1 INTRODUCTION

1.1 SCOPE AND PURPOSE

This report presents the results of 2017 annual groundwater monitoring and evaluation following closure of the former Columbia Gorge Aluminum Smelter West Surface Impoundment (WSI). Statistical evaluation of the groundwater monitoring data was conducted to evaluate natural attenuation in the concentration of groundwater contaminates. This monitoring and statistical evaluation was conducted in accordance with the Groundwater Sampling Data Analysis and Evaluation Plan (GSDAEP) for the WSI facility (Parametrix 2004b). Groundwater sampling was performed in August 2017 by GeoPro LLC, Battle Ground, Washington.

1.2 SITE DESCRIPTION

The approximately 10-acre WSI was constructed as an earthen impoundment with Hypalon liner in 1981. It was used through 2001 to dispose of various types of waste generated from plant pollution controls. A map of the location is shown in Figure 1.

The WSI contains approximately 89,000 cubic yards of sludge comprised primarily of alumina, dust, and particulates from wastewater and residual waste generated by plant emission control systems. The WSI managed waste through evaporation of wastewater and disposal of emission control sludge (DOE 2014). The WSI discontinued accepting waste and was closed in September 2004 (Parametrix 2004a). Closure of the WSI included placement of an engineered RCRA cap consisting of soil and geosynthetic materials and development of a post-closure maintenance and groundwater monitoring plan (Parametrix 2004b).

1.3 HYDROGEOLOGIC SETTING

The geologic materials present beneath the WSI consist of unconsolidated alluvial deposits of Quaternary age, underlain by a series of basalt flows and sedimentary interbeds of the Columbia River Basalt Group (CH2M Hill 1995; Golder 1989). Aquifer A is the uppermost aquifer and occurs at a depth of 10 feet or more below the bottom of the WSI within the unconsolidated alluvium, colluviums, and top of the shallow brecciated basalt. Aquifer B occurs below Aquifer A below the WSI (Parametrix, 2005) within the fractured zone beneath the first basalt layer. Aquifer A is unconfined and the underlying Aquifer B is confined. A site-wide groundwater evaluation is currently being conducted as part of developing the Remedial Investigation work plan pursuant to the Agreed Order (DOE 2014).

The saturated thickness of Aquifer A decreases south of the WSI. Aquifer A is recharged by precipitation and Aquifer B is recharged by leakage from the overlying units. In addition, Aquifers A and B are both recharged by groundwater discharge through the basalt along the cliffs north of the WSI.

Groundwater in Aquifer A north of the WSI flows with a steep gradient toward the south-southeast (Parametrix, 2004b). The gradient flattens beneath the WSI; south of the

WSI, groundwater flows southwestward toward the Columbia River. The gradient and flow direction in the underlying Aquifer B are not defined.

1.4 PREVIOUS GROUNDWATER MONITORING

The current monitoring network at the site consists of sixteen monitoring wells, including some shallow and deep well clusters. The initial monitoring wells were installed in 1984, and another set of wells were installed in 1989. An additional monitoring well, MW-18, was installed near the downgradient property boundary, about 2,500-feet from the WSI, in October 2004.

Sampling and analysis of groundwater has been conducted since 1984, and followed a quarterly schedule between 1991 and 2004. One additional pre-closure sampling event was conducted in September 2004 for the five wells included in the post- closure monitoring plan to establish groundwater quality before the wells could be affected by subsurface disturbances from WSI closure construction. Post-closure sampling and analysis was conducted quarterly from 2005-2007, semiannually from 2008-2010, and annually beginning in 2011. Previous samples were analyzed for pH, conductivity, total organic carbon, sulfate, fluoride, chloride, sodium, iron, manganese, free cyanide, total cyanide, and total phenols. Sulfate and fluoride were determined to be representative indicator parameters for the WSI wastes, since sulfate concentrations show direct response to periods of waste discharge into the pond. Pre-closure maximum sulfate concentrations were observed in 2000 and 2001 (Parametrix 2004a).

2 GROUNDWATER INVESTIGATION

The post-closure monitoring investigation was described in the GSDAEP (Parametrix 2004b) and is summarized in this section.

2.1 MONITORING WELL LOCATIONS

The post-closure monitoring well locations include the following upgradient and downgradient wells:

- Upgradient well: MW-8A
- Downgradient wells near WSI: MW-10A, MW-12A, and MW-14A
- Downgradient wells farther from WSI: MW-3B and MW-18

The aquifer in which each well is screened will be determined as part of developing the Remedial Investigation work plan pursuant to the Agreed Order (DOE 2014). Monitoring well construction details are shown below in Table 1. Monitor well 12A has been dry except for the March 13, 2007 sampling event. Well locations are shown on Figure 2.

Well Number	Installed	Total Well Depth (ft bgs)	Well Screen Interval (ft bgs)	PVC Casing Diameter (inches)	Ground Surface Elevation (ft)	Top of PVC Elevation (ft)	Location
MW-8A	May 1989	41	22-32	4	490	492.97	Upgradient
MW-3B	April 1984	51	46-51	4	408	410.90	Downgradient
MW- 10A	April 1989	26	13-25.5	4	425	427.95	Downgradient
MW- 12A	May 1989	55	40-54	4	439	441.38	Downgradient
MW- 14A	May 1989	30.5	8.5-29.5	4	429	431.65	Downgradient
MW-18	October 2004	51	35-50	4	346	348.40	Downgradient

Table 1. Monitoring Well Construction Data

2.2 SAMPLING PROCEDURES

Samples were collected on August 9, 2017 by GeoPro LLC using a submersible pump. Sampling collection procedures are summarized below.

- The static water level was measured prior to sampling.
- Each monitor well was purged of stagnant water in the casing and filter by slowly setting the pump within the approximate middle of the screened interval or slightly above the middle until the temperature, conductivity and pH stabilized.
- Samples were collected by setting the pump within the approximate middle of the screened interval with a low flow pumping rate.
- Water samples were placed in appropriate containers prepared by the laboratory. The containers were filled to prevent air-entrapment, sealed, labeled, and placed in an ice chest at approximately 4°C for transport to OnSite Laboratory. The samples were accompanied by a completed and signed chain-of-custody form. The samples were submitted by OnSite to AmTest laboratory for cyanide analysis.

2.3 SAMPLE ANALYSES

Laboratory reports from Onsite Environmental, Inc., Redmond, Washington for analysis of the groundwater samples were completed on August 29, 2017. The laboratory reports are included in Appendix A2.

2.4 MONITORING SCHEDULE

Groundwater sampling follows the schedule outlined in the post-closure plan (Parametric 2007c). Beginning in 2005, the plan specified quarterly sampling for the first two years, semiannually for years 3 through 7, and annual sampling thereafter until

concentrations drop below groundwater protection standards, or for a maximum of 30 years. One semiannual sampling event was not completed in 2011.

2.5 DATA EVALUATION

The statistical approach for evaluating the post-closure groundwater monitoring data collected at the WSI is described in the GSDAEP (Parametrix 2004b). The objectives of the post-closure data evaluation for the WSI are to demonstrate the effectiveness of the correction action, that is, evaluate whether groundwater quality is improving, deteriorating, or remaining unchanged relative to pre-closure conditions, and to determine compliance with the groundwater protection standards. The data evaluation schedule is summarized below in Table 2.

Frequency of Evaluation **Statistical Procedure Purpose** Quarterly or semiannually Time-series plots Visually identify increasing or decreasing trends in concentrations Years 1-7 Quantitatively identify increasing or Trend analyses using Manndecreasing trends in concentrations Kendall test **Upper Confidence Limit** Compare concentrations to the Annually After Year 7 Evaluation groundwater protection standards Time-series plots Visually identify increasing or decreasing trends in concentrations

Table 2. Data Evaluation Schedule for WSI

Groundwater protection standards are MTCA¹ Method B cleanup standards and Maximum Contaminant Levels (MCLs). The groundwater protection standards for these parameters are presented in the following Table 3.

		MCL	(mg/L)
Parameter	MTCA B Cleanup Level (mg/L)	Primary	Secondary
Fluoride	0.96	4	2
Chloride	-	-	250
Sulfate	-	-	250
Total Cyanide	0.32	0.2	-

Table 3. Groundwater Protection Standards for WSI

The analysis for total cyanide is to be discontinued if not detected for four consecutive calendar quarters.

The GSDAEP (Parametrix 2004b) also recommended using Upper Prediction Limit (UPL) comparisons to evaluate post-closure data. However, EPA guidance (EPA 2004) does not recommend that UPL comparisons be used for sites such as WSI with pre-existing contamination.

¹ State of Washington Department of Ecology Model Toxics Control Act, Cleanup Regulations, Chapter 173-340 WAC, as revised.

Three years of quarterly data (2005-2007), three years of semiannual data (2008-2010), and seven years of annual data (2011-2017) from ground water sampling were used for analysis (see Appendix A1). The concentrations of fluoride, chloride, sulfate, and total cyanide in each well were evaluated and prepared to satisfy the quarterly and semiannual requirements. The time-series plots, Mann-Kendall test and UCL comparisons were conducted to satisfy the annual evaluation requirements. With approval from Paul Skyllingstad, DOE (personal communication, June 28, 2012) both the Washington Department of Ecology UCL calculator and the Environmental Protection Agency ProUCL calculator were used to calculate UCLs for the data.

Time-series plots were created using the Microsoft Excel graphing functions. The Mann-Kendall test was conducted using the EPA's ProUCL calculator. ProUCL did not directly create all the statistical outputs needed for the Mann-Kendall analysis. VAR(S) was computed using equation (1), Z was computed using equation (2), and probability was computed using Table A.21 (Hollander and Wolfe, 1973).

(1) Standard Deviation of S =
$$\sqrt{VAR(S)}$$

(2)
$$Z = \frac{|S|-1}{\sqrt{VAR(S)}}$$

The Washington DOE UCL (DOE, 2012) calculator was used to calculate the 95 percent UCL for normal and lognormal datasets as well as the mean, minimum value, and maximum value for each dataset. For datasets that were neither normal nor lognormal, the UCL was calculated using the EPA's ProUCL Calculator (ProUCL, 2012). The datasets evaluated using ProUCL were sulfate in MW-8A and MW-10A, chloride in MW-10A, and cyanide in MW-10A. Raw calculations for the DOE and EPA ProUCL calculators are presented in Appendix B.

3 RESULTS

3.1 SUMMARY

Post-closure data has been collected during 12 quarterly events between February 2005 and November 2007, 6 semiannual events between May 2008 and October 2010, and 7 annual events in July 2011, April 2012, June 2013, April 2014, July 2015, August 2016 and August 2017. The post-closure data are summarized in Appendix A1 and individual results that exceed the groundwater protection level are highlighted.

3.2 STATISTICAL EVALUATION

3.2.1 Time-Series Plots

During the post-closure period beginning in February 2005 groundwater samples were analyzed for sulfate, fluoride, chloride, and total cyanide. Time-series plots of data collected since 2005 are presented in Appendix B1. For the time-series non-detected data, points were plotted using one half of the laboratory practical quantitative limit.

Visual inspection of the time-series plots indicates the following trends since closing of the WSI in 2004.

Sulfate

The sulfate concentrations are increasing in downgradient well MW-10A; decreasing in downgradient wells MW-14A; slightly decreasing in MW-3B; and relatively steady in downgradient well MW-18. The sulfate concentration upgradient of the WSI in well MW-8A is relatively steady at just below 10 mg/L. Sulfate is still well below the preclosure sulfate concentrations of over 23,000 mg/L in downgradient wells MW-10A and 20,000 mg/L in MW-14A (Parametrix, 2007). The highest downgradient sulfate concentrations during the post-closure period were 6,100 mg/L in 2014 in well MW-10A, 7,900 mg/L in 2007 in well MW-14A, and 1,700 mg/L in 2016 and other sampling events in well MW-18.

Fluoride

Fluoride concentrations are steady in the upgradient well MW-8A and downgradient wells MW-3B and MW-18; decreasing in the downgradient well MW-14A; and slightly increasing in downgradient well MW-10A.

Chloride

Chloride concentrations are steady in the upgradient well MW-8A. Chloride concentrations are increasing in the downgradient wells MW-10A and MW-14A. Chloride concentrations are slightly decreasing in downgradient well MW-3B. Pre-closure concentrations of chloride of over 1,200 mg/L for MW-10A and 900 mg/L in MW-14A (Parametrix, 2007) have decreased to less than the secondary MCL of 250 mg/L since the closure of the WSI.

Total Cyanide

Total cyanide concentrations are decreasing in wells MW-10A and MW-14A, and are below the groundwater protection standard. Total cyanide was not detected in the other wells.

3.2.2 Mann-Kendall Test

The Mann-Kendall test (Gilbert, 1987; Hollander and Wolfe, 1973) was used to evaluate temporal trends in the concentrations of analytes. The nonparametric Mann-Kendall test evaluates the direction and significance of trends in the data at the 95 percent UCL. The GWSDAEP specified that Sen's slope tests were to be used to evaluate trends in the data, but have not been used because they provide similar information to the Mann-Kendall test and are less conservative, since they evaluate the significance of the data at the 90 percent UCL.

The Mann-Kendall test was conducted using the post-closure data. Results of the Mann-Kendall tests are presented in Appendix B2 and summarized in Table 4.

Total Cyanide Fluoride Chloride Well Sulfate Upgradient $\mathbf{\Psi}$ MW-8A Downgradient MW-3B $\mathbf{\Psi}$ MW-10A 个 + 1 MW-12A n/a n/a n/a n/a MW-14A MW-18 + +

Table 4. Post-Closure Significant Trends Using the Mann-Kendall Test

Notes:

- ↑ Significant Increasing Trend
- ◆ Significant Decreasing Trend
 - Negative Trend
- + Positive Trend

n/a Trend could not be calculated: only one data point available because the well is dry

The Mann-Kendall Trend test results indicate the following:

- Sulfate levels are significantly increasing in downgradient well MW-10A, and are significantly decreasing in downgradient wells MW-3B and MW-14A.
- Fluoride levels are significantly decreasing in upgradient well MW-8A and downgradient wells MW-3B and MW-18.
- Chloride levels are significantly decreasing in downgradient well MW-3B and significantly increasing in downgradient well MW-10A.
- Total cyanide levels are significantly decreasing in the downgradient wells MW-10A and MW-14A.

3.2.3 Upper Confidence Limits

The primary tool cited in MTCA (WAC 173-340-720[9]) for assessing whether data exceeds established cleanup levels is by comparing data to UCLs calculated on the mean. The UCL for each parameter at each well was calculated using the post-closure data, and the calculated UCL was compared to the MTCA cleanup level and MCL for each analyte to assess whether groundwater protection standards are being met. The results of the UCL comparisons are presented in Appendix B and summarized in Table 5.

Table 5. Upper Confidence Limits of Post-Closure Groundwater Data

		Upper Confi	dence Limit (m	g/L)
	Sulfate	Chloride	Fluoride	Total Cyanide
Lowest Groundwater Protection Standard (mg/L)	250	250	0.96	0.2
Upgradient				
MW-8A	9.15	4.48	0.64	0.01
Downgradient				
MW-3B	2272.33	107.57	2.31	0.01
MW-10A	1958.75	66.96	3.42	0.03
MW-12A ¹	1800	150	6	0.01
MW-14A	3954.35	111.87	20.22	0.11
MW-18	1496.25	82.88	2.84	0.01

Notes:

Bold indicates UCL exceeds lowest groundwater protection standard.

All the sampled wells downgradient of the WSI have post-closure UCL concentrations above the groundwater protection standards for sulfate and fluoride and below the groundwater protection standard for chloride and total cyanide. Upgradient well MW-8A has a UCL below the groundwater protection standard for sulfate, chloride fluoride and total cyanide.

3.3 GROUNDWATER FLOW

Groundwater elevations were measured once during 2004, quarterly between 2005 and 2007, semiannually between 2008 and 2010, and annually during 2011 through 2017 in the five sampled wells. The groundwater elevation data and a hydrograph showing changes in groundwater elevation during post-closure are presented in Appendix C. A groundwater elevation contour map was prepared using groundwater levels measured in August 2017 and is provided in Figure 3. Groundwater flow is consistent with historical data and the overall flow direction downgradient from the WSI is toward the southwest.

¹ No UCL calculated. Well was dry during most sampling events.

Value represents single measurement collected on March 13, 2007.

² No UCL calculated, all data was non-detected.

4 CONCLUSIONS AND RECOMMENDATIONS

4.1 CONCLUSIONS

The following is concluded based on the August 2017 groundwater sampling results, trends, and statistical evaluation of historic data.

- Sulfate and fluoride concentrations in downgradient wells, based on the calculated UCLs, are above groundwater protection standards. Fluoride in the upgradient well is below groundwater protection standards.
- Sulfate concentrations are not significantly decreasing in concentration, based on calculated UCLs, since the last reporting period.
- Fluoride concentrations are not significantly decreasing in concentration, based on calculated UCLs, since the last reporting period.
- Chloride concentrations remain below groundwater protection standards, based on calculated UCLs, since the last reporting period. A significant increasing trend in chloride concentration continues in downgradient well MW-10A and a significantly decreasing trend continues for chloride in well MW-3B.
- Total cyanide concentrations are below groundwater protection standards, based on calculated UCLs, since the last reporting period. A significant decreasing trend continues since the last reporting period for total cyanide in wells MW-10A and MW-14A.

4.2 RECOMMENDATIONS

Post-closure fluoride and sulfate concentrations are much lower than pre-closure concentrations. However, the lack of significant reduction in their concentrations during the post-closure period may indicate that the WSI is continuing to contribute these contaminates to groundwater. Future sampling and data evaluation will be required to determine whether the concentrations of fluoride and sulfate decrease below the lowest groundwater protection standards.

As specified in the GSDAEP, the WSI groundwater monitoring frequency is on an annual basis. Also specified, future annual reports will continue to include time-series plots, Mann-Kendall tests for trend and a comparison of the UCLs of the most recent sampling data to groundwater protection standards.

Appendix A2 Laboratory Reports

14648 NE 95th Street, Redmond, WA 98052 • (425) 883-3881

August 29, 2017

Rick Kent GeoPro, LLC PO Box 26 Battle Ground, WA 98604

Re: Analytical Data for Project 160802

Laboratory Reference No. 1708-205

Dear Rick:

Enclosed are the analytical results and associated quality control data for samples submitted on August 15, 2017.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister Project Manager

Enclosures

Project: 160802

Case Narrative

Samples were collected on August 9, 2017 and received by the laboratory on August 15, 2017. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Data Qualifiers and Abbreviations

- A Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B The analyte indicated was also found in the blank sample.
- C The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E The value reported exceeds the quantitation range and is an estimate.
- F Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I Compound recovery is outside of the control limits.
- J The value reported was below the practical quantitation limit. The value is an estimate.
- K Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L The RPD is outside of the control limits.
- M Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.
- N Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 Hydrocarbons in diesel range are impacting lube oil range results.
- O Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P The RPD of the detected concentrations between the two columns is greater than 40.
- Q Surrogate recovery is outside of the control limits.
- S Surrogate recovery data is not available due to the necessary dilution of the sample.
- T The sample chromatogram is not similar to a typical .
- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 The practical quantitation limit is elevated due to interferences present in the sample.
- V Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X Sample extract treated with a mercury cleanup procedure.
- X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.
- Y The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

7 -

ND - Not Detected at PQL

PQL - Practical Quantitation Limit

RPD - Relative Percent Difference

Am Test Inc. 13600 NE 126TH PL Suite C Kirkland, WA 98034 (425) 885-1664 Professional Analytical Services

Aug 29 2017 On-Site Environmental 14648 NE 95th ST Redmond, WA 98052

Attention: David Baumeister

Dear David Baumeister:

Enclosed please find the analytical data for your 160802 project.

The following is a cross correlation of client and laboratory identifications for your convenience.

CLIENT ID	MATRIX	AMTEST ID	TEST
MW-8A-2017	Water	17-A013909	CONV
MW-14A-2017	Water	17-A013910	CONV
MW-10A-2017	Water	17-A013911	CONV
MW-10A-D-2017	Water	17-A013912	CONV
MW-3B-2017	Water	17-A013913	CONV
MW-18-2017	Water	17-A013914	CONV

Your samples were received on Wednesday, August 16, 2017. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.

The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to conact me.

Sincerely,

Aaron W. Young Laboratory Manager

Appendix B2 Summary of Results - Mann-Kendall Test for Trend

SUMMARY MANN-KENDALL TEST FOR TREND RESULTS

Well ID	Analyte	n	S	Variance	Z	Probability	Trend
MW-3B	Sulfate	24	-62	264	3.754	0.000	Significantly Negative
	Fluoride	24	-52	267	3.123	0.002	Significantly Negative
	Chloride	24	-46	267	2.756	0.006	Significantly Negative
	Cyanide	25	-1	112	0.000	1.000	Negative
MW-8A	Sulfate	24	-18	261	1.052	0.293	Negative
	Fluoride	24	-40	258	2.428	0.015	Significantly Negative
	Chloride	24	-20	267	1.164	0.245	Negative
	Cyanide	25	-9	217	0.543	0.587	Negative
MW-10A	Sulfate	24	50	269	2.989	0.003	Significantly Positive
	Fluoride	24	3	268	0.122	0.903	Positive
	Chloride	24	44	269	2.623	0.009	Significantly Positive
	Cyanide	25	-52	264	3.139	0.002	Significantly Negative
MW-12A	Sulfate	1	-	-	ı	-	-
	Fluoride	1	-	-	1	-	-
	Chloride	1	-	-	1	-	-
	Cyanide	1	-	-	1	-	-
MW-14A	Sulfate	23	-36	2	212.667	0.016	Significantly Negative
	Fluoride	23	-36	213	2.400	0.016	Significantly Negative
	Chloride	23	-29	212	1.925	0.054	Negative
	Cyanide	24	-44	213	2.949	0.003	Significantly Negative
MW-18	Sulfate	24	7	263	0.370	0.711	Positive
	Fluoride	24	-55	266	3.313	0.001	Significantly Negative
	Chloride	24	-20	264	1.169	0.242	Negative
	Cyanide	25	3	220	0.135	0.893	Positive

Notes:

n = Sample size

S = Mann-Kendall test statistic; calculated based on S and the estimated variance when the sample size is greater than 10.

Variance = Standard Deviation of S Squared

Z = Approximate normal test statistic; calculated based on S and the estimated variance when the sample size is greater than 10.

Probability from Table A.21 [Hollander and Wolfe (1973)]

Trends significant at alpha = 0.05 or less are shown in bold type

	· · · · · · · · · · · · · · · · · · ·	help the user to select the most appropriate 95%	
•		tudies summarized in Singh, Singh, and Iaci (2002	.)
and Singh and Singh (2003). However, simulat		ali keal World data sets.	
For additional insight the user may want to co	nsuit a statistician.		
Note: For highly negatively-skewed data, confi	idence limits (e.g., Chen, J	ohnson, Lognormal, and Gamma) may not be	
reliable. Chen's and Johnson's methods provide	de adjustments for positve	ely skewed data sets.

General Statistics									
Total Number of Observations		25		Number of	Distinct Ob	servations		4	
Number of Detects		1		Number of	Non-Detec	ts		24	
Number of Distinct Detects		1		Number of	Distinct No	n-Detects		3	
Warning: Only one distinct data valu	ue was detected! Pro	oUCL (or a	ny other so	ftware) sho	uld not be ι	ısed on such	a data set!		
It is suggested to use alternative site	specific values det	ermined b	y the Proje	ct Team to e	stimate en	vironmental	parameters (	e.g., EPC, B	STV).
The data set for variable CY18 was r	ot processed!
