RE: Colbert Landfill Remediation Project Annual Report 2017

Dear Huckleberry,

Enclosed is a copy of the Colbert Landfill Remediation Project Annual Report for April 2017.

If you have any comments or questions, please call me at (509) 238-6607.

Sincerely,

A handwritten signature in black ink, appearing to read "CKH".

## **1.0 Colbert Landfill Remediation Project Summary**

The Colbert Landfill Superfund site is a closed, 40-acre, municipal solid waste landfill located approximately 15 miles north of Spokane, Washington, and about 2.5 miles north of Colbert, Washington. The landfill received waste from 1968 to 1986 when it became filled to capacity. Groundwater in the vicinity of the landfill was found to be contaminated with volatile organic compounds and in 1983, the landfill was placed on the National Priorities List (NPL) by EPA. In 1989, a consent decree was executed to implement a site remedy. The site remedy includes:

- An available alternate water supply for residential wells impacted by groundwater contamination originating from the landfill.
- Institutional Controls
- Construction and operation of a pump and treat system to capture and prevent further spread of groundwater contaminants.
- Landfill closure according to the State of Washington regulations Minimal Functional Standards (WAC173-304).
- Monitoring of contaminants to protect human health and the environment at the site.

Construction of a pump and treat (P&T) system was completed in 1994. The P&T system operated successfully for 20 years. In 2014, an EPA recommended shut-down test was initiated to determine if the facility was continuing to add any significant benefit to the clean-up.

The programs currently in place include a Shut-down Test (lower aquifer) for the pump and treat system; and upper aquifer compliance groundwater monitoring (includes 1,4-dioxane monitoring' and MFS monitoring of the upper aquifer); residential well monitoring (includes both upper and lower aquifers); supplemental sampling (includes both upper and lower aquifers); and landfill cover maintenance and monitoring. The groundwater monitoring programs and criteria are summarized below.

### **Current Monitoring Programs**

| <b>Program</b>           | <b>Aquifer</b>  | <b>Parameters</b>                           | <b>Schedule</b>                                  |
|--------------------------|-----------------|---|--|
| Shut-down Test           | Lower           | VOC's                                       | Quarterly  |
| Upper Aquifer Compliance | Upper           | VOC's                                       | Annual<br>(Extraction wells Quarterly)           |
| 1,4-Dioxane Sampling     | Upper           | 1,4-Dioxane                                 | Annual   |
| MFS Monitoring           | Upper           | Cl/NH3/NO2/NH3<br>/SO4/Fe/Mn/Zn/T<br>OC/COD | Annual   |
| Residential Monitoring   | Lower<br>/Upper | VOC's                                       | Monthly/Quarterly/SemiAnnual<br>/Annual/BiAnnual |
| Supplemental Sampling    | Lower/<br>Upper | VOC's                                       | Every five years                                 |

## Program Criteria

| PROGRAM   | CRITERIA                | TCA | DCE  | DCA  | TCE  | PCE | MC   | 1,4-Dioxane | Units |      |
|---|-------------------------|-----|------|------|------|-----|------|-------------|-------|------|
| CONSENT DECREE  | Performance Evaluation  | 200 | 7    | 4050 | 5    | 0.7 | 2.5  |             | ug/L  |      |
|   |                         | 200 | 7    | 4050 | 5    | 0.7 | 2.5  | 7           |       |      |
| SHUT-DOWN TEST  | Action Level Evaluation | 130 | 4.55 | 2632 | 3.25 | 0.5 | 1.63 |             |       |      |
|   |                         | 200 | 7    | 4050 | 5    | 0.7 | 2.5  |             |       |      |
| <b>RESIDENTIAL</b><br>Monthly sampling initiated, evaluated in 12 months<br>Exceedance requires alternative drinking water source be supplied |                         | 130 | 4.55 | 2632 | 3.25 | 0.5 | 1.63 |             |       |      |
|   | MCL                     | 200 | 7    | 4050 | 5    | 0.7 | 2.5  |             |       |      |
|   |                         | Cl  | Fe   | Mn   | Zn   | TOC | COD  | SO4         | NO3   |      |
| MFS   | (mg/L)                  | 250 | 0.3  | 0.05 | 5    | NA  | NA   | 250         | 10    | mg/L |

### 1.1 Geology/Hydrogeology

The geology beneath the Site consists of six vertically stratified and laterally discontinuous geologic units derived from glacial and fluvial material, modified by erosional (and possibly landslide) processes, overlaid on granitic bedrock. There are two primary aquifers that include the saturated portion of the Upper Sand and Gravel Unit and the saturated portion of the Lower Sand and Gravel Unit, which are separated by a Lacustrine Unit that serves as an aquitard. The Latah Formation serves as an aquitard that underlies the Lower Sand and Gravel Aquifer at most locations. A basalt unit forms a secondary aquifer interbedded in the Latah Aquitard and is referred to as the Basalt Aquifer. The Granite Unit is an aquitard that underlies the Latah Formation and serves as the lower boundary to the regional flow system. For more information, please refer to the Phase I Engineering Report (Landau Associates 1991).

The Upper Sand and Gravel Unit aquifer (Upper Aquifer) is unconfined with a water table that lies approximately 90 ft below the ground surface. Groundwater flow in this aquifer is generally north to south, changing to the southeast approximately 1 mile south of the Site. The direction of flow appears to be influenced by the topography of the upper surface of the Lacustrine Aquitard (Landau Associates 1991).

The Lower Sand and Gravel Unit aquifer (Lower Aquifer) is confined to the west of the landfill and unconfined to the east of the landfill. To the west of the landfill, the Upper and Lower aquifers are separated by the Lacustrine unit, which causes the confined conditions in that area. Groundwater flow in the Lower Aquifer is predominantly toward the west with discharge to the Little Spokane River.

## **1.2 Shut-down Test-Lower Aquifer**

A pump and treat system was successfully operated from 1994 through March 31, 2014 to prevent further spread of groundwater contamination emanating from the landfill. A shut-down test for the lower aquifer pump and treat system was deemed appropriate for the site after a Remedial System Evaluation (RSE) was performed as recommended in the 2009 Five Year Review (EPA). The RSE recommendation stated that with the extensive groundwater monitoring programs in place and with concentrations having decreased substantially after 20 years of operation, the current pump and treat system may not be adding significant benefit to the overall protectiveness of the remedy and that a shut-down test would help determine its efficacy. The shut-down test procedures are outlined in the *Final Work Plan, Groundwater Pump and Treat System Shut-down Test, Colbert Landfill CERCLA Site, Spokane County Utilities/ Landau Assoc. 2013*. See Section 2 of this report for more details. The upper aquifer monitoring wells are governed by the Consent Decree compliance, Post Closure (MFS), and 1,4-dioxane sampling programs and are not included in the Shut-down test work plan.

## **1.3 Upper Aquifer Monitoring**

### **1.3.1 Compliance Monitoring (VOC's)**

The compliance monitoring sampling program is outlined in the Consent Decree and performed according to the Colbert Landfill Operations and Maintenance manual (*Colbert Landfill Operations and Maintenance Manual, 1998*.). During implementation of the lower aquifer system Shut-down Test, the compliance monitoring will only apply to the upper aquifer. Per conditions set forth in the consent decree (Appendix B, page V-7), the south system extraction wells are not required to be in operation and have been on stand-by status since 2004, and therefore are included in the compliance monitoring program.

### **1.3.2 1, 4-Dioxane Sampling**

During the 2005 (3<sup>rd</sup>) Five Year Site Review, EPA specified an additional constituent (1,4-Dioxane) for evaluation at the Colbert Landfill site. After extensive monitoring in both the upper and lower aquifers, it was determined that an ongoing monitoring program would apply to selected wells in the upper aquifer only. The selected upper aquifer well locations are sampled for 1,4-dioxane according to the *1,4-Dioxane Work Plan for the Colbert Landfill (December 2007)*.

### **1.3.3 Minimal Functional Standards Post Closure**

The landfill was closed pursuant to requirements of the Minimal Functional Standards for Solid Waste Handling (MFS, WAC173-304). Lower aquifer locations, as outlined in the MFS Groundwater Monitoring Plan (Landau Assoc., 1996), require no additional monitoring after the 2 year monitoring period, which ended in January 1999. Monitoring for the upper aquifer continue according to the *Colbert Landfill Operations and Maintenance Manual, 1998*, and the *MFS Groundwater Monitoring Plan, 1996* .

## **1.4 Residential Well Monitoring**

The Consent Decree specified that domestic wells within the vicinity of the landfill be monitored to protect human health. Domestic well locations and schedules for this program were selected by

proximity to landfill contamination and are evaluated on a regular basis to accommodate any changes in groundwater contamination. This program includes well locations in both the upper and lower aquifers. Sampling for this program is done in accordance with the *Quality Assurance and Field Sampling Plan-Colbert Residential Well Sampling, 1991* and is governed by the Consent Decree.

### **1.5 Supplemental Sampling**

Supplemental sampling occurs every five years and is intended to collect additional data from monitoring and residential wells not regularly sampled. Although there are no criteria for monitoring or reporting associated with supplemental sampling, data collected helps provide a more accurate snapshot of groundwater flow and contamination throughout the area.

### **1.6 Landfill Operations and Maintenance**

In 1997, the landfill closure construction (cover system and components) was completed as part of the MFS requirements. The landfill gas collection and treatment system is monitored and maintained on a regular basis as outlined in the *Operations and Maintenance Manual for Colbert Landfill Closure, CH2MHill, May 1997*.

## **2.0 Shut-down Test**

A shut-down test of the Colbert Landfill Groundwater Pump and Treat facility was initiated April 1, 2014 when all lower aquifer extraction wells were turned off and placed in standby mode. The shut-down test was deemed appropriate for the site after a Remedial System Evaluation (RSE) was performed as recommended in the 2009 Five Year Review (EPA). The shut-down test is performed according to the *Final Work Plan, Groundwater Pump and Treat System Shut-down Test, Colbert Landfill CERCLA Site, Spokane County Utilities/ Landau Assoc. 2013*.

### **2.1 Shut-down Testing Locations and Schedule**

The lower aquifer wells selected as monitoring locations for the Colbert Landfill pump and treat system shut-down test include: the compliance monitoring well clusters (CD-41, CD-42, CD-43, CD-44, CD-45, and CD-48), monitoring well CD-49, and the lower aquifer extraction wells (CP-E1, CP-E2, CP-E3, CP-W1, CP-W2, and CP-W3). Locations are presented in Figure 2-1. Collection of groundwater samples from the shut-down locations was performed as outlined in Table 2-1.

### **2.2 Shut-down Test Monitoring**

The lower aquifer extraction wells, the compliance monitoring well clusters (CD-41, CD-42, CD-43, CD-44, CD-45, and CD-48) and monitoring well CD-49 were sampled according to the *Colbert Landfill Operations and Maintenance Manual, 1998*. Field parameters were taken and VOC samples were collected. There were no problems/issues associated with sampling during the reporting period.

#### **2.2.1 Groundwater Elevations**

Groundwater elevations for the reporting period are shown in Table 2-2 and in Figure 2-2. Estimated groundwater contours and flow are shown in Figure 2-3. Elevations in the lower aquifer were significantly higher during the April/May sampling round due to an unseasonably wet winter, but measurements were otherwise consistent and followed typical seasonal variation with levels slightly higher in the spring and slightly lower during the fall. Extraction well hydrographs show the anticipated increase in groundwater levels at the immediate vicinity of those wells in April 2014 when the system was shut down.

#### **2.2.2 Field Parameters**

Field parameters taken at the shut-down test locations are shown in Table 2-2. The highest conductivities were mostly seen in the east system extraction wells. Conductivity values in monitoring wells ranged from 392 to 1219 umhos/cm. Measurements of pH ranged from 6.74 to 7.94, with the lowest pH values generally found in the east system extraction wells.

#### **2.2.3 Constituents of Concern (COC's)**

Constituent of concern concentrations for Shut-down Test locations are presented Table 2-4. Concentrations versus time for Shut-down locations are presented in Figure 2-4. All detected concentrations found in the shut-down test compliance wells were well below any applicable criteria. Criteria are shown in Table 3-2. The COC's found in the shut-down program criteria dependent wells were TCA and DCE and at low concentrations. Although concentrations found

were well are far below any criteria, monitoring well CD-49 was kept on a quarterly sampling schedule to better evaluate the increasing TCA concentrations found in this well. See Figure 2-9 for the estimated TCA plume boundaries in the lower aquifer.

Lower aquifer extraction wells are not criteria dependent locations, and therefore actions during the shut-down test are not governed by COC concentrations in these wells. Analytical results from the extraction well sampling are shown in Table 2-5. Time versus concentration plots are found in Figure 2-5 through Figure 2-8. In general, concentrations of COC's have remained relatively stable in east system wells and have significantly increased in CP-W3. Concentrations in CP-W2, after noticeably decreasing three months after the wells were inactivated, have remained low.

### **2.3 Data Evaluation**

Data indicates a slight shift in plume concentrations toward the western edge of landfill, evident by the emerging concentrations of TCA and DCE found in CD-49 and increasing concentrations (rebound) found in CP-W3. Supplemental sampling wells in the center of the landfill showed significant TCA concentrations and indicated a more connective plume than historically mapped. TCA data for supplemental sampling can be found in Table 5-3.

### **2.4 Program Changes or Modifications**

No criteria were exceeded during the reporting period. As stated in the work plan, sampling at the lower aquifer compliance monitoring wells is now on an annual schedule and will be sampled again in April 2018. The exception to this is monitoring well CD-49. Quarterly sampling will continue at CD-49 to observe the increasing trend in concentrations. If concentrations continue to increase at a steady rate, the sampling frequency at well clusters CD-43 and CD-42 will be re-evaluated.

Quarterly sampling will continue at the extraction wells, as running the wells periodically will assist with preventive maintenance and provide indicators for any possible changes in COC concentrations near the landfill boundaries.

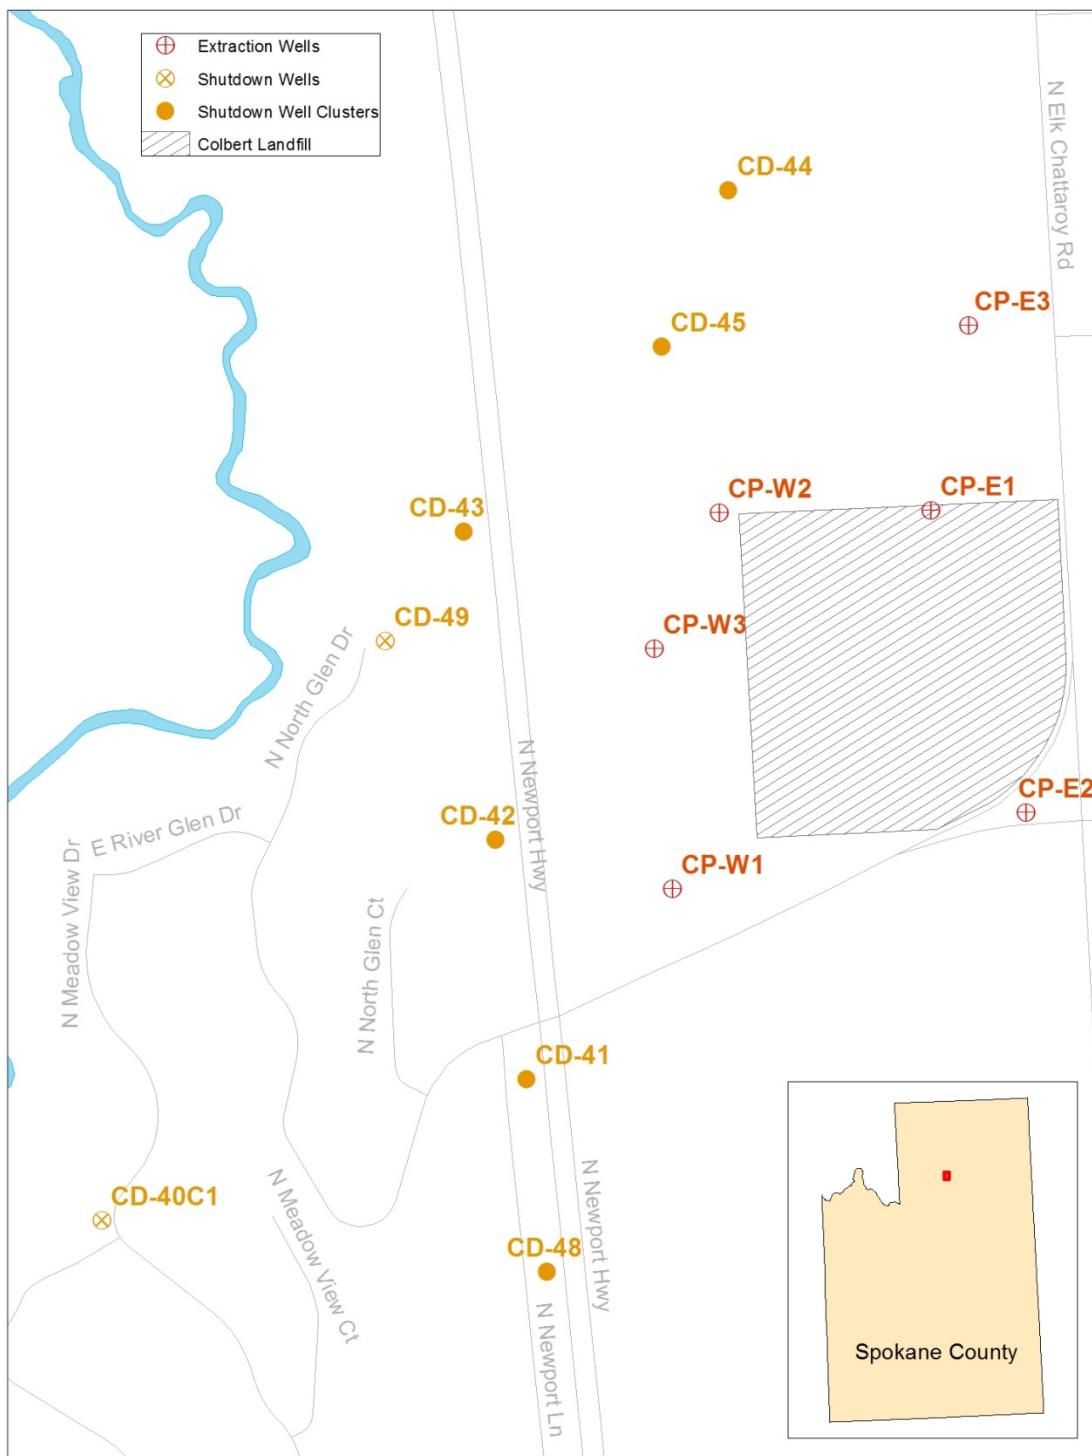

### **2.5 Cost Savings**

Typical electrical costs associated with operating the pump and treat system for the lower aquifer on a continual basis for a period of one year were approximately \$59,000. From May 2016 through April 2017 the cost for electricity at the facility during the second year of the shut-down test was \$16,150.

Increases in lab costs were minimal when compared to the savings in electricity. The estimated lab cost for the additional sampling rounds was \$6,200. Labor costs for additional sampling rounds were estimated to be approximately \$4,000.

| <b>Typical Annual Electrical Costs</b>             |  | <b>\$60,000</b> |
|--|--|-----------------|
| Electrical Costs for Third Year of Shut-down Test  |  | -\$16,150       |
| Additional Lab Cost Associated with Shut-down Test |  | -\$6,200        |
| Estimated labor costs for additional sample rounds |  | -\$4,000        |
| Estimated Total Cost Savings                       |  | \$35,150        |

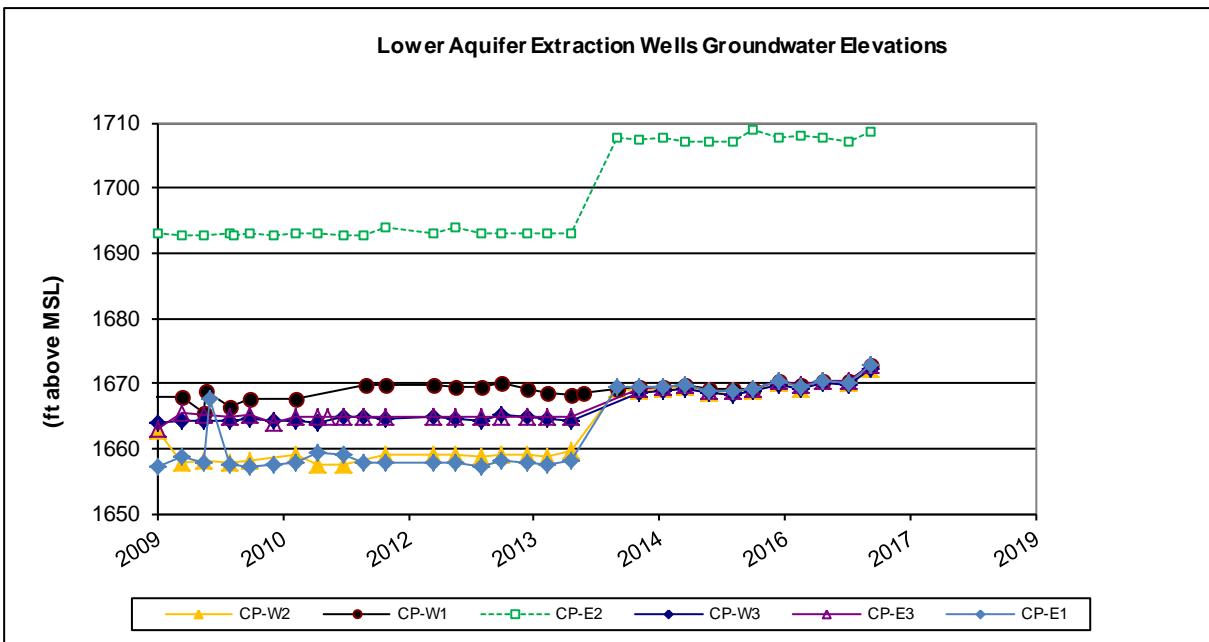

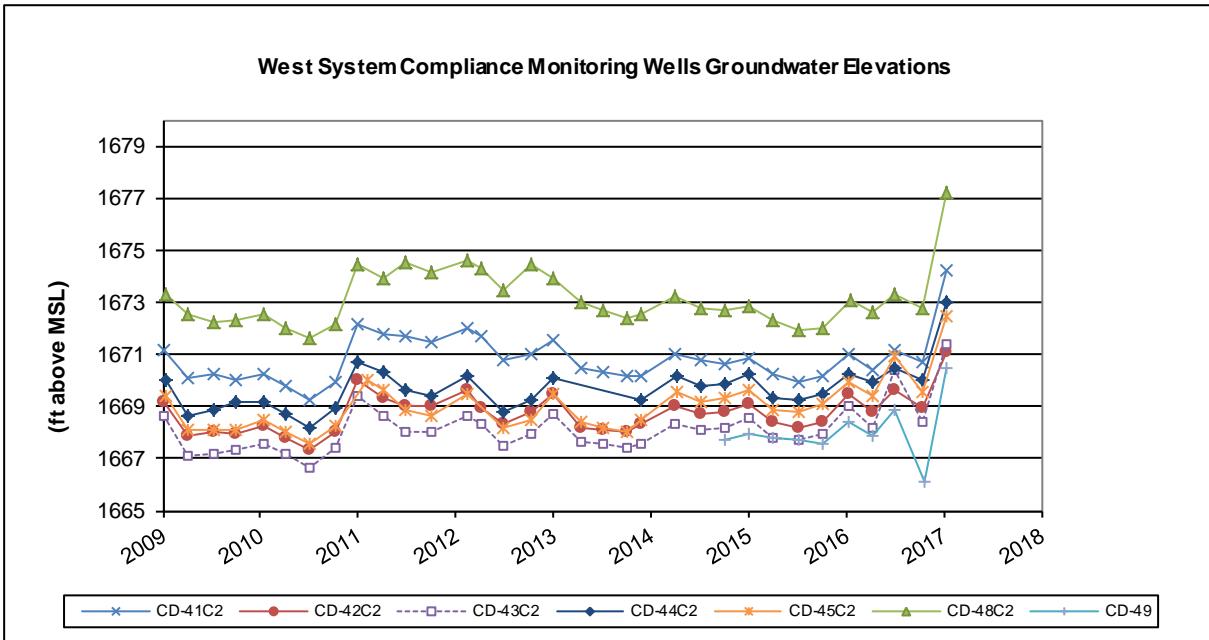

**Figure 2-1 Shut-down Test Locations**

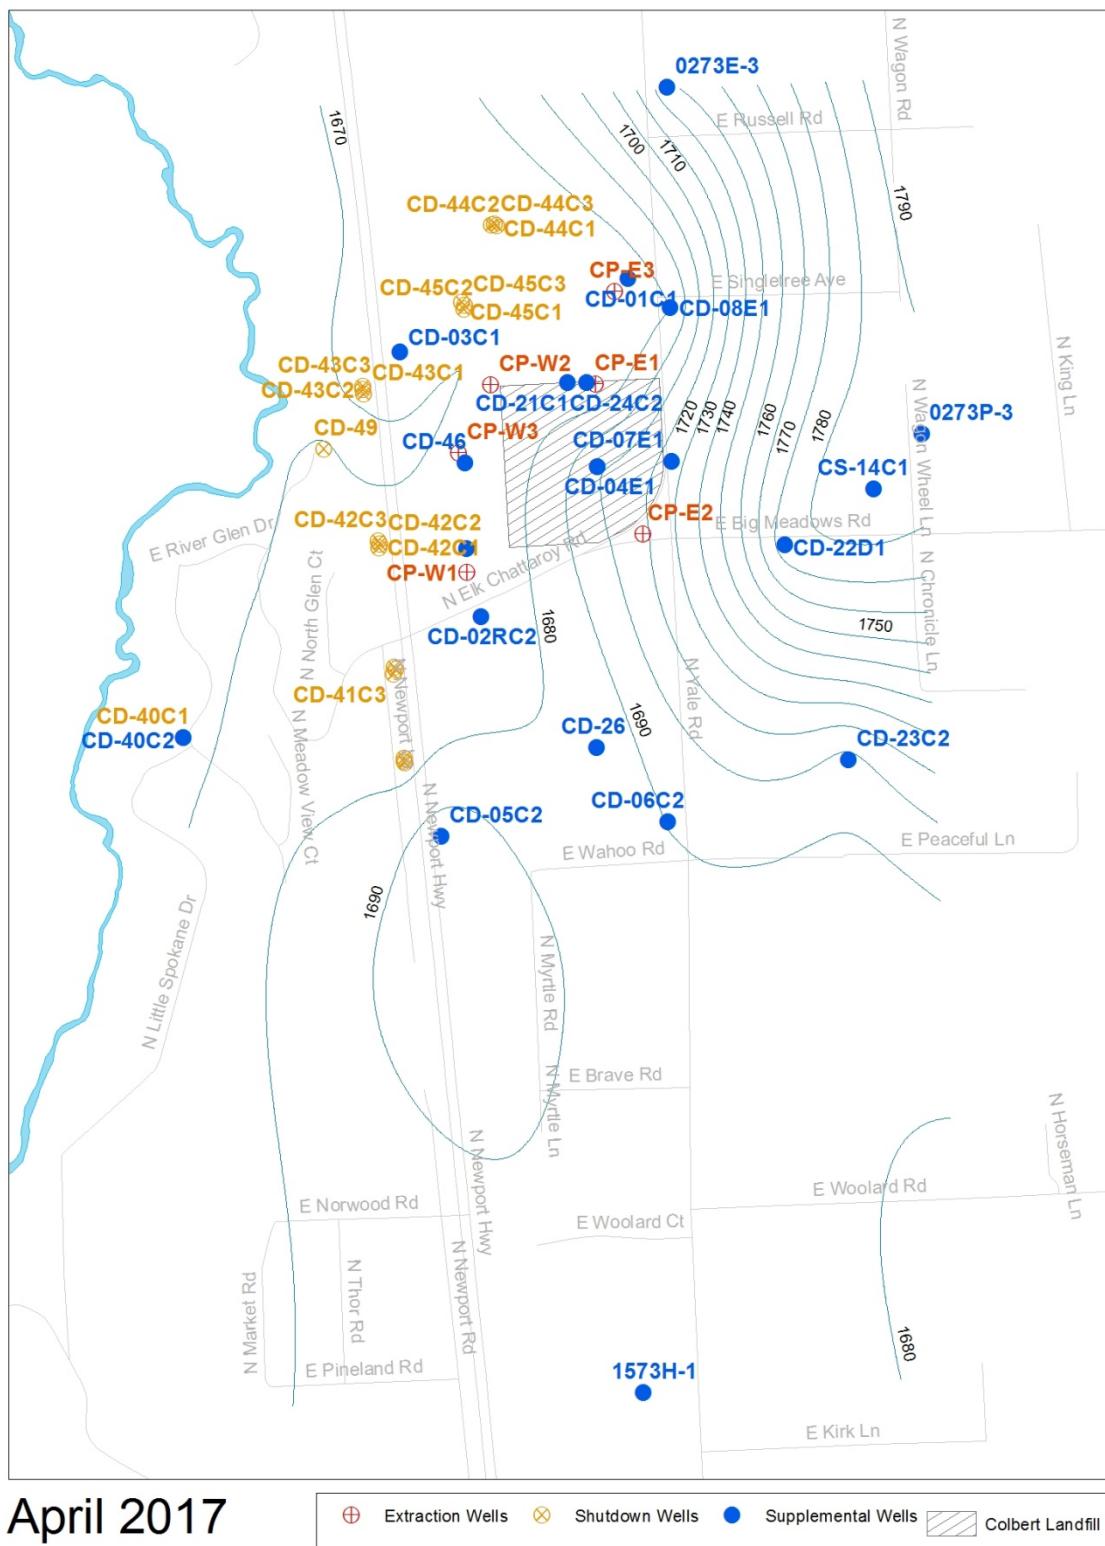

**Table 2-1 Colbert Landfill Shut-down Test Sampling Schedule Year 2 (May 2016 through April 2017)**

| System | Well ID | Monitoring Frequency |           | Shut-down Criteria Applies? |
|--------|---------|----------------------|-----------|-----------------------------|
|        |         | Water Levels         | Sampling  |                             |
| West   | CD-40C1 | Quarterly            | Annual    | Yes                         |

**Figure 2-7 Lower Aquifer Extraction Well Concentrations**

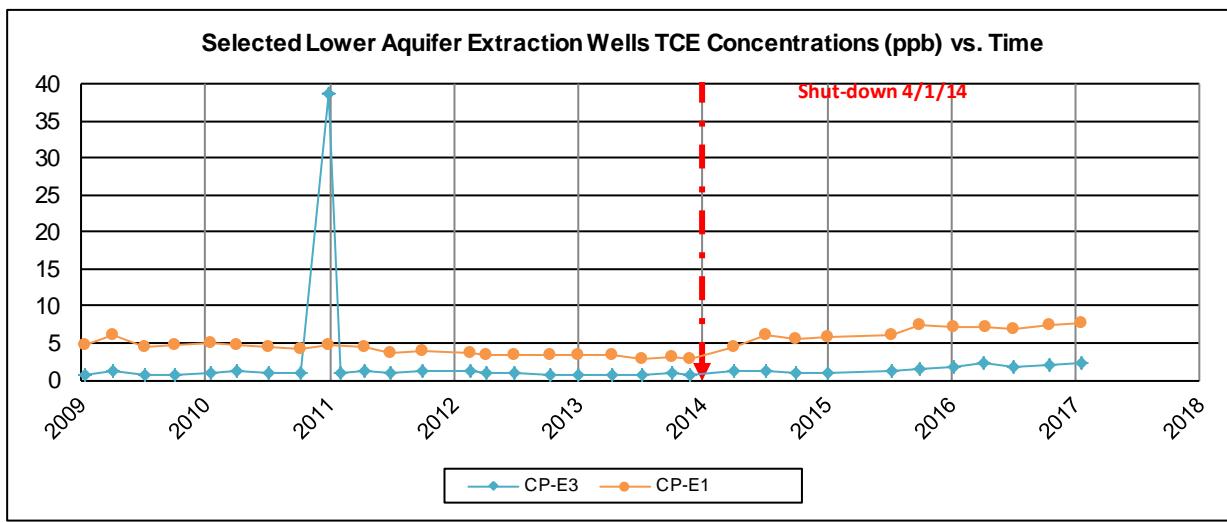

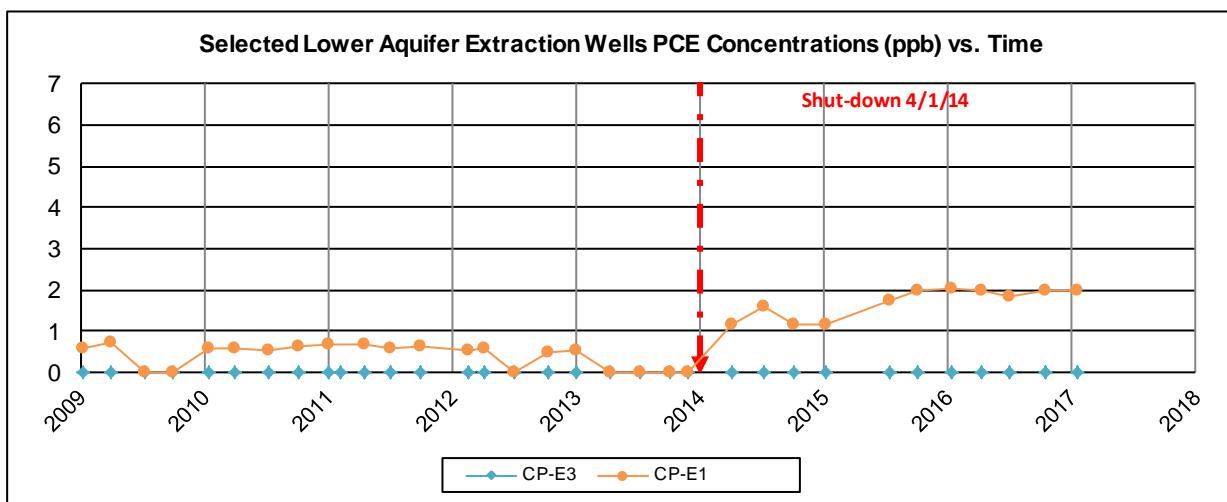

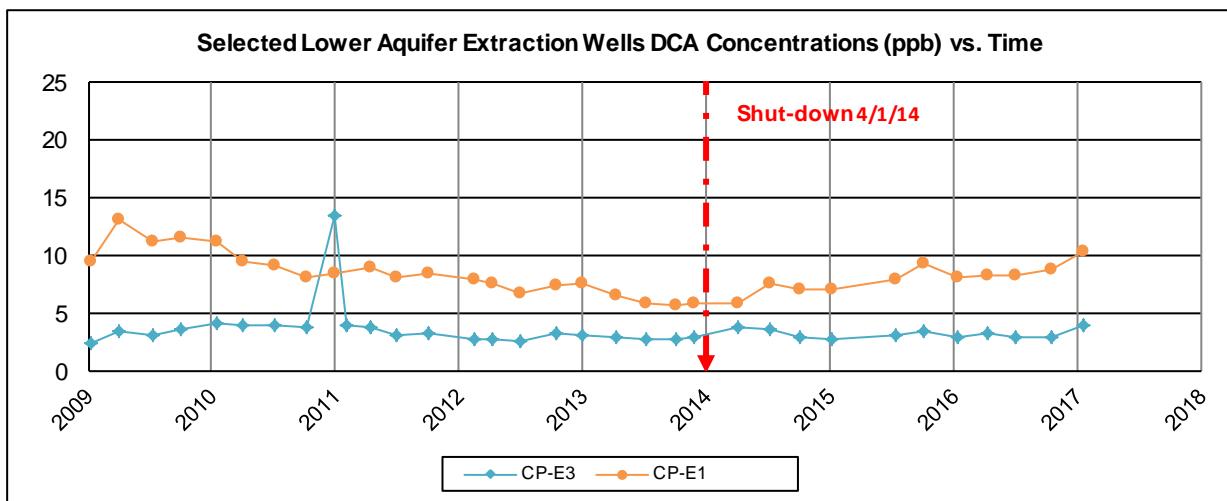

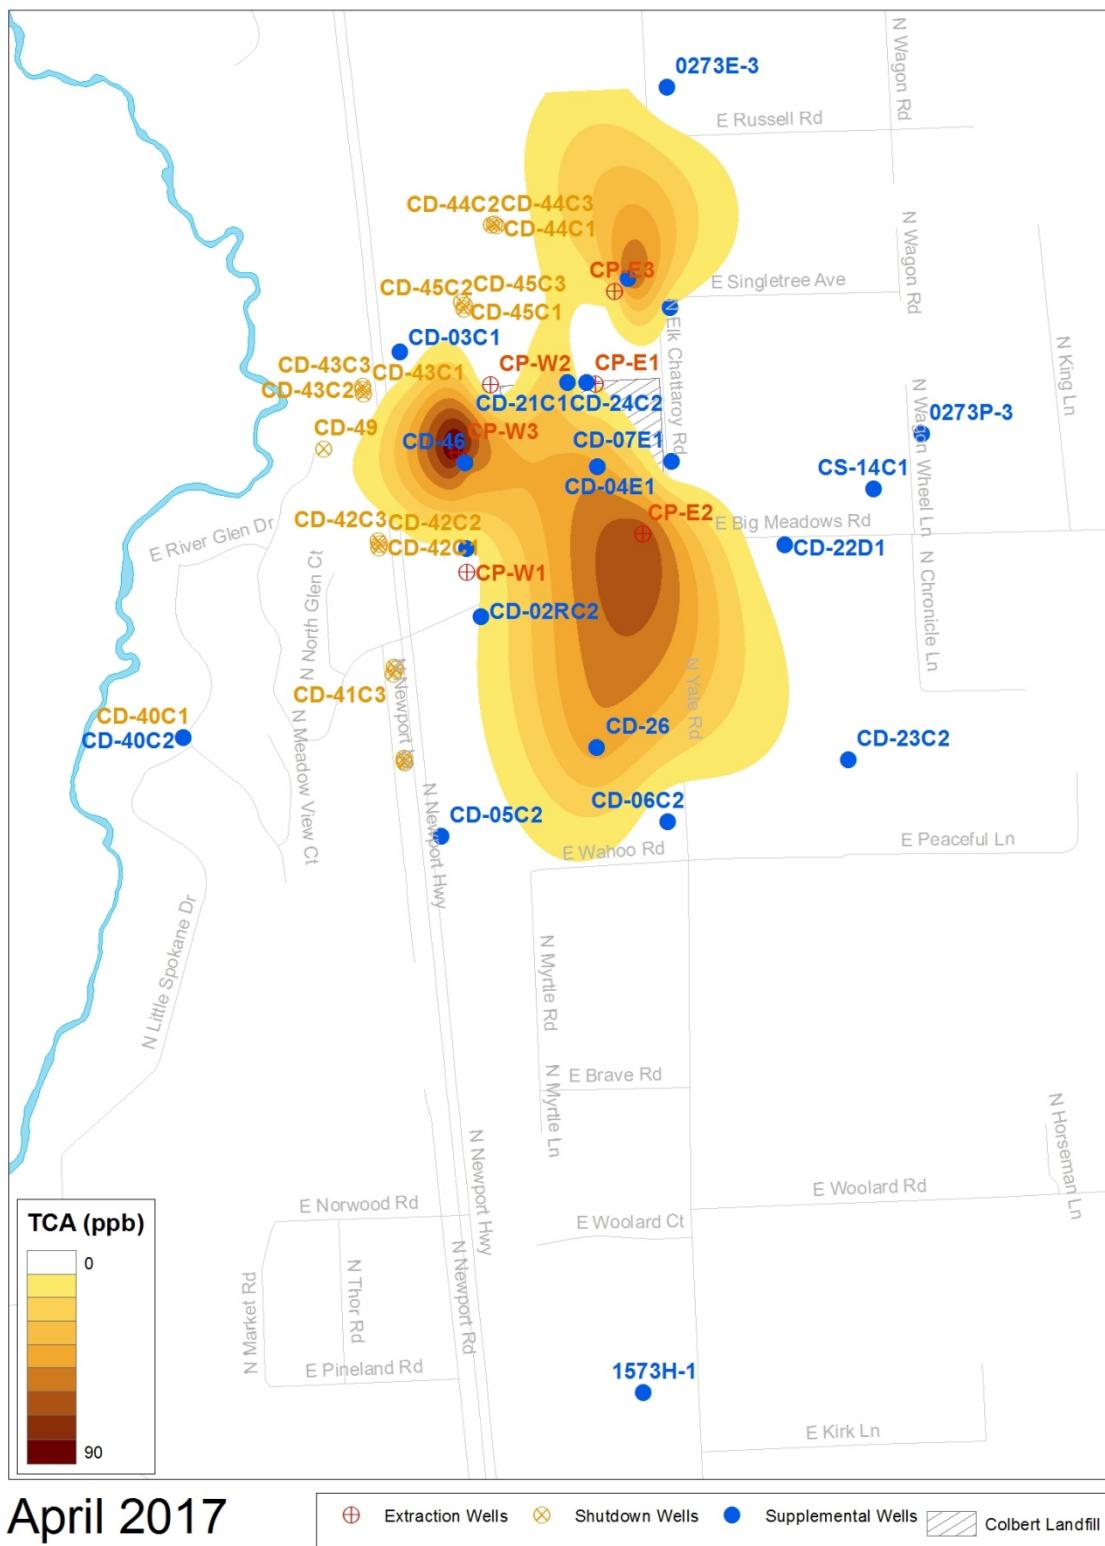

Figure 2-8 Lower Aquifer Estimated TCA Plume

April 2017

## **3.0 Upper Aquifer Monitoring**

The upper aquifer monitoring program includes the sampling of compliance indicator COC's (VOC's), 1,4-dioxane sample collection, and MFS sampling from selected monitoring wells. Table 3-1 presents all wells located in the upper aquifer monitoring program and the sample analyses assigned to each well. Upper aquifer monitoring locations are presented in Figure 3-1. All upper aquifer monitoring occurs on an annual basis with the exception of extraction wells, which are operated and sampled quarterly.

### **3.1 Field Data and Groundwater Elevations**

All upper aquifer compliance monitoring field parameters and groundwater elevations for this reporting period are shown in Table 3-3. Conductivity values ranged from 327 to 799 umhos/cm. Field pH values ranged from 6.44 to 7.57. Upper aquifer groundwater elevation contours and flow paths are presented in Figure 3-3.

### **3.2 Compliance Monitoring (VOC's)**

All wells in the upper aquifer have VOC samples collected from them and analyzed, even though the VOC analysis is not required in the MFS or 1,4-Dioxane work plan specifications.

#### **3.2.1 Chemical Data**

Constituent of concern concentrations at the south system extraction wells were consistent with previous quarters (see Table 3-4). Selected upper aquifer wells TCA concentrations versus time are presented in Figure 3-4. Upper aquifer TCA plume boundaries are shown in Figure 3-5.

#### **3.2.2 Criteria**

Criteria for the upper aquifer programs are presented in Table 3-2. There were no criteria exceeded in any of the upper aquifer compliance monitoring wells or extraction wells during this reporting period.

### **3.3 1,4-Dioxane Sampling**

As outlined in the *1,4-Dioxane Workplan for the Colbert Landfill (December 2007)*, five locations were selected for one year of Quarterly 1,4-dioxane sampling to further evaluate the extent of this analyte as well as protect residential wells at the Colbert Landfill site (see Table 3-1). In April 2009, that sample event concluded the year of quarterly sampling at these locations. Since then, Spokane County has continued sampling these wells on an annual basis. The 2017 1,4-dioxane sampling was performed during the month of April. 1073D-1 was not sampled because the resident had shut off the well.

#### **3.3.1 Chemical Data**

The results for April 2017 1,4-dioxane sampling are shown in Table 3-5. Concentrations versus time are presented Figure 3-6.

### **3.4 Upper Aquifer MFS Monitoring**

Upper aquifer locations designated in the MFS groundwater monitoring program were sampled in April 2017.

#### **3.4.1 Chemical Data**

Concentrations of analytes tested for under MFS monitoring were consistent with previous results (see Figure 3-7 and Figure 3-8). Zinc was not detected in the MFS wells during this reporting period.

#### **3.4.2 Criteria**

None of the MFS sampling locations exceeded any of the applicable criteria during this reporting period.

#### **3.4.3 Statistical Analysis**

The MFS Groundwater Monitoring Plan (Landau Assoc., 1996) requires three statistical methods be used when evaluating groundwater Quality in accordance with MFS requirements. Time series plots were performed and discussed previously. Box plots were required after one year of data was collected. Box plots are presented in Figure 3-9.

The third statistical method required is the Mann-Whitney nonparametric significance test. The summary results for this test are presented in Table 2-6 . Although lower aquifer locations are no longer scheduled for sampling, previous results are shown here as well. A statistically significant change (less than 0.05 level of significance) from this test indicates that a difference may exist between background and downgradient wells but does not differentiate between sets. While it is true that a difference in nitrate and chloride concentrations may exist between background and downgradient wells, when taking time series plots and box plots into consideration, it is not likely these differences were due to influence by the landfill.

**Table 3-1 Upper Aquifer Monitoring Programs and Locations**

| Program               | Schedule                                | Parameters                           | Wells  |
|-----------------------|---|--------------------------------------|--|

## **4.0 Residential Program**

### **4.1 Locations and Schedule**

Current residential well sampling locations can be found in Figure 4-1. The residential sampling schedule is included in Table 4-1.

### **4.2 Monitoring Results and Criteria**

Criteria for residential use wells were established in the Consent Decree. The Consent Decree states that if any residential well with a concentration over the evaluation criteria OR any residential well that has an average concentration over 65% of the evaluation criteria over a 12 month period, the county shall supply that residence with an alternative water source.

All residential well results were well below established criteria. Results from sampling are presented in Table 4-2. Time series plots for wells with COC detections are shown in Figure 4-2.

### **4.3 Data Evaluation**

Only two of the residential wells measured concentrations above the method detection limits for the 2016-2017 sampling year (June 2016). These detections were only slightly above the detection limit and far below any criteria.

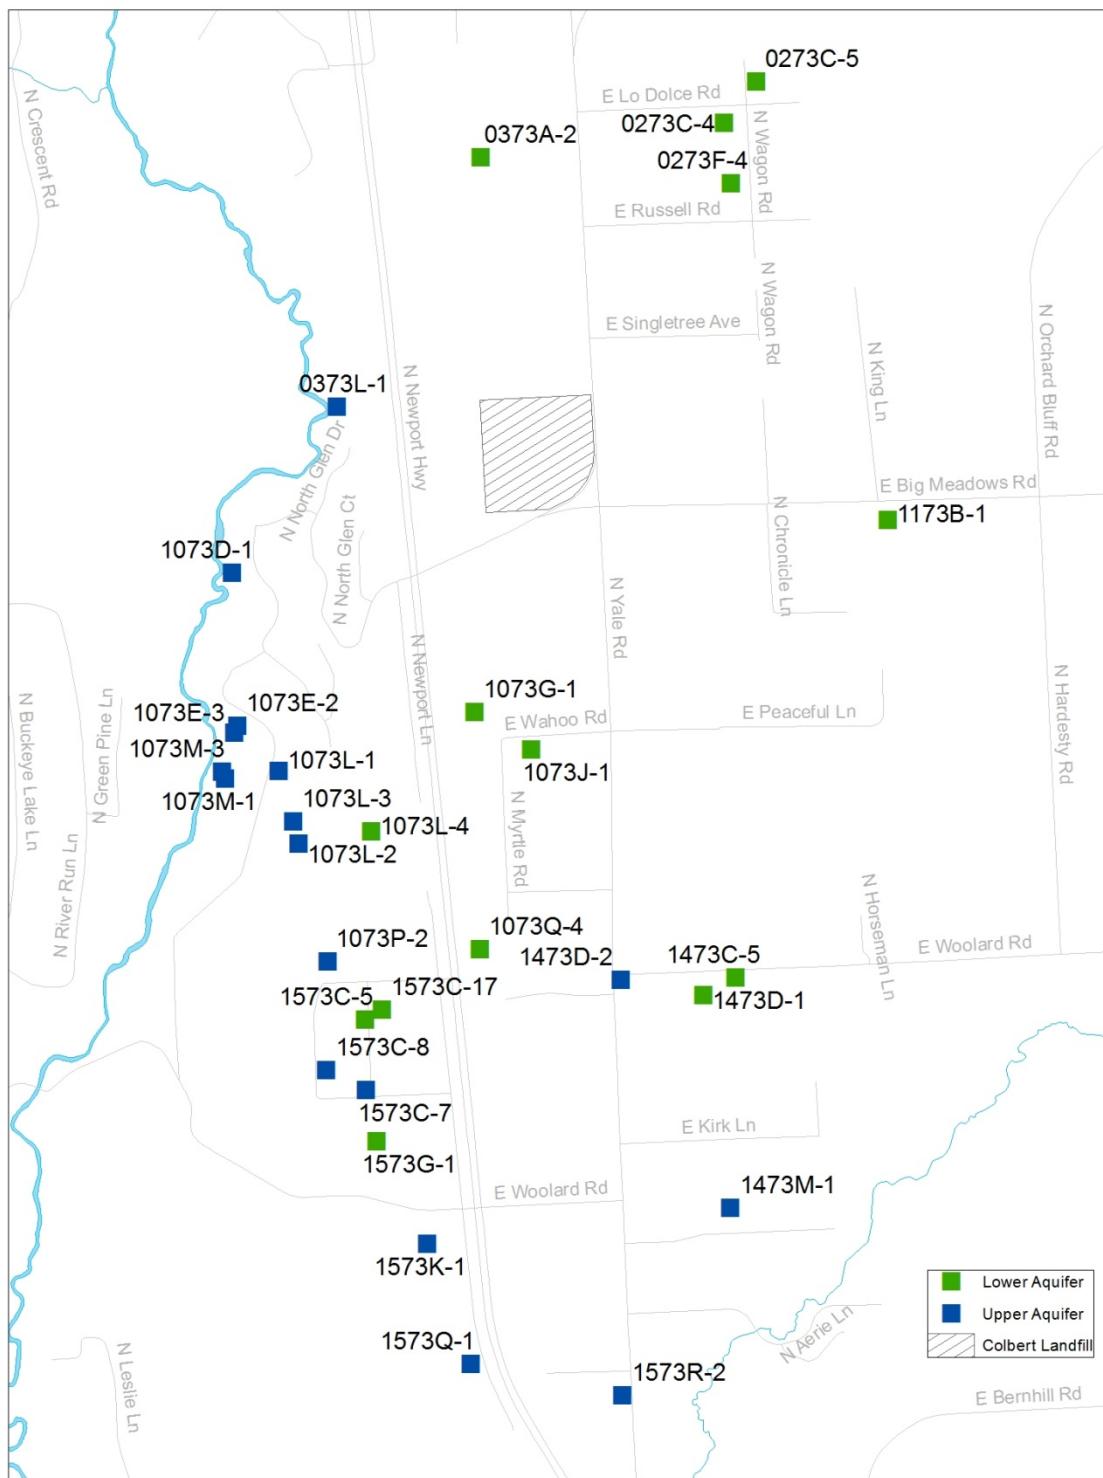

### **4.4 Program Modifications**

On a regular basis, the program schedule is re-evaluated to determine if any changes are needed. With the initiation of the Shut-down test, a re-evaluation was performed comparing plume maps and well locations as well as a list of residences connected to a public water supply. Some modifications to increase sampling in specific areas were made to the schedule to ensure a conservative approach with regard to public health.

No modifications have been made to the schedule for the upcoming 2017-2018 sampling year. However, minor adjustments can be made to the schedule to temporarily increase monitoring in the area just west of the landfill near the Little Spokane River if needed to monitor very low concentration changes in DCA and TCE if measured. Changes are not required by any documentation or work plan.

The 2017 residential well sampling schedule is presented in Table 4-3.

**Figure 4-1 Residential Well Sampling Locations**

**Figure 4-2 Upper Aquifer Residential Wells Concentrations vs Time**

**Figure 4-3 Lower Aquifer Residential Wells Concentrations vs Time**

## **5.0 Supplemental Sampling**

Every five years, supplemental wells are sampled during the annual sampling round to gather additional information and data on groundwater movement and contaminant transport around the Colbert Landfill. During the April sampling round, 33 supplemental wells were sampled.

### **5.1 Locations and Schedule**

Sampling locations for the 2017 supplemental sampling round can be found in Figure 5-1. The supplemental sampling matrix is included in Table 5-1.

### **5.2 Monitoring Results**

Because supplemental sampling is a voluntary program, there are no criteria for monitoring or reporting. The data is primarily used to get a more accurate snapshot of the groundwater flow and contaminant movement within and around the Colbert Landfill site.

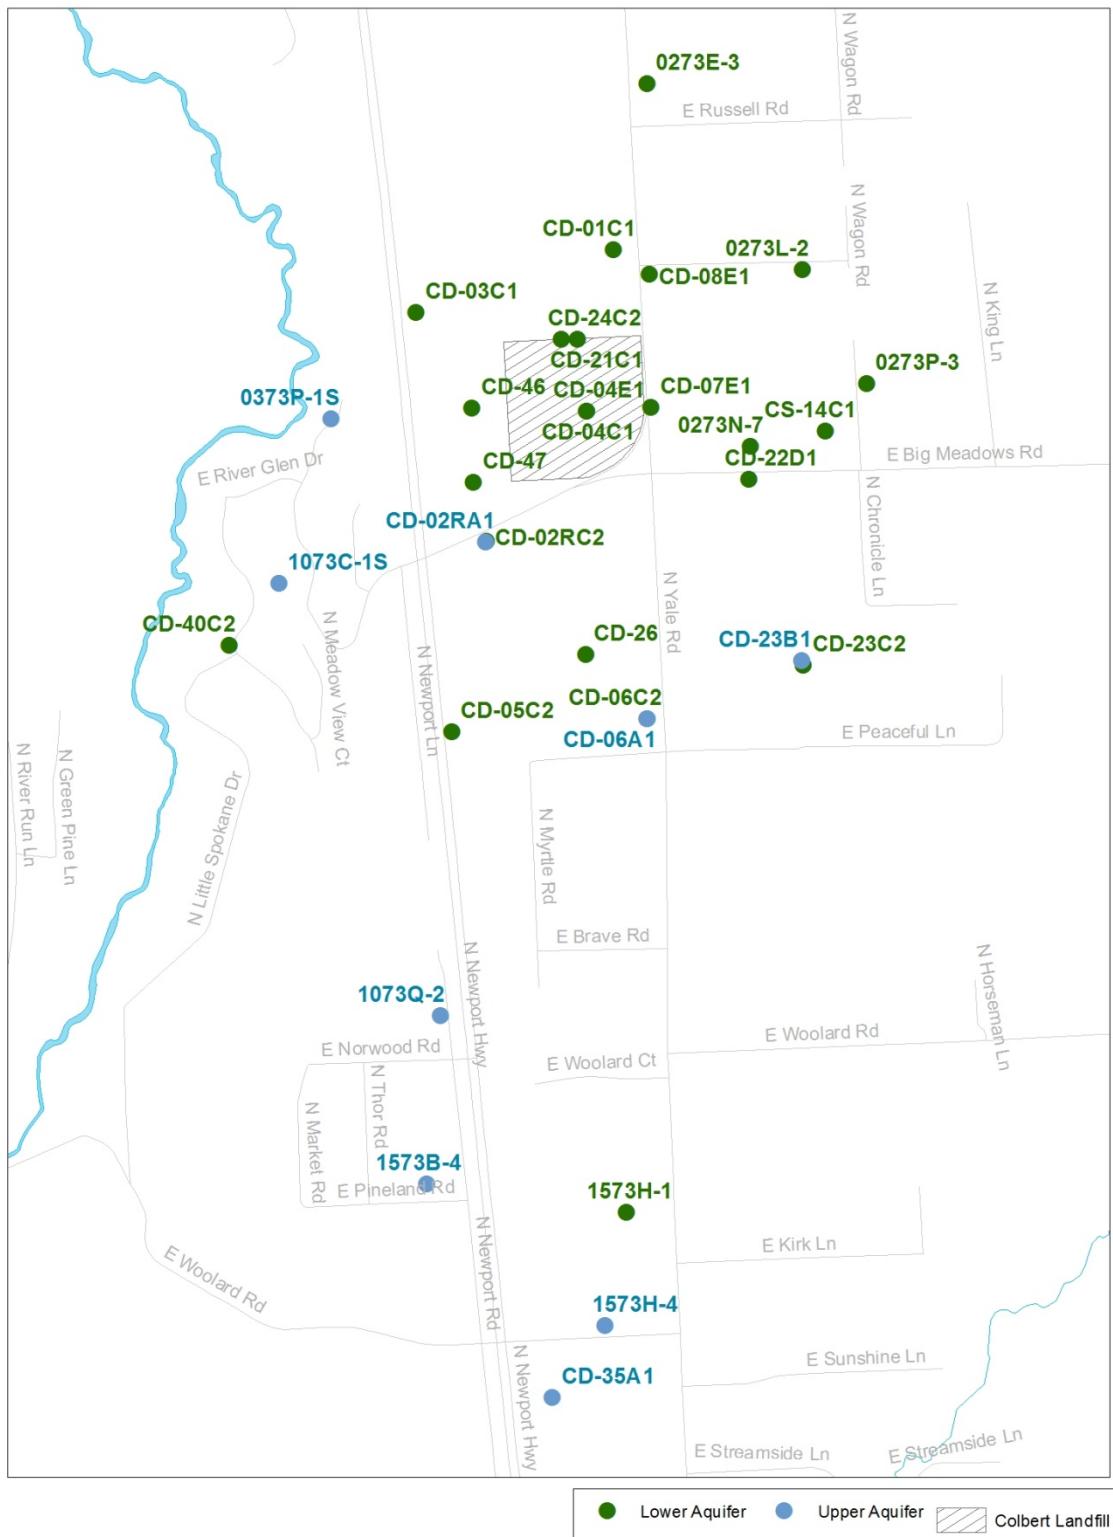

#### **5.2.1 Field Data and Groundwater Elevations**

All supplemental field parameters and groundwater elevations for this reporting period are shown in Table 5-2. Conductivity values ranged from 265 to 1169 umhos/cm. Field pH values ranged from 6.78 to 8.11. Groundwater elevations from supplemental wells were included in the creation of both the lower and upper aquifer contour and flow path maps presented in Figures 2-3 and 3-3. Some water levels could not be accurately measure because they were running.

#### **5.2.2 Chemical Data**

Constituent of Concern concentrations time-series plots are shown in Figures 5-2. Supplemental data was used in the creation and analysis of this year's groundwater elevation contours and TCA plume maps for both lower and upper aquifers.

**Figure 5-1 Supplemental Well Sampling Locations**

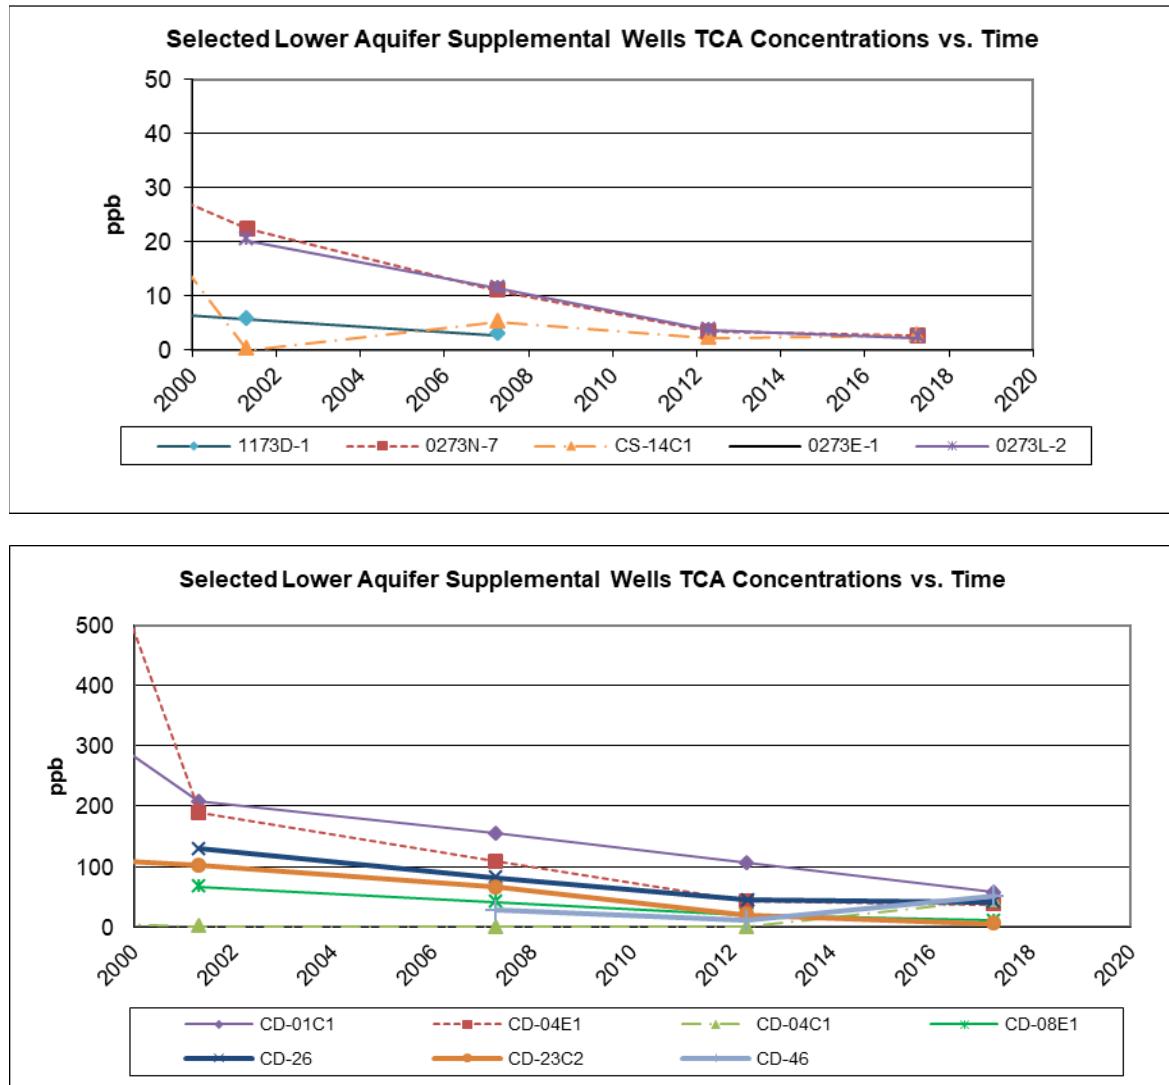

**Table 5-2 Supplemental Wells Field Parameters**

| StationID | Sample Date | WtrElev | FieldTemp | FieldPH | FieldConductivity | FieldTurbidity | Aquifer | Program |

## **6.0 Landfill Operations and Maintenance**

From May 1, 2014 through April, 2017 the following routine landfill cover and gas system monitoring and maintenance was accomplished at the Colbert Landfill. Data collected is included in this section.

- Monthly monitoring at gas probes and exhaust system
- Monthly condensate tank levels
- Monthly gas fan maintenance (greasing, belt tension adjustments, etc.)
- Landfill gas sampling and analysis (Method TO-15) was performed in April 2017.
- Quarterly monitoring of trench risers (June, October, February and April).

Other notable items include:

- Cover and ditch weed control was ongoing throughout the growing season.
- Carbon tub change outs were performed in November 2016 and April 2017.

## **Landfill Operations and Maintenance Field Data**

# COLBERT PERIMETER GAS MONITORING REPORT

Barometer:

27.8

Tech: MT

Calibration: Zeroed CH4 to AB air-> calgas CH4 reading 14.8%, calibrated 15.0%; CO2 reading 15.1%, calibrated to 15.0%; zeroed O2 to calgas. O2 reading 20.6% to AB air.

FanFlow:

57

Weather

Partly Cloudy mid-upper 60's

Equipment: Gem 500 #410

- ALL READING ARE IN NORMAL RANGE FOR  
 THIS TIME OF YEAR. NO ADJUSTMENT WERE  
 MADE NOTHING OUT OF THE ORDINARY OBSERVED.  
 DG/MT ~~ADDED~~ NOTICES A LOT OF NOX. WEED  
 NEED TO BE SPRAYED.

- KNOCK OUT VESSEL C Ø
- V BELT TENSION ON BELT 4.5-5 lbs OIL  
 NO WEAR ON BELT.
- GREASED BOTH BEARINGS 4 STROKES EACH
- COND NE CORNER TANK ø 1.5" IS ø 9.5"

6/22/16

- BU PULLED ALL SAPLINGS (PINE) OFF OF LANDFILL.
- BU SPRAYED 30 GALLONS OF WEED CONTROL SKELETON NOX WEEDS 2-4 D AMINE 4 ALONG WEST ROAD & NORTH RD TO E-1 + ON COVER.

7/13/2016

GF TEMP PLACED 2 MANUAL GP ON THE AREA WE REPLACED LINER DUE TO A DEPRESSION IN AREA SOUTH SIDE OF THE LANDFILL. WE HAVE HAD ISSUES NOT BEING ABLE TO GROW GRASS OR VEGITATION IN AREA. AFRAID THERE IS A GAS LEAK..

THE TWO TEMP GP WERE PLACED ON EAST AND WEST SIDE OF AREA

TGP-1 IS 18" DEEP 16" PEATGRAVEL & 2" TOP SOIL 3/4" PVC PIPE WITH A BARB HOSE BIB ON END TO SAMPLE WITH. AND A OPEN/CLOSE VALVE.

TGP-2 IS 24" DEEP WITH 8" TOPSOIL AND PETGRAVEL (16") A BARB HOSE BIB AND OPEN/CLOSE VALUE 5" OF SLOTTED 3/4" PIPE. TO ALLOW GAS FLOW (IF GAS (LANDFILL) IS PRESENT  
Reo in the Rain

7/13/16

GF SHOWED A LITTLE CONCERN w/ PEAGRASS  
ON COVER SOMETIMES SHARP ENDING  
(MIGHT CAUSE HOLES IN LINER) WILL  
KEEP A CLOSE EYE ON IT.
