Qualifiers

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Narrative

Receipt
The samples were received on 8/25/2016 4:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.9º C.

Receipt Exceptions
One 250ml nitric preserved poly and two 250ml unpreserved poly containers were received not labeled. The client was contacted and the laboratory was instructed to label the containers according to the client's instructions.

The unpreserved 1 Liter amber containers for sample MW-1A-082516 (590-4322-2) were submitted to the lab at a later date than all other containers. The containers were submitted on 08/26/16 at 1620.

GC/MS VOA
Method NWTPH-Gx: The matrix spike (MS) recoveries for analytical batch 590-8292 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8293 recovered above the upper control limit for Acetone and 2-Butanone (MEK). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. Because the recovery for Acetone was greater than 40%D, results for this analyte are estimates. The following sample is impacted: MW-12A-082516 (590-4322-1).

Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8293 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8260C: The matrix spike (MS) recoveries for analytical batch 590-8293 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260C: The laboratory control sample (LCS) for analytical batch 590-8293 recovered outside control limits for the following analyte: Acetone. This analyte was biased high in the LCS and not detected above the reporting limit in the associated samples; therefore, the data have been reported.

Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8295 recovered outside acceptance criteria, low biased, for Bromomethane, 2,2-Dichloropropane and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8295 recovered above the upper control limit for Acetone and 2-Butanone (MEK). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. Because the recovery for Acetone was greater than 40%D, results for this analyte are estimates. The following samples are impacted: MW-1A-082516 (590-4322-2), MW-7B-082516 (590-4322-3) and DUP-082516 (590-4322-4).

Method 8260C: The matrix spike (MS) recoveries for analytical batch 590-8295 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260C: The laboratory control sample (LCS) for analytical batch 590-8295 recovered outside control limits for the following analyte: Acetone. This analyte was biased high in the LCS and not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The continuing calibration verification (CCV) associated with batch 580-226512 recovered above the upper control limit for N-Nitrosodiphenylamine and 3,3'-Dichlorobenzidine. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: MW-12A-082516 (590-4322-1), MW-1A-082516 (590-4322-2), MW-7B-082516 (590-4322-3), DUP-082516 (590-4322-4) and (CCVIS 580-226512/3).

Job ID: 590-4322-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

Method 8270D: The continuing calibration verification (CCV) associated with batch 580-226512 recovered outside acceptance criteria, low biased, for 4-Nitrophenol, Pentachlorophenol and 4-Nitroaniline. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-226512 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte is considered estimated.

Method 8270D: The following analytes recovered outside control limits for the LCS/LCSD associated with preparation batch 580-226299 and analytical batch 580-226512: 2,6-Dinitrotoluene, 4-Chloroaniline and Hexachlorocyclopentadiene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8270D: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 580-226299 recovered outside control limits for the multip analytes.

Method 8270D: The method blank for preparation batch 580-226299 and analytical batch 580-226512 contained Di-n-butyl phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8270D: The laboratory control sample duplicate (LCSD) for preparation batch 580-226299 and analytical batch 580-226512 recovered outside control limits for the following analytes: Bis(2-ethylhexyl) phthalate, Butyl benzyl phthalate and Benzyl alcohol. These analytes were biased high in the LCSD and were not detected at the reporting limit in the associated samples; therefore, the data have been reported.

Method 8270D: The method blank for preparation batch 580-226299 contained Benzyl alcohol above the reporting limit (RL). There was insufficient holding time remaining to perform a re-extraction and/or re-analysis within holding time; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA

Method 8151A: The continuing calibration verification (CCV) for 2,4-D, Dalapon and 2,4-DB associated with analytical batch 280-340865 recovered outside the control limit on one column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control.

Method 8151A: The continuing calibration verification (CCV) for several compounds associated with analytical batch 280-341438 recovered outside the control limit on one column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control. The surrogate 2,4-Dichlorophenylacetic acid is in control on both columns and reported from the column that is in control in the CCV.

Method 8141B: The initial calibration verification (ICV) for 8141 exceeded control criteria for mevinphos on the back (confirmation) column. The impacted samples were ND for mevinphos and are reported from the front, in control, column. Per the laboratory SOP the ICV is acceptable if the average of the percent differences (%D) values for all of the analytes is within +/- 15% and the %D for all individual analytes is within +/- 30%.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-343654 recovered below the lower control limit for Simazine on the confirmation column. The client samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the column in control (front). The following samples are impacted: MW-12A-082516 (590-4322-1), MW-7B-082516 (590-4322-3) and DUP-082516 (590-4322-4).

Method 300.0: Because the correct container was not labeled by the client, the aliquot used for the initial analysis for sample MW-1A-082516 (590-4322-2) was taken from an unpreserved amber container. The concentration of Nitrate as N in this sample exceeded the calibration range. The sample was then re-analyzed outside of the holding time for the method. Both sets of data have been qualified and reported.

Job ID: 590-4322-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

Method 300.0: The continuing calibration blank (CCB) for analytical batch 590-8311 contained Nitrate as N above the reporting limit (RL). All reported samples associated with this CCB were either ND for this analyte or contained this analyte at a concentration greater than 10X the value found in the CCB; therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 200.8: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 580-226128 and 580-226335.

Method 245.1: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 580-226278 and 580-226470.

Method 200.8: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 580-226278 and 580-226471.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
Method 335.4: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 490-368088 and analytical batch 490-368113 were outside control limits. Sample matrix interference suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-339916.

Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 340257.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Narrative

Receipt
The sample was received on 8/29/2016 4:45 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

Receipt Exceptions
One Voa container for the following sample 590-4346-W-1 was broken in sample control.: MW-16:082916 (590-4346-1). There was enough remaining volume to continue with analysis.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8354 recovered above the upper control limit for 1,1,2-Trichlorotrifluoroethane and Acetone. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. Because the recovery of acetone was greater than 40%D, the results for this analyte are considered estimates. The following sample is impacted: MW-16:082916 (590-4346-1).

Method 8260C: The method blank for analytical batch 590-8354 contained Acetone above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The continuing calibration verification (CCV) associated with batch 580-226767 recovered above the upper control limit for 3,3'-Dichlorobenzidine and 4-Nitrophenol. The sample associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: MW-16:082916 (590-4346-1).

Method 8270D: The following analyte recovered outside control limits for the LCS associated with preparation batch 580-226610 and analytical batch 580-226767: 4-Chloroaniline. The sample was non-detect for the affected analyte. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8270D: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 580-226610 recovered outside control limits for the following analytes: 4-Nitrophenol, 4-Chloroaniline and 3,3'-Dichlorobenzidine.

Method 8270D: The method blank for preparation batch 580-226610 and analytical batch 580-226767 contained Di-n-butyl phthalate and Butyl benzyl phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8270D: Surrogate recovery for the following sample was outside control limits: MW-16:082916 (590-4346-1). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with analytical batch 341826. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. The grand mean of each CCV met acceptance criteria and sample result was ND for these compounds, therefore, the data has been reported.

Method 8141B: The initial calibration verification (ICV) for 8141 exceeded control criteria for mevinphos on the back (confirmation) column. The impacted sample was ND for mevinphos and was reported from the front, in control, column. Per laboratory SOP the ICV is acceptable if the average of the percent differences (%D) values for all of the analytes is within +/- 15% and the %D for all individual analytes is within +/- 30%. The data has been qualified and reported.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-343604 recovered outside acceptance criteria, low biased, for simazine on the back column. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the

Job ID: 590-4346-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

associated samples were non-detect for this analyte, the data have been reported from the column in control.

Method 8082A: The continuing calibration verification (CCV) associated with batch 590-8331 recovered above the upper control limit for Tetrachloro-m-xylene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: MW-16:082916 (590-4346-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 340643.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
*	RPD of the LCS and LCSD exceeds the control limits
*	LCS or LCSD is outside acceptance limits.
B	Compound was found in the blank and sample.

Narrative

Receipt
The sample was received on 8/29/2016 4:45 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

Dioxin
Method 8290A: The Isotope Dilution Analyte (IDA 13C-OCDD) recovery associated with the ending Continuing Calibration Verification (CCV) is below the method recommended limit: CCV 320-129406/14. Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for this IDA in this CCV and all associated samples. The 13C-OCDD IDA recovery for all associated samples is within recovery limits.

Method 8290A: The bracketing continuing calibration verification (CCV) associated with batch 320-129408 1,2,3,4,7,8-HxCDD with percent difference values that are between the method criteria of 20% to 25% deviation from the initial calibration curve. Per method guidelines, an average relative response factor (RRF) is calculated from the bracketing CCV and is used to quantitate any positive results in the associated samples for the affected analytes.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Narrative

Receipt
The samples were received on 8/26/2016 4:20 PM; the samples arrived in good condition.

Air - GC/MS VOA
Method TO-15: 1,2-Dichloroethane-d4 (Surrogate) recovery for the following samples was outside control limits: (CCV 320-125451/10), (LCS 320-125451/11) and (LCSD 320-125451/12). This analyte is not use as a monitoring analyte.

Method TO-15: 4-Bromofluorobenzene (Surrogate) recovery for the following samples was outside control limits: LFB-11-082616 (590-4339-4) and LFB-4-082616 (590-4339-5). Re-analysis was performed with concurring results.

Method TO-15: The method blank for preparation batch 125451 contained Ethanol above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Narrative

Receipt
The sample was received on 8/29/2016 4:40 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 590-8354 recovered above the upper control limit for 1,1,2-Trichlorotrifluoroethane and Acetone. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. Because the recovery of acetone was greater than 40%D, the results for this analyte are considered estimates. The following sample is impacted: SW-1:082916 (590-4348-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The continuing calibration verification (CCV) associated with batch 580-226767 recovered above the upper control limit for 3,3'-Dichlorobenzidine and 4-Nitrophenol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: SW-1:082916 (590-4348-1).

Method 8270D: The continuing calibration verification (CCV) associated with batch 580-226767 recovered outside acceptance criteria, low biased, for 4-Nitrophenol. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated sample was non-detect for this analyte, the data have been reported.

Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-226767 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte is considered estimated.

Method 8270D: The following analyte recovered outside control limits for the LCS associated with preparation batch 580-226610 and analytical batch 580-226767: 4-Chloroaniline. The sample was non-detect for the affected analyte. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8270D: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 580-226610 recovered outside control limits for the following analytes: 4-Nitrophenol, 4-Chloroaniline and 3,3'-Dichlorobenzidine.

Method 8270D: The method blank for preparation batch 580-226610 and analytical batch 580-226767 contained Di-n-butyl phthalate and Butyl benzyl phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with analytical batch 341826. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. The grand mean of each CCV met acceptance criteria and all sample results were ND for these compounds, therefore, the data has been reported.

Method 8141B: The initial calibration verification (ICV) for 8141 exceeded control criteria for mevinphos on the back (confirmation) column. The impacted sample was ND for mevinphos and is reported from the front, in control, column. Per the laboratory SOP the ICV is acceptable if the average of the percent differences (%D) values for all of the analytes is within +/- 15% and the %D for all individual analytes is within +/- 30%. The data has been qualified and reported.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-343604 recovered outside acceptance criteria, low biased, for simazine on the back column. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported from the column in control.

Job ID: 590-4348-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

Method 8082A: The continuing calibration verification (CCV) associated with batch 590-8331 recovered above the upper control limit for Tetrachloro-m-xylene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: SW-1:082916 (590-4348-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 245.1: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 580-226414 and 580-227318.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8141B_3510C: The following sample formed emulsions during the extraction procedure: SW-1:082916 (590-4348-1). The emulsions were broken up using the pour back method on the first two spins of the extraction.

Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 340643.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Narrative

Receipt
The sample was received on 8/29/2016 4:40 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

Dioxin
Method 8290A: The Isotope Dilution Analyte (IDA 13C-OCDD) recovery associated with the ending Continuing Calibration Verification (CCV) is below the method recommended limit: CCV 320-129406/14. Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for this IDA in this CCV and all associated samples. The 13C-OCDD IDA recovery for all associated samples is within recovery limits.

Method 8290A: The bracketing continuing calibration verification (CCV) associated with batch 320-129408 1,2,3,4,7,8-HxCDD with percent difference values that are between the method criteria of 20% to 25% deviation from the initial calibration curve. Per method guidelines, an average relative response factor (RRF) is calculated from the bracketing CCV and is used to quantitate any positive results in the associated samples for the affected analytes.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Data Validation Report

Project: Marshall Landfill Site
November and December 2016 Samples

GEI File No: 00504-104-00

Date: February 3, 2017

This report documents the results of a United States Environmental Protection Agency (EPA)-defined Stage 2A data validation (EPA Document 540-R-08-005; EPA, 2009) of analytical data from the analyses of water and air samples collected as part of the November and December 2016 sampling events, and the associated laboratory and field quality control (QC) samples. The samples were obtained from the Marshall Landfill site located in Spokane County, Washington.

In summary and in our opinion, the quality and accuracy of the analytical data are acceptable for the intended use, with the qualifications applied from the data validation. The primary data validation qualifiers were: (1) GeoEngineers, Inc. (GeoEngineers) qualified selected data as estimated (J/UJ) because of accuracy outliers; and (2) GeoEngineers qualified selected data as non-detected (U) because of method blank contamination and ion abundance ratio (dioxin/furans only) outliers.

The evaluation criteria and qualifications are discussed in greater detail below; a summary of qualified samples is listed in Table 2.

OBJECTIVE AND QUALITY CONTROL ELEMENTS

GeoEngineers completed the data validation consistent with the EPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (EPA, 2008), Inorganic Superfund Data Review (EPA 2010), and Chlorinated Dioxin/Furan Data Review (EPA 2011) (National Functional Guidelines) to determine if the laboratory analytical results meet the project objectives and are usable for their intended purpose. Data usability was assessed by determining if:

- The samples were analyzed using well-defined and acceptable methods that provide reporting limits below applicable regulatory criteria;
- The precision and accuracy of the data are well-defined and sufficient to provide defensible data; and
- The quality assurance/quality control (QA/QC) procedures utilized by the laboratory meet acceptable industry practices and standards.

In accordance with the Quality Assurance Project Plan (QAPP), Appendix B of the Remedial Investigation/Feasibility Study Work Plan (GeoEngineers 2015), the data validation included review of the following QC elements:

- Data Package Completeness
- Chain-of-Custody Documentation
- Holding Times and Sample Preservation
- Surrogate Recoveries
- Method Blanks

- Matrix Spikes/Matrix Spike Duplicates
- Laboratory Control Samples/Laboratory Control Sample Duplicates
- Laboratory and Field Duplicates
- Miscellaneous

DATA VALIDATION SUMMARY

The results for each of the QC elements are summarized below.

Data Package Completeness

TestAmerica provided the required deliverables for the data validation according to the National Functional Guidelines. The laboratory followed adequate corrective action processes and the identified anomalies were discussed in the relevant laboratory case narrative.

Chain-of-Custody Documentation

Chain-of-custody (COC) forms were provided with the laboratory analytical reports. The COCs were accurate and complete when submitted to the laboratory, with the following exception:

SDG 590-5079-1: The laboratory noted that one 250mL NaOH preserved sample vial and one 1L unpreserved sample vial were received without a sample ID, sample collection date, or sample collection time written on the sample vial labels. The sample vials were identified through process of elimination to be for Samples MW-8A:112816 and MW-11A:112816, respectively.

Holding Times and Sample Preservation

The sample holding time is defined as the time that elapses between sample collection and sample analysis. Maximum holding time criteria exist for each analysis to help ensure that the analyte concentrations found at the time of analysis reflect the concentration present at the time of sample collection. Established holding times were met for each analysis. The sample coolers arrived at the laboratory within the appropriate temperatures of between 2 and 6 degrees Celsius, with the exception noted below.

SDG 590-5117-1: One sample cooler temperature recorded at the laboratory was 1.4 degrees Celsius. Since the samples were not frozen, this temperature should likely not affect the sample analytical results.

Surrogate Recoveries

A surrogate compound is a compound that is chemically similar to the organic analytes of interest, but unlikely to be found in an environmental sample. Surrogates are used for organic analyses and are added to the samples, standards, and blanks to serve as an accuracy and specificity check of each analysis. The surrogates are added to the samples at a known concentration and percent recoveries are calculated following analysis. The surrogate percent recoveries for field samples were within the laboratory control limits, with the following exceptions:

SDG 590-5079-1: (Organophosphorus Pesticides) The percent recovery for surrogate chlormefos was less than the control limits in Sample MW-4A:112816. The reporting limits for organophosphorus pesticides target analytes were qualified as estimated (UJ) in this sample.

SDG 590-5100-1: (Organophosphorus Pesticides) The percent recovery for surrogate chlormefos was less than the control limits in Samples MW-9A:113016, MW-DUP:113016, MW-14:113016, MW-15:113016, MW-16:113016, and MW-16A:113016. The reporting limits for organophosphorus pesticides target analytes were qualified as estimated (UJ) in these samples.

SDG 590-5134-1: (VOCs-Air) The percent recovery for surrogate 4-Bromofluorobenzene was greater than the control limits in Sample LFB-4:120216; however, the sample was spiked with two additional surrogates and in each case the percent recoveries were within their respective control limits. No action was required for this outlier.

Method Blanks

Method blanks are analyzed to ensure that laboratory procedures and reagents do not introduce measurable concentrations of the analytes of interest. A method blank was analyzed with each batch of samples, at a frequency of 1 per 20 samples. For each sample batch, method blanks for the applicable methods were analyzed at the required frequency. None of the analytes of interest were detected in the method blanks, with the following exceptions:

SDG 590-5079-1: (NWTPH-Gx) There was a positive result for gasoline-range hydrocarbons detected above the method detection limit, but below the reporting limit in the method blank extracted on 12/2/2016. The positive results for gasoline-range hydrocarbons were qualified as non-detected (U) in Samples MW-4A:112816, MW-8A:112816, MW-8B:112816, and MW-11A:112816.

(NWTPH-Dx) There was a positive result for diesel-range hydrocarbons detected above the method detection limit, but below the reporting limit in the method blank extracted on 12/5/2016. The positive results for diesel-range hydrocarbons were qualified as non-detected (U) in Samples MW-8A:112816 and MW-8B:112816. There were no positive results for diesel-range hydrocarbons in Samples MW-4A:112816 and MW-11A:112816; therefore, no qualifications were required.

(Dissolved Metals) There were positive results for dissolved barium, dissolved iron, and dissolved selenium detected above the method detection limit, but below the reporting limit in the method blank digested on 12/7/2016. The positive results for dissolved iron and dissolved selenium were qualified as non-detected (U) in Samples MW-8A:112816 and MW-8B:112816. The positive results for dissolved selenium were qualified as non-detected (U) in Samples MW-4A:112816 and MW-11A:112816. The positive results for dissolved barium in Samples MW-4A:112816, MW-8A:112816, MW-8B:112816, and MW-11A:112816 were greater than 10X the concentration in the method blank; and there were no positive results for dissolved iron in Samples MW-4A:112816 and MW-11A:112816; therefore, no qualifications were required.

Matrix Spikes/Matrix Spike Duplicates

Since the actual analyte concentration in an environmental sample is not known, the accuracy of a particular analysis is usually inferred by performing a matrix spike (MS) analysis on one sample from the associated batch, known as the parent sample. One aliquot of the sample is analyzed in the normal manner and then a second aliquot of the sample is spiked with a known amount of analyte concentration and analyzed. From these analyses, a percent recovery is calculated. Matrix spike duplicate (MSD) analyses are generally performed for organic analyses as a precision check and analyzed in the same sequence as a matrix spike. Using the result values from the MS and MSD, the relative percent difference (RPD) is calculated. The percent recovery control limits for MS and MSD analyses are specified in the laboratory documents, as are the RPD control limits for MS/MSD sample sets.

One MS/MSD analysis should be performed for every analytical batch or every 20 field samples, whichever is more frequent. The frequency requirements were met for each analysis and the percent recovery and RPD values were within the proper control limits, with the following exceptions:

SDG 590-5100-1: (COD) The laboratory performed a matrix spike on Sample MW-14:113016. The percent recovery for COD was greater than the control limits in the MS extracted on 12/12/2016. There were no positive results for COD in Sample MW-14:113016; therefore, no qualification was required.

(Ammonia (as N)) The laboratory performed a matrix spike on Sample MW-9A:113016. The percent recovery for ammonia (as N) was less than the control limits in the MS extracted on 12/5/2016. The positive result for ammonia (as N) was qualified as estimated (J) in Sample MW-9A:113016.

SDG 590-5101-1: (Total Cyanide) The laboratory performed a matrix spike on Sample SW-1:113016. The percent recovery for total cyanide was greater than the control limits in the MS extracted on 12/6/2016. There were no positive results for total cyanide in Sample SW-1:113016; therefore, no qualification was required.

SDG 590-5117-1: (COD) The laboratory performed a matrix spike on Sample MW-7D:120116. The percent recovery for COD was less than the control limits in the MS extracted on 12/12/2016. The positive result for COD was qualified as estimated (J) in Sample MW-7D:120116.

Laboratory Control Samples/Laboratory Control Sample Duplicates

A laboratory control sample (LCS) is a blank sample that is spiked with a known amount of analyte and then analyzed. An LCS is similar to an MS, but without the possibility of matrix interference. Given that matrix interference is not an issue, the LCS/LCSD control limits for accuracy and precision are usually more rigorous than for MS/MSD analyses. Additionally, data qualification based on LCS/LCSD analyses would apply to all samples in the associated batch, instead of just the parent sample. The percent recovery control limits for LCS and LCSD analyses are specified in the laboratory documents, as are the RPD control limits for LCS/LCSD sample sets.

One LCS/LCSD analysis should be performed for every analytical batch or every 20 field samples, whichever is more frequent. The frequency requirements were met for all analyses and the percent recovery and RPD values were within the proper control limits, with the following exceptions:

SDG 590-5079-1: (Organophosphorus Pesticides) The percent recovery for azinphos-methyl was greater than the control limits in the LCSD extracted on 12/5/2016; however, the percent recovery for this target analyte was within the control limits in the corresponding LCS. No action was required for this outlier. Additionally, in the same LCS/LCSD sample set, the percent recoveries for coumaphos and dichlorvos and the RPD values for dichlorvos and mevinphos were greater than the control limits in the LCS and LCSD. There were no positive results for coumaphos, dichlorvos, and mevinphos in the associated field samples; therefore, no qualifications were required.

(Total Cyanide) The percent recovery for total cyanide was greater than the control limits in the LCS extracted on 12/1/2016. There were no positive results for total cyanide in the associated field samples; therefore, no qualifications were required.

SDG 590-5100-1: (Organophosphorus Pesticides) The percent recovery for azinphos-methyl was greater than the control limits in the LCSD extracted on 12/5/2016; however, the percent recovery for this target analyte was within the control limits in the corresponding LCS. No action was required for this outlier. Additionally, in the same LCS/LCSD sample set, the percent recoveries for coumaphos and dichlorvos and the RPD values for dichlorvos and mevinphos were greater than the control limits in the LCS and LCSD. There were no positive results for coumaphos, dichlorvos, and mevinphos in the associated field samples; therefore, no qualifications were required.

SDG 590-5101-1: (Organophosphorus Pesticides) The percent recovery for azinphos-methyl was greater than the control limits in the LCSD extracted on 12/5/2016; however, the percent recovery for this target analyte was within the control limits in the corresponding LCS. No action was required for this outlier. Additionally, in the same LCS/LCSD sample set, the percent recoveries for coumaphos and dichlorvos and the RPD values for dichlorvos and mevinphos were greater than the control limits in the LCS and LCSD. There were no positive results for coumaphos, dichlorvos, and mevinphos in the associated field sample; therefore, no qualifications were required.

SDG 590-5117-1: (Organophosphorus Pesticides) The percent recoveries for azinphos-methyl, coumaphos, dichlorvos, and mevinphos were greater than the control limits in the LCSD extracted on 12/5/2016; however, the percent recovery for these target analytes were within the control limits in the corresponding LCS. No action was required for these outliers.

Laboratory Duplicates

Internal laboratory duplicate analyses are performed to monitor the precision of the analyses. Two separate aliquots of a sample are analyzed as distinct samples in the laboratory and the RPD between the two results is calculated. Duplicate analyses should be performed once per analytical batch. If one or more of the samples used has a concentration less than five times the reporting limit for that sample, the absolute difference is used instead of the RPD. The RPD control limits are specified in the laboratory documents. Laboratory duplicates were analyzed at the proper frequency and the specified acceptance criteria were met.

Field Duplicates

In order to assess precision, field duplicate samples were collected and analyzed along with the reviewed sample batches. The duplicate samples were analyzed for the same parameters as the associated parent samples. Precision is determined by calculating the RPD between each pair of samples. If one or more of

the sample analytes has a concentration greater than five times the reporting limit for that sample, then the absolute difference is used instead of the RPD. The RPD control limit for water samples is 35 percent.

SDG 590-5100-1: One field duplicate sample pair, MW-12A:113016 and MW-DUP:113016, was submitted with this SDG. The precision criteria for all target analytes were met for this sample pair.

Narrative

Receipt
The samples were received on 11/29/2016 8:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.8º C.

Receipt Exceptions
A 250ml NaOH preserved poly and a 1 Liter unpreserved amber were received without a sample ID, collection date or time listed on the container. The samples were identified by the process of elimination: MW-8A:112816 (590-5079-1) and MW-11A:112816 (590-5079-3).

GC/MS VOA
Method NWTPH-Gx: The method blank for analytical batch 590-9881 contained Gasoline above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-234074 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte is considered estimated.

Method 8270D: The method blank for preparation batch 580-233897 and analytical batch 580-234074 contained Anthracene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The continuing calibration verification (CCV) associated with batch 280-354373 recovered above the upper control limit for 2,4,5-T, 2,4-D, 2,4-DB, 2,4-Dichlorophenylacetic acid, Dalapon, Dicamba, Dichlorprop, MCPA, MCPP, and Silvex (2,4,5-TP) on the primary column. Recoveries on the confirmation column were in control. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported: MW-8A:112816 (590-5079-1), MW-8B:112816 (590-5079-2), MW-11A:112816 (590-5079-3), MW-4A:112816 (590-5079-4), (CCV 280-354373/19), (CCV 280-354373/30), (CCVRT 280-354373/8), (LCS 280-353896/2-A), (LCSD 280-353896/3-A) and (MB 280-353896/1-A)

Method 8141B: The surrogate, chlormefos, recovered below the lower control limit on both columns: MW-4A:112816 (590-5079-4).

Method 8141B: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 280-354183 and analytical batch 280-355174 recovered outside control limits for the following analytes: Chlormefos, Coumaphos, Dichlorvos, and Azinphos-methyl. Azinphos-methyl was biased high in the LCSD and was not detected in the associated samples. Coumaphos was biased high in the LCS and LCSD and was not detected in the associated samples. Dichlorvos was biased high in the LCS and biased low in the LCSD. The surrogate, chlormefos, was low in the LCSD.

Method 8141B: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 280-354183 recovered outside control limits for the following analytes: Mevinphos.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-355174 recovered outside acceptance criteria, low biased, for Atrazine, Simazine and Propazine. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8081B: The method blank for preparation batch 580-233792 and analytical batch 580-234067 contained gamma-Chlordane and alpha-Chlordane above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8081B: The closing continuing calibration verification (CCV) associated with batch 580-234067 recovered above the upper control

limit for Methoxychlor on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported: MW-8A:112816 (590-5079-1), MW-8B:112816 (590-5079-2), MW-11A:112816 (590-5079-3), MW-4A:112816 (590-5079-4) and (CCV 580-234067/56).

Method NWTPH-Dx: The method blank for preparation batch 590-9886 and analytical batch 590-9885 contained Diesel Range Organics (DRO) (C10-C25) above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Method 335.4: The laboratory control sample (LCS) for preparation batch 490-391174 and analytical batch 490-391486 recovered outside control limits for the following analyte: Cyanide, Total. The analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-353896.

Method 8141B_3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-354183.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Narrative

Receipt
The samples were received on 11/30/2016 4:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 4.6º C, 4.7º C and 5.1º C.

Receipt Exceptions
Method 8290A: Sample containers for the following samples were delayed by federal express and were to arrive on Friday the 2nd, 2016 but did not arrive till Monday the 5th, 2016: MW-15:113016 (590-5100-3) and MW-DUP:113016 (590-5100-7). The samples were received out of temperature at 7.4 degrees Celsius. Due to this the containers were removed from circulation and additional volume was shipped and received within temperature specifications on 12/09/2016.

GC/MS VOA
Method NWTPH-Gx: The method blank for analytical batch 590-9881 contained Gasoline above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-234074 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte is considered estimated.

Method 8270D: The method blank for preparation batch 580-233897 and analytical batch 580-234074 contained Anthracene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The continuing calibration verification (CCV) associated with batch 280-354926 recovered above the upper control limit for 2,4-D, 2,4-Dichlorophenylacetic acid, Dalapon, Dicamba, Dichlorprop, MCPA, and MCPP. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The surrogate is in control on both columns for the associated samples: MW-14:113016 (590-5100-1), MW-12A:113016 (590-5100-2), MW-15:113016 (590-5100-3), MW-16:113016 (590-5100-4), MW-16A:113016 (590-5100-5), MW-9A:113016 (590-5100-6), MW-DUP:113016 (590-5100-7), (CCV 280-354926/24), (CCV 280-354926/35), (CCVRT 280-354926/8), (LCS 280-354292/2-A), (LCSD 280-354292/3-A) and (MB 280-354292/1-A).

Method 8141B: The surrogate chlormefos recovered below the lower control limit on both columns: MW-14:113016 (590-5100-1), MW-15:113016 (590-5100-3), MW-16:113016 (590-5100-4), MW-16A:113016 (590-5100-5), MW-9A:113016 (590-5100-6) and MW-DUP:113016 (590-5100-7). There is no obvious matrix interference.

Method 8141B: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 280-354183 and analytical batch 280-355174 recovered outside control limits for the following analytes: Chlormefos, Coumaphos, Dichlorvos, and Azinphos-methyl. Azinphos-methyl was biased high in the LCSD and was not detected in the associated samples. Coumaphos was biased high in the LCS and LCSD and was not detected in the associated samples. Dichlorvos was biased high in the LCS and biased low in the LCSD. The surrogate, chlormefos, was low in the LCSD.

Method 8141B: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 280-354183 recovered outside control limits for the following analytes: Mevinphos.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-355174 recovered outside acceptance criteria, low biased, for Atrazine, Simazine and Propazine. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8081B: The method blank for preparation batch 580-233792 and analytical batch 580-234067 contained gamma-Chlordane and alpha-Chlordane above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore,

Job ID: 590-5100-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

re-extraction and/or re-analysis of samples was not performed.

Method 8081B: The closing continuing calibration verification (CCV) associated with batch 580-234067 recovered above the upper control limit for Methoxychlor on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported: MW-14:113016 (590-5100-1), MW-12A:113016 (590-5100-2), MW-15:113016 (590-5100-3), MW-16:113016 (590-5100-4), MW-16A:113016 (590-5100-5), MW-9A:113016 (590-5100-6), MW-DUP:113016 (590-5100-7) and (CCV 580-234067/56).

Method NWTPH-Dx: The method blank for preparation batch 590-9886 and analytical batch 590-9885 contained Diesel Range Organics (DRO) (C10-C25) above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method 350.1: The matrix spike (MS) recovery for preparation batch 490-391760 and analytical batch 490-392495 was outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 410.4: The matrix spike (MS) recovery for analytical batch 490-393685 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8141B_3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-354183.

Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-354292.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Narrative

Receipt
The samples were received on 12/1/2016 2:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 1.4º C, 2.8º C, 3.3º C, 4.0º C, 4.4º C and 4.7º C.

Receipt Exceptions
Eight 1 liter unpreserved amber glass containers were requested to be collected for all samples but only seven were received for sample MW-7B:120116 (590-5117-2) and nine were received for sample MW-7D:120116 (590-5117-1).

A 250ml unpreserved amber glass container was received without a label. The sample was identifed to be MW-7B:120116 (590-5117-2) by the process of elimination.

GC/MS VOA
Method NWTPH-Gx: The method blank for analytical batch 590-9881 contained Gasoline above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-234074 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The continuing calibration verification (CCV) associated with batch 280-354926 recovered above the upper control limit (+15%) for 2,4-D, 2,4-Dichlorophenylacetic acid, Dalapon, Dicamba, Dichlorprop, MCPA, and MCPP. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The surrogate is in control on both columns for the associated samples. The following samples are impacted: MW-7D:120116 (590-5117-1), MW-7B:120116 (590-5117-2), MW-15A:120116 (590-5117-3), MW-2A:120116 (590-5117-4), MW-3:120116 (590-5117-5), MW-5A:120116 (590-5117-6), (CCV 280-354926/24), (CCV 280-354926/35), (CCV 280-354926/45), (CCVRT 280-354926/8), (LCS 280-354292/2-A), (LCSD 280-354292/3-A) and (MB 280-354292/1-A).

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-355621 recovered above the upper control limit for Dichlorvos. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: MW-15A:120116 (590-5117-3), MW-2A:120116 (590-5117-4), MW-3:120116 (590-5117-5) and MW-5A:120116 (590-5117-6).

Method 8141B: The laboratory control sample duplicate (LCSD) for preparation batch 280-354313 and analytical batch 280-355621 recovered outside control limits for the following analytes: Azinphos-methyl, Coumaphos, Dichlorvos and Methyl parathion These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8081B: The following CCV failed low outside the control limits for Toxaphene on the primary column. All data for the affected analyte will be reported from the column which met the control limits.

Method NWTPH-Dx: The method blank for preparation batch 590-9886 and analytical batch 590-9885 contained Diesel Range Organics (DRO) (C10-C25) above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Job ID: 590-5117-1 (Continued)

Laboratory: TestAmerica Spokane (Continued)

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method 410.4: The matrix spike (MS) recovery for analytical batch 490-393766 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-354292.

Method 8141B_3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-354313.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Narrative

Receipt
The samples were received on 11/30/2016 4:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 4.6º C, 4.7º C and 5.1º C.

Receipt Exceptions
Method 8290A: Sample containers for method 8290A were delayed by federal express and were to arrive on Friday the 2nd, 2016 but did not arrive till Monday the 5th, 2016. The sample was received out of temperature at 7.4 degrees Celsius. Due to this the containers were removed from circulation and additional volume was shipped and received within temperature specifications on 12/09/2016.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 590-9939 recovered above the upper control limit for 1,1,1-Trichloroethane and Carbon tetrachloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: SW-1:113016 (590-5101-1).

Method 8260C: The continuing calibration verification (CCV) associated with batch 590-9939 recovered outside acceptance criteria, low biased, for 1,1,2,2-Tetrachloroethane and Naphthalene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 580-234074 was outside criteria for the following analyte: N-Nitrosodi-n-propylamine. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte is considered estimated.

Method 8270D: The method blank for preparation batch 580-233897 and analytical batch 580-234074 contained Anthracene above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8151A: The continuing calibration verification (CCV) associated with batch 280-354926 recovered above the upper control limit for 2,4-D, 2,4-Dichlorophenylacetic acid, Dalapon, Dicamba, Dichlorprop, MCPA, and MCPP. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The surrogate is in control on both columns for the associated samples. The following samples are impacted: SW-1:113016 (590-5101-1), (CCV 280-354926/24), (CCV 280-354926/35), (CCV 280-354926/45), (CCVRT 280-354926/8), (LCS 280-354292/2-A), (LCSD 280-354292/3-A) and (MB 280-354292/1-A).

Method 8141B: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 280-354183 and analytical batch 280-355174 recovered outside control limits for the following analytes: Chlormefos, Coumaphos, Dichlorvos, and Azinphos-methyl. Azinphos-methyl was biased high in the LCSD and was not detected in the associated samples. Coumaphos was biased high in the LCS and LCSD and was not detected in the associated samples. Dichlorvos was biased high in the LCS and biased low in the LCSD. The surrogate, chlormefos, was low in the LCSD.

Method 8141B: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 280-354183 recovered outside control limits for the following analytes: Mevinphos.

Method 8141B: The continuing calibration verification (CCV) associated with batch 280-355174 recovered outside acceptance criteria, low biased, for Atrazine, Simazine and Propazine. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8081B: The method blank for preparation batch 580-233792 and analytical batch 580-234067 contained gamma-Chlordane and alpha-Chlordane above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Laboratory: TestAmerica Spokane (Continued)

Method 8081B: The closing continuing calibration verification (CCV) associated with batch 580-234067 recovered above the upper control limit for Methoxychlor on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Dioxin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method 335.4: The matrix spike (MS) recovery for preparation batch 490-392115 and analytical batch 490-392251 was outside control limits. Sample matrix interference and/or non-homogeneity is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Biology
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 8141B_3510C: The following sample formed emulsions during the extraction procedure: SW-1:113016 (590-5101-1). The emulsions were broken up using a centrifuge on all three extractions.

Method 8141B_3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-354183.

Method 8151A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-354292.

Method 8151A: The following sample formed emulsions during the extraction procedure: SW-1:113016 (590-5101-1). The emulsions were broken up using a pour back for the second MeCl2 clean up step only

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
