HW & TRP - SWRO
P.O. Box 47775
Olympia, WA 98504-7775

Ms. Pang:

Enclosed are three copies of the Final Interim Action Report for Philip's Washougal facility. All of Chris Neumiller's comments have been incorporated into the report. In addition, I have included:

- The Department of Ecology's split sample data in Appendix A,
- Field photographs in Appendix B, and
- Field data from the 1986 soil boring program where DNAPL was first discovered on site.

If you have any questions or comments, please feel free to call me at (425) 227-6121.

Sincerely,

A handwritten signature in black ink, appearing to read "CM".

Carolyn Mayer

1.0 Introduction

This report is submitted in accordance with Section VII.C.8 and VII.C.9 of the Burlington Environmental Inc. d.b.a. Philip Services Corp. ("Philip") Washougal Facility RCRA Final Status Permit. The work performed for this investigation was completed in accordance with Section VII.C.5. of this permit. The regulatory requirements of an Interim Action are described in WAC 173-340-430. The main purpose of the investigation was twofold. First, Philip tried to determine the extent of contamination around monitoring wells MC-7 and MC-18 and make a determination as to close these wells or keep them in the monitoring program. Second, the investigation included a soil removal action beneath the former interim status tank system, which exceeded 100 x Groundwater MTCA Method B cleanup levels.

1.1 Location

Philip's Washougal facility is located off 32nd Street in Washougal, Washington. The facility is located within a diked portion of the Columbia River floodplain in the Camas-Washougal Industrial Park. See Figure 1-1 for a Location Map.

1.2 Facility Description

The facility occupies approximately 5.2 acres of the park. The facility consists of a water and stormwater treatment facility, two RCRA drum storage buildings, and an office. See Figure 1-2 for a detailed Site Map.

1.3 Facility History

The facility was constructed in 1978 by McClary-Columbia Corporation and was used to produce phenolic resins. In January 1979, the facility began producing defoamers and water treatment chemicals for use in the paper industry. Production of phenolic resins ceased in November 1979. Waste oil recovery began in November 1979 and ended in late 1980. The plant began recycling waste solvents in 1980 and converted the former resin plant to the present solvent recovery plant by 1981. The two drum storage facilities were constructed in 1981 and 1985. The non-RCRA waste oil blending facility was completed in 1986.

Chemical Processors, Inc. (Chempro) purchased majority ownership of the facility from McClary-Columbia in June 1985, and purchased full ownership in late 1987. In early 1988, Burlington Resources purchased Chempro and formed Burlington Environmental, Inc. In late 1993, Philip Environmental purchased Burlington Environmental, Inc. In 1997, Philip Environmental changed its name to Philip Services Corp. However, the facility continues to operate under the Burlington Environmental, Inc. name.

2.0 Site Geology and Hydrology

The facility is constructed on approximately seven to ten feet of sandy dredge spoils from the Columbia River. The saturated portion of this sand unit comprises the shallow aquifer, which is generally between four and seven feet thick. Depth to groundwater fluctuates seasonally, but is usually between two and four feet below ground surface (bgs). Groundwater flow in the shallow aquifer is to the east towards Steigerwald Marsh. Previous investigations have shown a measured range for the hydraulic conductivity of the shallow aquifer from 2.4×10^{-2} cm/s to 5.7×10^{-4} cm/s , a hydraulic gradient of 0.012, and an average linear velocity of 3.1 feet per day. No beneficial use of this aquifer has been identified.

Beneath the sand dredge spoils is a laterally continuous native silt unit derived from the marsh that was present at the site prior to filling with dredge spoils. The thickness of the silt aquitard varies across the site. In the western-upgradient portion of the site, the silt layer is between 1-2 feet thick. In the central portion of the site, the zone of contamination, the silt layer thickness varies from 8.5 to 15.5 feet. On the eastern-downgradient side of the site, the silt layer ranges from 6-9 feet in thickness. The silt unit functions as an aquitard confining the deep aquifer. The hydraulic conductivity of the silt unit averages 5.2×10^{-7} cm/s.

Characterization of the deep aquifer has focused on the upper portion, and the total thickness of the aquifer has been estimated to be at least 78 feet thick, based on water well logs from the area. The upper portion of the deep aquifer at the site is composed of gravel and sand. Flow direction of this aquifer appears to be influenced by the Columbia River stage, which is slightly influenced by tides at Washougal. The dominant flow direction appears to be south towards the river, but fluctuates between southwest and northeast depending on the stage of the Columbia River. No information regarding the hydraulic properties of the deep aquifer has been acquired in previous investigations.

3.0 Previous Investigations

Previous investigations have identified organic contaminants in the groundwater, soil, and surface water at the facility. Primary areas of soil contamination included areas beneath the tank farm, and north of the tank farm in the vicinity of the abandoned sump. Chlorinated solvents, various other volatile organic compounds (VOCs), metals and some polycyclic aromatic hydrocarbons (PAHs) have been detected in the soil. Dense non-aqueous phase liquid (DNAPL) was detected in soil borings beneath the tank farm in October of 1986.

DNAPL was detected at approximately 4.5 to 5.5 feet below ground surface (bgs) at two locations near former tanks N and O. The DNAPL was described as a two-phase liquid that was dark brown to black in color. The primary contaminants identified in the DNAPL samples were: 1,1,1-trichloroethane, trichloro-trifluoroethane (Freon- 113), trichloroethylene, tetrachloroethylene, toluene, and xylene.¹ The concentrations of these chemicals exceeded the chemical solubility limits and were therefore considered free-phase DNAPLs.

Various organic compounds and metals, primarily in the north and northeast portions of the facility have impacted the shallow aquifer. No free-phase DNAPL has been detected in monitoring wells. The primary contaminants in the shallow aquifer include: chlorinated solvents (1,1-dichloroethane [1,1,-DCA], 1,1-dichloroethene [1,1-DCE], cis-1,2-dichloroethene [cis-1,2-DCE], 1,2,2-trichloro-1,1,2-trifluoroethane [Freon- 113], 1,1,1-trichloroethane [1,1,1-TCA or methyl chloroform], trichloroethene [TCE], and tetrachloroethene [perchloroethylene or PCE]); vinyl chloride; acetone; BTEX compounds (benzene, toluene, ethylbenzene, and xylene); phenols; naphthalenes; and arsenic.

Several VOCs have been detected in three of five deep aquifer groundwater monitoring wells. Like the shallow aquifer, the most prevalent compound in the deep aquifer is Freon-113, present in concentrations of up to several thousand micrograms per liter (ug/l). The highest concentrations of VOCs in the deep aquifer were detected in monitoring well MC-18, located north of the tank farm (Figure 1-2).

Low concentrations of volatile organic compounds were detected in surface water and sediment samples from Steigerwald Marsh. However, more sampling is planned to determine the nature and extent of contamination in the marsh.

The results of the previous site investigations have resulted in characterization of the shallow aquifer and have identified potential sources of organic contamination at the facility. Additional characterization of the deep aquifer is planned. Installation of three more deep aquifer wells is planned for 1998. A silt investigation revealed that an underlying silt layer is laterally continuous across the site and acts as a confining layer between the shallow and deep aquifers.

Interim Measures have been in effect at Washougal since 1986. Interim Measures have focused on collecting data necessary to characterize the potential source area(s) for the impacted groundwater present at the site. They also intend to provide information that will be used to evaluate potential

¹ Information on the 1986 soil borings can be found in two letter reports which are provided in Appendix B From: Sweet, Edwards & Associates, Inc. To: Jack McClary at McClary Columbia Corp., October 24, 1986; and From: CrownZellerbach To: Mr. Dave Deupree at McClary Columbia Corp., October 27, 1986

remedial alternatives for the source area(s). Methods of evaluating potential remedial alternatives will be presented in an Interim Measures Study Work Plan, submitted after completion of the Interim Measures Investigation, in accordance with the schedule included in Section VII.D.5 of the Part B permit.

4.0 Purpose of Investigation

The scope of work performed for this investigation is described in the Interim Action Work Plan, dated September 1997 and in Section VII.C.5. of the Burlington Environmental Inc. d.b.a. Philip Services Corp. ("Philip") Washougal Facility RCRA Final Status Permit. These tasks are summarized below. The regulatory requirements of an Interim Action are described in WAC 173-340-430.

- Conduct a subsurface soil investigation of the area around groundwater monitoring well MC-18 to determine the source of elevated levels of VOCs in the deep aquifer.
- Conduct a subsurface soil investigation of the area around groundwater monitoring well MC-7 to determine the source of elevated levels of tetrachloroethene (PCE) in the shallow aquifer.
- Remove, designate and dispose of soils beneath the former interim status tank system which exceed MTCA Method B (100X groundwater) soil cleanup levels, and verify removal through in-situ verification sampling.
- If found necessary, remove, designate and dispose of soils in the vicinity of groundwater monitoring wells MC-18 and MC-7 which exceed MTCA Method B (100X groundwater) soil cleanup levels.

During the 1996 Silt Investigation, no evidence was discovered to indicate the presence of free phase DNAPL accumulation on the confining silt unit beneath the site. The highest concentrations of contaminants were detected in samples collected from four feet below ground surface (bgs) in the fill sands beneath the former tank pad. The 1996 Silt investigation yielded only one sample that exceeded the MTCA Method B residential cleanup level (GP-15, @4 feet bgs, for PCE). All other exceedances were of the more stringent MTCA Method B 100 x Groundwater formula values. A "contained-in" policy determination was made (September 9, 1997 letter from Ecology to Philip) to allow disposal of soil and debris contaminated with F001-F005 listed dangerous constituents (spent halogenated and non-halogenated solvents) in a Subtitle D landfill. The "contained in" policy specifies that, if the dangerous constituents in contaminated media and/or debris fall below MTCA residual cleanup levels (Method B formula values, direct contact, soil) and the media and/or debris do not exhibit any dangerous waste characteristics, then Ecology can determine that the media and/or debris no longer contain dangerous wastes. This is because the MTCA residential exposure assumptions represent very conservative assessments of the potential exposure risks posed by the contaminated media and/or debris. Management of the media and/or debris as a dangerous waste is therefore no longer required, although Ecology can issue guidelines regarding disposal.

Excavation of contaminated soil beneath the former tank farm intended to substantially reduce the source of the contamination observed in the shallow aquifer and that observed in the deep aquifer at groundwater monitoring well MC-18. The effects of this interim action will reduce the threat to the environment, provide a partial cleanup of the site, and will not affect future cleanup actions if deemed necessary.

The excavation satisfied the final closure step described in the July 28, 1995 Interim Status Dangerous Waste Tank System Closure Plan by removing and disposing of the tank system containment pad and the North Loading Pad.

5.0 Field Investigations

5.1 Soil Borings

Philip completed eight soil borings at the site on September 15, 1997. Figure 5-1 shows the locations of these eight borings. A concrete corer was used to gain access to the underlying soil in areas where concrete covered the surface. A 2.25-foot auger was used to drill down to approximately two feet at which point a split-spoon sampler was advanced in front of the auger. Samples were collected at two feet intervals until the top of the silt layer was reached. Soil samples were collected from each boring using a two-inch diameter by two-foot long split-spoon sampler. A decontaminated stainless steel spoon was used to remove the soil from the split-spoon and place it immediately into a sample jar. Each boring was backfilled with bentonite chips upon sampling completion. Immediately following sample collection, the samples were placed in an iced cooler. The samples were hand delivered to the Philip Renton laboratory on September 14, 1997. The samples were analyzed for VOCs and SVOCs.

5.1.1 Soil Borings at MC-18

Five shallow soil borings were completed around MC-18 (Figure 5-1) to determine whether the source of VOCs in this deep well was from the shallow aquifer. Boring IAB-03 was located 25 feet north of MC-18 on the opposite (north) side of the buried pipelines. The boring was advanced to a depth of 13 feet, six feet into the silt layer, to evaluate if the lithology surrounding MC-18 is native sediment or disturbed material implaced during installation of the pipelines. Analytical samples were only collected to six feet bgs. Boring IAB-01 was installed approximately 15 feet west of MC-18 to a depth of 6 feet bgs. Boring IAB-02 was installed approximately 5 feet west of MC-18 to a depth of 8 feet bgs. Boring IAB-04 was installed 10 feet east of MC-18 to a depth of six feet bgs. Boring IAB-05 was installed approximately 15 feet south-southeast of MC-18, at the midpoint between MC-18 and soil boring location GP-09. (GP-09 was installed during the silt investigation, refer to the Washougal Silt Investigation, Technical Memorandum, November 1996). Boring IAB-05 was installed to a depth of six feet bgs.

5.1.2 Soil Borings at MC-7

Two borings were completed upgradient and one boring downgradient of MC-7 (Figure 5-1) to determine the source of the groundwater contaminants in MC-7. Boring IAB-06 was placed approximately 30 feet west of MC-7 to a depth of 6 feet bgs. Boring IAB-07 was placed 15 feet west of MC-7 to a depth of 6 feet bgs. The third boring, IAB-08, was placed downgradient of MC-7 between the well and the former tank system at a depth of six feet bgs.

5.2 Tank Farm Excavation

From September 15 through October 2, 1997, Philip removed the former tank system concrete containment area and the concrete north loading pad and excavated the underlying soil. A track-hoe

was used to break the concrete into sections and load it into bulk containers (end dumps) for disposal at Rabanco Regional Disposal Co. in Roosevelt, Washington. Once the concrete cover was removed, the underlying soils were excavated to six feet below ground surface. Soil removal began in the southwest corner of the tank system using an excavator positioned above and reaching down to remove the soils. Initially, the excavation was to be completed at a depth of four feet bgs. However the soil at four feet was still determined to be contaminated due to the odor of the soil, and a cooperative decision was made between Ecology and Philip to continue the excavation to six feet bgs where the soil was no longer physically contaminated. The 10 NDU criterion for the "contained in" policy determination was not exceeded during a field screening with a PID. Therefore, the soil did not have to be managed as a dangerous waste as specified by the "contained-in" policy for managing excavated soil as dangerous waste vs. solid waste.

Laterally, the excavation extended two feet beyond the tank system containment walls, except along Building 1 (east side) where the excavation extended to within three feet of the building.

Approximately 3360 tons of concrete and soil were removed. The excavated material was loaded directly into dump trucks for disposal at the Rabanco Regional Disposal Co.

During the excavation activities, recovery well MC-R was removed. MC-R is a driven well with no gravel pack and a base at nine feet bgs. The soil around recovery well MC-R was excavated to six feet bgs. The casing was then pulled using the track-hoe. The remaining three-foot hole was backfilled with bentonite.

Two feet southwest of MC-R, approximately three plastic 5-gallon buckets connected in a vertical series were discovered. Their presence was unknown to Philip prior to the excavation activities and no mention of this structure was made in any previous report. The bottom-most bucket was perforated along the side with the bottom intact. The buckets above all had their bottoms removed. The buckets extended from just below the surface concrete to 6 feet bgs. The buckets were removed during the excavation and Ecology notified of the discovery.

Following the excavation to six feet bgs, soil confirmation samples were collected from the bottom of the excavation. Sample locations were determined using a grid system. Figure 5-1 displays the grid system and sampling locations. Initially, samples were to be collected at 25 nodes in the grid at a depth of four feet below ground surface (bgs). However, during the collection of four foot bgs confirmation samples, Ecology decided that samples need not to be collected from all 25 grid nodes, because a decision was made to extend the entire excavation to six bgs. Therefore, only eight four-foot soil samples were collected at grid points: 1-4 and 6-9. Fourteen confirmation samples were re-collected at 6 feet bgs from grid points: 1, 3, 5, 6, 8, 10, 11, 13, 15, 16, 18, 20, 23, and 25. The excavation intercepted the water table between four to six feet bgs. For samples collected below the groundwater level in the excavation pit, the water was decanted off the sample prior to submitting for analysis to provide a more representative measure of soil contamination levels. Immediately following sample collection, the samples were placed in an iced cooler. The samples were submitted to the Philip Renton Laboratory and analyzed for VOCs and SVOCs.

The excavation was backfilled following completion of the soil removal. Pre-load material already on site was used to fill in the excavation pit to a level just below the perimeter elevation. The backfill was laid down in lifts and compacted.

6.0 Results

6.1 Soil Borings

As stated in Section 5.0, a subsurface soil investigation consisting of collection and analysis of soil samples from eight soil borings in the area surrounding groundwater monitoring wells MC-18 and MC-7 was conducted as part of Interim Actions at the site. Five shallow soil borings (IAB-01 through IAB-05) were installed to evaluate soil in the vicinity of monitoring well MC-18 as a potential source of VOCs in the deep aquifer beneath the site. Three shallow soil borings (IAB-06, IAB-07, and IAB-08) were installed to evaluate soil in the vicinity of groundwater monitoring well MC-7 as a potential source of PCE in the shallow aquifer beneath the site.

A total of thirteen VOCs were detected in soil samples collected from the soil borings around MC-18, including: PCE, TCE, 1,1,1-TCA, methylene chloride, 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, ethylbenzene, toluene, m,p-xylenes, o-xylene, 2-butanone, acetone, and freon-113. While 10 VOCs were detected in the soil borings surrounding MC-7, including PCE, 1,2,4-trimethylbenzene, ethylbenzene, toluene, m,p-xylenes, o-xylene, 2-butanone, acetone, freon-113 and carbon disulfide. All of these VOCs except for carbon disulfide were detected in confirmatory soil samples from beneath the former tank farm.

PCE, the primary chemical of concern in the groundwater at these wells, was detected in four of the borings installed around monitoring well MC-18 (IAB-02 - IAB-05). While PCE was only detected in one sample from the borings surrounding MC-7: 2.63 µg/kg in the sample from 6 ft below ground surface (bgs) in boring IAB-08 (Figure 5-2). Each of these detections was well below the 100 x Groundwater cleanup levels of 87.5 µg/kg for PCE in soil. These results indicate that soil in the vicinity of MC-7 is not acting as a source of PCE in the shallow aquifer.

Toluene and acetone were the only two VOCs detected in more than one sample from any single boring. Toluene was detected in the 2 and 4 ft bgs samples from boring IAB-04, but was not detected in the 6 ft bgs sample. Acetone was the most frequently detected VOC in soil samples from the soil borings. Acetone was detected in the deepest sample collected from each boring and was the only VOC detected in all eight soil borings.

As shown in Table 6-3, the concentrations of each of the VOCs detected in the soil borings were well below 100 x Groundwater cleanup levels. Further, the concentration of VOCs observed in samples from the soil borings do not indicate that soils in the vicinity of wells MC-7 or MC-18 are acting as significant sources of VOCs in groundwater.

Soil samples from the soil borings were also analyzed for SVOC concentrations. Only one SVOC (4-bromophenyl phenyl ether) was detected in soil from the soil borings (Table 6-4). There is no established 100 x Groundwater cleanup levels listed for 4-bromophenyl phenyl ether.

6.2 Confirmation Sampling

In total, 22 confirmation samples were collected from the bottom of the excavation pit (Figure 5-1) and analyzed for VOC and SVOC concentrations. The objective of these analyses was to verify removal of soil exceeding the 100 x Groundwater MTCA Method B cleanup levels.

Three SVOCs (naphthalene, 2-methyl naphthalene, and di-n-butyl phthalate) were detected in confirmation samples. Two SVOCs (naphthalene and 2-methyl naphthalene) were detected in the 6 ft bgs sample from CIA-08, one SVOC (2-methyl naphthalene) was detected in the 6 ft bgs sample from CIA-13, and one SVOC (di-n-butyl phthalate) was detected in the 6 ft bgs sample from CIA-23. The concentrations of naphthalene and di-n-butyl phthalate detected in confirmation samples CIA-08 and CIA-23, respectively, were each below their 100 x Groundwater cleanup levels (Table 6-1). There is no established 100 x Groundwater cleanup level listed for 2-methyl naphthalene.

A total of 36 different VOCs were detected in confirmation soil samples collected from the bottom of the former tank farm excavation pit (Table 6-2). Three of the VOCs (PCE, vinyl chloride, and 1,1,2,2-tetrachloroethane) were present at concentrations in excess of the 100 x Groundwater cleanup levels. PCE was present above the 100 x Groundwater cleanup levels in borings CIA-11, CIA-13, and CIA-20; vinyl chloride exceeded its 100 x Groundwater cleanup levels in samples CIA-08, CIA-13, and CIA-15; and 1,1,2,2-tetrachloroethane exceeded its 100 x Groundwater cleanup levels in CIA-10. Boring CIA-13 was the only sampling location that contained more than one VOC above 100 x Groundwater cleanup levels. Isoconcentration contour maps showing the distribution of PCE, and vinyl chloride are provided in Figures 6-1 and 6-2. Freon-113 (1,2,2-trichloro-1,1,2-trifluoroethane) was detected in concentrations ranging from non-detect (<15 ug/kg) to ~15,000 ug/kg.² However, none of the Freon-113 detections were close to exceeding the MTCA Method B 100 x Groundwater cleanup standards of 4,800,000 ug/kg or the MTCA Method B Residential Cleanup Standards for soils of 2,400,000 ug/kg.

Together, the results of the VOC analyses indicate the presence of residual soil contamination in excess of the 100 x Groundwater cleanup levels along the western portion of the excavation adjacent to the existing facility warehouse/office building and extending from CIA-20 in the northeastern portion of the excavation towards CIA-11 (Figure 6-3). These results also indicate that residual soil contamination in excess of the 100 x Groundwater cleanup levels also exists beneath the facility building.

It should be noted that Philip's confirmation samples were not submitted for percent dry weight analysis, therefore the reported analytical results may represent lower concentrations than if calculated on a percent dry weight basis.

² All detections >2000 ug/kg are flagged because the samples were not diluted prior to analysis.

7.0 Conclusions

7.1 Soil Borings

Eight borings were installed around monitoring wells MC-7 and MC-18 to determine if there was a source of groundwater contamination in the soils near these wells. The soils sampled from these borings were analyzed for VOCs and SVOCs. All samples were well below the 100 x Groundwater cleanup levels. Consequently, the data gathered from the soil borings suggests that the only potential source of groundwater contamination would be from the soils beneath the tank farm. It is anticipated that the excavation of the soils beneath the tank farm will lead to lower concentrations of groundwater contaminants in the future.

7.2 Tank Farm Excavation

The contaminated soils beneath the former tank farm were excavated to the top of the silt layer in several locations. In other areas, several inches of fill was left in place. It was not possible to excavate to the silt layer in all locations without jeopardizing the integrity of the silt confining layer and possibly creating a conduit to the lower aquifer. In addition, the excavation filled with groundwater at approximately 4 feet bgs. Since the most heavily contaminated soils had been removed in the upper four feet of the excavation it was determined that the cost of dewatering the excavation, then storing, treating, and disposing of the water, would far outweigh any measurable benefit. The soils at the bottom of the excavation were screened and analyzed to confirm that contaminated soils exceeding MTCA Method B 100 x Groundwater formula values had been removed.

The confirmation samples revealed that most of the contamination had been removed. All sample concentrations were well below the MTCA Method B residential cleanup levels. However there were three chemicals that exceeded the 100 x Groundwater cleanup levels for soil in the 6 foot bgs interval. Although these chemicals were found in concentrations above the 100 x Groundwater cleanup levels, the concentrations were significantly lower than those found in the four foot bgs interval, which contained the most contaminated soil.

Quarterly groundwater monitoring of all wells on site will continue, according to Philip's Part B Permit, to determine the effects of this removal action.

* 100 times listed MTCA Method B Formula Value for Groundwater

Note: Freon 113 was not on the original list of analytes therefore dilutions were not performed to ascertain the true values for each sample.
Any value over 2000 ppb should be considered an estimate, as it is outside the working calibration range of the instrument.

**Table 6-3: VOCs Detected in Soil Borings
Washougal Facility**

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

Notes and Definitions

#	Note
1	This compound is not associated with the calibration standard, therefore this value should be considered estimated.
2	* The response of the internal standard associated with this compound was outside the method control limit, therefore this value should be considered estimated.
3	The response of the internal standard associated with this compound was outside the method control limits, therefore this value should be considered estimated.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
Recov.	Recovery
RPD	Relative Percent Difference

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

191-24-2	Benzo[g,h,i]perylene	EPA 8270	ND	330	ug/kg	z	

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

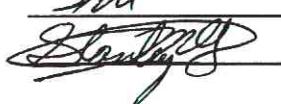

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

ND = Not Detected at Detection Limit. B = Analyte Found in Method Blank.

E = The concentration of this analyte exceeds the calibration range of the instrument.

Q = Analyte concentration and/or MDL is greater than the 1996 MTCA B Limits.

z = Analyte not listed in 1996 MTCA Method B.

CASE NARRATIVE

September 23, 1997

Subject: BEI Washougal

Samples: 9738000, 97398001

Project ID: 156097

Project Officer: Chris Neumiller

By: Karin Feddersen *KF*

SEMIVOLATILE ORGANICS

ANALYTICAL METHODS:

The samples were extracted following the EPA CLP and SW 846 8270 procedure. The sediment extracts were cleaned up with Gel Permeation Chromatography (GPC) followed by silica gel chromatography. Analysis was by capillary GC/MS. Normal QA/QC procedures were performed with the analyses.

HOLDING TIMES:

The samples were stored at 4 degrees C until extraction. They were extracted and were analyzed within the recommended holding times.

BLANKS:

Low levels of some analytes and TICs were detected in the laboratory blanks. Analytes that are detected in the sample and in the blank are considered native to the sample if the levels in the sample are greater than or equal to ten times the amount of analytes in the associated method blanks.

SURROGATES:

The standard Manchester Laboratory surrogates were added to the sample prior to extraction. All surrogate recoveries were within acceptable limits.

MATRIX SPIKE AND MATRIX SPIKE DUPLICATE:

No matrix spikes were performed on these samples.

ANALYTICAL COMMENTS:

The data is acceptable for use as reported.

DATA QUALIFIER CODES:

- U - The analyte was not detected at or above the reported value.
- J - The analyte was positively identified. The associated numerical value is an estimate.
- UJ - The analyte was not detected at or above the reported estimated result.
- REJ - The data are unusable for all purposes.
- NAF - Not analyzed for.
- N - For organic analytes there is evidence the analyte is present in this sample.
- NJ - There is evidence that the analyte is present. The associated numerical result is an estimate.
- E - This qualifier is used when the concentration of the associated value exceeds the known calibration range.
- bold** - The analyte was present in the sample. (Visual Aid to locate detected compound on report sheet.)

Note: Freon 113 was not on the original list of analytes.

Due to the fact Freon 113 was not on the list of analytes, dilutions were not performed to ascertain the true values for each sample.

* Any value over 2000 ppb should be considered an estimate, as it is outside the working calibration range of the instrument.

The detection limit for Freon 113 was 15 ppb, except for flagged samples which had a detection limit of 50 ppb.

VOA Data Review
November 18, 1997

Project: **BEI Washugal**

Samples: 97398000, 973398001

By: Stuart Magoon *SM*

**Case Summary for Volatile Organic Compounds
(VOC)**

Data from these analyses were reviewed for qualitative and quantitative accuracy, validity, and usefulness. These samples were prepared and analyzed according to EPA method SW-846 8260.

The results are reported (ug/Kg; parts per billion).

Holding times:

Sample no.	Collect date	Analysis date	#days from collection to Analysis
97398000	09/24/97	10/07/97	13
97398001	09/24/97	10/07/97	13

Both samples were analyzed within the recommended holding time of fourteen (14) days from collection.

Method Blank:

Low levels of some target analytes were detected in the method blanks. Both Acetone and methylene chloride were detected in several samples at concentrations near that of the corresponding method blank. It is most likely that the detection of these analytes was due

to laboratory contamination and not native to the samples. Since the detection of these analytes was below the quantitation limit and most likely due to contamination sample results for these two analytes have been reported as not detected at the corresponding quantitation limit.

None of the other analytes detected in the method blank are of concern since they were either not detected in the samples or the concentrations detected in the samples were well above the concentrations of these analytes in the method blank, and possible contribution from contamination is considered insignificant.

Calibration:

All of the analytes met the criteria for sensitivity and linearity with a few exceptions. Dichlorodifluoromethane, Vinyl Chloride, Bromomethane, Acetone, and Acrylonitrile calibration curves did not meet linearity requirements. Since neither Dichlorodifluoromethane, Bromomethane, nor Acrylonitrile were detected in these samples, and the low calibration standard demonstrated acceptable sensitivity no data qualification was warranted for these analytes. Acetone was detected in these samples at low concentrations, but the detection was considered due to contamination, and since sensitivity was acceptable no further qualification was necessary. Vinyl Chloride was detected in sample 97398000 and qualified as an estimate ("J"); possibly biased high. Vinyl Chloride was not detected in sample 97398001 or the method blank, and since it met sensitivity requirements no qualification was necessary.

Surrogate Recoveries:

All surrogate recoveries were within quality control limits.

Internal Standards:

Every internal standard response met the quality control criteria.

Summary:

Freon 113 exceeded the calibration range in sample 97398000 and the duplicate analysis of sample 97398000, and was qualified as an estimated amount ("E" qualifier). The analyst did not perform a dilution because he did not discover that the compound exceeded the calibration range until after the holding time had expired. This data is acceptable for use as qualified.

RE: OCTOBER 1986 TEST BORINGS

Dear Jack:

Enclosed are the available results from the test borings completed in the solvent distillation process area. The test boring locations are shown on Figure 1.

The test borings were drilled with a hand auger to the water table, approximately 5 feet below the top of the concrete slab. At each boring, a stainless steel screen was driven into the top of the water table. A ground water sample was then obtained with a Teflon bailer. This was done after at least three pore volumes of water had been removed from the well screen with a peristaltic pump. The screen was then driven down to the top of the underlying silt layer where another water sample was obtained following the same procedure. All drilling equipment was steam cleaned between borings and all sampling equipment was washed with methanol and distilled water between samples. The water sampling depths and water sample designations are listed on Table 1.

The water testing is being done at the Crown Zellerbach lab in Camas, Washington. The testing results available to date are listed on Table 2.

As noted on Table 1, the dark colored solvent mixture was noted only in test holes A and AA. Although this liquid is heavier than water, the test boring results indicate that classical DNAPL migration may not be occurring because of capillary tension in the sand. Available data indicates that the solvent is being held in the capillary fringe and upper water table.

McClary
October 24, 1986
Page Two

The water quality data on Table 2 indicate that there are significant concentrations of dissolved organic chemicals present in shallow ground water in the test boring area. These contaminants are not necessarily derived strictly from the solvents located beneath the old concrete sump, but from past site releases.

Additional evaluation of the water quality data is in progress.

Respectfully submitted,

SWEET, EDWARDS & ASSOCIATES, INC.

JOHN E. EDWARDS

DAVE EDELMAN, JR., Ph.D.

Very truly yours,

Please call if we can be of further assistance.

Samples of groundwater and solvent received here October 23 have been analyzed for methylene chloride, freon 113, 1,1,1-trichloroethane, trichloroethylene, tetrachloroethylene, toluene, and xylenes. Results are shown in Tables 1 and 2. Chain-of-custody information is shown in Appendix A.
