## EXECUTIVE SUMMARY

This report contains the results of the November 1992 geotechnical investigation of the Yakima R.R. area, Yakima, Washington. The purpose of this investigation was to identify additional potentially liable persons responsible for soil and ground water contamination throughout the Yakima R.R. area. Potentially liable persons (PLPs) are defined in Part V of the Washington Model Toxics Control Act (MTCA), WAC-173-340-500.

Twelve facilities within a 3.5 mile length of the Yakima R.R. corridor area were investigated. Ground water monitoring wells, ranging in depths from 25 ft. to 100 ft., were installed at six locations. Chlorinated hydrocarbons, ranging in concentration from less than 1 ppb to greater than 400 ppb were detected in the ground water at six locations. Chlorinated hydrocarbons and volatile organic compounds, ranging in concentration from 1 ppb to 8,100 ppb, were detected in soil at five locations.

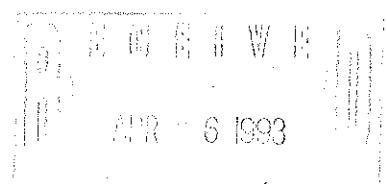

Alluvium, consisting of approximately 60% sand and 40% gravel and basalt clasts, was the dominant soil lithology encountered within the railroad study area. Ground water depths ranged from 4 - 28 ft. below ground surface and ground water flow rates for the railroad area are estimated to range from 6 to 12 ft/day (2,190 - 4,380 ft/yr). For the unconfined aquifer, the predominant flow direction from the railroad is approximately S 35° E towards the Yakima River.

The Yakima Railroad study area is located within the confines of a broad flat basin that has been cut by the Yakima River. Coarse gravelly soils are predominant from ground surface to depths of 500 ft. or more. Ground water is typically found at depths ranging from less than 10 ft. to greater than 20 ft. Ground water flow velocities within the alluvium range from less than a foot to nearly 100 feet per day (U.S.G.S.). Ground water flows downstream from the west side of the basin and discharges into the Yakima River. The ground water table typically rises several feet during the summer irrigation months and returns to previous levels during the winter months.

This investigation was paid for by the Washington State Department of Ecology, Toxics Cleanup Program. The total cost of this investigation was approximately \$35,000.

## Investigation of Potentially Liable Persons (PLPs) Yakima R.R. Area

### Purpose of the Investigation

This report contains the results of a November 1992 geotechnical investigation of the Yakima R.R. area, Yakima, Washington. The purpose of the investigation was to identify additional potentially liable persons responsible for ground water contamination throughout the Yakima R.R. area. Potentially liable persons (PLPs) are defined in Part V of the Washington Model Toxics Control Act (MTCA), WAC 173-340-500.

### Focus of this Investigation

This investigation focused on an 3.7 mile long area of Central Yakima known as the "Yakima R.R." (Figure 1, Yakima R.R. Facility Location Map). Ground water within this area has been contaminated with perchloroethylene or tetrachloroethylene, a chlorinated hydrocarbon compound. Twelve locations within the immediate vicinity of the Yakima R.R. corridor were investigated (see Figure 1). Eleven of the twelve locations have active business operations (Table 1, Facility Investigation List). The only location without an active business operation is Crest Linen site, at North 1st & B St.. This property is now a vacant lot. The City of Yakima has since acquired the Crest Linen property via tax reversion. One facility, Timpke Machine, was not investigated due to the close proximity of overhead powerlines (drilling rig could not be maneuvered into position to collect samples).

### Hydrogeologic Setting

The City of Yakima is located in a broad flat synclinal river basin between two prominent east-west trending basalt ridges to the north and south (see Figure 2, Yakima Map). The USGS has characterized this area as the Ahtanum-Moxee subbasin (Foxworthy, 1952, Figure 3, Ahtanum-Moxee Subbasin). Each basalt ridge is cut by the Yakima River, which enters from the north through Selah gap and exits to the south at Union Gap. Streams flow from the high basalt ridges into the basin and eventually join the Yakima River. The narrow gorge at Union Gap is also the apex of funnel-like surface water flow from the west half of the basin. The flow velocity of the Yakima River nearly doubles through the basin due to the amount of ground water discharge, which has been estimated at 9,000 acre-feet/month (67,884 gpm). Ground water flow from the alluvium represents approximately 25 % of the total discharge to the river (U.S.G.S.). The funnel effect of Union Gap is probably influencing ground water flow as well.

This document was part of the official  
Administrative Record for the Yakima  
Railroad Area on October 31, 1986.

**Figure 2: City of Yakima. T.S. 12/13 N, R 18/19 E, Yakima East, West, Selah, and Pomona Quadrangles (U.S.G.S.). Railroad study area is located in Sections 19, 30, & 31.**

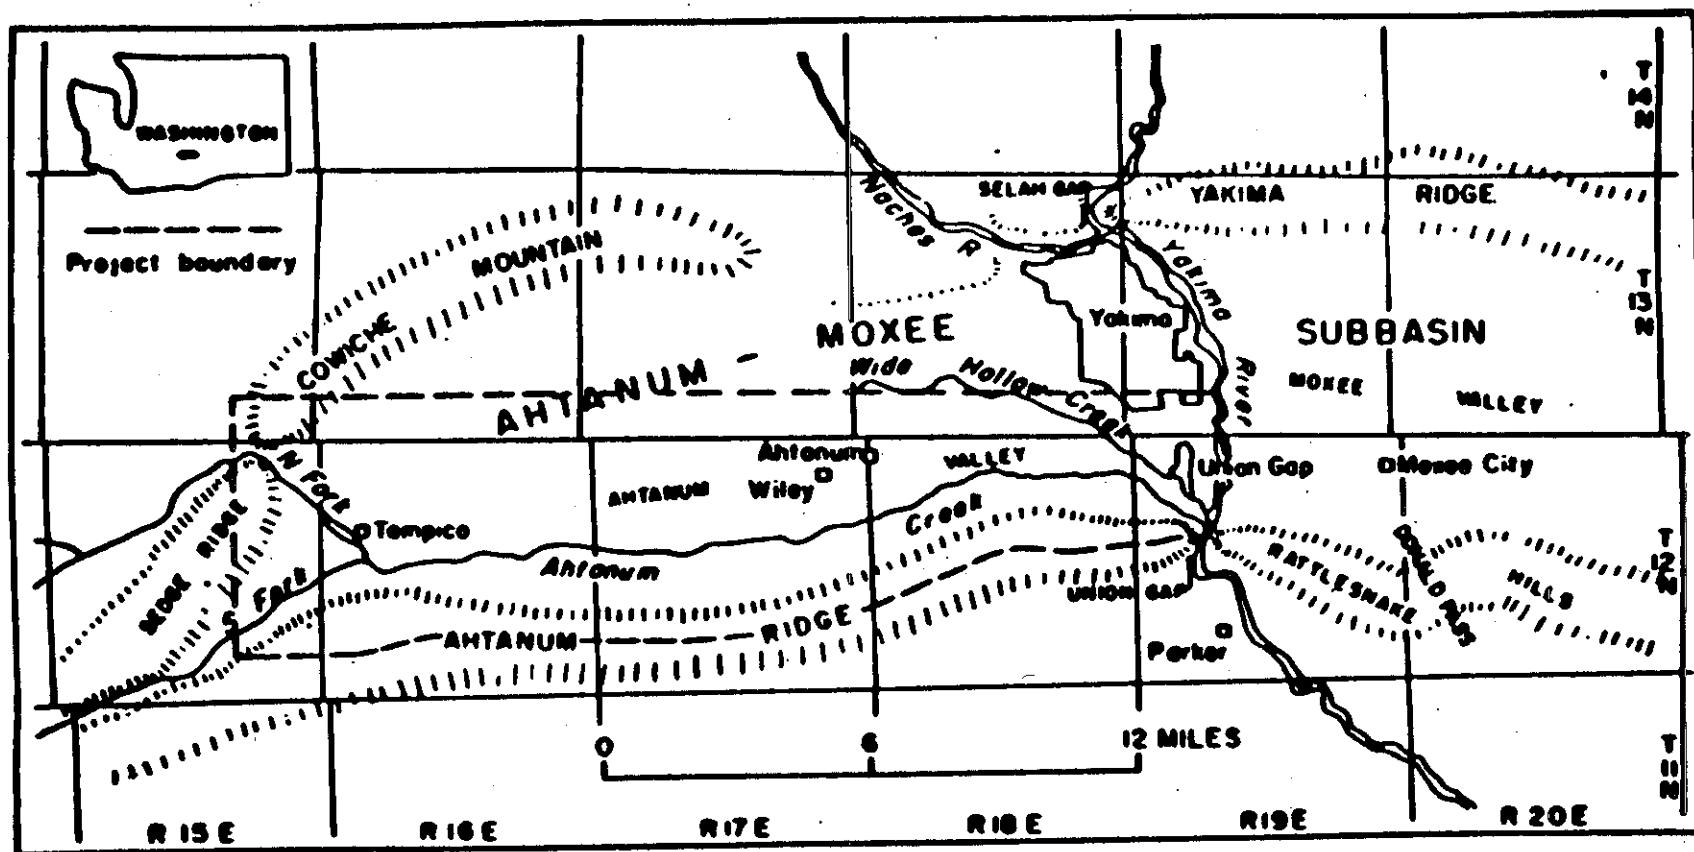

Figure 3: Ahtanum-Moxee Subbasin (Foxworthy, 1952).

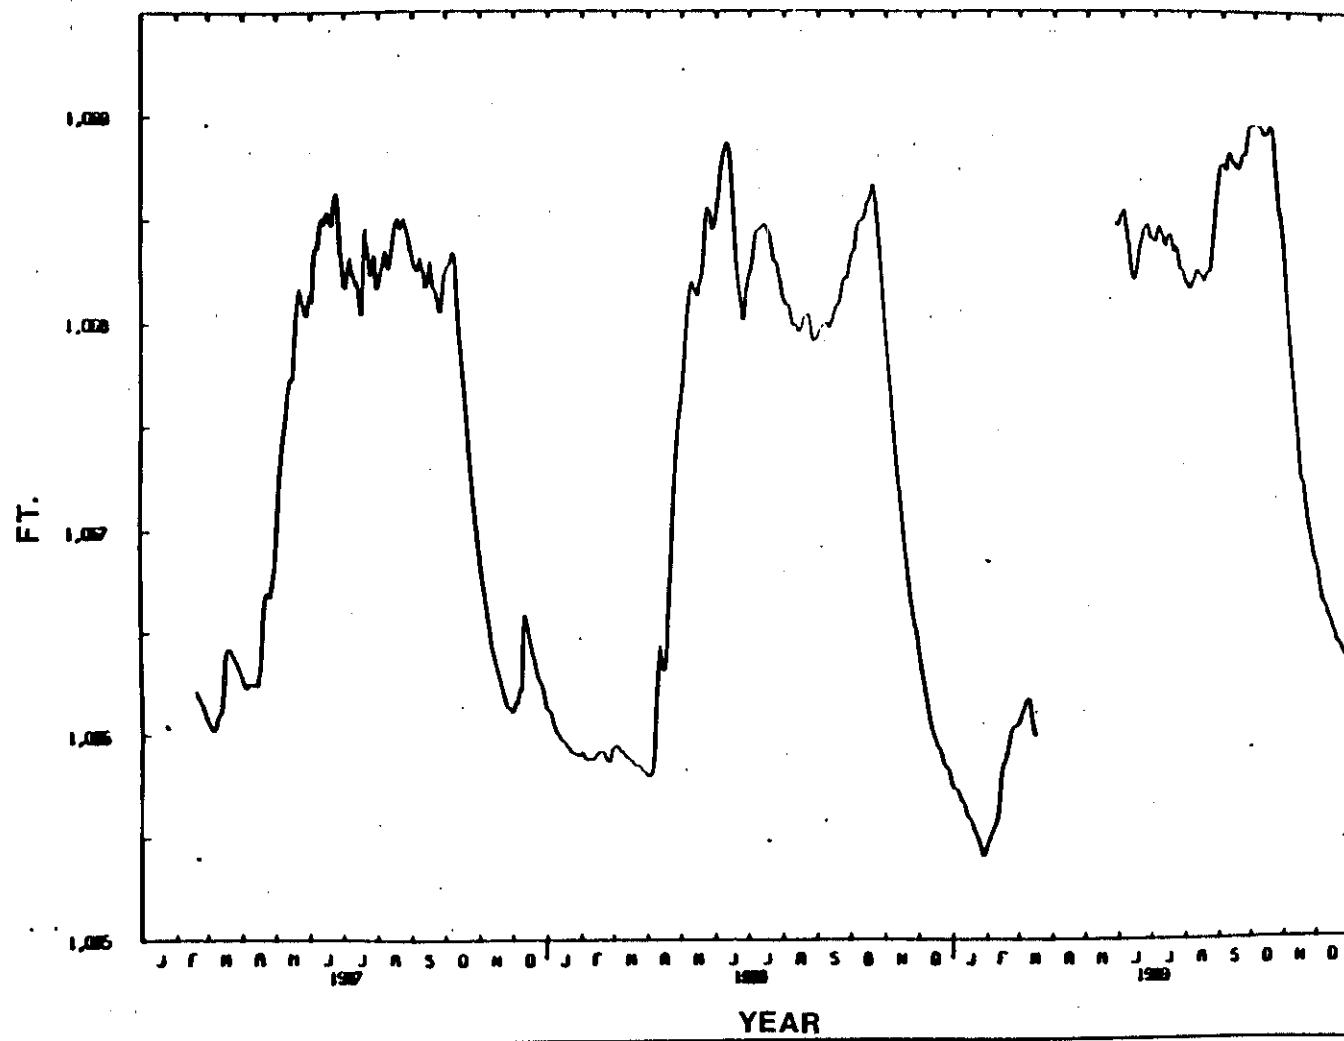

Figure 4: Ground water table fluctuation, Yakima. Several feet of fluctuation is common during the summer irrigation season (Source: U.S.G.S., MW-14, North Yakima Leaking Underground Storage Tank Investigation).

## Aquifer Properties

Yield rates of 100 - 400 gpm have been reported for the unconsolidated alluvium (USGS). Yields of 50 - 100 gpm have been reported for several wells within the confines of the railroad area (T.S. 13 N., R 18 & 19 E, Sections 1, 6, 19, 24, 25, 30, 31, & 36). A series of pump tests performed by the USGS (Foxworthy, 1962) on wells set in the alluvium found hydraulic conductivity values ranging from 100 - 6,000 ft/day (USGS, see **Table 3, Ground Water Flow Rates and Aquifer Properties**). Literature hydraulic conductivity values for clean sand to gravel range from  $10^2$  -  $10^4$  gpd/ft<sup>2</sup> (Freeze, and Cherry, 1979). Estimated transmissivity values for the unconfined aquifer range from  $10^2$  -  $10^5$  gpd/ft (based on an aquifer thickness of 100 ft.).

Unconfined ground water depths for northern Yakima are typically less than 15 ft. below grade. Ground water depths for the Union Gap area are in some cases less than 5 ft. below ground surface. The close proximity of ground water to land surface is a reflection of marsh or wetland-type topography in the Union Gap area. Large tracts of land in this area, such as the Yakima Valley Mall, have since been developed and paved.

## Ground Water Flow Velocities

Flow rates of 0.4 - 86 ft/day (146 - 31,390 ft/yr) have been reported by the USGS for the Ahtanum-Moxee subbasin. Flow velocities of 6 - 12 ft/day (2,190 - 4,380 ft/yr) were calculated for the railroad study area (see **Table 3, Ground Flow Rates and Aquifer Properties**) based on data from this investigation. Flow rates were computed using the two facilities with the highest and lowest head measurements, (Crest Linen and N.W. Truck Repair).

## Ground Water Elevations

Ground water elevational data is presented in **Table 4**. Ground surface and top of casing elevations were surveyed to the nearest 0.01 ft. by Bell & Upton Land Surveyors, Yakima, Washington.

## Ground Water Flow Direction

Computer-generated and hand drawn potentiometric surface maps are presented in **Figures 5 & 6**. A three-point solutions was used to analyze flow vectors and hydraulic gradients (see **Figure 7, three-point flow**). The predominant flow direction through the railroad area is approximately S 35° E towards the Yakima River. Flow vectors in the north half of the study area (north of Nob Hill) are more easterly (S 40-60° E).

**Table 2: Principal Aquifer Units - Ahtanum Moxee Subbasin, Yakima Washington**

Age	K (gpd/ft <sup>2</sup> )	Description
Holocene	100 - 6,000 <sup>1</sup>	Alluvium consisting of sand, silt, gravel, and cobbles. Generally forms a thin mantle < 50 thick but may be thicker in places.
Pleistocene		Coarse sand and gravel with large amounts of cemented basalt gravels. Up to 500 ft. in thickness.
Tertiary		Colombia River basalt flows. Contains some interbedded lake and stream-deposited material. Up to 4,000 ft. thick.

<sup>1</sup> All ground water elevations taken on November 17, 1992.

## **Ground Water Flow Direction (cont.).**

A change in flow vector to S 62° E was noted within the vicinity of the Rainier Plastics facility. The unconfined ground water elevation at Rainier (1016.88 ft.) may be a reflection of lower topography. The Rainier facility has been constructed in a low gully area that has since been filled-in with soil for construction purposes. The plant entrance at Ledwich St. is the approximate edge of the former gully. The lower ground water elevation at Rainier may thus be a reflection of lower topography beneath the Nob Hill overpass (see Figures 1 or 2).

## **Hydraulic Gradient**

Hydraulic gradient values for the railroad were calculated at .004 ft/ft or 20 ft/mile (**Table 3, Ground Water Flow Rates & Aquifer Properties**).

## **Soil Lithology**

Poorly sorted alluvium, consisting of approximately 60% fine to coarse sand and 40% gravel (or mixtures thereof) was the predominant soil type encountered. Six soil samples were collected at four separate locations for grain size analysis (**Table 5, Grain Size Analysis Summary**, see **Appendix B** also). The predominant USCS soil classification ranged from SW (gravelly sands) to GW (clean gravels). Gravel-sized particles were typically flat subangular to subrounded basalt clasts, ranging from 1/2" - 1" in length. Cobbles and larger stones approaching cobble size were common. Sand-sized particles were typically dark brown in color and varied from coarse to fine. Silt-sized particles normally comprised < 10% of the matrix.

## **Soil Adsorptive Properties**

One to two soil samples were collected at each drilling location and analyzed for total organic carbon (**Table 6, Total Organic Carbon and Soil Metals Values**). Total organic carbon values ranged from 0.0006 to 0.031.

The Soil Adsorption Coefficient,  $K_{\infty}$ , is a measure of the solid/liquid partitioning that takes place when an organic chemical is adsorbed with soil. It can also be thought of as the ratio of the amount of chemical adsorbed per unit weight of organic carbon (oc) in the soil to the concentration of the chemical in solution at equilibrium (Lyman and Reehl, 1982):

$$K_{\infty} = \frac{\text{ug adsorbed/g organic carbon (oc)}}{\text{ug/ml solution}}$$

Table 5: Grain Size Analysis Summary, Yakima R.R. Sites

Site	Percentage of Coarse to Fine Sand (< 4.75 mm)	Percentage of Fine to Coarse Gravel (> 4.75 mm)	Percentage of Fines (< .075 mm)	Uniformity Coefficient ( $D_{60}/D_{10}$ )	ASTM Classification
Crest Linen	61 %	39 %	7 %	30	SP-SM
Rainier Plastics	58 %	42 %	6 %	25	SW-SM
B.N.R.R. MW-3D @ 18 ft.	86 %	14 %	16 %	17	SM
B.N.R.R. MW-3D @ 70 ft.	29 %	71 %	3 %	9	GW
M & M Fabricators	89 %	11 %	10 %	23	SW-SM
Burrows Tractor	64 %	36 %	10 %	45	SW-SM
Average =	64.5 %	35.5%	8.7 %	25

U = Analyte was not detected at or above the reported result.

P = The Analyte was detected above the instrumentation detection limit but below the established minimum quantitation limit.

## **Soil Adsorptive Properties (cont.)**

Estimated Soil  $K_{\infty}$  values are presented in Table 6. Several factors including temperature, pH, and soil particle size/fraction of organic carbon content ( $f_{oc}$ ) will affect the soil  $K_{\infty}$  value. In general, chemicals with a  $K_{\infty} < 1,000$  will not readily adsorb to soil organic carbon (Ney, 1990). The low adsorptive capacity of shallow soils (< 100 ft.) within the Yakima R.R. can in part be attributed to the wide range in grain size and lack of fine-grained or colloidal-size (< 0.075mm) material.

**Table 6: Estimated Soil  $K_{oc}$  Values**

Chemical	log $K_{ow}$	Equation	$K_{\infty}$
1,1,1-Trihaloethane	148	$_1 \log K_{\infty} = -0.21 + \log K_{ow}$	91
Perchloroethylene	758	$_2 \log K_{\infty} = -0.557 + \log S \text{ (S in mole fraction)} + 4.277$	247
Benzene	135	$_3 \log K_{\infty} = 0.088 + 0.909 \log K_{ow}$	106

<sub>1</sub> From Karickhoff et al., 1979

<sub>2</sub> From Lhyman, and Reehl, 1982

<sub>3</sub> From Hassett et al., 1983

## **Soil Metals Values**

Lead, cadmium, chromium, arsenic, and selenium soil metals values are presented in Table 7, Total Organic Carbon and Soil Metals Values.

## **Contaminant Characteristics**

This investigation focused on the presence of chlorinated hydrocarbons in the shallow aquifer beneath the Yakima R.R. area. Physical and chemical properties for various chlorinated hydrocarbons and volatile organic compounds are presented in Table 8, Contaminant Physical and Chemical Properties. All of the compounds presented in Table 8 were detected in the soil or ground water during this investigation.

## **Investigation Results**

Sample results for soil and water are presented in **Tables 9 & 10**. Trace (< 1 ppb, Crest Linen property) to high (> 400 ppb, Yakima Steel/Agri-Tech property) levels of chlorinated hydrocarbons were detected in ground water at six locations. Low levels (1.0 - 29.0 ppb) of volatile organic and chlorinated hydrocarbon compounds were detected at five locations. Higher levels of chlorinated hydrocarbon compounds (8,100 ppb) were detected in soil at the Agri-Tech site.

## **Individual Summaries**

### **Rainier Plastics**

Installed one flush mount well to 29 ft. depth. Located monitoring well next to previous location of injection well. Injection well had been used as the discharge point (gravity feed from an indoor strand tank) for plant cooling water. There has been historical concerns about the quality of water in/out of the Rainier cooling water system. The injection well has since been removed due to overflow problems during the summer months (rise in ground water table from irrigation recharge). Water supply well for plant cooling system still in place but not operational (NW corner of the building, may be used to water the lawn). **Detected 15 ppb of chlorinated hydrocarbons in ground water.** Data is consistent with earlier sampling events (Ecology & Environment, 12/87). No obvious signs of soil contamination. **Microtip readings equal to 0.0 @ 5 ft. depth. One soil sample non-detect for volatile organic compounds (No. 468085, 0 - 6").** Rainier and sister facility, Shields Bag, produce plastic bags for various consumer products (celery, etc.).

### **Central Engineering & Machine**

Completed one soil boring to 5 ft. depth (see **SB-1, Appendix A**). Soil samples non-detect for volatile organic compounds.

### **Northwest Truck Repair**

Completed one soil boring approximately 20 ft. north of the 4" monitoring well (see **SB-2, Appendix A**). Underground utilities prevented location of soil boring closer to the truck maintenance area. Trace levels (5.7 ppb) of tetrachloroethane detected in site ground water monitor well (well completed as part of a previous investigation).

### **Southgate Laundry**

Completed one soil boring to 5 ft. depth (see **SB-5, Appendix A**). Trace levels of tetracholorethene (29.0 ppb), toluene (1.2 ppb), and total xylenes (4.6 ppb) detected.

## **Individual Summaries (Cont.)**

### **M & M Fabricators**

Completed one flush mount well to 28 ft. depth. Located well next to dry well at rear of shop. Dry well is apparently used for discharge of wash water from shop. Trace levels of soil (total xylene @ 19.0 ppb) and ground water (2.3 ppb tetrachloroethene) contamination detected.

### **Timpke Machine**

This facility was not investigated due to the close proximity of overhead powerlines and the associated difficulties of maneuvering a drill rig into position.

### **Burrows Tractor**

Completed one soil boring to 10 ft. depth. Microtip readings to 1.4 ppm (Sample Events 190 & 193). Trace levels (7.0 ppb) of acetone detected in soil samples.

### **Martinizing Dry Cleaners**

Completed one soil boring to 5 ft. depth. Microtip readings to 1.9 ppm (Sample Event 227). Low levels (27.0 ppb) of volatile organics (xylene) detected in soil. Small-sized (15 gal.) hazardous waste drum stored on the ground behind facility. No obvious signs of soil contamination.

### **Yakima Steel**

Completed one well to 17 ft. depth and one soil boring to 5 ft. depth. Elevated levels of chlorinated hydrocarbons detected in soil/waste material (2,200 ppb tetrahclorethene) and ground water (430 ppb trichloroethane). Pesticide-type waste streams associated with former property tenants. No explanation for detection of chlorinated hydrocarbons in what was thought to be pesticide waste material. Parking lot area between Yakima Steel and Agri-Tech, the next business immediately north, is underlain by a former pesticide processing lagoon or pit. Historical aerial photographs show pit or lagoon with dimensions of approximately 200 ft. x 50 ft. (Dick Bassett, Toxics Cleanup Program, CRO). Pit was allegedly used by a former tenant (Famers Supply) to mix sulfur and lime. The lime/sulfur mixture is then mixed with an emulsified oil and sprayed on apple trees to prevent bark scaling. Encountered ground water @ 4 ft. Waste material encountered almost immediately (1-2 ft. depth). Used Level "C" protection to complete both borings due to extremely pungent odors (up to 50 ppm on the Microtip). Ground water dark black in color and very pungent odors. Encountered a green clayey-like waste material (may be sulfur) while drilling the monitor well.

## **Individual Summaries (Cont.)**

### **Van Cleave Body Shop**

Completed one soil boring to 2.5 ft. depth. Encountered large cobbles (8-12" diameter) @ 2.5 ft. depth. All soil samples non detect for volatile organic compounds (see SB-7, Appendix A for location of boring).

### **CMX Corporation**

Completed one flush mount monitor well to 24.5 ft.. Microtip readings are non-detect (Sample Events 217-218). Soil and ground water samples non-detect. Fairly high degree of turbidity in formation water, had trouble developing well. No obvious signs of soil contamination. CMX processes and ships medical x-rays.

### **Crest Linen**

Installed one above ground monitor well to 35 ft. depth. Completed well along the east side of the property near previous location of soil boring DH-2 (Chen-Northern, 1/91). Trace level (< 1 ppb, tetrachloroethene) detected in ground water.

**Microtip readings to 1.0 ppm @ 5.0 ft. depth. Laboratory tentatively identified Alkyl Benzene Isomer ( $C_{14}H_{10}$ ) in soil @ 7.0 ppb (No. 468081, 17 ft. depth).**

Trace levels of chlorinated hydrocarbons detected (2.5 ppb 1,2-dichloroethene) in ground water during previous investigation (Chen-Northern, 1991). Site is a vacant lot. No obvious signs of soil contamination.

### **Burlington Northern R.R. Roundhouse Area**

Installed three monitor wells to 28, 51.5, and 97 ft. depths. Had previously intended to complete borings closer to the repair shop; however, railroad personnel informed Ecology that the repair shop foundation extends outward from this area for some distance. Noted stained surficial soils near the locomotive repair shop (see Figure 19). **Microtip readings to 8 ppm in the first 36 ft. of drilling, WDOE-3D (Sample Events 196 - 208).** Acetone detected @ 26.0 ppb, 36.5 ft. depth. Observed a slight oily sheen in the bailed sample water. Detected higher levels (100 ppb of 1,1,1-trichloroethane) in the intermediate depth well (3I) than the shallow or deep well (both wells < 45 ppb 1,1,1-trichloroethane). Higher contaminant concentrations in the intermediate well may be due to the presence of lower permeability sediments starting at approximately 30 ft. (gray silty-sand and clayey gravel). Formations grades to a well sorted gravel (GW) @ 60 ft. Deeper well (3D) had slightly higher ground water elevation (0.02 ft.). Upward head noted while drilling this well. Roundhouse area is used to repair and recondition heavy locomotives.

## **Drilling Methods**

Ponderosa Drilling of Spokane, Washington was contracted by Ecology for monitoring well and soil boring drilling. All drilling was performed with a top-drive Chicago Pneumatic air rotary drill rig equipped with a air compressor filter. Downhole air pressure was approximately 50 PSI with an air velocity range of 300 - 700 ft<sup>3</sup>/min. Each hole was drilled with a 6" diameter tricone bit. A 6" diameter temporary support casing was also used on each borehole. The temporary support casing was removed upon completion of all shallow wells (< 35 ft.). Water was not injected during drilling. All downhole equipment was steam-cleaned between each soil boring or well completion.

Collection of split-spoon samples at each location was attempted. A 3 ft. long 2" diameter split-spoon core barrel was used. Nearly all of the core samples generated < 6" of recovery due to the gravelly soils and cobbles. Grab samples were also collected from the 55-gal. drill cuttings drum or via a hand-held wire mesh strainer beneath the "cyclone" (funnel off the drill cuttings discharge hose).

## **Air Rotary vs. Other Drilling Methods**

Air rotary drilling was selected for this investigation in anticipation of the cobbles and gravels that comprise the unconsolidated alluvium. Other drilling methods, including hollow stem augur, were considered but ruled out because of concerns about the depths needed (up to 100 ft.) to complete the investigation. Use of backhoe was also considered for sampling soils; however, this method was also ruled out because of the damage potential to asphalt parking lots.

Due to the lack of fines or colloidal-sized material (typically less than 10%), the unconsolidated alluvium has a low adsorptive capacity. Detection of trace to low levels of volatile organic compounds was anticipated because of the low soil adsorptive capacity. The alluvium also poses problems when collecting of split-spoon samples. Cobble-sized stones typically get stuck in the end of the core barrel, which eliminates further recovery within the core barrel. Spilt-spoon recovery values for this investigation were typically a few inches or less.

Previous investigative data from the Crest Linen site suggests that other drilling methods may have little or no effect on the outcome of sample results. Five boreholes were completed at the Crest Linen site by Chen-Northern Inc. during a January 1991 investigation. Cable tool drilling was used to complete each borehole. Trace levels (1.0 ppb) of chlorinated hydrocarbons were detected in soil. This data compares favorably with the results produced by this investigation (tentatively identified compound @ less than 1 ppb in soil, Crest Linen).

## **Sample Collection, Transport, and Analysis**

All soil and ground water samples were logged using a Department of Ecology Chain of Custody form. The date, number, sample location, and type of analysis requested was recorded on the chain of custody form. All samples were transported in a sealed cooler via Greyhound Bus to the U.S. EPA/Department of Ecology Manchester Laboratory, Port Orchard.

## **Field Equipment**

A Photovac Microtip HL-200 was used to screen all soil samples. The Microtip was calibrated with isobutylene gas prior to the start of each day used. **Microtip field data is presented in Appendix D.**

## **Storage/Disposal of Drill Cuttings & Fluids**

The Microtip was used to screen all drill cuttings. All drill cuttings, except for those cuttings from the two deep wells (3I & 3D) at Burlington Northern Railroad, were stored in 55-gal. drums. Drill cuttings from soil borings were either drummed or placed back in the borehole and grouted.

## **Monitor Well Construction**

Monitor well logs, construction diagrams, and location maps are found in Appendix B

## **Investigation Timeframe**

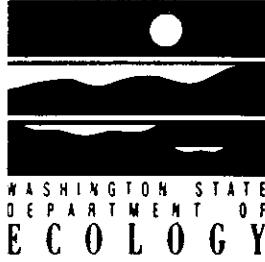

All of the work for this investigation took place between 2 Nov 92 and 18 Nov 92.

## Report Conclusions

- Ground water is flowing southeast through the railroad area with a gradient and of .002 ft/ft and a flow velocity of between 6 and 12 ft/day. Ground water from the railroad area is discharging to the Yakima River at an approximate rate of 9,000 acre/ft month (68,000 gpm, U.S.G.S.).
- A change in flow vector to nearly due east was noted between the B.N.R.R. roundhouse facility and Rainier Plastics. The change in flow vector is probably the result of gully-like topography beneath what is now the Rainier facility.
- Ground water is much closer to ground surface throughout the Union Gap area.
- Aquifer hydraulic conductivity values for the unconsolidated alluvium range from  $10^2$  -  $10^3$  gpd/ft<sup>2</sup>. Aquifer transmissivity values range for the alluvium are approximately equal to  $10^5$  gpd/ft.
- The unconsolidated alluvium is comprised of approximately 60% fine to coarse sand and 40% fine to coarse gravel. The unconsolidated alluvium ranges in thickness from 50-100 ft.. A "well-cemented" basalt-gravel was not encountered during this investigation.
- The percentage of fines within the alluvium is typically < 10%. The unconsolidated alluvium has a low adsorptive capacity due to the low percentage of fines.
- Total organic carbon values for the unconsolidated alluvium (0-5 ft. depth) range from .0006 to .091 g/g.
- Use of a standard split-spoon core barrel is for the most part not effective when sampling the unconsolidated alluvium.
- Chlorinated hydrocarbons, ranging in concentration from 1 ppb - 400 ppb, were detected in ground water at six different locations during this investigation. Ground water contamination was also detected to a depth of 100 ft. and contaminants are undergoing rapid dispersion and dilution.
- Intermittent layers of silty-sand within the alluvium are affecting contaminant movement and acting as partially confining layers. A slight upward head (0.02 ft.) was noted between shallow and deep monitoring wells at one location (B.N.R.R.).
- Trace (< 1.2 ppb) to high (8,100 ppb) levels of chlorinated hydrocarbons were detected in soil at five locations. Volatile organic compounds, ranging in concentration from 1.8 - 27.0 ppb, were detected in soil at three locations.

## **Additional Investigation Recommendations**

- Locate three to five additional ground water monitoring points along the west side of the Yakima River. Survey each point and assess ground water flow direction and hydraulic interaction with the Yakima River. Recommended locations are (in relation to current roads): Ahtanum Road, Washington, Mead Ave., Nob Hill, Yakima Ave., and Tamarack.
- Locate additional ground water monitoring wells immediately downgradient of the B.N.R.R. roundhouse and Yakima Steel/Agri-Tech properties.
- Complete additional soil borings to identify the approximate limits and waste characteristics of the pesticide mixing pit at the Yakima Steel/Agri-Tech property. Assess how or why chlorinated hydrocarbons were detected in soil and ground water at this location (historical waste streams, etc.).
- Use both a backhoe and a drill rig to collect soil samples at a site with known soil contamination. Assess the impact, if any, of various sample collection techniques within the unconsolidated alluvium.
- Conduct a 24 hour pump test of WDOE-3D (B.N.R.R.) to assess aquifer yield, transmissivity, and hydraulic conductivity values.
- Collect quarterly ground water elevations and assess seasonal water table fluctuations and ground water flow patterns.

## Acknowledgements

Several staff members of the Toxics Cleanup Program Central Regional Office (CRO) were instrumental in the planning and implementation of this investigation. Special assistance was provided by student intern John Allgair, Unit Supervisor Tony Valero, Section Head Tony Grover, and Mark Peterschmidt of the Leaky Underground Storage Tank (LUST) Program. Special assistance on contract issues was provided by Ecology Contracts Officer Chuck Hinds. Ecology is most grateful to Roger Kelly and Art Schroeder of Ponderosa Drilling for the excellent work provided on this project.

## **Total Organic Carbon Data**

STATE OF WASHINGTON

DEPARTMENT OF ECOLOGY

MANCHESTER ENVIRONMENTAL LABORATORY

7411 Beach Drive East • Port Orchard, Washington 98366-8204 • (206) 895-4737 • SCAN 744-4737

December 31, 1992

TO: Project Officer

FROM: David A Thomson

SUBJECT: Quality Assurance memo for Yakima RR TOC Results

**SAMPLE RECEIPT**

The samples from the Yakima RR project was received by the Manchester Laboratory on November 6, November 13, and November 20, 1992 in good condition. The analysis of this sample was subsequently contracted to Sound Analytical Services. The samples were run using EPA Method 9060 modified for soils.

**HOLDING TIMES**

All analyses were performed on December 4, 1992.

**PROCEDURAL BLANKS**

The procedural blanks associated with these samples showed no analytically significant levels of analytes.

**PRECISION DATA**

The sample 468126 was run in duplicate to evaluate precision on this sample set. The Relative Percent Difference (RPD) for TOC was 3%.

**SUMMARY**

The data generated by the analysis of these samples can be used noting the data qualifications discussed in this memo. Please note that the results are reported on a dry weight basis.

Please call David A Thomson at SCAN 744-4737 to further discuss this project.

## ANALYTICAL NARRATIVE

Client: WA St. Dept. of Ecology  
Lab No: 28745n  
Date: December 8, 1992

Samples were thoroughly mixed and approximately 5 grams dried at 20°C to a constant weight.

The dried sample was then pulverized using a mortar and pestle and analyzed for total organic carbon in accordance with EPA Method 9060.

A duplicate analysis was performed on sample 28745-8

## **Soil Metals Data**

STATE OF WASHINGTON

December 18, 1992

TO: Charles San Juan

FROM: Bill Kammin, Environmental\_Lab\_Director *BK*

SUBJECT: Metals Quality Assurance memo for the Yakima Railroad Project

**SAMPLE INFORMATION**

The samples from the Yakima Railroad project were received by the Manchester Laboratory on 11/6/92 in good condition.

**HOLDING TIMES**

All analyses were performed within the USEPA Contract Laboratory Program (CLP) holding times for metals analysis (28 days for mercury, 180 days for all other metals).

**INSTRUMENT CALIBRATION**

Instrument calibration was performed before each analytical run and checked by initial calibration verification standards and blanks. Continuing calibration standards and blanks were analyzed at a frequency of 10% during the run and again at the end of the analytical run. All initial and continuing calibration verification standards were within the relevant USEPA (CLP) control limits. AA calibration gave a correlation coefficient (*r*) of 0.995 or greater, also meeting CLP calibration requirements.

**PROCEDURAL BLANKS**

The procedural blanks associated with these samples showed no analytically significant levels of analytes.

**SPIKED SAMPLE ANALYSES**

Spike and duplicate spike sample analyses were performed on this data set. All spike recoveries were within the CLP acceptance limits of +/- 25%.

## **PRECISION DATA**

The results of the spike and duplicate spike samples were used to evaluate precision on this sample set. The Relative Percent Difference (RPD) for all analytes was within the +/- 20% CLP acceptance window for duplicate analysis.

## **LABORATORY CONTROL SAMPLE (LCS) ANALYSES**

LCS analyses were within the windows established for each parameter.

## **SERIAL DILUTION ANALYSES**

Serial dilution is used in ICP analyses to examine sample results for potential interferences. The serial dilution results for this sample set met CLP specifications.

## **SUMMARY**

For sample -8117 the selenium detection limit was slightly raised to because of a negative interference on the selenium line.

The data generated by the analysis of these samples can be used noting the data qualifications discussed in this memo.

Please call Bill Kammin at SCAN 744-4737 to further discuss this project.

March 9, 1993

TO: Charles San Juan  
FROM: Bill Kammin, Environmental Lab Director *BK*  
SUBJECT: Metals Quality Assurance memo for the Yakima R. R. sediments Project

#### SAMPLE INFORMATION

The samples from the Yakima R. R. sediments project were received by the Manchester Laboratory on 11/20/92 in good condition.

#### HOLDING TIMES

All analyses were performed within the USEPA Contract Laboratory Program (CLP) holding times for metals analysis (28 days for mercury, 180 days for all other metals).

#### INSTRUMENT CALIBRATION

Instrument calibration was performed before each analytical run and checked by initial calibration verification standards and blanks. Continuing calibration standards and blanks were analyzed at a frequency of 10% during the run and again at the end of the analytical run. All initial and continuing calibration verification standards were within the relevant USEPA (CLP) control limits. AA calibration gave a correlation coefficient (*r*) of 0.995 or greater, also meeting CLP calibration requirements.

#### PROCEDURAL BLANKS

The procedural blanks associated with these samples showed no analytically significant levels of analytes.

#### SPIKED SAMPLE ANALYSES

Spike and duplicate spike sample analyses were performed on this data set. All spike recoveries were within the CLP acceptance limits of +/- 25%.

## **PRECISION DATA**

The results of the spike and duplicate spike samples were used to evaluate precision on this sample set. The Relative Percent Difference (RPD) for all analytes was within the 20% CLP acceptance window for duplicate analysis.

## **LABORATORY CONTROL SAMPLE (LCS) ANALYSES**

LCS analyses were within the windows established for each parameter.

## **SERIAL DILUTION ANALYSES**

Serial dilution is used in ICP analyses to examine sample results for potential interferences. The serial dilution results for this sample set met CLP specifications.

## **SUMMARY**

The data generated by the analysis of these samples can be used noting the data qualifications discussed in this memo.

Please call Bill Kammin at SCAN 744-4737 to further discuss this project.

Data Review  
December 24, 1992

Project: Yakima R.R.

Sample(s): 478230, 478233, 478236, 478237, 478238, 478241, 478243, 478247,  
478248, 478249, 478250, 478252, 478253, 478254, 478255

Laboratory: Analytical Resources, Inc. C290

By: Karin Feddersen KF  
Through: Stuart Magoon Sm

#### Case Summary

These samples were received at the Manchester Environmental Laboratory on November 20, 1992, and transported to Analytical Resources, Inc. on November 20, 1992 for VOC and Pesticide/PCB analysis.

This data was reviewed for qualitative and quantitative accuracy, validity, and usefulness.

There is no need to assimilate the "dilution factor" or "sample wt/vol" into the final values reported; these calculations have already been figured into the reported values.

#### DATA QUALIFIER DEFINITIONS

- U - The analyte was not detected at or above the reported result.
- UJ - The analyte was not detected at or above the reported estimated result.
- J - The associated numerical result is an estimated quantity.
- NJ - There is evidence that the analyte is present. The associated numerical result is an estimate.

## **VOA**

### **Holding Times:**

These samples were analyzed within the SW-846 recommended holding time.

### **Method Blank:**

Acetone was detected in the method blank at a concentration below the quantitation limit, but not in either of the samples.

### **GC/MS Tuning and Calibration:**

Calibration against Bromofluorobenzene (BFB) is acceptable for the initial calibration, continuing calibration and all associated sample analyses.

### **Initial Calibration:**

The initial calibration met the minimum response criteria for the average relative responses. The % Relative Standard Deviations were within the maximum of 30%.

### **Continuing Calibration:**

The average relative response factors for all target analytes were above the minimums. The percent deviations between the initial and continuing calibration standards were within the maximum of 25%, with two exceptions, neither of which affected quantitations of the target analytes in the corresponding samples.

### **Surrogates:**

All surrogate recoveries for this sample, and the associated method blank are reasonable, acceptable, and within QC limits.

### **Sample Data:**

This data is acceptable for use as amended.

## Pesticide/PCB

### **Holding Times:**

This sample was extracted and analyzed within the SW-846 recommended holding time.

### **Method Blank:**

No target analytes were detected in the method blank.

### **Blank Spike:**

Blank spike recoveries are reasonable, acceptable, and within advisory QC limits.

### **Surrogates:**

All surrogate recoveries for this sample and the associated method blank are reasonable, acceptable, and within advisory QC limits, with the exception of the spike blank.

Tetrachlorometaxylene was detected below the advisory QC limit on the DB608 column. This column is used for confirmation of identification only, and therefore does not affect the results. Tetrachlorometaxylene detected was within advisory QC limits on the DB5 column, which is the column used for quantitation of all target analytes. Thus, no qualification of data was warranted.

### **Sample Data:**

4,4'DDE and Endrin Ketone were detected in sample 478250 at amounts below the quantitation limit, but they were not reported by ARI. The concentrations for these analytes have been calculated and added to the sample data sheet (Form I).

This data is acceptable for use as amended.

Data Review  
December 12, 1992

Project: Yakima R.R.  
Sample(s): 468080, 468081, 468085, 468089, 468090, 468095, 468096, 468098  
Laboratory: Analytical Resources, Inc. C191  
By: Karin Feddersen KF  
Through: Stuart Magoon

#### Case Summary

These samples were received at the Manchester Environmental Laboratory on November 6, 1992, and transported to Analytical Resources, Inc. on November 9, 1992 for VOC analysis.

This data was reviewed for qualitative and quantitative accuracy, validity, and usefulness.

There is no need to assimilate the "dilution factor" or "sample wt/vol" into the final values reported; these calculations have already been figured into the reported values.

#### DATA QUALIFIER DEFINITIONS

- U - The analyte was not detected at or above the reported result.
- UJ - The analyte was not detected at or above the reported estimated result.
- J - The associated numerical result is an estimated quantity.
- NJ - There is evidence that the analyte is present. The associated numerical result is an estimate.

## **VOA**

### **Holding Times:**

These samples were analyzed within the SW-846 recommended holding time.

### **Method Blank:**

Acetone was detected in the method blank at concentrations below the quantitation limit. Acetone was also detected in some of the samples at a concentration less than five times that detected in the blank. Therefore, the Acetone detected in these samples is most likely due to laboratory contamination and not native to the samples. All sample results for Acetone have been changed (qualifier "U") to indicate that Acetone was not detected at or above the reported result.

### **GC/MS Tuning and Calibration:**

Calibration against Bromofluorobenzene (BFB) is acceptable for the initial calibration, continuing calibration and all associated sample analyses.

### **Initial Calibration:**

The initial calibration met the minimum response criteria of greater than 0.05 for the average relative response. The % Relative Standard Deviation was within the maximum of 30%.

### **Continuing Calibration:**

The average relative response factors for all target analytes were above the minimums. The percent deviations between the initial and continuing calibration standards were within the maximum of 25%, with several exceptions which did not affect the results.

### **Matrix Spikes (MS/MSD):**

Matrix spike recovery and precision data are reasonable, acceptable, and within advisory QC limits.

### **Surrogates:**

All surrogate recoveries for this sample, and the associated method blank are reasonable, acceptable, and within QC limits.

### **Sample Data:**

This data is acceptable for use as amended.

RE: Yakima R.R. /ARI Job No. C191

Dear Ms. Feddersen:

Please find enclosed original reports and sample deliverables for the above referenced project. Eight soil samples were received intact on November 9, 1992. The samples were analyzed for volatile organic compounds, according to the laboratory service request form. The samples are listed below:

468080      468081      468085      468089      468090      468095  
                468096                          468098

The samples were analyzed within the required holding times by GC/MS purge and trap methodology. All samples were analyzed on November 11, 1992, using GC/MS instrument FINN #5. The requirements for tuning and calibration were met according to USEPA CLP protocol 6/91. Sample analysis was routine and no problems were encountered.

As always, a copy of these reports and all associated raw data will remain on file with ARI. If you have any questions or require additional information, please feel free to contact me at your convenience. I can be reached at the number above, or direct at (206)340-2866, ext. 116. You can also leave a message if I'm not available.

Sincerely,

ANALYTICAL RESOURCES, INC.

Laboratory: Analytical Resources, Inc. C230

By: Karin Feddersen *KF*  
Through: Stuart Magoon *SM*

#### Case Summary

These samples were received at the Manchester Environmental Laboratory on November 13, 1992, and transported to Analytical Resources, Inc. on November 13, 1992 for VOC and Pesticide/PCB analysis.

This data was reviewed for qualitative and quantitative accuracy, validity, and usefulness.

There is no need to assimilate the "dilution factor" or "sample wt/vol" into the final values reported; these calculations have already been figured into the reported values.

#### DATA QUALIFIER DEFINITIONS

- U - The analyte was not detected at or above the reported result.
- UJ - The analyte was not detected at or above the reported estimated result.
- J - The associated numerical result is an estimated quantity.
- NJ - There is evidence that the analyte is present. The associated numerical result is an estimate.

Tetrachlorometaxylene (TCMX)	89.6%	60-150

Data Qualifiers

- Value If the result is a value greater than or equal to the detection limit, report the value.  
J Indicates an estimated value when that value is less than the calculated detection limit.  
X Indicates a value above the linear range of the detector. Dilution required.  
S Indicates no value reported due to saturation of the detector.  
D Indicates the surrogate was diluted out.  
U Indicates compound was analyzed for, but not detected at the given detection limit.  
NA Indicates compound not analyzed.

## **VOA**

### **Holding Times:**

These samples were analyzed within the SW-846 recommended holding time.

### **Method Blank:**

Methylene Chloride was detected in two of the method blanks. Methylene Chloride was also detected in sample 468132 at a concentration near that detected in the associated method blank. Therefore, the Methylene Chloride result for sample 468132 has been changed (qualifier "U") to indicate that this analyte was not detected at or above the suspected laboratory contamination level.

### **Soil Methanol Blank:**

Methylene Chloride and Carbon Disulfide were detected in the soil methanol blank which corresponds with the medium level extraction of sample 468110 only. Methylene Chloride was detected in this sample at a concentration near that detected in the blank. Therefore, the Methylene Chloride result for sample 468110 has been changed (qualifier "U") to indicate that this analyte was not detected at or above the suspected laboratory contamination level.

### **GC/MS Tuning and Calibration:**

Calibration against Bromofluorobenzene (BFB) is acceptable for the initial calibration, continuing calibration and all associated sample analyses.

#### **Initial Calibration:**

The initial calibration met the minimum response criteria for the average relative responses. The % Relative Standard Deviations were within the maximum of 30%.

#### **Continuing Calibration:**

The average relative response factors for all target analytes were above the minimums. The percent deviations between the initial and continuing calibration standards were within the maximum of 25%.

#### **Surrogates:**

All surrogate recoveries for these samples and the associated method blanks are reasonable, acceptable, and within QC limits.

**Sample Data:**

Use the sample results from the medium level extraction of sample 468110 for Trichloroethene and tetrachloroethene only. This data is acceptable for use as amended.

**Pesticide/PCB**

**Holding Times:**

These samples were extracted and analyzed within the SW-846 recommended holding times.

**Method Blank:**

No target analytes were detected in the method blank.

**Matrix Spikes (MS/MSD):**

Matrix spike recovery and precision data are reasonable, acceptable, and within advisory QC limits.

**Surrogates:**

All surrogate recoveries for these samples, the matrix spikes, and the associated method blank are reasonable, acceptable, and within advisory QC limits with two exceptions.

Tetrachloromethylene detected on the DB5 column in samples 468105 and 468108, and for their subsequent dilutions, was calculated at amounts that vastly exceed the upper advisory QC limit. This is most likely attributable to matrix interferences, and does not indicate a problem with the analysis, since acceptable recoveries for this surrogate in both samples was demonstrated on the DB608 column.

**Sample Data:**

The detection limit has been elevated for analytes that were detected above the quantitation limit, but for which the relative percent difference (RPD) of the calculated concentration was greater than 15% between the two columns. Due to the matrix interference observed in samples 468105 and 468108, the detection limits for Aroclor 1221 and 1232 were raised. Dilutions of these samples were analyzed, and a decreased matrix effect was observed, allowing the detection limits for Aroclor 1221 and 1232 to be lowered in these samples.

Analytes in samples 468106 and 468122 were detected at an amount below the quantitation limits, but they were not reported by ARI. The concentrations for these analytes have been calculated and added to the appropriate sample data sheets (Form I).

This data is acceptable for use as amended.

RE: Yakima R.R. /ARI Job No. C230

Dear Ms. Feddersen:

Please find enclosed original reports and sample deliverables for the above referenced project. Eighteen soil samples were received intact on November 13, 1992. The following samples were analyzed for volatile organic compounds (VOC) and pesticide/PCBs, according to the laboratory service request form:

468105	468106	468107	468108	468109	468110	
468114	468115	468116	468118	468120	468121	
468122	468124	468125	468127	468131	468132	

The samples were analyzed within the required holding times, according to USEPA method SW-8080 and method SW-8260. The VOCs were analyzed on November 17, 1992, using GC/MS purge and trap methodology. The VOC analysis was completed using GC/MS instrument FINN #1. Due to the presence of analytes above the instrument linear range sample reanalysis was required. Sample 468110 was reanalyzed on November 18, 1992, and sample 468109 was reanalyzed on November 19, 1992.

The pesticide analysis was initiated on November 17, 1992. The samples were analyzed on GC-ECD instrument #3. A 1 to 10 sample dilution has been included for samples 468105 and 468108. These sample dilutions have been included due to the raised Aroclor detection limit in the initial analyses. These samples had elevated baselines associated with a possible matrix effect. A pH values greater than 11 was also documented for sample 468105 and 468108, indicating a difference in sample matrix.

Due to a discrepancy with the actual and reported surrogate concentrations in a vendors pesticide standard mix, all of the pesticide surrogate recoveries associated with this delivery group were calculated using an individual surrogate standard (24-NOV-92 17:16). This standard has been included as part of the standard deliverables.

As always, a copy of these reports and all associated raw data will remain on file with ARI. If you have any questions or require additional information, please feel free to

Ms. Karin Feddersen (12/15/92)

Data Qualifiers

- Value      Description
- J      If the result is a value greater than or equal to the detection limit, report the value.  
Indicates an estimated value when that value is less than the calculated detection limit.
- X      Indicates a value above the linear range of the detector. Dilution required.
- S      Indicates no value reported due to saturation of the detector.
- D      Indicates the surrogate was diluted out.
- U      Indicates compound was analyzed for, but not detected at the given detection limit.
- NA     Indicates compound not analyzed.

Data Review  
January 14, 1993

Project: **Yakima RR**  
Sample: **468126**  
Laboratory: **Sound Analytical Services 29323**  
By: **Stuart Magoon**

**Case Summary**

This review is for the WTPH-418.1 Modified analysis.

This data was reviewed for qualitative and quantitative accuracy, validity, and usefulness.

There is no need to assimilate the "dilution factor" or "sample wt/vol" into the final values reported; these calculations have already been figured into the reported values.

**DATA QUALIFIER DEFINITIONS**

**U -** The analyte was not detected at or above the reported result.

**UJ -** The analyte was not detected at or above the reported estimated result.

**J -** The associated numerical result is an estimated quantity.

## **WTPH-418.1 Modified**

### **Holding Times:**

This sample was extracted 41 days beyond the suggested maximum extraction holding time, and analyzed 24 days beyond the suggested maximum analytical holding time .

### **Method Blank:**

No petroleum hydrocarbons as heavy oils were detected in the method blank

### **Duplicate:**

A duplicate analysis was performed in accordance with the method. The duplicate analysis was performed on a sample from another project. Results from the duplicate analysis are acceptable and in good agreement with the original analysis.

### **Sample results:**

This data is acceptable for use as amended.

This sample has been stored in a properly cleaned and sealed jar at 4 degrees Celsius since collection. It is unlikely that exceeding the suggested maximum holding times has had a significant effect upon the results.

## ANALYTICAL NARRATIVE

Client: WA State Dept. of Ecology      Date: January 13, 1993

Project: Yakima RR      Lab No.: 29323

Delivered By: WDOE

---

Sample 29323 was analyzed for total petroleum hydrocarbons in accordance with WA State DOE Method WTPH-418.1 Modified. The sample was extracted and analyzed on 01-04-93, which was outside of the method-required holding time. All other quality control parameters were within acceptable limits.

RE: Yakima R.R. /ARI Job No. C290

Dear Ms. Feddersen:

Please find enclosed original reports and sample deliverables for the above referenced project. Nine water samples and five soil samples were received intact on November 20, 1992. The following samples were analyzed for volatile organic compounds (VOC) and pesticide/PCBs, according to the laboratory service request form:

478241	478243	478247	478248	478249	478252
478253	478254	478255	478230	478233	478236
		478237	478238	478250	

The samples were analyzed within the required holding times, according to USEPA method SW-8260 and method SW-8080. The VOCs in water were analyzed on November 23, 1992, and the VOCs in soil were analyzed on November 24, 1992. All of the VOC samples were analyzed by GC/MS purge and trap methodology. The VOC analysis was completed using GC/MS instrument FINN #1 (soils) and Finn#5 (waters).

The pesticide analysis was initiated on November 23, 1992. Some of the pesticide and PCB-Aroclor detection limits have been raised due to the variation between the initial column and confirmation column results. This variation can be attributed to a sample matrix affect.

As always, a copy of these reports and all associated raw data will remain on file with ARI. If you have any questions or require additional information, please feel free to contact me at your convenience. I can be reached at the number above, or direct at (206)340-2866, ext. 116. You can also leave a message on voice mail if I am unavailable and I will return your call.

Sincerely,

ANALYTICAL RESOURCES, INC.
