GeoEngineers, Inc. (GeoEngineers) is pleased to submit one copy of the report, "Remedial Investigation, Marshall Landfill Site, Spokane County, Washington."

We appreciate the opportunity to be of service to the Washington State Department of Ecology. Please contact us if you have questions regarding this report or other aspects of the project.

Sincerely,
GeoEngineers, Inc.

Bruce D. Williams
Principal

ABBREVIATIONS AND ACRONYMS

bgs – below ground surface

COC – contaminants of concern

COD – Chemical Oxygen Demand

COPEC – contaminants of potential environmental concern

CRBG – Columbia River Basalt Group

CSM – Conceptual Site Model

CUL – cleanup level

DNR – Department of Natural Resources

DOT – Department of Transportation

Ecology –Washington State Department of Ecology

EPA – Environmental Protection Agency

Fetrow – Fetrow Engineering, Inc.

FS – Feasibility Study

ft/d – feet per day

GeoEngineers – GeoEngineers, Inc.

gpm – gallons per minute

HQ – hazard quotient

IDW – investigation-derived waste

LEL – Lower Explosive Limit

MA – million years ago

µg/kg – micrograms per kilogram

µg/L – micrograms per liter

mg/L – milligrams per liter

MS – mass spectrometer

MSW – municipal solid waste

MTCA – Model Toxics Control Act

NAVD 88 – North American Vertical Datum of 1988

NTU – nephelometric turbidity units

PCBs – Polychlorinated biphenyls

PGG – Pacific Groundwater Group

PID – photoionization detector

PLP – potentially liable person

ABBREVIATIONS AND ACRONYMS (CONTINUED)

ppm – parts per million

PVC – polyvinyl chloride

QAPP – Quality Assurance Project Plan

SL – screening level

TEE – Terrestrial Ecological Evaluation

TOC – total organic carbon

TPH – Total petroleum hydrocarbons

RI – Remedial Investigation

SAP – Sampling and Analysis Plan

SCHD – Spokane County Health District

SVOCs – semi-volatile organic compounds

VOCs – volatile organic compounds

WAC – Washington Administrative Code

WWR – Water Well Reports

EXECUTIVE SUMMARY

GeoEngineers, Inc. conducted a Remedial Investigation (RI) at the Marshall Landfill site (Site) in Spokane County, Washington for the Washington State Department of Ecology (Ecology). The Site is situated northwest of Cheney-Spokane Road about 1 mile southwest of the town of Marshall, Washington and 7 miles southwest of the city of Spokane, Washington. This RI summarizes Site characterization activities as a basis for assessing geologic/hydrogeologic conditions and the extent of subsurface contamination beneath the Site. This RI also includes a Conceptual Site Model (CSM) and provides proposed cleanup standards protective of human health and the environment. A Feasibility Study (FS) currently is being prepared for the Site, and the draft FS has been submitted to Ecology under separate cover.

The Site consists of four primary historic land use areas, including the approximate 25-acre Main Landfill, the Five-Acre Landfill, a gravel pit and the Former Spokane County Landfill. The Former Spokane County Landfill is located adjacent to the southern boundary of the Main Landfill and was operated by Spokane County as a daily-burn landfill from the 1950s until 1970. The Former Spokane County Landfill is considered part of the Site but is not addressed in this document because RI exploration was not possible within the property.

The Main and Five-Acre Landfills received waste during portions of the period from 1970 through 1990. Neither the Main Landfill nor the Five-Acre Landfill is equipped with a bottom liner. In 1990, the Main Landfill and Five-Acre Landfill were planned for closure under Permit No. SCHD SW-MARSH-001. A passive landfill gas venting system and a compacted cap composed of relatively low permeability soil was installed in 1990 at the Five-Acre Landfill; however, the as-built condition of the low permeability cap is not well documented. The Main Landfill was apparently covered with a layer of fine to medium sand; however, we have not encountered associated documentation.

Geologic units underlying the Site include metamorphic and plutonic rocks (basement rocks), the Columbia River Basalt Group (CRBG) and associated sediments, and glaciofluvial/alluvial sediments. An ancestral drainage that fully truncates the CRBG and has been filled with glaciofluvial sediment underlies the southern portion of the Site.

The Site's position near the confluence of the Minnie Creek and Marshall Creek drainages, with upland areas situated to the north, west and south of the Site, suggests the presence of converging groundwater flow conditions within shallow aquifer systems near the Site. Shallow groundwater flow generally mimics topographic conditions and is directed from the area surrounding the Site towards discharge areas situated to the northeast. The Site generally is underlain by a minimum of three hydrostratigraphic units. These units occur within: (1) basement rocks; (2) the CRBG; and (3) glaciofluvial sediments.

Site contamination greater than likely cleanup levels (CULs) is limited to groundwater and landfill gases (volatile organic compounds [VOCs] and methane). RI soil results and the Terrestrial Ecological Evaluation (TEE) indicate that soil at the landfills does not pose a significant risk to human health or the environment. However, observations of the low permeability cap over the Five-Acre Landfill indicated that the cap is not intact over the entire area of the landfill and some waste was exposed. The FS addresses the caps at both landfills and provides remedial alternatives that will meet current regulatory standards.

The results of RI groundwater monitoring (conducted during 2016 and 2017) indicate that the extent of groundwater with analyte concentrations greater than likely CULs beneath the Site is limited, discontinuous and variable between monitoring events. Given the limited and sporadic nature of groundwater with analyte concentrations greater than likely CULs observed within the Site groundwater monitoring wells during the RI investigation, it is logical to conclude that off-site groundwater supply wells are unlikely to be affected by Site-related groundwater contamination. However, a detailed evaluation of this pathway, including sampling of nearby groundwater supply wells, was not within the scope of this RI.

RI results indicate that the boundaries and extent of landfill gas contamination (VOCs and methane) have not been fully delineated for both the Main and Five-Acre Landfills. The primarily concern associated with VOC and methane landfill gas concentrations is the potential for vapor intrusion into overlying or nearby buildings. Vapor intrusion could potentially be a concern for structures built in proximity to the Main and Five-Acre Landfills in the future. Currently, buildings are not present on either landfill. The only existing buildings near either landfill that may be subject to vapor intrusion are the buildings situated between the gravel pit and the Main Landfill. The FS considers the potential for off-site migration of landfill gases (VOCs and methane).

During RI analysis and evaluation, several data gaps related to the nature and extent of subsurface contamination beneath the Site were identified. These are related to the extent of elevated landfill gas concentrations, the extent of damage to existing landfill covers, potential seasonal or other variation in soil gas pressure within landfill waste areas, and soil movement within sloped portions of the landfills.

The summary is provided for general informational purposes and should not be solely relied upon. Please refer to the entire report to obtain a more comprehensive understanding of the RI activities.

1.0 INTRODUCTION

1.1. General Site Information

1.1.1. Introduction

This document presents results of the Remedial Investigation (RI) conducted at the Marshall Landfill site in Spokane County, Washington (herein referred to as "Site"). A Feasibility Study (FS) currently is being prepared for the Site and the draft FS has been submitted to Ecology under separate cover. The RI described herein has been prepared in general accordance with the following documents:

- Washington State Department of Ecology (Ecology) Work Assignment No. C11145YY (dated June 6, 2014) and associated Amendment No. 1 through Amendment No. 6.
- Remedial Investigation/Feasibility Work Plan, Marshall Landfill Site, Spokane County Washington (GeoEngineers 2015). The project Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) form Appendices A and B, respectively, of the Work Plan.
- Ecology Publication No. 16-09-006, Remedial Investigation Checklist (dated May 2016).
- Chapter 173-340-350 of the Washington Administrative Code (WAC).

1.1.2. Location and Topography

The Site is situated northwest of Cheney-Spokane Road about 1 mile southwest of the town of Marshall, Washington and 7 miles southwest of the city of Spokane, Washington. The Site is located within portions of Section 21 and 28 of Township 24 North, Range 42 East, approximately shown in the Vicinity Map, Figure 1. The Site is bounded on the east by South Cheney-Spokane Road, on the south by a former landfill property owned by Spokane County, and on the west and north by privately-owned vacant land. The general Site layout and the locations of groundwater monitoring wells described in this report, are presented in the Site Plan and Groundwater Monitoring Well Location Map, Figure 2.

The Site is located on a terrace elevated above Minnie Creek, an intermittent portion of which is located less than 500 feet from the east Site boundary. Surface water within Minnie Creek adjacent to the Site is controlled by the stage of Queen Lucas Lake, which is located within the Minnie Creek drainage about ½ mile south (upstream) of the Site. When lake elevation exceeds approximately 2,130 feet (Pacific Groundwater Group [PGG] 2005), water overtops the Queen Lucas Lake outlet and flows within Minnie Creek adjacent to the Site. Elevations in this report are provided relative to the North American Vertical Datum of 1988 (NAVD 88) unless otherwise specified. Minnie Creek's confluence with Marshall Creek is located about ½ mile northeast (downstream) of the Site. Both Minnie Creek and Marshall Creek are losing streams (discharge to groundwater) near the Site (PGG 2005).

Topography generally slopes downward to the southeast across the Site, decreasing from an elevation of approximately 2,350 feet in the northwest portion of the Site to 2,200 feet in the southeast portion of the Site. The stage elevation of Minnie Creek, when it contains surface water, is approximately 2,130 to feet, or about 70 to 220 feet lower than ground surface across the Site.

Land use within the Site is zoned for rural conservation use and mineral lands. Surrounding the Site, most land is zoned for rural conservation and rural traditional land use, with mineral land zoning associated with gravel pits situated north of the town of Marshall.

1.2. Site History

1.2.1. General Site Layout and Site History

Four primary historic land use areas within the Site and surrounding area are delineated in Figure 2; these consist of the following:

- The Main Landfill: This approximate 25-acre waste disposal area is located within the south-central portion of the Site. Sand and gravel removed from the Main Landfill were replaced with waste during the period from 1970 through 1990. Thickness of landfilled waste was estimated at 100 feet in the Main Landfill (Fetrow Engineering, Inc. [Fetrow] 1991).
- The Five-Acre Landfill: This approximate 5-acre waste disposal area is located within the northwest portion of the Site. Waste was disposed within the Five-Acre Landfill during the period from 1980 through 1984. Thickness of landfilled waste was estimated at 45 feet in the Five-Acre Landfill (Fetrow 1991).
- The gravel pit: This area is located north of the Main Landfill and east of the Five-Acre Landfill. It currently is operated as a gravel pit by Action Materials, Inc.
- The Former Spokane County Landfill: This property is located adjacent to the southern boundary of the Main Landfill. The property owner is identified by Spokane County's Tax Parcel System (Parcel No. 24282,9002) as Spokane County Engineers. The Former Spokane County Landfill was operated by Spokane County as a daily-burn landfill from the 1950s until 1970. This landfill has no bottom liner (Fetrow 1991).

  The Former Spokane County Landfill technically is part of the Site, as interpreted through practice in the Model Toxics Control Act (MTCA). Although the Former Spokane County Landfill is considered part of the Site, is not addressed in this document because RI exploration was not possible.

Marshall Landfill, Inc. is identified as the property owner for the Marshall Landfill Site by Ecology (2015A). Ecology (2015A) identifies Marshall Landfill Inc, as a potentially liable person (PLP) that is not financially able to contribute toward cleanup costs.

Neither the Main Landfill nor the Five-Acre Landfill is equipped with a bottom liner. As the Main Landfill and Five-Acre Landfills were filled, daily cover material consisting of 6 to 12 inches of sand was placed on the solid waste (Fetrow 1991). As a result, both Site landfills consist of alternating layers of waste material and sand of variable thickness.

Disposal operations ceased on-Site in 1990. At that time, the Main Landfill and Five-Acre Landfill were planned for closure under Permit No. SCHD SW-MARSH-001 (Fetrow 1991). A passive landfill gas venting system and a compacted cap composed of relatively low permeability soil was installed in 1990 at the Five-Acre Landfill; however, the as-built condition of the low permeability cap is not well documented. Observations of the low permeability cap over the Five-Acre Landfill prior to the RI indicated that the cap was not intact over the entire area of the landfill and some waste was exposed. The Main Landfill was

apparently covered with a layer of fine to medium sand; however, we have not encountered associated documentation.

The southern and southeastern boundaries of the Main Landfill were buttressed with what appears to be a berm constructed of sandy materials from the adjacent gravel pit. The buttress berm reportedly was constructed to add additional capacity to the Main Landfill. The design parameters and as-built constructed condition of the buttress berm are not well documented.

1.3. Site Use

1.3.1. Disturbed Land

GeoEngineers performed a review of Washington State Department of Natural Resources (DNR) aerial photographs for the period from 1968 through 2011 as a basis for identifying the growth of disturbed land within the Site (that could be indicative of waste disposal and/or gravel mining) over time. Our observations are summarized in Historic Limits of Disturbed Land Use, Figure 3, and summarized below:

- In 1968, disturbed land was limited to an area within and immediately north of the Former Spokane County Landfill.
- By 1974, the disturbed area associated with the Former Spokane County Landfill had expanded to the east to South Cheney Spokane Road. Most of the Main Landfill, except the northeast corner, had been disturbed by this time.
- By 1979, disturbed areas had extended through most of the northeast portion of the Main Landfill, roughly the southern half of the Five-Acre Landfill, and three relatively small areas within the gravel pit.
- By 1986, disturbed areas had expanded throughout the Five-Acre Landfill and the southwest portion of the gravel pit.
- By 1992, the entire Main Landfill was disturbed, and the disturbed portion of the gravel pit had expanded to the north and east.
- Disturbed areas were relatively static during the period from 1992 to 1994.
- The gravel pit expanded to the north and northeast between 1994 and 2011.

1.3.2. Disposal of Hazardous Materials

Prior to closure, Marshall Landfill received solid waste and demolition debris from southwest Spokane County, including the communities of Cheney, Spangle, Airway Heights, Medical Lake and Colfax, at a rate that exceeded 20,000 cubic yards per month (Fetrow 1991). Between 1975 and 1983, Fetrow (1991) reports that Spokane County Health District (SCHD) files also report the disposal of potentially hazardous liquid waste at the Site. The composition and volume of this disposed liquid waste (and/or soil impacted by liquid waste) has been enumerated by both Fetrow (1991) and PGG (2005) and include:

- 38,000 gallons of oily waste water in 1978.
- 1,000 gallons of containerized latex paint in 1978.
- 22,000 cubic yards of pentachlorophenol-contaminated soil in 1981.
- 2,500 gallons of caustic soda solution in 1981.

- More than 100 gallons of used oil and transformer oil in 1982.
- More than 3,000 gallons of waste liquid used to clean electric motor parts in 1982.
- 15,000 gallons of water and lignin sulfonate in 1983.
- 270 cubic yards of tetrachloroethene-contaminated soil in 1975.
- 100,000 gallons of oil and sludge in 1975.
- 40,000 gallons of jet fuel during the 1970's.
- Potentially 18,000 gallons of waste water used for cleaning boilers in 1991.

Corkill (1993) provides additional detail on disposed waste, though some of the description is similar is nature and volume to the above and it is unclear whether Corkill's information is duplicative.

Fetrow (1991) indicates that the precise locations of liquid waste disposal are unknown, but landfill personnel indicated that liquids were disposed of "at the southern end of the five-acre cell and also in the main cell." The latex paint was described as containerized. However, it is unknown if any of the other disposed liquid waste was containerized. PGG (2005) reports that open, unlined pits were used to store oil and sludge during approximately 1975.

2.0 FIELD INVESTIGATIONS

2.1. Previous Environmental Investigations

2.1.1. Previous Investigations and Documents

Environmental and/or hydrogeologic conditions at the Site have been investigated sporadically from 1982 to present. The components of the previous investigations are briefly summarized below.

Phase I and II Investigations, Shannon and Wilson: In 1982 and 1983, Shannon & Wilson, Inc. conducted a hydrogeologic evaluation of the Marshall Landfill, the results of which were presented in two reports (Shannon & Wilson, Inc. 1983; Shannon & Wilson, Inc. 1984). The Phase I evaluation included a summary of the potential for leachate generation and migration. The Phase II evaluation provided results of groundwater monitoring activities in six existing wells near the Site. Groundwater monitoring results identified elevated concentrations of 1,1,1-trichloroethane in a down-gradient well.

Phase I and II Site Investigations, Ecology: In 1987, Ecology conducted a site investigation of the Marshall Landfill, the results of which were presented by Ecology (1987). Ecology collected groundwater samples from four existing wells near the Site. No contaminants were detected.

Environmental Impact Analysis, Golder Associates, Inc, (Golder) and Century West Engineering Corporation (Century West): In 1989, Golder and Century West drilled, constructed and sampled five groundwater monitoring wells at the Site, the results of which were presented by Golder and Century West (1989). Analytical results identified elevated volatile organic compound (VOC) concentrations in two wells.

Prior to GeoEngineers' RI, three primary investigations have been conducted at the Site since 1991, which are summarized in the following documents:

Marshall Landfill Site Characterization Study Final Report, prepared by Fetrow in 1991 (Fetrow 1991).

Marshall Landfill 2005 Hydrogeologic Summary, prepared by PGG in 2005 (PGG 2005).

Quarterly Groundwater Monitoring Reports prepared by Land and Water Environmental Services, Inc. (Land and Water) for the period from 2005 to 2010.

Collectively, these three documents provide the following information about the Site:

- Estimates of the types and quantities of solid and hazardous wastes disposed;
- Findings associated with the installation and monitoring of 17 on-site groundwater monitoring wells between 1989 and 1991 (well depths ranging from between 50 and 393 feet below ground surface [bgs] and one exploratory boring [CH-1] was advanced about 335 feet bgs).
- Identification of primary water-bearing units underlying the Site.
- Landfill gas data collected in 1990 at locations within the Five-Acre Landfill, Main Landfill and Spokane County Landfill, which indicated the presence of VOCs likely associated with hazardous waste disposal.
- Groundwater quality data collected between 1989 and 2011 (22 years), including data from samples collected from select on-Site groundwater monitoring wells and local water supply wells (Fetrow 1991; LAWS 2010). (Note: groundwater data was not available from the Spokane County Landfill).
- Documentation of contaminant migration (VOCs) in groundwater, with generally decreasing concentrations since 2005.

2.1.2. Existing Groundwater Monitoring Wells

Prior to GeoEngineers' RI, 17 groundwater monitoring wells were installed at the Site as components of previous investigations. These groundwater monitoring wells included MW-1A, MW-2, MW-2A, MW-3, MW-4, MW-4A, MW-5, MW-5A, MW-6, MW-7A, MW-7B, MW-7C, MW-8A, MW-8B, MW-9A, MW-11A and MW-12A. Existing groundwater monitoring well locations are presented in Figure 2. Note that wells MW-6, MW-7A and MW-7C could not be located during RI activities.

A drilling and well construction summary for existing groundwater monitoring wells is provided in Drilling and Well Construction Summary, Table 1. Well logs for existing wells (as well as Core Hole CH-1 [Fetrow 1991]) are provided in Appendix A.

2.1.3. Historic Groundwater Level Data

A database of historic Site groundwater level data was provided to GeoEngineers by Ecology. GeoEngineers reduced the groundwater level data for presentation in the data tables and associated figures provided in Appendix B. Historic Site groundwater elevations are summarized in Historic Groundwater Elevations, Figure B-1, and described in the "Groundwater Occurrence and Flow" section of this report.

2.1.4. Historic Groundwater Analytical Data

A database of historic Site groundwater analytical data was provided to GeoEngineers by Ecology. GeoEngineers reduced the analytical data for presentation in the data tables provided in Appendix C.

2.1.5. Contaminants of Concern

Previous studies identified VOCs as the primary contaminants of concern (COCs) in groundwater at the Site. Fetrow (1991) specified the following VOCs are specific primary Site groundwater COCs:

- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,1-dichloroethane (1,1-DCA)
- Tetrachloroethene (PCE)
- Trichlorofluoromethane (CFC-11)
- Benzene
- Toluene
- 1,2-dichloroethane (1,2-DCA)
- Trichloroethene (TCE)
- 1,2-dichloropropane
- 1,1,2-trichloroethane (1,1,2-TCA)
- Chloroethane

PGG categorized VOCs as either primary or secondary contaminants of concern based on the frequency of detection in Site groundwater samples (PGG 2005). The primary contaminants of concern (those compounds detected at a frequency of 40 percent or more in a given well) identified by PGG included:

- Ethanes: 1,1,1-TCA and 1,1-DCA
- Ethenes: PCE and 1,1-dichloroethene (1,1-DCE)
- Methanes: methylene chloride and CFC-11

Based on information provided by PGG (2005), the primary contaminants of concern were detected in groundwater samples collected from groundwater monitoring wells MW-1A, MW-2, MW-3, MW-5, MW-5A and MW-8B at concentrations greater than the Groundwater Quality Criteria established in WAC 173-200 (Water Quality Standards for Groundwaters of the State of Washington). The primary contaminants were not detected in samples collected from groundwater monitoring wells, MW-4/4A, MW-7A/B/C, MW-9A, MW-11A and MW-12A. The primary contaminants also were not detected in private or community wells at concentrations greater than the WAC 173-200 screening levels. A summary of primary contaminant detections in existing Site groundwater monitoring wells are presented in Historic Data, Primary VOC Groundwater Contaminants, Figure 4.

PGG classified contaminants that were detected at a frequency of 40 percent but not routinely detected in groundwater samples from multiple wells as secondary COCs. PGG identified the following as secondary COCs:

- Ethanes: 1,2-DCA
- Ethenes: TCE, cis-1,2-dichloroethene (cis-1,2-DCE), and total 1,2-dichloroethene (1,2-DCE)

- 1,2-dichloropropane
- Chloroform
- Benzene

Secondary COCs were detected in samples from groundwater monitoring wells MW-1A, MW-5 and MW-11A at concentrations exceeding the WAC 173-200 applicable regulatory levels. Secondary COC detections in Site groundwater monitoring wells are presented in Historic Data, Secondary VOC Groundwater Contaminants, Figure 5.

2.1.6. Other Contaminants

As described above, 1,1,1-TCA was identified by Fetrow as a primary groundwater COC. Because 1,4-Dioxane is frequently used as a stabilizer for 1,1,1-TCA, 1,4-Dioxane is a potential contaminant at sites contaminated with 1,1,1- TCA (EPA 2013; Mohr 2001).

Based on the historic groundwater data compiled by Land and Water (2010), the semi-volatile organic compound bis(2-ethylhexyl)phthalate was detected in samples from three groundwater monitoring wells (MW-1A, MW-3 and MW-5A) at concentrations greater than the WAC 173-200 regulatory level (6 micrograms per liter). Bis(2-ethylhexyl)phthalate also was detected in samples from two additional wells (MW-8A and MW-9A) at concentrations less than the regulatory level. Land and Water (2010) also report that bis(2-ethylhexyl)phthalate has not been detected since March 1995 in well MW-8A.

Dissolved iron and manganese also were reported at concentrations exceeding the WAC 173-200 regulatory level in samples from groundwater monitoring wells MW-1A, MW-3 and MW-9A (Land and Water 2010).

2.2. Site Characterization

2.2.1. Area Water Use

2.2.1.1. General

GeoEngineers conducted a Potential Receptor Evaluation to identify receptors (people and sensitive ecological receptors) that could possibly encounter Site-related contamination. The Potential Receptor Evaluation is provided in Appendix D.

One component of the Potential Receptor Evaluation identifies potential users of water in proximity to the Site. A full discussion of area water use is provided in Appendix D and summarized below.

2.2.1.2. Water Rights

Surface water and groundwater use in Washington State is administered by Ecology through water right allocations. Ecology tabulates water rights within the state through their Water Resources Explorer database. On January 4, 2017, GeoEngineers conducted a search of the Water Resources Explorer database within a 1-mile radius of the approximate center of the Main Landfill (herein termed the water rights inventory area). Search results are compiled in Table D-1.

The water rights inventory area contains totals of three surface water rights and 25 groundwater rights. Of these, 20 are water right claims, seven are water right certificates, and one is a water right change.

The total annual water use claimed and/or allocated within the water rights inventory area is 722.7 acre-feet.

2.2.1.3. Water Well Inventory

Water use within Washington State that is external to the water rights permitting system generally occurs through the Groundwater Permit Exemption (Chapter 90.44.050 of the Revised Code of Washington). The Groundwater Permit Exemption allows for uses of small groundwater quantities (generally less than 5,000 gallons per day) for specific uses. Within the area surrounding Marshall Landfill, this permit-exempt water use generally is for single-home domestic use through small-diameter water supply wells. Numerous single-home domestic wells are located in proximity to Marshall Landfill.

Water well construction within Washington State is reported to Ecology, who tabulates Water Well Reports (WWRs) within their Washington State Well Log Viewer database. GeoEngineers compiled WWRs from Ecology's Washington State Well Log Viewer database within the following Water Well Report inventory area:

- The southwest (SW) quarter of Section 15, Township (T) 24 North (N), Range (R) 42 East (E)
- The southeast (SE) and SW quarters of Section 16, T24N, R42E
- The SE quarter of Section 17, T24N, R42E
- The SE and northeast (NE) quarters of Section 20, T24N, R42E
- Section 21, T24N, R42E
- The SW and northwest (NW) quarters of Section 22, T24N, R42E
- The NW quarter of Section 27, T24N, R42E
- The NE and NW quarters of Section 28, T24N, R42E
- The NE quarter of Section 29, T24N, R42E

The boundaries of the Water Well Report inventory area are shown in Figure D-4, and search results are tabulated in Table D-2. We compiled a total of 168 WWRs, completed in the following hydrostratigraphic units (units are described in detail in Section 2.2.9):

- Six wells are completed within the glaciofluvial unit. Their distribution is scattered throughout the inventory area.
- 98 wells are completed within the Columbia River Basalt Group (CRBG) unit. Most of the wells north and immediately south of the Site are completed in the CRBG unit.
- 51 wells are completed within the basement rock unit. These wells primarily are located west and southwest of the Site.
- 11 wells are completed within both the CRBG and basement rock units.
- Two wells are completed within uncertain hydrostratigraphic units.

WWR's are provided in Appendix D. Approximate WWR locations are shown by hydrostratigraphic unit in Figure D-4. These locations are based on the location information provided in the WWRs and should be considered approximate.

2.2.2. Data Gaps

In 2015 and 2016, GeoEngineers conducted supplemental RI field investigation activities to assist in addressing the data gaps identified in the project Work Plan (GeoEngineers 2015). These data gaps included:

- The nature and extent of the wastes disposed at the Site.
- The extent of soil, landfill gas and groundwater contamination.
- Soil, landfill gas and groundwater at/near the Site boundary with the Spokane County Landfill to better understand potential contaminant sources originating from the Spokane County Landfill.
- The vertical and horizontal extent of buried municipal solid waste (MSW) in the Five-Acre and Main Landfills.
- Components of the hydrogeologic conceptual model for the Site.
- Slope stability of the buttress berm on the southern and southeastern boundaries of the Main Landfill.

2.2.3. Project Explorations

Supplemental explorations associated with GeoEngineers' RI investigation included the following:

New Groundwater Monitoring Wells: Six new groundwater monitoring wells were drilled and constructed (designated MW-7D, MW-14, MW-15, MW-15A, MW-16 and MW-16A). New groundwater monitoring well locations are shown in Figure 2. A drilling and well construction summary for these new and existing groundwater monitoring wells is provided in Table 1.

Soil Borings: 33 soil borings (designated LFB-1 through LFB-6, LFB-6A, LFB-7, LFB-7A, LFB-8 through LFB-17, MW-13, SB-1 through SB-3, SB-3A, SB-4 through SB-7, and SB-9 through SB-13) were drilled on Site. Note that MW-13 was planned as a groundwater monitoring well installation, however no well was installed because of shallower than expected bedrock. Also, a soil boring SB-8 was planned; however, the location was not drilled and no SB-8 exists.

Ten of the landfill borings were completed as landfill gas monitoring wells (LFB-3 through LFB-5, LFB-8 through LFB-11, and LFB-15 through LFB-17).

Soil boring locations associated with the Main Landfill are presented in the Main Landfill Explorations, Figure 6. Soil boring locations associated with the Five-Acre Landfill are presented in the Five-Acre Landfill Explorations, Figure 7.

Test Pits: 71 test pits, the locations of which are shown in Figures 6 and 7.

Field procedures are described in Appendix E. We classified soil encountered in project explorations in general accordance with the Unified Soil Classification System described in Figure E-1. The exploration logs for the monitoring wells, borings, and test pits listed above are provided in Figures E-2 through E-111.

2.2.4. Soil Samples

GeoEngineers submitted a total of 20 soil samples from project explorations for laboratory analysis. Soil samples were analyzed for some or all of the following constituents:

- Gasoline-range hydrocarbons by NWTPH-Gx
- Diesel- and lube oil-range hydrocarbons by NWTPH-Dx
- Metals by Environmental Protection Agency (EPA) Method 6020A
- Cyanide by EPA Method 9012B
- Mercury by EPA Method 7471B
- Polychlorinated biphenyls (PCBs) by EPA Method 8082A
- VOCs by EPA Method 8260B
- Semi-volatile organic compounds (SVOCs) by EPA Method 8270C
- Pesticides/Herbicides by EPA Method 8151A/8141B/8081A

Soil sample chemical analytical results are summarized in Soil Analytical Results, Tables 2 through 5.

2.2.5. Groundwater Samples

GeoEngineers collected groundwater samples from project groundwater monitoring wells during four groundwater monitoring events, conducted during August 2016, November 2016, February 2017 and December 2017. Groundwater sampling methods are described in Appendix E.

During each monitoring event GeoEngineers attempted to collect groundwater samples from a total of 20 monitoring wells (MW-1A, MW-2, MW-2A, MW-3, MW-4, MW-4A, MW-5, MW-5A, MW-7B, MW-7D, MW-8A, MW-8B, MW-9A, MW-11A, MW-12A, MW-14, MW-15, MW-15A, MW-16 and MW-16A). Wells that did not contain sufficient water for sampling (were dry) were omitted from the respective sampling event. During the August 2016, November 2016 and February 2017 monitoring events, groundwater samples were analyzed for the following constituents:

- Gasoline-range hydrocarbons by NWTPH-Gx
- Diesel- and lube oil-range hydrocarbons by NWTPH-Dx
- Total and dissolved metals by EPA Method 200.8
- Mercury by EPA Method 245.1
- Anions by EPA Method 300.0
- Ammonia by EPA Method 350.1
- Cyanide by EPA Method 335.4
- Chemical Oxygen Demand (COD) by EPA Method 410.04
- Total Organic Carbon (TOC) by EPA Method 5310C
- E. Coli and total coliform by EPA Method 9223B
- PCBs by EPA Method 8082A
- VOCs by EPA Method 8260C
- SVOCs by EPA Method 8270D

- Pesticides/Herbicides by EPA Method 8151A/8141B/8081B
- Dioxins/furans by EPA Method 8290

The analyte list for the December 2017 sampling event was limited to total and dissolved metals, cyanide, nitrate, VOCs, SVOCs (including 1,4-dioxane) and chlorinated herbicides. This reduced analyte list was based upon previous groundwater analytical results and agreed upon during a meeting between Ecology and GeoEngineers on October 11, 2017.

Groundwater sample chemical analytical results are summarized in Groundwater Analytical Results, Tables 6 through 10.

2.2.6. Surface Water Samples

GeoEngineers collected surface water samples from one location along Marshall Creek during the August 2016, November 2016 and February 2017 monitoring events. The surface water sampling location is shown in Figure 1.

Surface water samples were analyzed for the constituents listed in the preceding section for groundwater samples. Surface water sample chemical analytical results are summarized in Surface Water Analytical Results, Tables 11 through 15.

2.2.7. Landfill Gas Samples

GeoEngineers collected landfill gas samples from landfill gas monitoring wells during four monitoring events, conducted during September 2015, August 2016, December 2016 and February 2017. Landfill gas sampling methods are described in Appendix E.

During each monitoring event, GeoEngineers collected landfill gas samples from a total of 10 landfill gas monitoring wells (LFB-3, LFB-4, LFB-5, LFB-8, LFB-9, LFB-10, LFB-11, LFB-15, LFB-16 and LFB-17). Landfill gas samples were analyzed for VOCs by EPA Air Method Toxic Organics 15. Landfill gas sample chemical analytical results and field-measured methane levels are summarized in Soil Vapor Analytical Results – VOCs, Table 16 and Soil Vapor Analytical Results – Methane, Table 17, respectively.

2.2.8. Landfill Gas Pressure Monitoring

GeoEngineers measured static pressure within landfill gas monitoring wells (LFB-3 through LFB-5, LFB-8 through LFB-11, and LFB-15 through LFB-17) during the December 2017 monitoring event. Landfill gas sampling methods are described in Appendix E. Results are summarized below in Table 18.

TABLE 18. LANDFILL GAS PRESSURE SUMMARY

Landfill Gas Monitoring Well	Static Landfill Gas Pressure (Inches of Water)
LFB-3	0.11
LFB-4	0.21
LFB-5	0.04
LFB-8	-0.02
LFB-9	0.00

Landfill Gas Monitoring Well	Static Landfill Gas Pressure (Inches of Water)
LFB-10	0.09
LFB-11	0.10
LFB-15	0.04
LFB-16	0.01
LFB-17	0.01

Results indicate that, during the December 2017 monitoring event, pressure in each landfill gas monitoring well was minimal. The maximum pressure was 0.21 inches of water, observed in landfill gas monitoring well LFB-4.

2.2.9. Geologic/Hydrogeologic Setting

2.2.9.1. Geology

The Site is situated along the northeast margin of the Palouse Slope structural region, which encompasses the north and north-central portions of the Columbia Plateau and extends from near the confluence of the Columbia and Wenatchee Rivers east to Idaho. The Palouse Slope primarily consists of relatively un-deformed basalt with a gentle, rolling slope with elevation generally declining to the southwest (Kahle et al. 2011). Faults are relatively widely dispersed and of limited displacement. Folding, where present, is northwest-trending with only a few tens of feet of amplitude (Whiteman et al. 1994).

The Site's position near the east margin of the Columbia Plateau, combined with erosional structures associated with Pleistocene-age outburst flood events and more recent alluvial processes, has resulted in complex stratigraphic conditions beneath and adjacent to the Site. Based on our Site explorations, understanding of regional stratigraphy and review of previous Site studies (Fetrow 1991; PGG 2005), we interpret that the Site is underlain by five primary stratigraphic units. From oldest to youngest, these include:

1. *Precambrian-age (greater than about 570 million years ago [MA]) metamorphic rocks associated with the Belt Supergroup*: Near the Site, Belt Supergroup rocks primarily consist of gneiss and schist. These rocks were intruded by granitic plutonic rocks during the Mesozoic (245 to 65 MA) and Tertiary (65 to 1.5 MA). These metamorphic and plutonic rocks are collectively designated "basement rocks" herein. Previous and RI explorations have identified an intensely weathered upper section of basement rock beneath the Site, variably described as clayey silt, micaceous sand, and/or saprolite and observed at thicknesses up to 85 feet in project explorations.
2. *Miocene-age (23 to 5 MA) basalt flows associated with the CRBG*: Basement rocks are stratigraphically overlain by basalt flows associated with the CRBG. Two CRBG Formations, the Grande Ronde overlain by the Wanapum, have been identified within the Marshall area (Drost and Whiteman 1986). The CRBG was deposited during an extended period of Miocene (23 to 5 MA) volcanism that extruded a series of very fluid lava flows. The lava flowed from north-northwest trending fissures as much as 90 miles long which were located primarily in northeastern Oregon and southeast Washington (Hooper 1982). The resulting basalt deposits are hundreds to thousands of feet thick in some areas of eastern Washington and extend throughout the Columbia Plateau. As the basalt flowed into the Spokane area (which is situated near the eastern terminus of the CRBG), it filled preexisting depressions, lapping onto elevated areas of older, uplifted metamorphic and igneous rocks. Steptoes (vertical formations

extending above the surrounding surface) were formed where knobs or ridges of the underlying "basement" rock were completely encircled by the Columbia River Basalt flows.

Because the Site is situated near the eastern terminus of the CRBG, the thickness of the CRBG is relatively thin compared to more central portions of the Columbia Plateau. Near the Site, the CRBG has been completely truncated within some current and ancestral drainages. One such ancestral drainage underlies the southern portion of the Site, where Pleistocene-age (about 2.6 MA to 12,000 years ago) sedimentary deposits directly contact basement rocks at depth.

3. *Miocene-age Latah Formation*. Numerous sedimentary interbeds exist between specific basalt flows and units within the CRBG. Collectively, these sedimentary units are termed the Ellensburg Formation, despite differences in age, location, lithology and continuity (Reidel and Tolan 2013). Interbeds are generally thicker and more frequently encountered near contacts with pre-Miocene basement rocks and are abundant within the CRBG stratigraphic section near Marshall.

   The Latah Formation (which stratigraphically correlates with the Vantage Formation in other portions of the Columbia Plateau) is a sedimentary interbed that underlies, intercalates and overlies the CRBG in eastern Washington and west-central Idaho (Leek 2006). The Latah Formation consists primarily of variably-indurated clay and silt, with locally extensive sand and gravel layers (Whiteman et al. 1994; Kahle et. al. 2011). Near the Site, the Latah Formation generally consists of variably-weathered claystone, sandstone and siltstone (PGG 2005).

4. *Pleistocene-age glaciofluvial (outburst flood) deposits*: Glaciofluvial sediments near the Site primarily consist of unsorted mixtures of silt, sand, gravel and cobbles derived from Pleistocene-age flood events due to repeated failures of ice dams associated with Glacial Lake Missoula. Depending on the location, glaciofluvial deposits overlie and contact both basement rocks and CRBG. Near the Site, glaciofluvial deposits filled ancestral drainages associated with tributaries to Latah Creek such as the ancestral drainage that underlies the southern portion of the Site.

   The top of basement rock and/or CRBG undulates across area surrounding the Site. This topographic relief was reduced by deposition of glaciofluvial sediments during the Pleistocene and recent placement of fill during area development activities. These processes have resulted in a relatively complex distribution in the thickness of sediments overlying bedrock within the study area. Flood deposits observed in project explorations range in thickness from about 11 feet (MW-12A) to more than 259 feet (MW-15A).

5. *Recent alluvial deposits*: Recent alluvial deposits consist of interbedded silt, sand and gravel deposited within the modern Minnie Creek and Marshall Creek drainages.

2.2.9.2. Cross Sections

Based on the boring logs provided in Appendices A and E, GeoEngineers prepared five geologic cross sections (A-A' through E-E') along the section lines shown in Cross Section Transects, Figure 8. Cross sections A-A' through E-E' are provided in Figures 9 through 13 and summarized by the following:

Cross Section A-A', Figure 9: This cross section summarizes interpreted subsurface conditions along a line (shown in Figure 8) roughly oriented north to south and extending from the northwest portion of the gravel pit through the main landfill to South Cheney Spokane Road. The section originates (A) outside of the ancestral drainageway, within an area underlain by shallow CRBG. The CRBG pinches out north of monitoring well MW-7D, where bedrock consists of variably-weathered basement rock. The thickness of the

ancestral drainageway and associated glaciofluvial sediments, increases to the south. Glaciofluvial sediments are saturated below an elevation of about 2,090 feet in monitoring well MW-2A.

Layered sand and MSW associated with the Main Landfill extends from test pit TP-6 to soil boring SB-3/3A. Thickness of the layered sand/MSW is about 68 feet at landfill gas monitoring well LFB-3.

Cross Section B-B', Figure 10: This cross section summarizes interpreted subsurface conditions along a line roughly oriented west to east and extending from monitoring well MW-11A across the southern termini of the Five Acre Landfill and gravel pit to just west of Minnie Creek. The entire section is within the ancestral drainageway and is underlain by glaciofluvial sediment and variably weathered basement rock. However, saturated glaciofluvial sediment appears to occur only east of monitoring well MW-7B. Glaciofluvial sediments are saturated below an elevation of about 2,075 feet in monitoring well MW-5A.

Layered sand and MSW associated with the Five Acre Landfill was encountered between MW-1A and MW-7D. Thickness of the layered sand/MSW is about 7 feet at test pit TP-M-1A.

Minnie Creek is located just west of the eastern section terminus (B'). The approximate streambed elevation (2,140 feet) is about 70 feet higher than the glaciofluvial groundwater elevation in adjacent monitoring well MW-8B (2,070 feet), indicating Minnie Creek is a losing stream adjacent to the Site.

Cross Section C-C', Figure 11: This cross section summarizes interpreted subsurface conditions along a line paralleling South Cheney Spokane Road (oriented southwest to northeast) and extending from the southeast corner of the Former Spokane County landfill to the southeast portion of the gravel pit. The entire section is within the ancestral drainageway and is underlain by glaciofluvial sediment and variably-weathered basement rock. Glaciofluvial sediment thickens to the northeast, increasing from about 78 feet at monitoring well MW-4A to 182 feet at monitoring well MW-6. Saturated glaciofluvial sediment underlies the entire section, with the groundwater table decreasing from an elevation of about 2,100 feet at monitoring well MW-4A to about 2,075 feet at monitoring well MW-5A.

Layered sand and MSW was observed to a depth of 12 feet below ground surface at monitoring well MW-4, which is situated along the east margin of the Former Spokane County Landfill.

Cross Section D-D', Figure 12: This cross section summarizes interpreted subsurface conditions along a line that transects the Main Landfill from southwest to northeast. The entire section is within the ancestral drainageway and is underlain by a thick sequence (in excess of 150 feet) of glaciofluvial sediment underlain by variably-weathered basement rock. Saturated glaciofluvial sediment underlies the entire section, with the groundwater table decreasing from an elevation of about 2,095 feet at monitoring well MW-14 to about 2,080 feet at monitoring well MW-15A.

Layered sand and MSW associated with the Main Landfill was encountered throughout the section northeast of SB-12. Thickness of the layered sand/MSW generally decreases to the northeast, ranging from about 92 feet in landfill gas monitoring well LFB-4 to about 35 feet in monitoring well MW-15A.

Cross Section E-E', Figure 13: This cross section summarizes interpreted subsurface conditions along a line that originates at monitoring well MW-11A and transects the Five-Acre Landfill from south to north. The section originates (E) within an approximately 200-foot-thick, but unsaturated, portion of the ancestral drainageway, within an area underlain by weathered basement rock. An apparent canyon wall of the

ancestral drainageway formed by CRBG is located beneath the approximate center of the Five-Acre Landfill. CRBG was encountered at a depth of about 31 feet in boring LFB-1.

Layered sand and MSW associated with the Five Acre Landfill was encountered throughout the section north of MW-1A. Thickness of the layered sand/MSW ranged from about 5 feet in test pit TP-5B to about 52 feet in boring LFB-2.

2.2.10. Hydrogeology

2.2.10.1. Hydrostratigraphic Units and Occurrence

The Site's position near the confluence of the Minnie Creek and Marshall Creek drainages, with upland areas situated to the north, west and south of the Site, suggests the presence of converging groundwater flow conditions within shallow aquifer systems near the Site (PGG 2005). Shallow groundwater flow generally mimics topographic conditions and is directed from the area surrounding the Site towards discharge areas situated to the northeast.

The Site generally is underlain by a minimum of three hydrostratigraphic units. These units occur within: (1) basement rocks; (2) the CRBG; and (3) glaciofluvial sediments. The basement rock unit is interpreted to underlie the entire area surrounding the Site at depth and, in places, is overlain by the CRBG unit and/or the glaciofluvial unit. The CRBG unit is truncated by the ancestral drainageway and generally occurs within upland areas along the flanks of the drainageway. The glaciofluvial unit occurs within the saturated portion of the ancestral drainageway. The glaciofluvial aquifer likely receives recharge from the CRBG unit along canyon walls.

Because of the relatively complex geologic conditions summarized above, the uppermost aquifer at a given location within and adjacent to the Site could be associated with the basement rock unit, the CRBG unit, or the glaciofluvial unit. The approximate boundaries of the uppermost units, adapted from interpretations presented by Fetrow (1991), are presented in Uppermost Aquifer Boundaries, Figure 14. Surficial geologic conditions also are shown in Figure 14 for comparison.

The glaciofluvial unit forms a southwest to northeast-trending aquifer of limited width that underlies the Former Spokane County Landfill, most of the Main Landfill, and the southeast corner of the gravel pit (Figure 14). The glaciofluvial unit is approximately 2,000 feet in width near the Former Spokane County Landfill but thins to about 500 feet within an apparent constriction located immediately southeast of the gravel pit.

The basement rock unit forms the uppermost aquifer underlying the north portion of the Main Landfill, most of the Five-Acre Landfill, and the central portion of the gravel pit. The CRBG unit is the uppermost aquifer underlying the north portions of the Five-Acre Landfill and gravel pit.

2.2.10.2. Basement Rock Unit

Groundwater occurs in basement rocks in fractured and/or weathered zones; these zones have variable hydraulic continuity. Porosity and permeability are generally low. The yield of water wells completed within the basement rock aquifer system typically are on the order of several gallons per minute (gpm) or less. Recharge to the upper portion of the basement rock aquifer occurs primarily within upland areas to the north, west and south, flowing laterally to discharge areas within the Minnie Creek, Marshall Creek and/or Hangman Creek valleys.

Based on hydraulic conductivity testing in monitoring wells MW-6, MW-7A and MW-7B, Fetrow (1991) reported basement rock hydraulic conductivities on the order of 3 x10^{-3} to 3 x 10^{-4} feet per day. PGG (2005) estimated groundwater velocities within this hydrostratigraphic unit to be about 1 foot per year.

2.2.10.3. CRBG Unit

The CRBG consists of a series of individual basalt flows. Groundwater is most readily transmitted through the broken vesicular and scoriaceous interflow zones that characterize the top of each flow. The interflow zones are separated by the less porous and less transmissive entablature and colonnade, which comprise 90 to 95 percent of the total flow volume (Whiteman et al. 1994). The flows are locally interlayered with sedimentary deposits of the Latah Formation. This system of multiple flows and interlayered sedimentary deposits creates multiple stacked confined to semi-confined aquifers which can yield significant volumes of groundwater to wells.

Within the area surrounding the Site, the CRBG is overlain, in places, by glaciofluvial and/or alluvial deposits. In other locations, the CRBG directly crops out on the surface. Recharge to the CRBG occurs through direct precipitation, vertical infiltration from the overlying unconfined aquifer, and lateral recharge from basement rock. Discharge from the CRBG occurs through leakage to adjacent aquifers, along gaining reaches of streams, and to water supply wells.

Previous investigators (PGG 2005) have separated the CRBG Unit into two sub-units; an upper basalt aquifer and lower basalt aquifer (presumably separated by discontinuous sedimentary deposits associated with the Latah Formation). However, this distinction is based on a paucity of hydraulic head information for the lower basalt unit and, in our judgment, likely oversimplifies the complexity of the geometry of compound flows characteristic of the CRBG system in proximity to the margin of the Columbia Plateau.

2.2.10.4. Glaciofluvial Sediments

Glaciofluvial sediments typically consist of relatively free-draining sand and gravel with relatively high permeability that have filled the Minnie Creek and Marshall Creek drainages. This sedimentary aquifer system generally is unconfined and relatively susceptible to degradation from point and non-point sources of contamination because of the lack of an overlying confining unit and a generally shallow depth to the groundwater table. Recharge is primarily derived from precipitation, losing reaches of Minnie and Marshall Creeks, applied irrigation, septic systems and potentially through leakage from CRBG and basement rock aquifers. Discharge occurs through leakage to adjacent aquifers, along gaining reaches of streams, and to water supply wells.

Golder conducted a single-well pumping test using well GR-2, located about 0.7 miles northeast of the Site in 1989. Based on the pumping test results, which were summarized by Fetrow (1991), Golder estimated a hydraulic conductivity of 256 feet per day (78 meters per day) and a groundwater velocity of 12 feet per day within the glaciofluvial sediments.

2.2.11. Groundwater Occurrence and Flow

2.2.11.1. Historic Groundwater Elevation Data

Historic Site groundwater level data are provided in Appendix B and summarized in Figure B-1. The period of record for Site groundwater level monitoring extends from 1989 through December 2017, although there is a gap in the record from 2011 through 2015.

Review of historic data suggest the following for wells completed within the **glaciofluvial unit** (monitoring wells MW-2, MW-2A, MW-3, MW-4A, MW-5, MW-8B and MW-9A):

- Groundwater elevations in glaciofluvial unit wells generally decrease from southwest to northeast and are in the range of 2,050 to 2,150 feet.
- In individual glaciofluvial wells, the range in observed groundwater elevation for the period of record is as high as approximately 80 feet.
- A pronounced seasonal fluctuation is observed in glaciofluvial wells, with high groundwater elevations generally observed during spring and early summer and low groundwater elevations during fall and early winter. This suggests glaciofluvial aquifer groundwater level is strongly influenced by recharge associated with winter precipitation and snowmelt.
- The magnitude of the seasonal fluctuation in groundwater elevation in individual glaciofluvial wells is high relative to the other hydrostratigraphic units, up to approximately 40 feet.
- No long-term trend in groundwater elevation (increasing or decreasing) is observed.

Only one monitoring well, MW-12A, is completed within the **CRBG unit**. Review of these data suggest the following:

- Groundwater elevations in the CRBG unit well generally are in the range of 2,230 to 2,240 feet, and about 80 to 180 feet higher than glaciofluvial unit wells. This suggests that the CRBG unit discharges to the glaciofluvial unit where they contact each other and are in hydraulic continuity.
- In MW-12A, the range in observed groundwater elevation for the period of record is approximately 63 feet.
- A seasonal fluctuation is present in the CRBG unit well, but muted relative to the glaciofluvial unit. As in the glaciofluvial unit, high groundwater elevations generally are observed during spring and early summer and low groundwater elevations during fall and early winter. However, the magnitude of the seasonal fluctuation is generally less than 5 feet.
- No long-term trend in groundwater elevation (increasing or decreasing) is observed.

Review of historic data suggest the following for wells completed within the **basement rock unit** (monitoring wells MW-1A, MW-6, MW-7A, MW-7B, MW-7C and MW-8A):

- Groundwater elevations in basement rock wells generally are similar to the glaciofluvial unit wells and are in the range of 2,050 to 2,150 feet. This suggests hydraulic connection between the two hydrostratigraphic units.
- In individual basement rock wells, the range in observed groundwater elevation for the period of record is as high as approximately 90 feet.
- Two of the basement rock wells (MW-6 and MW-8A) are situated within the boundaries of the glaciofluvial unit (Figure 14). In these wells, a strong seasonal fluctuation that mirrors the glaciofluvial unit in both timing and magnitude is observed. This also suggests hydraulic connection between the glaciofluvial and basement rock units.

- The other basement rock wells are situated outside of the boundaries of the glaciofluvial unit. In these wells, a seasonal fluctuation is present, but similar to the CRBG unit is muted relative to the glaciofluvial unit.
- No long-term trend in groundwater elevation (increasing or decreasing) is observed.

2.2.11.2. Supplemental RI Groundwater Monitoring

GeoEngineers measured groundwater levels in a total of 20 Site monitoring wells during four groundwater monitoring events, conducted during November 2015, August 2016, November 2016, February 2017, and December 2017. Groundwater levels are presented in Groundwater Elevation Summary, Table 19, and compared to historic data in Figure B-1. Project monitoring wells include 13 wells completed within the glaciofluvial unit, one well completed in the CRBG unit, and six wells completed in the basement rock unit, as identified in Table 19. A general comparison of observed groundwater elevations yields the following observations:

- In November 2015, groundwater levels in each hydrostratigraphic unit were low relative to subsequent monitoring events, though comparable to historic periods of low groundwater elevation (Figure B-1).
- In August 2016, groundwater levels in the glaciofluvial, CRBG and basement rock units increased by averages of 16.86 feet, 5.47 feet and 9.57 feet, respectively, relative to November 2015.
- In November 2016, groundwater levels in the glaciofluvial, CRBG and basement rock units decreased by averages of 6.12 feet, 1.37 feet and 4.80 feet, respectively, relative to August 2016.
- In February 2017, groundwater levels in the glaciofluvial, CRBG and basement rock units increased by averages of 4.82 feet, 2.78 feet and 2.88 feet, respectively, relative to November 2016.
- Precipitation and snowmelt (and associated groundwater recharge) during 2017 resulted in relatively large increases in groundwater levels in the glaciofluvial and basement rock units. In December 2017, groundwater levels in the glaciofluvial and basement rock units increased by 39.26 feet and 33.45 feet, respectively, relative to February 2017. Groundwater level in the CRBG unit, however, decreased by 3.64 feet relative to February 2017.

Groundwater elevations for the November 2015, August 2016, November 2016, February 2017, and December 2017 events are graphically presented in Groundwater Elevations, Figures 15 through 19, respectively. Aquifer boundaries, groundwater elevation contours, and groundwater flow direction are shown for the glaciofluvial unit. For each event, groundwater flow direction within the glaciofluvial unit generally was directed along the axis of the ancestral drainageway to the east and northeast. Hydraulic gradient during the first four monitoring events (November 2015 through February 2017) was relatively consistent in the glaciofluvial unit and on the order of 1×10^{-2} feet per foot (about 50 feet per mile). The elevated groundwater conditions observed during December 2017 coincided with an approximate 50 percent reduction in glaciofluvial unit hydraulic gradient, to approximately 5×10^{-3} feet per foot (about 25 feet per mile).

Based on examination of groundwater elevations in monitoring wells MW-8A, MW-11A and MW-16A, groundwater flow direction in the basement rock unit is to the east, and generally offset from the glaciofluvial unit by about 20 to 40 degrees to the south. Hydraulic gradient in the basement rock unit is consistently in the range of about 1×10^{-2} feet per foot (50 feet per mile).

2.2.11.3. Hydraulic Conductivity Testing

GeoEngineers conducted falling and rising head slug tests in monitoring wells MW-14, MW-15A and MW-16A on November 12, 2015 as a basis for estimating saturated hydraulic conductivity within target water-bearing zones beneath the Site. Slug tests also were planned in monitoring wells MW-2, MW-3, MW-5, MW-15 and MW-16. However, these wells either were dry (MW-2, MW-5, MW-16) or did not contain an adequate water column to induce sufficient change in hydraulic head outside of the well's filter pack (MW-3, MW-15).

Falling and rising head slug tests are performed by rapidly increasing or decreasing, respectively, the water level in a well and measuring the subsequent rate of water level change as head conditions recover. Increasing and decreasing water level is achieved by quickly inserting or removing, respectively a slug (in this case a sealed polyvinyl chloride (PVC) pipe filled with impermeable material) of known volume into or out of the water column. During testing, we recorded water level data with a Model PT2X transducer/data logger manufactured by INW of Kirkland, Washington. After slug testing, we downloaded and reduced pressure data. During data reduction, we observed an oscillatory response to slug testing in each monitoring well, which generally indicates the wells are completed in formation(s) of relatively high hydraulic conductivity. As such, we analyzed project slug test data for hydraulic conductivity using a solution developed by Butler and Garnett (2000) for high-hydraulic conductivity aquifers. This spreadsheet-based solution is an extension of previous and widely-accepted models introduced by Bouwer and Rice (1976) and Hvorslev (1951) and compares the observed head response to a standard damped spring physical solution (Kreyszig 1979).

Slug test data are presented for monitoring wells MW-14, MW-15A and MW-16A in Slug Test Plots, Figures F-1 through F-3, respectively of Appendix F. Three falling head and three rising head tests were performed in each monitoring well. The initial falling head test in MW-14 was not analyzed because the measurement interval was too large to adequately characterize the rapid water level recovery.

A relatively narrow range in water level response to slug testing was observed in the three tested monitoring wells. Water level recovery was very rapid, with full recovery achieved in a few seconds, and the data sets generally were characterized by underdamped oscillatory behavior. The geometric means of the hydraulic conductivity analyses at MW-14, MW-15A and MW-16A were about 93 feet per day (ft/d), 266 ft/d and 99 ft/d, respectively.

These saturated hydraulic conductivity estimates are, on balance, high and generally indicative of permeable aquifer conditions. Results of hydraulic conductivity analyses are summarized in Table 20 below.

TABLE 20. SLUG TEST RESULTS SUMMARY

Well Number	Hydrostratigraphic Unit	Test Designation	Hydraulic Conductivity (feet per day)
MW-14	Glaciofluvial	Rising Head 1	161
		Falling Head 2	88
		Rising Head 2	85
		Falling Head 3	64
		Rising Head 3	91

Well Number	Hydrostratigraphic Unit	Test Designation	Hydraulic Conductivity (feet per day)
		Geometric Mean	**93**
MW-15A	Glaciofluvial	Falling Head 1	246
		Rising Head 1	364
		Falling Head 2	198
		Rising Head 2	303
		Falling Head 3	192
		Rising Head 3	342
		Geometric Mean	**266**
MW-16A	Basement Rock	Falling Head 1	91
		Rising Head 1	137
		Falling Head 2	80
		Rising Head 2	103
		Falling Head 3	83
		Rising Head 3	109
		Geometric Mean	**99**

2.2.11.4. Groundwater Velocity

Groundwater velocity is estimated by the following equation, adapted from Domenico and Schwartz (1990):

$$v = (K/n_e)*dh/dl \qquad \text{Equation 1}$$

where:

v = groundwater velocity; K = hydraulic conductivity; n_e = effective porosity; and dh/dl = hydraulic gradient.

For the glaciofluvial unit, we estimate groundwater velocity is about 5 feet per day (2,000 feet per year), based on the following assumptions:

- K equals 160 feet per day, based on the geometric mean of slug test results from MW-14 and MW-15A.
- n_e equals 0.3, based on typical values for sand and gravel aquifers provided by Domenico and Schwartz (1990).
- dh/dl equals 1×10^{-2} feet per foot.

For the basement rock unit, we estimate groundwater velocity is about 100 feet per day (40,000 feet per year), based on the following assumptions:

- K equals 99 feet per day, based on slug test results from MW-16A.

- n_e equals 0.01, based on typical values for fractured crystalline rock aquifers provided by Domenico and Schwartz (1990).
- dh/dl equals 1 x 10^{-2} feet per foot.

2.2.12. MSW Thickness

GeoEngineers compiled data regarding the thickness of observed MSW in project explorations. These data are presented for the Main Landfill and Five-Acre Landfill in Thickness of Municipal Solid Waste, Figures 20 and 21, respectively. For the purposes of Figures 20 and 21 and this discussion, MSW thickness was assumed equal to the deepest observed MSW in a specific exploration. However, MSW generally is interbedded with layers of sand fill of varying thickness.

MSW thickness within the Main Landfill exceeds 90 feet in boring LFB-4 and LFB-14. As shown in Figure 20, this creates an axis of relatively thick MSW oriented southwest to northeast within the approximate center of the landfill. MSW thickness generally exceeds 40 feet within the entire area located more than 200 feet from landfill boundaries. MSW thickness decreases steeply near Main Landfill boundaries. However, MSW appears to extend between the Main Landfill and Five-Acre Landfill in a deposit that exceeds 10 feet in thickness and about 100 feet in width.

MSW within the Five-Acre Landfill appears to be roughly half the thickness of the Main Landfill. Within the approximate landfill center, MSW exceeds 50 feet in boring LFB-2. MSW thickness attenuates with distance from the landfill center though more gently than the Main Landfill near landfill boundaries.

2.3. Sampling/Analytical Results

2.3.1. Quality of Analyses

A detailed quality assessment of RI laboratory analytical data is provided in the data validation reports in Appendix G. In summary, data quality for GeoEngineers chemical analytical sampling data was found to be acceptable, including where noted or qualified, with a few exceptions. Results for several analytes in one soil sample and four groundwater samples were rejected based on unacceptable quality control results. Based on soil and groundwater results for other samples obtained at the Marshall Landfill, these rejected results, which are discussed below, do not affect the RI conclusions.

- Soil Sample LFB-8 (17-18): benzoic acid was not detected; the reporting limit was rejected based on MS/MSD recoveries.
- Groundwater Samples MW-1A-082516, MW-7B-082516, DUP-082516 and MW-12A-082516: 2,6-dinitrotoluene, 4-chloroaniline and hexachlorocyclopentadiene were not detected (except 2,6-dinitrotoluene in sample DUP-082516); the reporting limits were rejected based on LCS/LCSD recoveries. The positive result for 2,6-dinitrotoluene was qualified as estimated (J).

2.3.2. Results

2.3.2.1. Soil

GeoEngineers collected 20 soil samples between June and August 2015. Soil sampling locations are shown on Figures 6 (Main Landfill) and 7 (Five Acre Landfill). Section 2.2.4 lists the constituents analyzed for and the analytical methods followed.

Soil chemical analytical results are summarized and compared to Model Toxics Control Act (MTCA) Method A or B cleanup levels (CULs) in Tables 2 through 5.

Methylene chloride was the only analyte detected in soil at a concentration greater than a soil CUL. Methylene chloride was detected at soil sample location LFB-4 at a depth of 92 to 93 feet below ground surface at a concentration of 120 J micrograms per kilogram (µg/kg), which is greater than the Method A CUL of 20 µg/kg. The methylene chloride CUL is based on protection of groundwater for drinking water use; methylene chloride was not detected in groundwater in the 19 monitoring wells sampled during the three groundwater monitoring events. Therefore, based on empirical evidence, the soil to groundwater pathway is not complete for methylene chloride and the Method A soil CUL is not appropriate.

The Method B CUL (based on soil ingestion) of 480,000 µg/kg was then used to evaluate observed methylene chloride concentrations in soil. Methylene chloride was not detected at a concentration greater than the Method B CUL and is, therefore, not considered an analyte that exceeds the Method B CUL for the Marshall Landfill Site.

2.3.2.2. Groundwater

GeoEngineers collected groundwater samples from project groundwater monitoring wells during four groundwater monitoring events, conducted during August 2016, November 2016, February 2017, and December 2017. Unless the respective monitoring well was dry upon inspection, during each monitoring event we collected groundwater samples from 20 groundwater monitoring wells (MW-1A, MW-2, MW-2A, MW-3, MW-4, MW-4A, MW-5, MW-5A, MW-7B, MW-7D, MW-8A, MW-8B, MW-9A, MW-11A, MW-12A, MW-14, MW-15, MW-15A, MW-16 and MW-16A). Groundwater sampling locations are shown on Figure 2; quarterly results (analytes and wells with concentrations that exceed the respective CULs) are shown in Chemical Concentrations – Groundwater, Figure 22. Section 2.2.5 lists the constituents analyzed for and the analytical methods followed.

Groundwater chemical analytical results are summarized and compared to MTCA Method A or B CULs in Tables 6 through 10. Analytes that were detected at concentrations greater than CULs are discussed below.

Metals: Total cadmium and lead were detected at concentrations greater than Method A CULs in groundwater samples collected from MW-1A (both metals) and MW-7B (lead only). MW-1A was only sampled in August 2016 because it was dry in September 2016 and February 2017. Total lead was elevated in a duplicate sample obtained from MW-7B in August 2016, but not in the original sample or in samples collected from MW-7B during December 2016 and February 2017. Dissolved cadmium and lead concentrations were less than CULs in all groundwater samples obtained in 2016 and 2017.

Anions: Nitrate was detected at a concentration greater than the Method B CUL in the groundwater sample collected from MW-1A during the August 2016 monitoring event.

Nitriles: Cyanide was detected at concentrations greater than the Method B CUL in groundwater samples collected from MW-5 and MW-5A in August 2016 and December 2016, respectively. Both wells are located at the southeast end of the gravel pit. Cyanide was not detected in MW-5 and MW-5A in February 2017.

Pesticides: 2-methyl-4 chlorophenoxyacetic acid (MCPA) and/or Mecoprop (MCPP) were detected at concentrations greater than Method B CULs in groundwater samples collected from MW-5, MW-7B, MW-8B, MW-12A, MW-14, MW-15A, MW-16 and MW-16A. The concentrations that exceed the respective CULs were

all less than analyte reporting limits (qualified as estimated) and were only from groundwater samples obtained in February 2017. MCPA and MCPP were not detected in any of the groundwater samples obtained during the August 2016, December 2016, or December 2017 groundwater monitoring events.

SVOCs: 1,4-Dioxane, 2,6-dinitrotoluene or bis(2-ethylhexyl)phthalate were detected at concentrations greater than Method B CULs in groundwater samples from the following monitoring wells: MW-11A (1,4-dioxane), MW-7B and MW-8A (2,6-dinitrotoluene), and MW-5, MW-5A and MW-15A (bis[2-ethylhexyl]phthalate). Except for 2,6-dinitrotoluene in MW-7B and MW-8A, these SVOCs were detected at elevated concentrations in only one of the groundwater monitoring events; 2,6-dinitrotoluene was detected at elevated concentrations in MW-7B and MW-8A in three and two rounds of groundwater monitoring, respectively.

VOCs: Methylene chloride was detected at a concentration greater than the Method B CUL in the groundwater sample collected from MW-12A during the December 2017 monitoring event. Methylene chloride was detected in five monitoring wells in December 2017 but was not detected in any monitoring well during the previous RI monitoring events. Although methylene chloride was identified as a primary COC by PGG (2005), the presence of methylene chloride may be the result of laboratory contamination. Methylene chloride is a common laboratory contaminant, though it was not detected in the applicable method blank samples.

As shown in Figure 22, one or more groundwater analytes were observed to exceed project CULs in slightly greater than half of the project groundwater monitoring wells during the RI monitoring period. However, these concentrations that exceed the respective CULs generally occurred in only one of four RI groundwater monitoring events (except for 2,6-Dinitrotoluence in MW-7B, which exceeded twice). This suggests that any groundwater contaminant plume below the Site is discontinuous both spatially and temporally.

2.3.2.3. Surface Water

GeoEngineers collected surface water samples from one location along Marshall Creek (at the northeast end of the City of Marshall) during three monitoring events, conducted during August 2016, November 2016 and February 2017. The surface water sampling location is shown in Figure 1. Section 2.2.5 lists the constituents analyzed for and the analytical methods followed.

Surface water sample chemical analytical results are summarized and compared to MTCA Method B CULs in Tables 11 through 15. The surface water CULs in Tables 11 through 15 are the lowest values of (1) MTCA Method B formula values (WAC 173-340-730, Equation 730-2) based on the human health fish consumption pathway and (2) freshwater water quality criteria (WAC 173-201, national toxics rule and Clean Water Act) based on protection of aquatic life.

Arsenic is the only constituent detected at concentrations greater than surface water CULs. The observed total and dissolved arsenic surface water concentrations range from 0.0014 milligrams per liter (mg/L) to 0.0020 mg/L, which are greater than the CUL of 0.0000982 mg/L.

The arsenic surface water CUL of 0.0000982 mg/L is the MTCA Method B formula value (WAC 173-340-730, Equation 730-2) based on the human health fish consumption pathway. As discussed in Section 3.0 of this report (Conceptual Site Model), the fish consumption pathway is not expected to be complete. Therefore, the arsenic surface water results were also compared to aquatic life water quality criteria (WAC 210A, National Toxics Rule and the National Recommended Water Quality Criteria). The lowest

applicable freshwater aquatic life surface water quality criteria for arsenic is 0.150 mg/L (National Recommended Water Quality Criteria). Arsenic was not detected in surface water at concentrations greater than 0.150 mg/L.

Based on the above discussion, surface water at the Site is in compliance with applicable MTCA Method surface water CULs.

2.3.2.4. Landfill Gas

GeoEngineers collected landfill gas samples from landfill gas monitoring wells during four monitoring events, conducted during September 2015, August 2016, December 2016 and February 2017. The soil vapor sampling locations (LFB-3, LFB-4, LFB-5, LFB-8, LFB-9, LFB-10, LFB-11, LFB-15, LFB-16 and LFB-17) are shown in Figure 6 (Main Landfill), Figure 7 (Five Acre Landfill) and Figure 8 (both landfills). Landfill gas samples were analyzed for VOC concentrations by EPA Air Method Toxic Organics 15. In addition, landfill gas was screened in the field at each location using a handheld GEM 2000+ meter to measure concentrations of methane, carbon dioxide and oxygen (2016 and 2017 events only).

Landfill gas sample chemical analytical results are summarized and compared to MTCA Method B shallow (sub-slab) soil gas screening levels (SLs) in Table 16; methane screening results are summarized in Table 17. The shallow soil gas SLs, which are equal to the MTCA Method B air CUL divided by 0.03 (or multiplied by approximately 33.3), are based on the potential for vapor intrusion into residential homes on, or adjacent to, the landfills.

A total of 12 VOCs were detected at concentrations greater than the MTCA Method B shallow soil gas SLs in at least one sample. Concentrations that exceed the respective SLs were observed in 8 of the 10 landfill gas monitoring wells. These 12 VOCs are primarily petroleum-related compounds or chlorinated solvents. VOCs were not detected at elevated concentrations (that is, greater than soil gas SLs) in wells LFB-15 and LFB-16, which are located at the south end of the Main Landfill (see Soil Gas VOC Summary, Figure 23). The landfill gas results indicate that VOCs are present at concentrations greater than MTCA Method B shallow soil gas SLs throughout both landfills, except for the south end of the Main Landfill.

Methane concentrations measured during the 2016 and 2017 events are shown in Methane Monitoring Results 2016-2017, Figure 24. Observed methane concentrations were greater than the lower explosive limit (LEL) of 5 percent in two of four landfill gas monitoring wells at the Five Acre Landfill and three of six landfill gas monitoring wells at the Main Landfill during at least one monitoring event. Per WAC 173-304-460 (Landfilling Standards), methane concentrations should not be greater than the LEL at the landfill boundary. This criterion has been met at the south and southeastern boundary of the Main Landfill, but not at the west and north boundaries of the Main Landfill or at the Five Acre Landfill.

3.0 CONCEPTUAL SITE MODEL

3.1. General

The Conceptual Site Model (CSM) is a model of the potential contaminant sources, release mechanisms and transport mechanisms currently present at the Site. The CSM also identifies potential receptors and associated exposure pathways for Site contaminants. The CSM does not quantify potential risks to human health or the environment posed by Site-related contamination. It is intended to focus remedial actions (site investigations, monitoring, cleanup actions, etc.) on those areas of the Site that may warrant further

consideration. The CSM is graphically depicted in Conceptual Site Model, Figure 25, and expanded upon below and in Appendix D (Potential Receptor Evaluation).

3.2. Potential Contaminant Sources, Exposure Pathways and Receptors

GeoEngineers conducted a potential receptor evaluation to identify: (1) contaminant sources and (2) potential receptors (people and sensitive ecological receptors) that could encounter Site-related contamination. The Potential Receptor Evaluation is provided in Appendix D.

The source of contamination at the Site is the landfilled waste. Potentially complete exposure pathways, including release mechanisms, exposure points, and exposure routes for contamination contained within the landfill generally are:

- Direct contact with soil impacted by waste and/or leachate from the landfill (dermal contact and inhalation/incidental ingestion of dust and contaminants).
- Inhalation of landfill gases emanating from the landfill.
- Direct contact and/or ingestion of groundwater and/or surface water impacted by leachate from the landfill.

Potential receptors include workers at the Action Materials facility, nearby residents and occasional trespassers. Potential terrestrial ecological receptors include plants, soil biota and wildlife. The MTCA site-specific Terrestrial Ecological Evaluation (TEE), provided in Appendix H, focuses on mammalian and avian wildlife (specifically, shrews, voles and robins) based on the greater availability of toxicity information for these receptors. The shrew, vole and robin are potential receptors at the Site. Other species that may occur at the Site but would likely be less exposed due to their greater home ranges, include resident predatory bird species such as red-tailed hawk (*Buteo jamaicensis*) and bald eagle (*Haliaeetus leucocephalus*). There are also numerous other resident and migratory birds common within the Spokane area; however, the robin conservatively assesses their potential exposure. Smaller mammals likely present at the Site, such as squirrels and chipmunks, are effectively assessed by the vole surrogate. Larger mammals that could use the Site are not directly represented by use of a surrogate; however, mammals such as coyote (*Canis latrans*), porcupine (*Erethizon dorsatum*), white-tailed deer (*Odocoileus virginianus*), and Rocky Mountain elk (*Cervus elaphus nelson*) require large tracks of land for foraging, wintering, breeding and nesting such that their use of the Site would be infrequent or unlikely. The home ranges of these species would be an order of magnitude greater than that of the shrew and vole.

3.2.1. Soil

No analyte was detected in soil at a concentration greater than applicable MTCA Method B soil CULs. Methylene chloride was detected in soil at a concentration greater than the MTCA Method A soil CUL based on the protection of groundwater; however, methylene chloride was not identified as a groundwater contaminant of concern. The methylene chloride soil data were subsequently compared to the MTCA Method B soil CUL based on direct contact (soil ingestion); methylene chloride was not detected in soil at concentrations greater than the direct contact CUL.

Dibutylphthalate, cyanide, lube oil-range petroleum hydrocarbons, selenium and vanadium were identified as contaminants of potential ecological concern (COPEC) in the Site-specific TEE. However, as discussed in

Appendix H, the results of the Site-specific TEE suggest that these analytes are not expected to pose a significant hazard to ecological receptors.

Except for one soil sample, the soil samples were obtained below the standard point of compliance for direct contact (deeper than 15 feet bgs). These deeper soil samples are assumed to conservatively represent shallow soil (that is, soil within the standard point of compliance).

The presence of the soil caps at the two landfills will significantly reduce any potential exposure by people and terrestrial ecological receptors to Site-related contamination. Potential exposure is limited to exposed waste at the two landfills.

3.2.2. Groundwater

The results of recent groundwater monitoring during the RI do not indicate evidence of groundwater contamination that can be reproduced during subsequent monitoring events. Note that this finding does not extend to 1,4-Dioxane results, which only was analyzed for during the December 2007 monitoring event.

RI groundwater analytical results indicate that the extent of groundwater with analyte concentrations greater than CULs is limited, discontinuous, and variable between monitoring events. Observed groundwater analyte concentrations that exceed respective CULs are summarized by the following:

- The groundwater monitoring wells with at least one groundwater analyte concentration that exceeded a CUL during RI monitoring events (MW-1A, MW-5, MW-5A, , MW-7B, MW-8A and MW-8B, MW-12A, MW-14A, MW-15A, MW-16, and MW-16A) are distributed throughout the Site (Figure 22).
- Concentrations of inorganic analytes that exceed respective CULs (cadmium, lead and nitrate) are limited to the west-central portion of the Site, extending from MW-1A along the south boundary of the Five-Acre Landfill to MW-7B along the north boundary of the Main Landfill.
- MCPA and MCPP, were only detected in February 2017, but were more widely-distributed.
- There is some uncertainty associated with the extent of 2,6-dinitrotoluene, MCPA and MCPP groundwater contamination due to elevated reporting limits for these three analytes. However, the laboratory reported the results down to the method detection limits, which only exceed the MTCA Method B groundwater CULs by a factor of two for these three analytes. Therefore, even if these analytes were presented in groundwater samples reported as not detected, the groundwater concentrations would be less than two times the MTCA Method B groundwater CUL. To address the elevated reporting limits for MCPA and MCPP, a mass spectrometer (MS) was used to identify and quantify MCPA and MCPP in groundwater samples collected in December 2017 resulting in reporting limits less than the MTCA Method B groundwater CULs. MCPA and MCPP were not detected in December 2017.

As discussed in “Section 2.2.10. Hydrogeology,” shallow groundwater flow within the glaciofluvial and basement rock units generally mimics topographic conditions and is directed from the area surrounding the Site towards discharge areas situated to the northeast and east. GeoEngineers was not tasked with conducting a survey of active private/community wells. However, based on our review of previous investigations, we estimate that there are a minimum of three groundwater supply or private/community wells within 1,500 feet of the Site. The Marshall Landfill groundwater supply well is located near

groundwater monitoring well MW-3; no detections above groundwater CULs were detected in MW-3 during the 2016/2017 monitoring events. The Countryman A&D well is located around 750 feet east of the Main Landfill and the Beck Well is located approximately 1,500 feet northeast of MW-8A and MW-8B. Given the limited and sporadic nature of analyte concentrations in groundwater that exceed respective CULs observed within the Site groundwater monitoring wells during the RI investigation, it is logical to conclude that these groundwater supply wells are unlikely to be affected by Site-related groundwater contamination. However, a detailed evaluation of this pathway, including sampling of nearby groundwater supply wells, was not within the scope of this RI.

3.2.3. Surface Water

As noted in Section 2.3.2, based on the single surface water sampling location, surface water at the Site is in compliance with applicable MTCA Method surface water CULs. In addition, both Minnie Creek and Marshall Creek, when they contain water, are losing streams (discharge to groundwater) near the Site (PGG 2005). Therefore, the direct contact and/or ingestion of surface water exposure pathways are incomplete.

3.2.4. Soil Vapor

Twelve VOCs were detected at concentrations greater than the MTCA Method B shallow soil gas SLs in at least one sample and in 8 of the 10 landfill gas monitoring wells. These 12 VOCs are primarily petroleum-related compounds or chlorinated solvents. Methane concentrations are greater than the LEL of 5 percent in two of four landfill borings at the Five Acre Landfill and three of six landfill borings at the Main Landfill during at least one monitoring event. The boundaries of landfill gas contamination have not been delineated, except for the following:

- VOC concentrations that exceed respective CULs appear to attenuate before the south boundary of the Main Landfill.
- Methane concentrations that exceed the CUL appear to attenuate before the south and southeast boundaries of the Main Landfill.

A primarily concern associated with VOC and methane landfill gas concentrations is the potential for vapor intrusion into overlying or nearby buildings. Vapor intrusion could potentially be a concern for structures built in proximity to the Main and Five-Acre Landfills in the future. Currently, buildings are not present on either landfill. The only existing buildings near either landfill that may be subject to vapor intrusion are the Action Materials' buildings between the gravel pit and the Main Landfill.

4.0 PROPOSED CLEANUP STANDARDS

Cleanup standards consist of: (1) CULs that are protective of human health and the environment; and (2) the point of compliance at which the CULs must be met. Proposed cleanup standards for remedial alternative evaluation are presented below.

4.1. Soil Cleanup Standards

Soil CULs for the Site are not required. Analytes were not detected in soil at concentrations greater than applicable MTCA Method A or B soil CULs and, as discussed in Appendix H, the results of the site-specific

TEE suggest that analytes identified as COPECs are not expected to pose a significant hazard to ecological receptors.

4.2. Groundwater Cleanup Standards

Groundwater CULs are presented in Summary of Cleanup Levels, Table 21 for analytes detected at concentrations greater than MTCA Method A or B CULS (Bis(2-ethylhexyl)phthalate [BEHP], cadmium, cyanide, 2,6-dinitrotoluene, lead, MCPA, MCPP and nitrate). The groundwater CULs are generally the standard MTCA Method B potable groundwater CUL (WAC 173-340-720[4][b]), obtained from Ecology's "CLARC Master Spreadsheet.xlsx" dated August 2015. However, these values were not selected as groundwater CULs if "sufficiently protective" federal or state criteria were available (BEHP, cadmium, lead and nitrate). According to Ecology (Ecology, 2005), a criterion is sufficiently protective if the "excess cancer risk does not exceed 1 in 100,000 (1×10^5) and the hazard quotient (HQ) does not exceed one (1)."

The standard point of compliance for groundwater under MTCA is throughout the Site.

4.3. Air Cleanup Standards

Air CULs are presented in Table 21 for analytes that were detected in soil gas samples obtained at the Site at concentrations greater than MTCA Method B shallow soil gas screening levels (Ecology 2015B; see analyte list below). The air CULs are based on the protection of human health. The standard point of compliance is ambient air throughout the Site; however, the air CULs may also apply to the Action Materials' buildings located between the gravel pit and the Main Landfill.

Air CULs were established for the following analytes:

- Petroleum Compounds: 1,2,4-trimethylbenzene, 1,3-butadiene, benzene, naphthalene, xylene
- Chlorinated Solvents: 1,2-dichloroethane, trichloroethene, vinyl chloride
- Other: 1,4-dichlorobenzene, 1,4-dioxane, benzyl chloride, chloroethane

4.4. Landfill Gas Standards

WAC 173-340-460 specifies air quality and toxic air emissions standards for explosive gases. Explosive gases (expressed as methane) shall not exceed the following levels (which also are listed in Table 21):

- 25 percent of the LEL (or 1.25 percent methane) in facility structures. There are currently no facility structures on the Main Landfill or Five-Acre Landfill and no structures are expected to be constructed in these locations in the future.
- The LEL (or 5 percent methane) at the property boundary or beyond.
- 100 parts per million by volume of methane in off-Site structures (that is, the Action Material's buildings).

5.0 SUMMARY AND CONCLUSIONS

Contamination greater than CULs is limited to groundwater and landfill gases (VOCs and methane), as summarized above and presented in Figures 22 through 24.

5.1. Soil

The soil results and TEE indicate that soil at the landfills do not pose a significant risk to human health or the environment. However, observations of the low permeability cap over the Five-Acre Landfill indicated that the cap is not intact over the entire area of the landfill and some waste was exposed. The FS considers the caps at both landfills.

5.2. Surface Water

Surface water exposure pathways do not appear to be complete. No further action is required.

5.3. Groundwater

The results of groundwater monitoring in 2016 and 2017 as part of remedial investigation do not indicate significant groundwater contamination. Rather, the results indicate that the extent of groundwater with analyte concentrations greater than CULs is limited, discontinuous and variable between monitoring events.

Given the limited and sporadic nature of groundwater analytes that exceed respective CULs observed within the Site groundwater monitoring wells during the RI investigation, it is logical to conclude that off-Site groundwater supply wells are unlikely to be affected by Site-related groundwater contamination. However, a detailed evaluation of this pathway, including sampling of nearby groundwater supply wells, was not within the scope of this RI. No groundwater remediation appears to be warranted based on the RI results. However, we recommend the Site groundwater monitoring program be continued on a quarterly basis. Because of the fluctuating nature of observed Site groundwater contamination, we recommend that the program initially contain each Site groundwater monitoring well and that the well network be reevaluated periodically as additional data emerge.

Because of its association with 1,1,1-TCA, 1,4-Dioxane was added to the groundwater analytical suite during the December 2017 monitoring event and should be retained for future groundwater monitoring activities. The 1,4-Dioxane detection limit should be less than 0.1 micrograms per liter (µg/L).

5.4. Landfill Gas

These results indicate that the boundaries and extent of landfill gas contamination (VOCs and methane) have not been fully delineated for both the Main and Five-Acre Landfills.

The primary concern associated with VOC and methane landfill gas concentrations is the potential for vapor intrusion into overlying or nearby buildings. Vapor intrusion could potentially be a concern for structures built in proximity to the Main and Five-Acre Landfills in the future. Currently, buildings are not present on either landfill. The only existing buildings near either landfill that may be subject to vapor intrusion are the Action Materials' buildings between the gravel pit and the Main Landfill.

The FS considers the potential for off-Site migration of landfill gases (VOCs and methane) and vapor intrusion at the Action Material's buildings.

Future landfill gas monitoring operations should be augmented by collection of landfill gas pressure measurements.

6.0 DATA GAPS

During RI analysis and evaluation, several data gaps related to the nature and extent of subsurface contamination beneath the Site were identified. These data gaps should be addressed during the remedial design phase and include the following:

- Extent of Elevated Landfill Gas Concentration: The majority of landfill gas monitoring wells were characterized by historic VOC and/or methane concentrations that exceeded CULs. As such, the RI explorations do not bound the extent of landfill gas concentrations that exceed CULs. This should be addressed by installation and monitoring of additional landfill gas monitoring wells prior to remediation.
- Damage to Landfill Cover: Solid waste was observed at ground surface in specific locations within the boundaries of Site landfills, suggesting damage to the landfill covers. However, the extent of the damage to the landfill covers has not been mapped. Depending on the selected remedial alternative, the extent of damage to existing landfill covers should be mapped prior to remedial design.
- Landfill Gas Pressure: Landfill gas pressure within landfill gas monitoring wells was measured during one (December 2017) monitoring event. Pressure measurements should be incorporated into the site landfill gas monitoring program and evaluated for seasonal or other fluctuation in landfill gas pressure.
- Soil Movement: Six survey monuments were installed within sloped portions of the Main Landfill during December 2017. Survey monuments are constructed of 5/8-inch-diameter rebar 30 inches in length and outfitted with a red control cap. The horizontal and vertical locations of the installed monuments are specified in Table I-1 of Appendix 1. Approximate survey monument locations also are presented in Figure I-1 of Appendix I. The extent or absence of creep movement on the slope face is unknown and should be monitored by survey on a semi-annual basis.

7.0 LIMITATIONS

This report has been prepared for the exclusive use of the Washington State Department of Ecology in their evaluation of the Site located in Spokane County, Washington. No other party may rely on the product of our services unless we agree in advance and in writing to such reliance.

Within the limitations of scope, schedule and budget, our services have been executed in accordance with generally accepted environmental science practices in this area at the time this report was prepared. No warranty or other conditions express or implied should be understood.

Any electronic form, facsimile or hard copy of the original document (email, text, table and/or figure), if provided, and any attachments are only a copy of the original document. The original document is stored by GeoEngineers, Inc. and will serve as the official document of record.

Notes:

[1]Northings and eastings are presented relative to Washington State Plane North, North American Datum of 1983 (NAD83) and were obtained from a survey conducted by TD&H Engineering, Inc. on December 9, 2016.

[2]Elevations in this table are presented relative to the North American Vertical Datum of 1988 (NAVD88). Wellhead elevations generally were obtained from a survey conducted by TD&H Engineering, Inc. on December 9, 2016.

[3]Monitoring wells MW-6, MW-7A, and MW-7C were not available for the December 9, 2016 survey. The provided elevations are from Fetrow (1991). Examination of the Fetrow (1991) survey indicates the datum was the National Geodetic Vertical Datum of 1929 (NGVD 29). 3.80 feet was added to correct to NAVD 88.

-- = not applicable; NA = not available.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Diesel- and lube oil-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Dx. Gasoline-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Gx.

[4]The reporting limit exceeds the MTCA Cleanup level for some or all samples analyzed for this compound.

[5]Gasoline-range petroleum hydrocarbon cleanup level is 100 mg/kg if benzene is not present and the total of ethylbenzene, toluene and xylenes is less than 1% of the gasoline mixture.

[6]Metals analyzed using EPA Method 6010C.

[7]Mercury analyzed using EPA Method 7471B.

[8]Nitriles were analyzed using EPA Method 9012B.

[9]PCBs analyzed using EPA Method 8082A.

[10]Total PCBs is the sum of all PCBs.

J = estimated result; U = analyte was not detected greater than the reporting limit; NE = not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; mg/kg = milligrams per kilogram; µg/kg = micrograms per kilogram

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Volatile organic compounds (VOCs) analyzed using EPA Method 8260B.

[4]This is the total value for all xylenes.

J = estimated result; NE= not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; U = analyte was not detected greater than the reporting limit; µg/kg = micrograms per kilogram;

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Bold and shading indicates analyte was detected above the applicable cleanup level.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Semi-volatile Organic Compounds (SVOCs) were analyzed using EPA Method 8270C.

[3]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[4]Total value for naphthalene, 1-methylnaphthalene and 2-methylnaphthalene.

[5]Carcinogenic PAH (cPAH) toxic equivalency (TEQ) calculated using toxicity equivalency factors (TEF) from MTCA Table 708-2, based on methodology described in MTCA Cleanup Regulation WAC 173-340-708.

J = estimated result; NE= not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; U = analyte was not detected greater than the reporting limit; µg/kg = micrograms per kilogram;

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Table 5

Soil Analytical Results - Pesticides[1]

Marshall Landfill Site
Spokane County, Washington

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Organochlorine pesticides analyzed using EPA Method 8081A.

[4]Organo-phosphorus pesticides analyzed using EPA Method 8141A

[5]Chlorinated herbicides using EPA Method 8151A.

-- = not analyzed; J = estimated result; NE= not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; U = analyte was not detected greater than the reporting limit; µg/kg = micrograms per kilogram;

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Table 6

Groundwater Analytical Results - TPH, Metals, GC, Anions and PCBs[1]

Marshall Landfill Site

Spokane County, Washington

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Diesel- and lube oil-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Dx. Gasoline-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Gx.

[4]Total and dissolved metals analyzed by EPA Method 200.8

[5]Mercury analyzed by EPA Method 245.1.

[6]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[7]Anions analyzed by EPA Method 300.0.

[8]Cations analyzed by EPA Method 350.1.

[9]Nitriles analyzed by EPA Method 335.4.

[10]Chemical Oxygen Demand analyzed by EPA Method 410.04, Total Organic Carbon analyzed by EPA Method 5310C, E. Coli and Total Coliform analyzed by EPA Method 9223B.

[11]PCBs analyzed by EPA Method 8082A.

[12]Total PCBs is the sum of all PCBs.

[13]Gasoline-range petroleum hydrocarbon cleanup level is 1,000 mg/kg if benzene is not present and the total of ethylbenzene, toluene and xylenes is less than 1% of the gasoline mixture.

J = estimated result; NE = not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; mg/L = milligrams per liter;

MPN/100mL = most probable number of coliform per 100 milliliters; U = analyte was not detected above the reporting limit; µg/L= micrograms per liter;

Bold indicates that the analyte was detected above the laboratory reporting limit.

Bold and shading indicates analyte was detected above the applicable cleanup level.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Volatile organic compounds (VOCs) analyzed by EPA Method 8260C.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[5]1,2-Dibromoethane analyzed by EPA Method 8011.

[6]Total Xylenes.

J = estimated result; NE = not established; U = analyte was not detected above the reporting limit; µg/L = milligrams per Liter

NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level as discussed in Section 2.2.5.

Bold indicates that the analyte was detected above the laboratory reporting limit.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet.

When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Semi-volatile Organic Compounds (SVOCs) analzyed by EPA Method 8270D.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[5]Carcinogenic PAH (cPAH) toxic equivalency (TEQ) calculated using toxicity equivalency factors (TEF) from MTCA Table 708-2, based on methodology described in MTCA Cleanup Regulation WAC 173-340-708.

[6]Total value for naphthalene, 1-methylnaphthalene and 2-methylnaphthalene.

[7]1,4-Dioxane analyzed by EPA Method 8270SIM.

J = estimated result; R = rejected result; NE = not established; U = analyte was not detected above the reporting limit; µg/L = milligrams per Liter

NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level as discussed in Section 2.2.5.

Bold indicates that the analyte was detected above the laboratory reporting limit.

Bold and shading indicates analyte was detected above the applicable cleanup level.

Table 9

Groundwater Analytical Results - Pesticides[1]

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Practical Quantitation Limit (PQL) provided by TestAmerica Laboratories and submitted in the Quality Assurance Project Plan (QAPP). PQLs are when MTCA Method A or B, is less than the PQL, as stated in the QAPP.

[3]Dioxins/Furans analyzed by EPA Method 8290.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for dioxins/furans.

[5]Total Dioxins/Furans toxic equivalency (TEQ) calculated using toxicity equivalency factors (TEF) from MTCA Table 708-1, based on methodology described in MTCA Cleanup Regulation WAC 173-340-900.

J = estimated result; U = analyte was not detected above the reporting limit; pg/L = picograms per Liter

Bold indicates that the analyte was detected above the laboratory reporting limit.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. Values presented are the lowest MTCA Method B formula values (human health) and water quality criteria (aquatic life; WAC 173-201, national toxics rule and Clean Water Act). When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Diesel- and lube oil-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Dx. Gasoline-range petroleum hydrocarbons were analyzed using Northwest Method NWTPH-Gx.

[4]Total and dissolved metals analyzed using EPA Method 200.8

[5]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[6]Anions analyzed using EPA Method 300.0.

[7]Cations analyzed using EPA Method 350.1.

[8]Nitriles analyzed using EPA Method 335.4.

[9]Chemical Oxygen Demand analyzed using EPA Method 410.04, Total Organic Carbon analyzed using EPA Method 5310C, E. Coli and Total Coliform analyzed using EPA Method 9223B.

[10]PCBs analyzed using EPA Method 8082A.

[11]Total PCBs is the sum of all PCBs.

GC = general chemistry; J = estimated result; NE = not established; NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level; mg/L = milligrams per liter; MPN/100mL = most probable number of coliform per 100 milliliters; µg/L= micrograms per liter; U = analyte was not detected greater than the reporting limit.

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Bold and shading indicates analyte was detected greater than the applicable cleanup level.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. Values presented are the lowest MTCA Method B formula values (human health) and water quality criteria (aquatic life; WAC 173-201, national toxics rule and Clean Water Act). When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Semi-volatile Organic Compounds (SVOCs) analyzed using EPA Method 8270D.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[5]Carcinogenic PAH (cPAH) toxic equivalency (TEQ) calculated using toxicity equivalency factors (TEF) from MTCA Table 708-2, based on methodology described in MTCA Cleanup Regulation WAC 173-340-708.

[6]Total value for naphthalene, 1-methylnaphthalene and 2-methylnaphthalene.

NE = not established; U = analyte was not detected greater than the reporting limit; µg/L = milligrams per Liter

NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level as discussed in Section 2.2.5.

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. Values presented are the lowest MTCA Method B formula values (human health) and water quality criteria (aquatic life; WAC 173-201, national toxics rule and Clean Water Act). When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Organochlorine Pesticides were analyzed using EPA Method 8081B.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

[5]Organophosphorus Pesticides analyzed using EPA Method 8141B.

[6]Chlorinated Herbicides analyzed using EPA Method 8151A.

NE = not established; U = analyte was not detected greater than the reporting limit; µg/L = micrograms per Liter

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Practical Quantitation Limit (PQL) provided by TestAmerica Laboratories and submitted in the Quality Assurance Project Plan (QAPP). PQLs are used in place of MTCA Method B, as stated in the QAPP.

[3]Dioxins/Furans analyzed using EPA Method 8290.

[4]Total Dioxins/Furans toxic equivalency (TEQ) calculated using toxicity equivalency factors (TEF) from MTCA Table 708-1, based on methodology described in MTCA Cleanup Regulation WAC 173-340-900.

U = analyte was not detected greater than the reporting limit; pg/L = picograms per Liter

Notes:

[1]Samples analyzed by TestAmerica Laboratories.

[2]Model Toxics Control Act (MTCA) 2015 Sub-slab Soil Gas Screening Level Method B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet dated July 2015. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]Volatile organic compounds (VOCs) analyzed by EPA Air Method Toxic Organics - 15.

[4]The reporting limit exceeds the MTCA cleanup level for some or all samples analyzed for this compound.

J = estimated result; NE = not established; U = analyte was not detected greater than the reporting limit; mg/m^3 = milligram per cubic meter

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Bold and gray shading indicates analyte was detected above the selected cleanup level.

Table 17

Methane Screening Results

Marshall Landfill Site

Spokane County, Washington

Location	Methane Screening Results (percent)		
	August 2016	November 2016	March 2017
LFB-3	11.2	6.9	3.3
LFB-4	6.2	7.2	3
LFB-5	7.0	4.5	1.5
LFB-8	0.0	0.4	0.0
LFB-9	0.0	0.1	25.9
LFB-10	0.0	0.1	0.0
LFB-11	29.7	30.5	2
LFB-15	0.0	0.2	0.0
LFB-16	0.0	0.2	0.0
LFB-17	4.6	1.1	0.1

Notes:

Landfill gas measurements taken with a Landtec GEM 2000+ (carbon dioxide, oxygen and balance results also obtained).

Shading indicates methane concentration is greater than the lower explosive limit of 5 percent.

Table 19

Groundwater Elevation Summary

Marshall Landfill

Spokane County, Washington

Notes:

[1]Groundwater elevations are referenced to NAVD88 datum.

[2]Depth to groundwater in this column is referenced to the top of PVC well casing (bpvc).

[3]Depth to groundwater in this column is referenced to existing site grade (bg).

[4]Change in groundwater elevation referenced to previous measurement.

NA = not applicable; NM = not measured; ppm = parts per million

Table 21

Summary of Cleanup Levels

Marshall Landfill Site

Spokane County, Washington

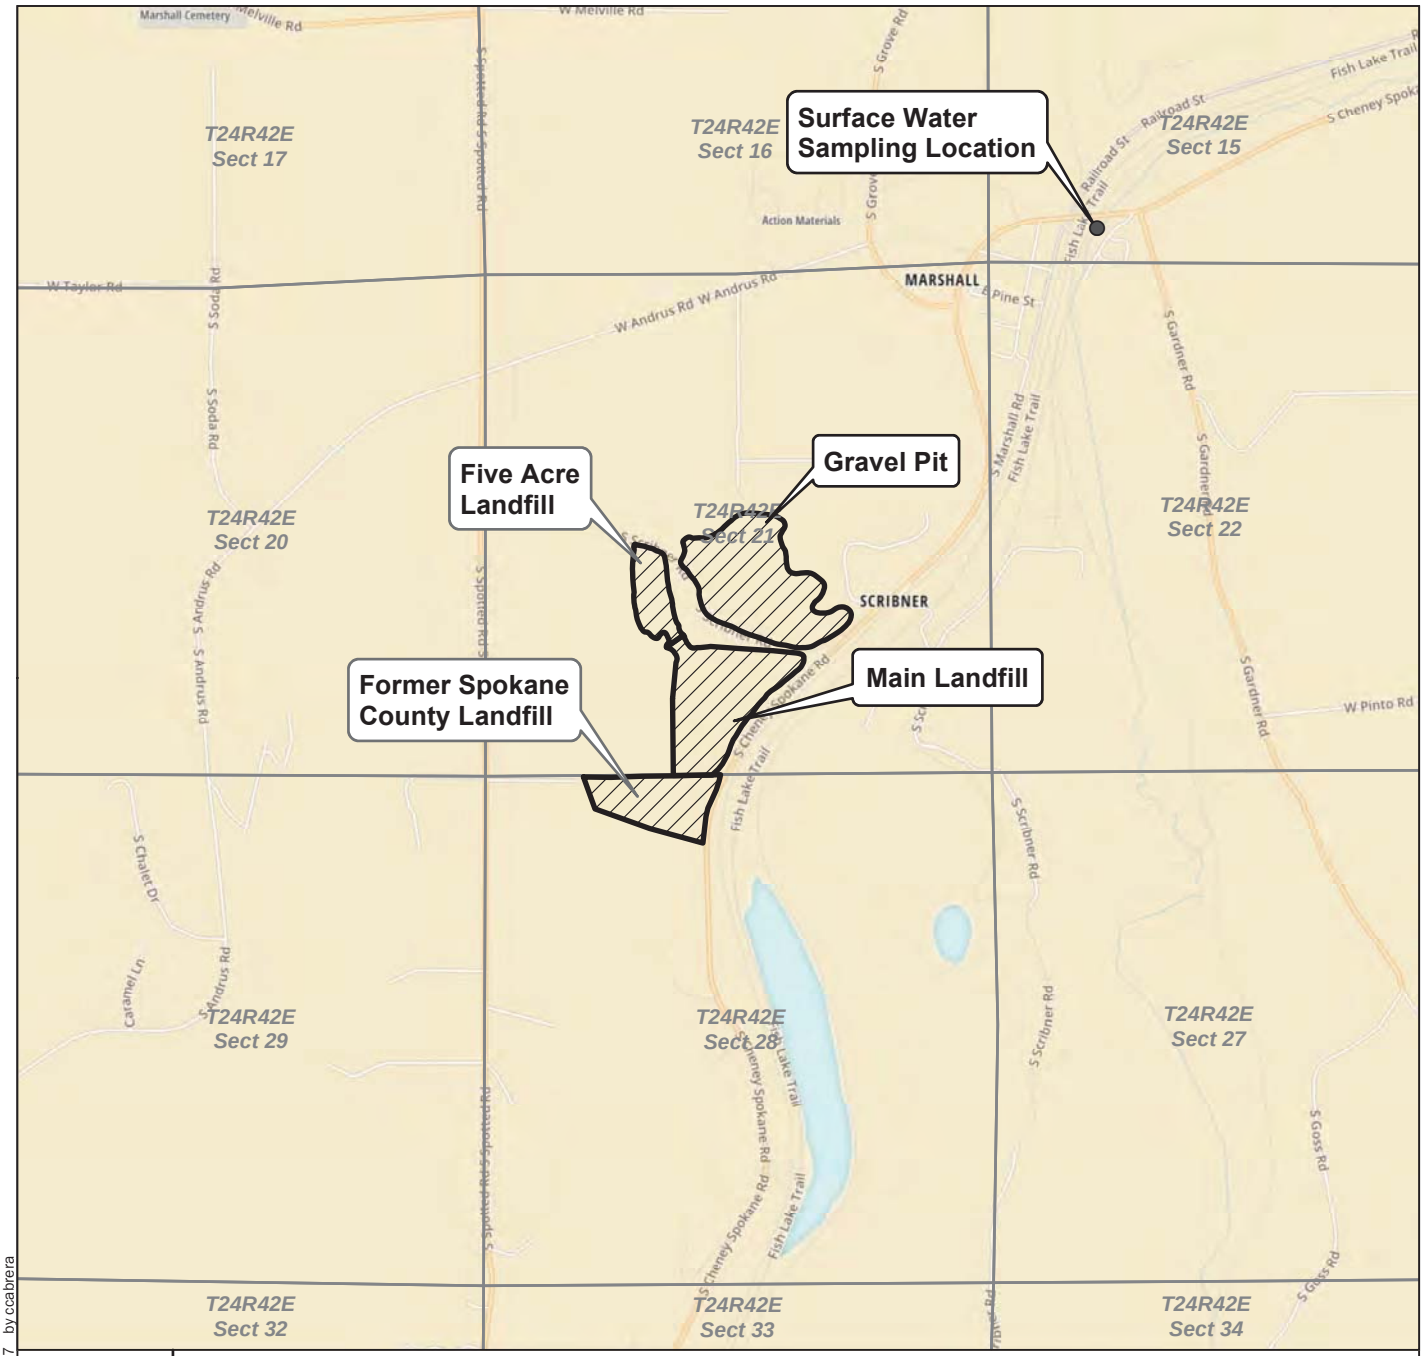
Analyte	Groundwater	Air	Basis for Cleanup Level
Groundwater			
2,6-dinitrotoluene	0.058 µg/L	na	Method B
Bis(2-ethylhexyl)phthalate	6.0 µg/L	na	MCL
Cadmium	5.0 µg/L	na	MCL
Cyanide	9.6 µg/L	na	Method B
Lead	15 µg/L	na	MCL
MCPA	8.0 µg/L	na	Method B
MCPP	16 µg/L	na	Method B
Nitrate	10,000 µg/L	na	MCL
Air			
1,2-dichloroethane	na	0.096 $\mu g/m^3$	Method B
1,2,4-trimethylbenzene	na	3.2 $\mu g/m^3$	Method B
1,3-butadiene	na	0.083 $\mu g/m^3$	Method B
1,4-dichlorobenzene	na	0.23 $\mu g/m^3$	Method B
1,4-dioxane	na	0.5 $\mu g/m^3$	Method B
Benzene	na	0.32 $\mu g/m^3$	Method B
Benzyl chloride	na	0.051 $\mu g/m^3$	Method B
Chloroethane	na	4,570 $\mu g/m^3$	Method B
Naphthalene	na	0.074 $\mu g/m^3$	Method B
Trichloroethene	na	0.37 $\mu g/m^3$	Method B
Vinyl chloride	na	0.28 $\mu g/m^3$	Method B
Xylenes	na	46 $\mu g/m^3$	Method B
Landfill Gas			
Methane - onsite structures	na	1.25 percent	WAC 173-304-460
Methane - property boundary	na	5 percent	WAC 173-304-460
Methane - offsite structures	na	100 ppmv	WAC 173-304-460

Notes:

MCL = maximum contaminant level; obtained from CLARC Master Spreadsheet dated July 2015.

Method B = MTCA Method B drinking water or air cleanup levels; obtained from CLARC Master Spreadsheet dated July 2015.

na = compound is not an indicator hazardous substance for this medium, therefore, no cleanup level is needed.



ppmv = parts per million by volume

µg/L = microgram per liter

$\mu g/m^3$ = microgram per cubic meter

40'	#8			(40.0-41.0)Sample #8: Dusky yellow brown, moderately sorted, very coarse sand with scattered fine gravel. 10-15% fine to medium sand. Damp.	
45'	#9			(45.0-46.0) Sample #9: Dusky yellow brown, well sorted, subangular, coarse sand with 10% medium sand. No gravel. Sand consists mostly of basalt and quartz. Moist.	
50'	#10			(50.0-51.0) Sample #10: Dusky yellow brown, moderately sorted, coarse to very coarse sand and granules with trace of silt and fine to medium sand. Compositionally, sand is 60% basalt, 30% quartz, and 10% feldspar. Moist.	
55'	#11			(55.0-56.0) Sample #11: Dusky yellow brown, well sorted, coarse to very coarse subangular sand. 50% basalt, 45% quartz, and 5% feldspar. Trace of fine sand and scattered granules. Moist.

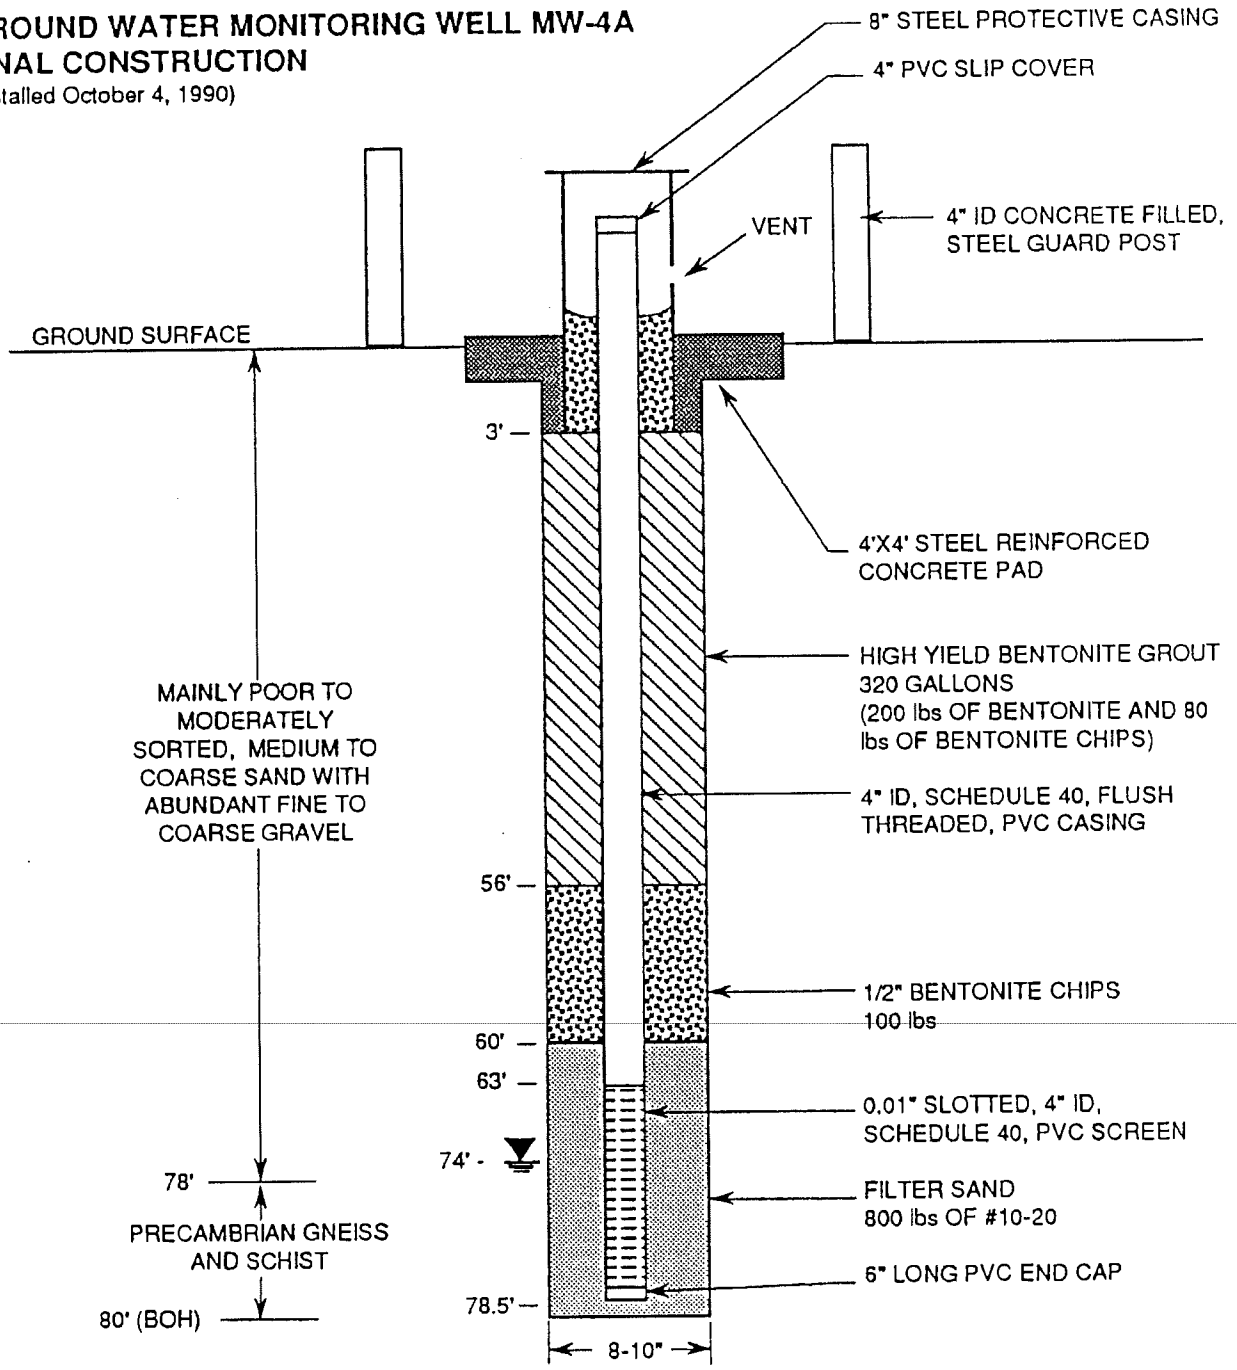
BORING LOG

PAGE 3 OF 3
BORING NO.: MW -4A
PROJECT : MARSHALL LANDFILL
PROJECT CODE: MARSH 04
LOCATION : 150' WEST OF CHENEY SPOKANE ROAD AND APPROXIMATELY 600' SOUTH OF MAIN LANDFILL

DATE COMPLETED : 10/4/90
TOTAL DEPTH : 80'
SURFACE ELEVATION : 2150'
DRILLING METHOD : 7 7/8" AIR ROTARY
DRILLED BY : BARTHOLOMEW BROTHERS DRILLING
LOGGED BY : PETE ZAGAR / CHARLES SCHWARZ



DEPTH	SAMPLE NUMBER/ LOCATION	PENE-TRATION BLOW COUNTS	LITHOLOGY	LITHOLOGIC DESCRIPTION	AS BUILTS
60'	#12			(60.0-61.0) Sample #12: Moderate to well sorted subangular sandy fine gravel. Contains 20-30% very coarse sand and granules. Gravel fragments are primarily basaltic in composition. Very moist.	
65'	#13			(65.0-66.0)Sample #13: Moderately sorted, subangular, coarse to very coarse sand with scattered granules and trace of fine sands. 60% basalt, 35% quartz, and 5% feldspar. Moist.	
70'	#14			(70.0-71.0)Sample #14: Moderately sorted, subangular, coarse to very coarse sand with abundant fine gravel. Gravel consists mostly of angular quartz and feldspar fragments.	
75'	#15			(75.0-76.0) Sample #15: Continue same as above.	
			78.0		
80'	#16		80.0	(79.0-80.0) Sample #16: Metamorphic bedrock, very hard . Cuttings consist of large (1cm), broken quartz and feldspar crystals and finely crystalline muscovite. 80.0	
85'				Bottom of hole.	
90'					

NOTES

Depth to water measured on 10/25/90 - 74.5' below ground surface. Pulled 8" conductor casing on 10/4/90 and installed 4" PVC monitoring well.

RUSS FETROW ENGINEERING, INC.
2535 B PRAIRIE ROAD
EUGENE, OREGON 97402

NOTES

Installed 4" PVC monitoring well on 3/8/91. Pulled 8" conductor casing. Depth to water measured on 4/8/91- 113' below ground surface. Testing indicates that well is capable of producing 1gpm.

GROUND WATER MONITORING WELL MW-12A
FINAL CONSTRUCTION
(Installed March 8, 1991)

ELEVATIONS:

GROUND SURFACE = 2340'
TOP OF PVC CASING = 2342.05'
WATER SURFACE = 2227.10' (4/8/91)

Notes:

[1] Groundwater elevations are referenced to NAVD88 datum.

[2] The reference elevations for the historic depth to groundwater measurements are assumed to be the top of polyvinyl (PVC) well casing, as surveyed on December 9, 2016.

[3] Monitoring wells MW-6, MW-7A, and MW-7C were not available for the December 9, 2016 survey. The provided elevations are from Fetrow (1991). Examination of the Fetrow (1991) survey indicates the datum was the National Geodetic Vertical Datum of 1929 (NGVD 29). 3.80 feet was added to correct to NAVD 88.

Historical Analytical Results Tables Notes

Marshall Landfill

Spokane County, Washington

Notes:

[1]Location of analyses is unknown.

[2]Current Model Toxics Control Act (MTCA) Method A and B cleanup levels. Method B cleanup levels are referenced from Ecology's CLARC Master Spreadsheet. When compounds have multiple cleanup levels referenced in CLARC (carcinogenic and non-carcinogenic), the most conservative value is displayed.

[3]General Chemistry analyzed by Enironmental Protection Agency (EPA) methods 300.0, 335.2, 335.3, 350.1, 350.2, 350.3, 354.1, 410.4, 415.1 and UNKNOWN.

[4]Metals analyzed by EPA Methods 200.7, 204.2, 206.2, 239.2, 245.1, 270.2, 279.2, 6010, 6010B, 6010C, 6020, 7061, 7470, 7741 and UNKNOWN.

[5]Organochlorine Pesticides analyzed by EPA Method 8080.

[6]Polychlorinated biphenyls analyzed by EPA Methods 8080, 8082 and UNKNOWN.

[7]Semi-volatile organic compounds analyzed by EPA Method 8270C and UNKNOWN.

[8]Volatile organic compounds analyzed by EPA Methods 8010, 8240, 8260, 8260B, 8270C and UNKNOWN.

-- = not tested

J = estimated result

NE = not established

NL = indicates that a value (Method A or Method B) is available, but was not selected as the project cleanup level

mg/L = milligrams per liter

Deg C = degrees celcius

mg/L as N = milligrams per liter as nitrogen

SU = standard unit; umhos/cm = micromhos per centimeter

U = analyte was not detected above the reporting limit

µg/L= micrograms per liter

PCBs = polychlorinated biphenyls

SVOCs = semi-volatile organic compounds

VOCs = volatile organic compounds

Bold indicates that the analyte was detected greater than the laboratory reporting limit.

Bold and shading indicates analyte was detected greater than the applicable cleanup level.

Blue shading indicates the reporting limit for this specific compound is greater than the applicable cleanup level.

APPENDIX D
Potential Receptor Evaluation

APPENDIX D
POTENTIAL RECEPTOR EVALUATION

INTRODUCTION

Marshall Landfill (herein designated the Site) is situated northwest of Cheney-Spokane Road about one mile southwest of the town of Marshall, Washington and seven miles southwest of the city of Spokane, Washington. The Site is located within portions of Sections 21 and 28 of Township 24 North, Range 42 East, approximately shown in the Vicinity Map, Figure D-1. The Site is bounded on the east by South Cheney-Spokane Road, on the south by a former landfill property owned by Spokane County, and on the west and north by vacant land. The general Site layout, and the locations of monitoring wells described in this report, are presented in the Site Plan and Groundwater Monitoring Well Map, Figure D-2.

The objective of this potential receptor evaluation is to identify receptors (people and sensitive ecological receptors) that could possibly come into contact with site-related contamination. This potential receptor evaluation contains four primary components, including:

- An evaluation of potential exposure pathways and receptors.
- Discussion of land use within and immediately surrounding the Site.
- Identification of sensitive ecological receptors.
- Discussion of potential users of water in proximity to the Site.

POTENTIAL EXPOSURE PATHWAYS AND RECEPTORS

Conceptual Site Model

GeoEngineers prepared a conceptual site model (CSM) to describe surface and subsurface site conditions, define the nature and extent of known contamination, and to identify potential exposure pathways to Site contaminants of concern and potential receptors. The CSM is graphically depicted in Conceptual Site Model, Figure D-3, and expanded upon in the below discussion.

Potential Contaminant Sources

Exposure Pathways

The source of contamination at the Site is the landfilled waste. Potentially complete exposure pathways, including release mechanisms, exposure points, and exposure routes for contamination contained within the landfill generally are:

- Direct contact with soil impacted by waste and/or leachate from the landfill (dermal contact and inhalation/incidental ingestion of dust and contaminants).
- Inhalation of landfill gases emanating from the landfill.
- Direct contact and/or ingestion of groundwater and/or surface water impacted by leachate from the landfill.

Exposed Landfill Waste

The Site consists of two waste disposal areas: the approximate 25-acre "Main Landfill," which operated from 1970 through 1990, and an approximate 5-acre area known as the "Five-Acre Landfill," which operated from 1980 through 1984. Both the Five-Acre and the Main Landfills currently have earthen covers: the Five-Acre Landfill has a clay (loess) cap and the Main Landfill has a fine to medium sand cover. However, landfill waste is exposed in portions of the Main Landfill cover. Also, the as-built thickness of the clay cap on the Five-Acre Landfill appears to be discontinuous and waste is variably exposed at surface. Both conditions allow for potential direct contact with wastes contained in the landfill areas. Potential exposure pathways include dermal contact, inhalation of dusts and vapors, and ingestion of dust.

Landfill Gas

Landfill gas consists of volatile organic compound (VOC) vapors from industrial and other waste disposed in the landfills and methane generated from bacterial decomposition of landfilled wastes. Landfill gas migration from the Five-Acre Landfill to ambient air is likely minimal because the competent portions of the clay cap limit this exposure pathway.

The Main Landfill is capped with a relatively high-permeability fine to medium-grained sand cover that minimally restricts vapor migration from the landfill area, allowing landfill gas to migrate to ambient air.

A primarily concern associated with VOC and methane landfill gas concentrations is the potential for vapor intrusion into overlying or nearby buildings. Buildings are not present on either landfill and are not expected to be constructed on either landfill in the future. The only buildings near either landfill that may be subject to vapor intrusion are the Action Materials' buildings between the gravel pit and the Main Landfill.

Leachate

Leachate consists of liquid wastes directly disposed into the landfills and precipitation infiltration through the landfills that extracts solutes as it contacts solid and liquid wastes. Observations of the clay cap over the Five-Acre Landfill during recent Site visits indicate that the cap is not intact over the entire area of the landfill and some waste is exposed. Precipitation likely infiltrates through the cover and into the landfilled waste at these exposed points as well as through vegetation penetrations and animal burrows. Precipitation over the Five-Acre Landfill that does not infiltrate likely evapotranspirates or forms surface water runoff.

Infiltration through the Main Landfill is only minimally restricted by the permeable sand cover and will continue to generate leachate as precipitation migrates through the cover, the landfill, and eventually to groundwater. Contaminants in the leachate will sorb onto unsaturated soil in the migration path, leaving a zone of residual contamination. Closer to the smear zone of water table fluctuation, the residual contamination will be periodically flushed into groundwater continuing a cycle of continuous groundwater contamination.

Potential exposure locations for leachate-impacted groundwater include drinking water wells and downgradient surface water bodies hydraulically connected to groundwater. People are the most likely potential receptors of leachate-impacted groundwater through drinking water wells, although livestock and pets also could be potential receptors. Minnie Creek, located east of the Site across Cheney-Spokane Road, is the closest surface water body. Minnie Creek is an ephemeral stream and losing when flowing; therefore,

the potential for impact to Minnie Creek is minimal. Minnie Creek flows into Marshall Creek over half a mile down-gradient (northeast) of the Site.

Other Contaminant Sources

Spokane County operated a separate landfill on the adjacent property to the south of the Main Landfill. Reportedly the Spokane County Landfill was a "daily burn" landfill where waste was burned each day for disposal. Incomplete combustion (like burning waste at lower temperatures) generates carcinogenic polycyclic aromatic hydrocarbons (cPAH) and dioxins and furans as byproducts. There is a potential that buried waste and contaminants associated from daily burn activities (products of incomplete combustion) at the Spokane County Landfill have contaminated surrounding soil and/or groundwater beneath the Site.

LAND USE AND ACCESS

Based on the Generalized Zoning Map produced by Spokane County Building and Planning, the Marshall Landfill Site is in an area zoned as Rural Conservation (RCV). According to Spokane County Zoning Code (adopted 2004), the RCV zone applies to "environmentally sensitive areas, including critical areas and wildlife corridors." The RCV "encourages low-impact uses and utilizes rural clustering to protect sensitive areas and preserve open space." Other land uses in the Site vicinity include Rural Traditional (RT) and Mineral Lands (MZ or M). Rural Traditional zone "includes large-lot residential uses and resource-based industries, including ranching, farming and wood lot operations." Agricultural, residential and business uses are allowed, with some restrictions, in the Rural Conservation and Rural Traditional Zones. Mineral Lands zone "is provided to allow for the quarrying, blasting, reduction, processing and mining of minerals or materials;" commercial and residential uses are prohibited. The Mineral Lands zone applies to an area with gravel pits north of the City of Marshall, approximately three-quarters of a mile northeast of the Site.

The area north of the Main Landfill and east of the Five-Acre Landfill currently is a gravel pit operated by Action Materials. The property adjacent to the southern boundary of the Main Landfill was operated by Spokane County as a daily-burn landfill from the 1950s until 1970. The remaining land within a mile of the Site includes limited residential, several agricultural areas and open space.

The primary access to both the Action Materials facility and the Main and Five-Acre Landfills is a gravel roadway originating along the east portion of the Site at Cheney-Spokane Road. The gravel roadway travels through the Site and continues west, where it intersects South Spotted Road. Access to the gravel roadway is restricted by Action Materials through a gate located at Cheney-Spokane Road, which is closed and locked outside of Action Material's business hours. During business hours, the gate is left open.

Where the Site borders private property, it appears that the adjacent landowners have variably erected barb-wire fencing. However, there is no fencing system around the property that is designed to limit human and/or wildlife access. As such, the Site can be accessed by foot or by wildlife.

ECOLOGICAL RECEPTORS

According to the Washington Department of Fish and Wildlife (WDFW) Priority Habitats and Species (PHS) website (www.wdfw.wa.gov/conservation/phs/), there are no endangered, threatened, sensitive or candidate wildlife species identified in the Site vicinity. The PHS does indicate that the Site is in an area

used by the Rocky Mountain Elk (*Cervus ellaphus nelson*). However, multiple factors indicate that if the Rocky Mountain Elk were to use the Site, the amount of time on-site and subsequent exposure to landfill materials would be minimal. These factors include the size of the Site relative to the elk's home range (30 acres versus 2,500 to 10,000 acres), the disturbed nature of the Site, the presence of people nearby (residents, gravel pit, vehicle traffic, etc.) and the presence of superior habitats in the area, including the Turnbull National Wildlife Refuge and multiple conservation areas. In addition, the Washington Department of Natural Resources' Natural Heritage Program (www.dnr.wa.gov/natural-heritage-program) does not identify any endangered, threatened or sensitive plant species in Township 24N, Range 42E, Section 21, which includes the Marshall Landfill Site.

WATER USE

Water Rights

Surface water and groundwater use in Washington State is administered by the Washington State Department of Ecology (Ecology) through water right allocations. Ecology tabulates water rights within the state through their Water Resources Explorer database. On January 4, 2017, GeoEngineers conducted a search of the Water Resources Explorer database within a one-mile radius of the approximate center of the Main Landfill (herein termed the water resources inventory area). Search results are compiled in Table D-1.

The water rights inventory area contains totals of three surface water rights and 25 groundwater rights. Of these, 20 are water right claims, seven are water right certificates, and one is a water right change. The total annual water use claimed and/or allocated within the water rights inventory area is 722.72 acre-feet.

Water Wells

Water use within Washington State that is external to the water rights permitting system generally occurs through the Groundwater Permit Exemption (Chapter 90.44.050 of the Revised Code of Washington). The Groundwater Permit Exemption allows for uses of small groundwater quantities (generally less than 5,000 gallons per day) for specific uses. Within the area surrounding Marshall Landfill, this permit-exempt water use generally is for single-home domestic use through small-diameter water supply wells. Numerous single-home domestic wells are located in proximity to Marshall Landfill.

Water well construction within Washington State is reported to Ecology, who tabulate Water Well Reports (WWRs) within their Washington State Well Log Viewer database. GeoEngineers compiled WWRs from Ecology's Washington State Well Log Viewer database within the following Water Well Report inventory area:

- The southwest (SW) quarter of Section 15, Township (T) 24 North (N), Range (R) 42 East (E).
- The southeast (SE) and SW quarters of Section 16, T24N, R42E.
- The SE quarter of Section 17, T24N, R42E.
- The SE and northeast (NE) quarters of Section 20, T24N, R42E.
- Section 21, T24N, R42E.
- The SW and northwest (NW) quarters of Section 22, T24N, R42E.

- The NW quarter of Section 27, T24N, R42E.
- The NE and NW quarters of Section 28, T24N, R42E.
- The NE quarter of Section 29, T24N, R42E.

The boundaries of the Water Well Report inventory area are shown in Figure D-4, and search results are tabulated in Table D-2. We compiled a total of 168 WWRs, completed in the following hydrostratigraphic units:

- Six wells are completed within the glaciofluvial unit.
- 98 wells are completed within the Columbia River Basalt Group (CRBG) unit.
- 51 wells are completed within the basement rock unit.
- 11 wells are completed within both the CRBG and basement rock units.
- Two wells are completed within uncertain hydrostratigraphic units.

WWR's are provided in Attachment A. Approximate WWR locations are shown in Figure D-4. These locations are based on the location information provided in the WWRs, and should be considered approximate.

Notes:

[1]Water right data were obtained on January 4, 2017 from a database administered by the Washington State Department of Ecology (Ecology).

[2]Water right data were obtained for a search of the Ecology database for a one-mile radius of the approximate center of the Main Landfill at the Marshall Landfill site.

ID = Identification; ROE = Report of Examination; GPM = gallons per minute; CFS = cubic feet per second -- = not available; NE = northeast; SE = southeast; SW = southwest; NW = northwest; T = township; R = Range; S = section.

Table D-2

Water Well Report Summary [1]

Marshall Landfill

Spokane County, Washington

Water Well Designation [2]	Ecology Well ID	Owner	Well Address	Quarter-Quarter Section	Quarter Section	Township-Range-Section	Interpreted Hydrogeologic Unit	Well Diameter (inches)	Well Depth (feet bgs)	Screen/ Perforation Depth (feet bgs)	Open/Lined Borehole Depth (feet bgs)	Static Depth to Groundwater (feet bgs)	Date of Groundwater Measurement
WWR1	AKM029	Al Layton	9609 S. McKenzie Road	SE	SW	T24N-R42E-S15	CRBG	6	186	181 to 186	--	135	10/1/2004

Notes:

[1]Water Well Reports were obtained on January 4, 2017 from a database administered by the Washington State Department of Ecology.

[2]Water Well Designations were assigned by GeoEngineers as a basis for organizing the Water Well Reports. The Water Well Designations are specified at the tops of the Water Well Reports provided in Appendix A.

ID = Identification; -- = not available; bgs = below ground surface; N = north; E = east; NE = northeast; SE = southeast; SW = southwest; NW = northwest; T = township; R = Range; S = section; CRBG = Columbia River Basalt Group.

Figure D-2

Notes:
1. The subsurface conditions shown are based on interpolation between widely spaced explorations and should be considered approximate; actual subsurface conditions may vary from those shown.
2. This figure is for informational purposes only. It is intended to assist in the identification of features discussed in a related document. Data were compiled from sources as listed in this figure. The data sources do not guarantee these data are accurate or complete. There may have been updates to the data since the publication of this figure. This figure is a copy of a master document. The master hard copy is stored by GeoEngineers, Inc. and will serve as the official document of record.
3. This is a diagrammatic representation of subsurface conditions and potential exposure pathways for conceptual purposes. All elevations, locations, and dimensions shown are approximate.
4. Elevations refer to the North American Vertical Datum of 1988.

Construction/Decommission

☑ Construction

☐ Decommission *ORIGINAL INSTALLATION Notice of Intent Number* _____

Current

Notice of Intent No. WE02653

Unique Ecology Well ID Tag No. AKM029

Water Right Permit No. _____

Property Owner Name Al Layton

Well Street Address 9609 S. McKenzie Road

City Cheney **County** Spokane

Location SE 1/4-1/4 SW 1/4 Sec 15 Twn 24 R 42 EWM ☑ or WWM ☐ circle one

Lat/Long (s, t, r still REQUIRED) Lat Deg _____ Lat Min/Sec _____ Long Deg _____ Long Min/Sec _____

Tax Parcel No. _____

PROPOSED USE: ☑ Domestic ☐ Industrial ☐ Municipal ☐ DeWater ☐ Irrigation ☐ Test Well ☐ Other _____

TYPE OF WORK: Owner's number of well (if more than one) 2

☑ New well ☐ Reconditioned *Method:* ☐ Dug ☐ Bored ☐ Driven ☐ Deepened ☐ Cable ☑ Rotary ☐ Jetted

DIMENSIONS: Diameter of well 6 inches, drilled 186 ft. Depth of completed well 186 ft.

CONSTRUCTION DETAILS

Casing Installed: ☑ Welded 6 " Diam. from +1 ft. to 179 ft. ☐ Liner installed " Diam. from ft. to ft. ☐ Threaded " Diam. from ft. to ft.

Perforations: ☐ Yes ☑ No

Type of perforator used _____

SIZE of perfs in. by m. and no. of perfs from ft. to ft.

Screens: ☑ Yes ☐ No ☑ K-Pac Location 174 feet

Manufacturer's Name Johnson

Type Stainless Steel - Telescoping Model No. _____

Diam. 6" Slot size 15 from 181 ft. to 186 ft.

Diam. Slot size from ft. to ft.

Gravel/Filter packed: ☐ Yes ☑ No ☐ Size of gravel/sand _____

Materials placed from ft. to ft.

Surface Seal: ☑ Yes ☐ No To what depth? 18+ ft.

Material used in seal Baroid Bentonite

Did any strata contain unusable water? ☐ Yes ☑ No

Type of water? _____ Depth of strata _____

Method of sealing strata off _____

PUMP: Manufacturer's Name _____

Type: _____ H.P _____

WATER LEVELS: Land-surface elevation above mean sea level _____ ft.

Static level 135 ft. below top of well Date 10/01/04

Artesian pressure _____ lbs per square inch Date _____

Artesian water is controlled by _____ (cap, valve, etc.)

WELL TESTS: Drawdown is amount water level is lowered below static level

Was a pump test made? ☐ Yes ☑ No If yes, by whom? _____

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level

Date of test _____

Bailer test _____ gal./min. with _____ ft. drawdown after _____ hrs

Airtest 40 gal./min. with stem set at _____ ft. for _____ hrs

Artesian flow _____ g.p.m. Date _____

Temperature of water _____ Was a chemical analysis made? ☐ Yes ☑ No

CONSTRUCTION OR DECOMMISSION PROCEDURE

Formation: Describe by color, character, size of material and structure, and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of information indicate all water encountered. (USE ADDITIONAL SHEETS IF NECESSARY)

Construction/Decommission *("x" in circle)*

☒ Construction

☐ Decommission *ORIGINAL INSTALLATION*

Notice of Intent Number _____

PROPOSED USE: ☒ Domestic ☐ Industrial ☐ Municipal ☐ DeWater ☐ Irrigation ☐ Test Well ☐ Other _____

TYPE OF WORK: Owner's number of well (if more than one) 2

☒ New well ☐ Reconditioned *Method:* ☐ Dug ☐ Bored ☐ Driven ☐ Deepened ☐ Cable ☒ Rotary ☐ Jetted

DIMENSIONS: Diameter of well 6 inches, drilled 163 ft. Depth of completed well 163ft.

CONSTRUCTION DETAILS

Casing Installed: ☒ Welded 6" Diam. from +1 ft. to 19 ft. ☒ Liner installed 4" Diam. from 13 ft. to 163 ft. ☐ Threaded _____" Diam. From _____ ft. to _____ ft.

Perforations: ☒ Yes ☐ No

Type of perforator used bit

SIZE of perfs 3/8in. by _____ in. and no. of perfs _____ from 113ft. to 163ft.

Screens: ☐ Yes ☒ No ☐ K-Pac Location _____

Manufacturer's Name _____

Type _____ Model No. _____

Diam. _____ Slot size _____ from _____ ft. to _____ ft.

Diam. _____ Slot size _____ from _____ ft. to _____ ft.

Gravel/Filter packed: ☐ Yes ☒ No Size of gravel/sand _____

Materials placed from _____ ft. to _____ ft.

Surface Seal: ☒ Yes ☐ No To what depth? 18+ft.

Material used in seal Baroid Bentonite

Did any strata contain unusable water? ☐ Yes ☒ No

Type of water? _____ Depth of strata _____

Method of sealing strata off _____

PUMP: Manufacturer's Name _____

Type: _____ H.P. _____

WATER LEVELS: Land-surface elevation above mean sea level _____ ft.

Static level 100ft. below top of well Date 5/22/07

Artesian pressure _____ lbs. per square inch Date _____

Artesian water is controlled by _____ (cap, valve, etc.)

WELL TESTS: Drawdown is amount water level is lowered below static level

Was a pump test made? ☐ Yes ☒ No If yes, by whom? _____

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level

Date of test _____

Bailer test _____ gal./min. with _____ ft. drawdown after _____ hrs.

Airtest 3.5 gal./min. with stem set at _____ ft. for _____ hrs.

Artesian flow _____ g.p.m. Date _____

Temperature of water _____ Was a chemical analysis made? ☐ Yes ☒ No

APPENDIX E
Field Methods and Explorations

APPENDIX E
FIELD METHODS AND EXPLORATIONS

Explorations

Explorations associated with GeoEngineers' Remedial Investigation (RI) include the following:

- Six new groundwater monitoring wells (designated MW-7D, MW-14, MW-15, MW-15A, MW-16 and MW-16A). Groundwater monitoring well locations are shown in Figure 2.
- 33 landfill borings (designated LFB-1 through LFB-6, LFB-6A, LFB-7, LFB-7A, LFB-8 through LFB-17, MW-13, SB-1 through SB-3, SB-3A, SB-4 through SB-7, and SB-9 through SB-13). Ten of the landfill borings were completed as landfill gas monitoring wells (LFB-3 through LFB-5, LFB-8 through LFB-11, and LFB-15 through LFB-17. Landfill boring locations associated with the Main Landfill are presented in Figure 6. Landfill boring locations associated with the Five-Acre Landfill are presented in Figure 7.
- 71 test pits (designated TP-1, TP-2, TP-3E, TP-3W, TP-4, TP-5A, TP-5B, TP-6, TP-7, TP-8, TP-9A, TP-9B, TP-10A, TP-10B, TP-11A, TP-11B, TP-12A, TP-12B, TP-13, TP-14, TP-15A, TP-15B, TP-F-1N, TP-F-1S, TP-F-2N, TP-F-2S, TP-F-3N, TP-F-3S, TP-F-4A, TP-F-4B, TP-F-4C, TP-F-5A, TP-F-5B, TP-F-6, TP-F-7A, TP-F-7B, TP-F-7C, TP-F-7D, TP-F-8A, TP-F-8B, TP-F-9, TP-F-10, TP-F-11A, TP-F-11B, TP-F-11C, TP-F-11D, TP-F-12A, TP-F-12B, TP-F-13A, TP-F-13B, TP-F-14A, TP-F-14B, TP-F-15A, TP-F-15B, TP-F-16A, TP-F-16B, TP-FE-1, TP-FE-2, TP-FE-3, TP-F-TOP1, TP-F-TOP2, TP-M-1A, TP-M-1B, TP-M-2, TP-M-3, TP-M-4A, TP-M-4B, TP-M-5, TP-M-6, TP-Test-1 and TP-Test-2). Test pit locations are shown in Figures 6 and 7.

We classified soil encountered in project explorations in general accordance with the Unified Soil Classification System described in Figure E-1. The exploration logs for the monitoring wells, borings and test pits listed above are provided in Figures E-2 through E-111.

Soil Sampling Procedures

General

Samples were obtained using disposable nitrile gloves, which were discarded after each use. Samples were placed in laboratory-supplied sample containers.

Sample containers were filled to minimize headspace and labeled with a unique identification. Samples analyzed for volatile organic compounds (VOCs) were obtained using Environmental Protection Agency (EPA) Method 5035 sampling procedures. Samples were temporarily stored in an iced cooler before transfer to TestAmerica's laboratory in Spokane Valley, Washington for analysis. Chain-of-custody protocols were followed.

Drilled Samples

Soil borings and monitoring wells were completed by GeoEngineers' drilling subcontractor using air rotary, sonic, hollow-stem auger, or direct-push drilling methods. Drilling and well installation activities were continuously monitored by a geologist or engineer from our firm who collected, examined, and classified representative soil samples and maintained a detailed log of the explorations. During drilling, soil samples were collected at a variable interval using methods consistent with the respective drilling method.

Test Pit Samples

Samples collected via a backhoe were obtained from the middle of the bucket (not touching the bucket sides) using new nitrile gloves.

Field Screening

Soil

Field screening tasks were performed during Site exploration activities to evaluate the presence of contaminants in soil. Soils were field screened during drilling and test pit activities for evidence of petroleum or VOCs using a photoionization detector (PID). Soils and waste materials encountered during installation of test pits, landfill gas borings, landfill gas and groundwater monitoring wells were field-screened for the presence/absence of landfill gas and VOCs.

Initial screening was based on visual examination; if warranted, water sheen screening and headspace vapor screening using a PID also was conducted. Visual screening consisted of inspecting the soil for discoloration indicative of the presence of petroleum material in the sample. Water sheen screening was conducted by placing soil in water and observing the water surface for signs of sheen. Sheen classifications are as follows:

No Sheen	No visible sheen on the water surface;
Slight Sheen	Light, colorless, dull sheen; spread is irregular, not rapid; sheen dissipates rapidly. Natural organic matter in the soil might produce a slight sheen;
Moderate Sheen	Light to heavy sheen; might have some color/iridescence; spread is irregular to flowing, may be rapid; few remaining areas of no sheen on water surface; and
Heavy Sheen	Heavy sheen with color/iridescence; spread is rapid; entire water surface might be covered with sheen.

Headspace vapor screening was conducted by the following procedure. The soil sample is placed in a plastic bag. Air is captured in the sealed bag, and the bag is shaken to expose the soil to the air trapped in the bag. The probe of a PID is inserted into the bag, and the PID measures VOC vapor concentrations in parts per million (ppm). The PID is calibrated to isobutylene. The PID is designed to quantify VOC vapor concentrations in the range between 1 ppm and 2,000 ppm with an accuracy of 10 percent of the reading, and between 2,000 ppm and 10,000 ppm with an accuracy of 20 percent of the reading.

Landfill Gas

Landfill gas was screened in the field using a handheld GEM 2000+ meter or equivalent, capable of measuring concentrations of methane, carbon dioxide, oxygen and hydrogen sulfide. Readings were collected upon parameter stabilization, if possible. Multiple readings were recorded if relative stabilization did not occur.

Well Construction and Development

GeoEngineers installed landfill gas monitoring wells and groundwater monitoring wells during this supplemental RI investigation.

- Landfill gas monitoring wells were constructed using approximate 1-inch-diameter Schedule 80 PVC casing and well screen material. Well screen slot size was about 0.010 inches.
- Groundwater monitoring wells were constructed using approximate 2-inch-diameter Schedule 80 PVC casing and well screen material.

For both well types, screen slot size was 0.010 inches. Processed 10-20 Colorado silica sand was used as filter pack. Bentonite seal material was installed above filter pack as impermeable backfill. At the ground surface, the wells are protected by steel flush-mount monuments.

After installation, groundwater monitoring wells were developed by a combination of pumping and surging until purge water was relatively clear and free of suspended sediment.

Groundwater Monitoring

General

GeoEngineers collected groundwater samples from project monitoring wells during three groundwater monitoring events, conducted during August 2016, November 2016 and February 2017. Sampling methods generally were performed in compliance with the project Work Plan (GeoEngineers 2015).

Monitoring Headspace Vapor Measurements

Headspace vapor measurement involved placing the tip of the PID into the headspace of the monitoring well and covering the top of the monitoring well to prevent the exchange of ambient air with air in the monitoring well. Headspace vapor measurements targeted volatile petroleum hydrocarbon compounds. In this application, the PID measured concentration of organic vapors ionizable by a 10.6 electron volt (ev) lamp in the range between 1.0 and 2,000 ppm, with a resolution of +/- 2 ppm.

Groundwater Elevations

Depths to groundwater were measured relative to the monitoring well casing rim using an electric water level indicator. The probe of the water level indicator was decontaminated between wells using a detergent wash, followed by two distilled water rinses.

Low-Flow Sampling Procedures

Groundwater sampling generally was performed consistent with the EPA's low-flow groundwater sampling procedure, as described by EPA (1996) and Puls and Barcelona (1996). Monitoring well purging and sampling activities were accomplished using a QED Environmental Systems Sample Pro portable bladder pump with disposable bladders. During purging activities, water quality parameters, including pH, conductivity, temperature, turbidity, oxidation-reduction potential and dissolved oxygen, were measured using an In-Situ Troll 9500 multi-parameter meter equipped with a flow-through cell; measurements were recorded approximately every three minutes. The meter calibration was verified at the beginning of each work day consistent with manufacturer recommendations prior to purging and sampling activities.

Groundwater samples were collected after (1) water quality parameters had stabilized; or (2) a maximum purge time of 30 minutes was achieved. During purging and sampling, purge rate was not allowed to exceed 500 milliliters per minute. Water quality parameter stabilization criteria include the following:

- Turbidity: ±10 percent or ±10 nephelometric turbidity units (NTU);
- Dissolved oxygen: ±10 percent;
- Conductivity: ±3 percent;
- pH: ±0.1 unit;
- Temperature: ±3 percent; and
- Oxidation reduction potential: ±10 percent or ±10 millivolts (mV).

After groundwater quality stabilization criteria were reached, the pump's discharge tubing was disconnected from the flow-through cell and groundwater samples were collected for analysis.

Each sample was pumped directly into sample containers supplied by the laboratory. Groundwater samples collected for chemical analysis were kept cool during on-Site storage and transport to the laboratory. Chain-of-custody procedures were observed during transport of the groundwater samples.

Surface Water Sampling

Surface water samples were collected from one location on Marshall Creek. The surface water sampling location is shown in Figure 1. Samples were collected by direct filling of laboratory-supplied containers. Surface water samples collected for chemical analysis were kept cool during on-Site storage and transport to the laboratory. Chain-of-custody procedures were observed during transport of surface water samples.

Landfill Gas Monitoring

Landfill Gas Sampling

Landfill gas samples were collected at each location using the following protocol:

- The landfill gas meter was connected to the petcock on the landfill gas monitoring well. The petcock was opened to obtain a measurement of the static pressure in the gas probe. The barometric pressure measured by the gas meter also was recorded.
- The gas meter pump was turned on to evacuate the gas probe and allow measurement of methane, hydrogen sulfide, oxygen, carbon monoxide and carbon dioxide. A PID also was connected to the sample train to collect field readings for VOCs. Readings were recorded in the field notes. After the readings stabilized, the lab petcock on the gas probe was closed.
- A landfill gas sample was collected using a one-liter Summa® canister set to a flow rate of less than or equal to approximately 200 milliliters per minute. The canister was connected to the petcock on the landfill gas monitoring well such that connections are air tight. The petcock was opened, and the canister filled with landfill gas for approximately 5 minutes or until the vacuum remaining in the canister was approximately 5 inches of mercury. The initial and final canister vacuum were recorded.

Landfill Gas Pressure Monitoring

GeoEngineers retrofit ten landfill gas monitoring wells (LFB-3 through LFB-5, LFB-8 through LFB-11, and LFB-15 through LFB-17) for measurement of intra-well pressure using sealed well caps and valving for pressure gage installation. During the December 2017 monitoring event, we measured stabilized landfill

gas pressure at each well location and recorded those data in our daily field logs. Pressure was measured using Dwyer Instruments Magnehelic pressure gauges (pressure range of 0.01 to 100 inches of water).

Decontamination Procedures

The objective of our decontamination procedures was to minimize the potential for cross contamination between exploration locations and between individual samples within a specific exploration. A designated decontamination area was established for decontamination of drilling equipment and reusable sampling equipment. Drilling equipment was cleaned using pressure washing equipment.

Sampling or measurement equipment was decontaminated in accordance with the following procedures before each sampling attempt or measurement:

- Brush equipment with a wire brush, if necessary, to remove large particulate matter.
- Rinse with potable tap water.
- Wash with non-phosphate detergent solution (LiquiNox® and potable tap water).
- Rinse with potable tap water.
- Rinse with distilled water.

Handling of Investigation-Derived Waste (IDW)

IDW, which consisted primarily of drill cuttings and decontamination/purge water, was placed in Washington State Department of Transportation (DOT)-approved 55-gallon drums or roll-off boxes (soil) and poly tanks (water). Each drum was labeled with the project name, general contents, date and source location (boring number) of contents. The drummed IDW was stored on-Site pending analysis and disposal.

Disposable items, such as sample tubing, direct-push sampler acrylic sleeves, gloves and paper towels, etc., were placed in plastic bags after use and deposited in trash receptacles for disposal.

SOIL CLASSIFICATION CHART

SS	Slight Sheen
MS	Moderate Sheen
HS	Heavy Sheen
NT	Not Tested

NOTE: The reader must refer to the discussion in the report text and the logs of explorations for a proper understanding of subsurface conditions. Descriptions on the logs apply only at the specific exploration locations and at the time the explorations were made; they are not warranted to be representative of subsurface conditions at other locations or times.

No caving observed
MSW = municipal solid waste

Notes: See Figure E-1 for explanation of symbols.
The depths on the test pit logs are based on an average of measurements across the test pit and should be considered accurate to ½ foot.
