soils also have been impacted from historic on-site releases.
- Ground water at the subject property is impacted with GRPH, DRPH, benzene, toluene, ethylbenzene, xylenes, PCE, TCE, total naphthalenes, and vinyl chloride at concentrations above the appropriate MTCA Method A Ground Water Cleanup Levels. In addition, cis 1,2-DCE was detected in ground water at concentrations above the MTCA Method B Ground Water Cleanup Level.
- The apparent source for the GRPH and DRPH detected in ground water is the historic on-site gasoline station operations. The source of the GRPH ground water impacts appears to be on the west side of the subject property, in the vicinity of B-1 and BSB1. The source of the DRPH ground water contamination appears to be near the northeastern corner of the building and to the north of this building corner near boring BSB3. It appears likely that the impacts from both of these apparent source areas may extend off-site.

EPI Project No. 082165.1
May 2, 2002

- The relative concentrations of PCE, TCE, and cis-1,2-DCE suggest that the TCE and cis-1,2-DCE may be present as environmental degradation products of the PCE. The distribution of dissolved-phase PCE observed during this project is fully consistent with a source of release off-site and hydraulically up-gradient of the subject property. Viewed in the context of the available data, the most likely source for the PCE is the historic up-gradient and off-site dry cleaners and possibly the adjacent historic service station. The observed concentrations are consistent with the on-site migration of an off-site release of PCE and the attendant environmental weathering of the initial PCE release(s). PCE impacts may extend beyond the down-gradient subject property boundaries to the south and east.
- It remains EPI's opinion that the environmental conditions observed at the subject property represent a condition that requires reporting to the Washington Department of Ecology (Ecology), Toxics Cleanup Program. The responsibility for reporting the observed conditions generally lies with the property owner or operator. EPI recommends that Safeway seek the advice of counsel regarding reporting responsibilities and options.

EPI appreciates the opportunity to be of assistance on this project. If you have any questions or comments, please do not hesitate to contact me at (425) 889-4747.

Sincerely,

Thomas C. Morlin
Principal Geologist

DATA RESULTS

ANALYSIS ANALYSIS

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

) GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 30 MG/KG
DIESEL RANGE REPORTING LIMIT IS 500 MG/KG
LUBÉ OIL RANGE REPORTING LIMIT IS 200 MG/KG

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS

*** ANY POSITIVE MTBE RESULT SHOULD BE CONFIRMED BY GC/MS ANALYSIS

APPROVED BY: WJ

NOTES: CHROMATOGRAM INDICATES SAMPLE CONTAINS PRODUCT WHICH IS LIKELY DIESEL #1

SAMPLE MAY CONTAIN GASOLINE RATHER THAN DIESEL #1. IF SO, PRODUCT IS EXTREMELY WEATHERED.

GASOLINE REPORTING LIMIT IS RAISED DUE TO SEMIVOLATILE RANGE PRODUCT ELUTING IN VOLATILE RANGE

NOTES: CHROMATOGRAM INDICATES SAMPLE CONTAINS PRODUCT WHICH IS LIKELY DIESEL #1

SAMPLE MAY CONTAIN GASOLINE RATHER THAN DIESEL #1. IF SO, PRODUCT IS EXTREMELY WEATHERED.

GASOLINE REPORTING LIMIT IS RAISED DUE TO SEMIVOLATILE RANGE PRODUCT ELUTING IN VOLATILE RANGE

NOTES: CHROMATOGRAM INDICATES SAMPLE CONTAINS PRODUCT WHICH IS LIKELY DIESEL #1

SAMPLE MAY CONTAIN GASOLINE RATHER THAN DIESEL #1. IF SO, PRODUCT IS EXTREMELY WEATHERED.

GASOLINE REPORTING LIMIT IS RAISED DUE TO SEMIVOLATILE RANGE PRODUCT ELUTING IN VOLATILE RANGE

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 3 MG/KG

DIESEL RANGE REPORTING LIMIT IS 25 MG/KG

LUBE OIL RANGE REPORTING LIMIT IS 50 MG/KG

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 50 UG/L

DIESEL RANGE REPORTING LIMIT IS 130 UG/L

LUBE OIL RANGE REPORTING LIMIT IS 250 UG/L

UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS
