Attention: William Brown

SUBJECT: REPORT FOR REMOVAL OF DIESEL CONTAMINATED SOIL

LOCATED ADJACENT TO A 10,000 GALLON UST ON THE BON

MARCHE SITE, TUKWILA, WA.

Dear Mr. Brown,

Enclosed, please find three copies of the Diesel Contaminated Soil Removal Report as required by the Washington State Department of Ecology (WSDOE). Based on the data and findings reported herein, we find no evidence of diesel contaminated soil remaining in the vicinity of the UST which exceeds Method A Soil Cleanup Levels, as established by the Model Toxics Control Act, Chapter 173-340 WAC. Contaminated soil generated during the cleanup process may be treated by a variety of methods. The WSDOE requires that you retain this report for a minimum of ten years. We recommend you retain it indefinitely.

Contaminated groundwater identified during the in-place closure site assessment for the existing 10,000 gallon UST, was not removed or treated during this contaminated soil removal action.

We appreciate the opportunity to provide you technical assistance for your tank closure. Please call us at (509) 882-1144 if you have any questions or comments.

Respectfully Yours, WHITE SHIELD.

David L. Green

Geologist

Project Number: TLI-0292

cc:

Department of Ecology, Olympia Headquarters

The Bon Marche, Tukwila, WA

Executive Summary

White Shield, Inc. (WSI) provided field screening services and technical direction for removal of diesel contaminated soil at The Bon Marche, Tukwila, WA. We conducted our field investigation on March 6, 1992. Approximately 40 cubic yards of diesel contaminated soil was removed from the east end of the tank. The contaminated soil was placed upon a plastic liner and a dike was constructed around the perimeter of the stockpile. The soil was spread to a thickness of approximately three (3) feet.

Based upon our visual observations, field screening, analytical laboratory analyses and olfactory responses, we find no evidence of diesel in the soil remaining at the east end of the tank, exceeding Method A Cleanup Levels, as established by the <u>Model Toxics Control Act, Chapter 173-340 WAC</u>, remaining in the tank excavation.

The Bon Marche, Tukwila, WA

1.0 Introduction

1.1 Purpose

This report describes findings and actions taken for work associated with the Underground Storage Tank (UST) closure. The work and investigation responds to regulatory requirements set forth by the United States Environmental Protection Agency (EPA) and the Washington State Department of Ecology (WSDOE).

1.2 Scope of Work

This report completes the field screening, soil sampling, analytical services and technical direction for diesel contaminated soil removal, provided by White Shield, Inc. (WSI). Tank Liners, Inc. provided the excavation services.

2.0 Background Information

2.1 Site Location

The site is located at 17000 South Center Parkway, Tukwila, WA. It is situated in the NE 1/4 of the NM 1/4 of Section 26, Township 23 North, Range 4 East, Willamette Meridian.

2.2 Site Description and History

Diesel contamination was discovered in the soil and groundwater during the closure site assessment for a 10,000 gallon UST during February, 1992. Findings of the closure site assessment are detailed in WSI's Interim Status Report dated February, 1992.

2.3 Soils Description

Our inspection of the soil found silty clay and fine to medium sand. The fill material around the tank consists of poorly sorted gravels up to two (2) inches in diameter.

Diesel Contaminated Soil Removal - March, 1992

3.0 Field Activities

3.1 General Investigative Methods

We visually inspected the soil and the fill. We also used Thin Layer Chromatography (TLC), analytical laboratory analyses and olfactory responses for data. The methods and general conclusions are discussed below.

3.2 Diesel Contaminated Soil Removal

Rodney Heit, an environmental technician registered with the WSDOE Underground Storage Tank Program, provided technical direction for diesel contaminated soil removal on March 6, 1992 during and after removal of the soil. Figure 1 provides a tank site map and other key data. WSI used TLC for field analysis results to provide technical direction for contaminated soil removal. Upon removal of the soil, WSI collected three (3) soil samples from the excavation and submitted them to Materials Testing and Consulting (MTC), Mt. Vernon, Washington, for laboratory analysis and found that petroleum hydrocarbon concentrations fall below Method A Soil Cleanup Levels. In fact, no petroleum hydrocarbons were detected in the laboratory analyses. These sample locations are shown on Figure 1 and the Sampling Log is provided as Appendix A. The laboratory analyses are attached as Appendix B. Based upon the laboratory analytical results, no additional soil removal is required.

WSI also collected three (3) soil samples from the contaminated soil stockpile as required by the WSDOE <u>Guidance for Remediation of Releases from Underground Storage Tanks</u>. These samples were also submitted to MTC for laboratory analysis. The analyses found:

- diesel in concentrations up to 3,673 parts per million (ppm) and
- xylenes in concentrations up to 20,300 parts per billion (ppb).

Stockpile sampling locations are shown on Figure 2. The laboratory analytical results are included as Appendix B.

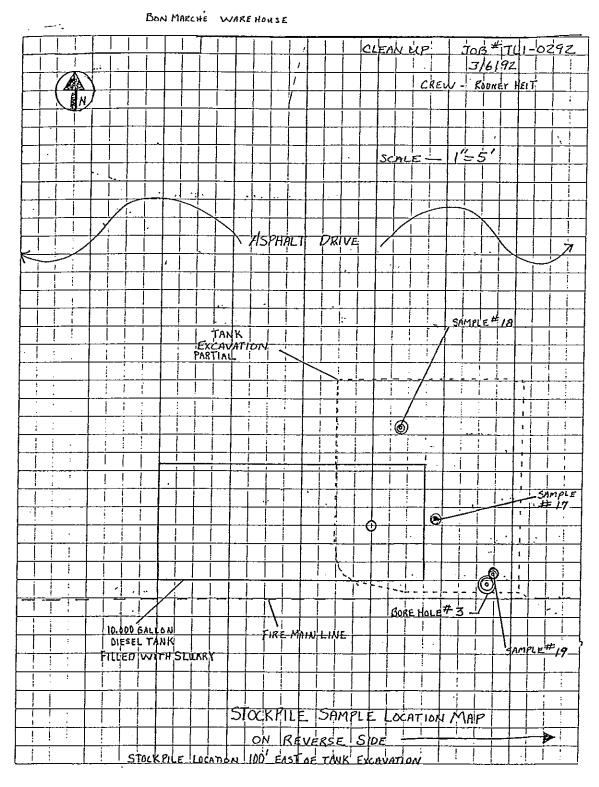

Figure 1. Sampling Locations for Contaminated Soil Removal

Diesel Contaminated Soil Removal - March, 1992

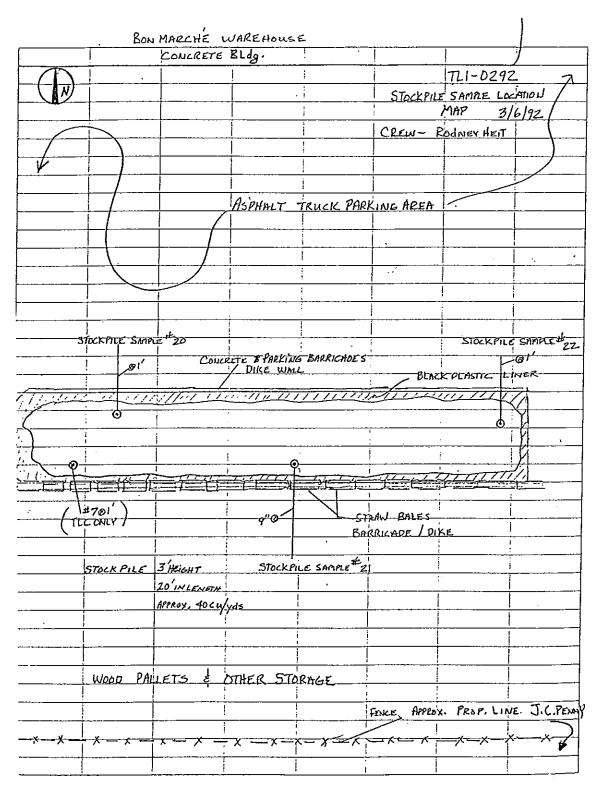

Figure 2. Sampling Locations for the Contaminated Stockpile

4.0 Investigative Methods and Results

4.1 Field Screening

For field analysis of semi-volatile (diesel) and non-volatile compounds (motor oil), we use Thin Layer Chromatography (TLC) for qualitative and quantitative analysis. This analytical technique utilizes the principle of chromatography to separate individual components for comparison to known standards.

TLC is classified as a solid-liquid chromatographic system, meaning there are two phases through which an extract of the sample is passed; a solid phase (silica gel) and a liquid phase (a solvent such as hexane).

The solid phase is stationary and is coated on a glass plate. During the chromatography process, the liquid phase carries the sample through the solid phase. The solvent moves at a fairly constant rate through the solid phase. However, the compound in the sample (analyte) are partitioned by a relative attractiveness of the analyte between the solid phase and the liquid phase. Analytes strongly attracted to the silica will remain on the silica longer and move more slowly than analytes that are not as strongly attracted to the silica. When the chromatography is stopped, the distance the analyte has moved relative to the distance the solvent has moved is used to identify the compound. When the plate is viewed under ultraviolet light, the analytes can be seen and compared to standards of known concentration for quantitative analysis.

4.2 Soil Sampling

The Field Sampling Log (Appendix A) presents the location, quantity and types of samples taken. In general, sample collection and control followed the following protocol:

- 1. Select a laboratory certified clean sample jar for sample collection.
- 2. Using clean latex gloves and clean sampling utensils (tri-sodium phosphate, chlorine solution, tap water rinse and distilled water rinse cycle) tightly pack the soil sample in the sample jar (4 oz.) to the top of the jar to prevent any airspace.

- 3. Label the jar with the soil sample number, the type of laboratory test required, the date, name of site and sampler. The sample is then entered on the chain of custody form.
- 4. Cool the sample in wet ice to approximately 4 degrees centigrade.
- 5. Repack the samples for shipment to the laboratory in blue ice and a cooler.
- 6. Relinquish sample to courier for shipment to the laboratory.

. .

5.0 Conclusion & Recommendations

5.1 Conclusion

Our investigation finds no petroleum hydrocarbons remaining in the soil at the east end of the tank. Based upon the laboratory analytical results, no additional soil removal is required.

5.2 Soil Treatment Options

A variety of soil treatment and/or disposal options are available. These options are as follows:

- soil bioremediation,
- soil venting,
- thermal desorption and
- landfilling.

6.0 Limitations

In performing our professional services, WSI uses a degree of care ordinarily exercised under similar circumstances by members of our profession. No warranty, expressed or implied, is made or intended. Our conclusions and recommendations, developed from our field and laboratory investigation reported herein, are based upon this firm's understanding of the tank removal project and are in concurrence with generally accepted practice.
