Creator: Kalicki, Samantha

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

TestAmerica Seattle is a part of TestAmerica Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

This report shall not be reproduced except in full, without prior express written approval by the laboratory. The results relate only to the item(s) tested and the sample(s) as received by the laboratory.

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan and meet all requirements of NELAC. All data have been found to be compliant with laboratory protocol, with the exception of any items noted in the case narrative.

CASE NARRATIVE
Client: Hart Crowser, Inc.
Project: Monte Cristo

Report Number: 580-29110-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) resulting from a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument or that reduces the interferences thereby enabling the quantification of target analytes.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 10/05/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 4.9 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS (ICP)
Samples PUSHER S-1 0-6 (580-29110-1), PUSHER S-1 6-12 (580-29110-2), PUSHER S-2 0-6 (580-29110-3), PUSHER S-2 6-12 (580-29110-4), PUSHER S-3 0-6 (580-29110-5), PUSHER S-3 6-12 (580-29110-6), IBEX S1 0-6 (580-29110-7), IBEX S2 0-6 (580-29110-8), O+B UPPER S1 0-6 (580-29110-9), O+B UPPER S2 0-6 (580-29110-10), O+B UPPER S3 0-6 (580-29110-11), O+B LOWER S1 0-6 (580-29110-12), O+B LOWER S2 0-6 (580-29110-13), 76-7 (580-29110-14), 76-8 (580-29110-15), CONGRESS S1 0-6 (580-29110-16), CONGRESS S1 6-12 (580-29110-17), PORTLAND 2 S1 0-6 (580-29110-18), PORTLAND 2 S1 6-12 (580-29110-19), PORTLAND 2 S2 0-6 (580-29110-20), CONGRESS S2 0-6 (580-29110-21), CONGRESS S2 6-12 (580-29110-22) and PORTLAND 2 S2 6-12 (580-29110-23) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 10/18/2011 and analyzed on 10/18/2011, 10/19/2011 and 10/20/2011.

Samples PUSHER S-1 0-6 (580-29110-1)[100X], PUSHER S-1 6-12 (580-29110-2)[100X], PUSHER S-2 0-6 (580-29110-3)[100X], PUSHER S-2 6-12 (580-29110-4)[100X], PUSHER S-3 0-6 (580-29110-5)[100X], PUSHER S-3 6-12 (580-29110-6)[100X], IBEX S1 0-6 (580-29110-7)[100X], IBEX S2 0-6 (580-29110-8)[100X], O+B UPPER S1 0-6 (580-29110-9)[100X], O+B UPPER S2 0-6 (580-29110-10)[100X], O+B UPPER S3 0-6 (580-29110-11)[100X], O+B LOWER S1 0-6 (580-29110-12)[100X], O+B LOWER S2 0-6 (580-29110-13)[100X], 76-8 (580-29110-15)[100X], CONGRESS S1 0-6 (580-29110-16)[100X], CONGRESS S1 6-12 (580-29110-17)[100X], PORTLAND 2 S1 0-6 (580-29110-18)[100X], PORTLAND 2 S1 6-12 (580-29110-19)[100X], PORTLAND 2 S2 0-6 (580-29110-20)[100X], CONGRESS S2 0-6 (580-29110-21)[100X], CONGRESS S2 6-12 (580-29110-22)[100X] and PORTLAND 2 S2 6-12 (580-29110-23)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Calcium and Iron were detected in method blank (MB) 580-97966/21-A in batch 580-98052 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Iron failed the recovery low for the matrix spike (MS) of sample PUSHER S-1 0-6MS (580-29110-1) in batch 580-98052[100X]. Iron failed the recovery high for the matrix spike duplicate (MSD). The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Iron was detected in method blank (MB) 580-97974/20-A in batch 580-98054 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Calcium failed the recovery high for the MS of sample PORTLAND 2 S1 0-6MS (580-29110-18) in batch 580-98054.

Magnesium failed the recovery low for the MS/MSD of sample PORTLAND 2 S1 0-6MS (580-29110-18) in batch 580-98054. The

presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Calcium, Iron and Magnesium failed the recovery high for the MS of sample PORTLAND 2 S1 0-6MS (580-29110-18) in batch 580-98054[100X]. Calcium and Iron failed the recovery high for the MSD. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount

Potassium failed the recovery low for the MS/MSD of sample PORTLAND 2 S1 0-6MS (580-29110-18) in batch 580-98286.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICPMS)

Samples PUSHER S-1 0-6 (580-29110-1), PUSHER S-1 6-12 (580-29110-2), PUSHER S-2 0-6 (580-29110-3), PUSHER S-2 6-12 (580-29110-4), PUSHER S-3 0-6 (580-29110-5), PUSHER S-3 6-12 (580-29110-6), IBEX S1 0-6 (580-29110-7), IBEX S2 0-6 (580-29110-8), O+B UPPER S1 0-6 (580-29110-9), O+B UPPER S2 0-6 (580-29110-10), O+B UPPER S3 0-6 (580-29110-11), O+B LOWER S1 0-6 (580-29110-12), O+B LOWER S2 0-6 (580-29110-13), 76-7 (580-29110-14), 76-8 (580-29110-15), CONGRESS S1 0-6 (580-29110-16), CONGRESS S1 6-12 (580-29110-17), PORTLAND 2 S1 0-6 (580-29110-18), PORTLAND 2 S1 6-12 (580-29110-19), PORTLAND 2 S2 0-6 (580-29110-20), CONGRESS S2 0-6 (580-29110-21), CONGRESS S2 6-12 (580-29110-22) and PORTLAND 2 S2 6-12 (580-29110-23) were analyzed for total metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 10/18/2011 and analyzed on 10/18/2011 and 10/19/2011.

Samples PUSHER S-1 6-12 (580-29110-2)[100X], PUSHER S-2 0-6 (580-29110-3)[100X], PUSHER S-2 0-6 (580-29110-3)[1000X], PUSHER S-2 6-12 (580-29110-4)[100X], PUSHER S-3 0-6 (580-29110-5)[100X], PUSHER S-3 6-12 (580-29110-6)[100X], IBEX S1 0-6 (580-29110-7)[100X], IBEX S2 0-6 (580-29110-8)[100X], O+B UPPER S1 0-6 (580-29110-9)[100X], O+B UPPER S1 0-6 (580-29110-9)[1000X], O+B UPPER S2 0-6 (580-29110-10)[100X], O+B UPPER S2 0-6 (580-29110-10)[1000X], O+B UPPER S3 0-6 (580-29110-11)[100X], O+B UPPER S3 0-6 (580-29110-11)[1000X], O+B LOWER S1 0-6 (580-29110-12)[100X], O+B LOWER S2 0-6 (580-29110-13)[100X], O+B LOWER S2 0-6 (580-29110-13)[1000X], CONGRESS S1 0-6 (580-29110-16)[100X], CONGRESS S1 6-12 (580-29110-17)[100X], PORTLAND 2 S1 0-6 (580-29110-18)[50X], PORTLAND 2 S1 6-12 (580-29110-19)[100X], PORTLAND 2 S2 0-6 (580-29110-20)[100X], CONGRESS S2 0-6 (580-29110-21)[100X], CONGRESS S2 6-12 (580-29110-22)[100X] and PORTLAND 2 S2 6-12 (580-29110-23)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Aluminum, Copper failed the recovery criteria high for the matrix spike (MS) of sample PUSHER S-1 0-6MS (580-29110-1) in batch 580-98033. Aluminum, Copper and Lead failed the recovery criteria high for the matrix spike duplicate (MSD). The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Antimony failed the recovery criteria low for the MS/MSD of sample PUSHER S-1 0-6MSD (580-29110-1) in batch 580-98109. Arsenic failed the recovery criteria high for the MS/MSD. Manganese failed the critical recovery high for the MSD only.

Lead was detected in method blank MB 580-97974/20-A in batch 580-98033 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Aluminum failed the recovery criteria high for the MS/MSD of sample PORTLAND 2 S1 0-6MSD (580-29110-18) in batch 580-98033. Several analytes failed the recovery criteria high for the MSD. Also, Beryllium and Silver exceeded the rpd limit. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Antimony and Arsenic failed the recovery criteria low for the MS of sample PORTLAND 2 S1 0-6MSD (580-29110-18) in batch 580-98109. Manganese failed the recovery criteria high. Antimony failed the recovery low for the MSD. Manganese failed the recovery high for the MSD. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples PUSHER S-1 0-6 (580-29110-1), PUSHER S-1 6-12 (580-29110-2), PUSHER S-2 0-6 (580-29110-3), PUSHER S-2 6-12 (580-29110-4), PUSHER S-3 0-6 (580-29110-5), PUSHER S-3 6-12 (580-29110-6), IBEX S1 0-6 (580-29110-7), IBEX S2 0-6 (580-29110-8), O+B UPPER S1 0-6 (580-29110-9), O+B UPPER S2 0-6 (580-29110-10), O+B UPPER S3 0-6 (580-29110-11), O+B LOWER S1 0-6 (580-29110-12), O+B LOWER S2 0-6 (580-29110-13), 76-7 (580-29110-14), 76-8 (580-29110-15), CONGRESS S1 0-6 (580-29110-16), CONGRESS S1 6-12 (580-29110-17), PORTLAND 2 S1 0-6 (580-29110-18), PORTLAND 2 S1 6-12 (580-29110-19), PORTLAND 2 S2 0-6 (580-29110-20), CONGRESS S2 0-6 (580-29110-21), CONGRESS S2 6-12 (580-29110-22) and PORTLAND 2 S2 6-12 (580-29110-23) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared and analyzed on 10/18/2011.

Samples PUSHER S-1 0-6 (580-29110-1)[10X], PUSHER S-1 6-12 (580-29110-2)[10X], PUSHER S-2 0-6 (580-29110-3)[10X], PUSHER S-2 6-12 (580-29110-4)[10X], PUSHER S-3 6-12 (580-29110-6)[10X], IBEX S1 0-6 (580-29110-7)[10X], O+B UPPER S1 0-6 (580-29110-9)[10X], O+B UPPER S2 0-6 (580-29110-10)[10X], O+B UPPER S3 0-6 (580-29110-11)[10X], O+B LOWER S1 0-6 (580-29110-12)[10X], O+B LOWER S2 0-6 (580-29110-13)[10X], 76-7 (580-29110-14)[10X], CONGRESS S1 0-6 (580-29110-16)[10X], CONGRESS S1 6-12 (580-29110-17)[10X] and PORTLAND 2 S1 0-6 (580-29110-18)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Mercury failed the recovery criteria high for the MSD of sample PUSHER S-1 0-6MSD (580-29110-1) in batch 580-98059.

Mercury failed the recovery criteria low for the MS of sample PORTLAND 2 S1 0-6MS (580-29110-18) in batch 580-98059. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the mercury analyses.

All other quality control parameters were within the acceptance limits.

CORROSIVITY (PH)

Samples PUSHER S-1 0-6 (580-29110-1), PUSHER S-1 6-12 (580-29110-2), PUSHER S-2 0-6 (580-29110-3), PUSHER S-2 6-12 (580-29110-4), PUSHER S-3 0-6 (580-29110-5), PUSHER S-3 6-12 (580-29110-6), IBEX S1 0-6 (580-29110-7), IBEX S2 0-6 (580-29110-8), O+B UPPER S1 0-6 (580-29110-9), O+B UPPER S2 0-6 (580-29110-10), O+B UPPER S3 0-6 (580-29110-11), O+B LOWER S1 0-6 (580-29110-12), O+B LOWER S2 0-6 (580-29110-13), 76-7 (580-29110-14), 76-8 (580-29110-15), CONGRESS S1 0-6 (580-29110-16), CONGRESS S1 6-12 (580-29110-17), PORTLAND 2 S1 0-6 (580-29110-18), PORTLAND 2 S1 6-12 (580-29110-19), PORTLAND 2 S2 0-6 (580-29110-20), CONGRESS S2 0-6 (580-29110-21), CONGRESS S2 6-12 (580-29110-22) and PORTLAND 2 S2 6-12 (580-29110-23) were analyzed for corrosivity (pH) in accordance with EPA SW-846 Method 9045C. The samples were analyzed on 10/17/2011.

No difficulties were encountered during the pH analyses.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS

Samples PUSHER S-1 0-6 (580-29110-1), PUSHER S-1 6-12 (580-29110-2), PUSHER S-2 0-6 (580-29110-3), PUSHER S-2 6-12 (580-29110-4), PUSHER S-3 0-6 (580-29110-5), PUSHER S-3 6-12 (580-29110-6), IBEX S1 0-6 (580-29110-7), IBEX S2 0-6 (580-29110-8), O+B UPPER S1 0-6 (580-29110-9), O+B UPPER S2 0-6 (580-29110-10), O+B UPPER S3 0-6 (580-29110-11), O+B LOWER S1 0-6 (580-29110-12), O+B LOWER S2 0-6 (580-29110-13), 76-7 (580-29110-14), 76-8 (580-29110-15), CONGRESS S1 0-6 (580-29110-16), CONGRESS S1 6-12 (580-29110-17), PORTLAND 2 S1 0-6 (580-29110-18), PORTLAND 2 S1 6-12 (580-29110-19), PORTLAND 2 S2 0-6 (580-29110-20), CONGRESS S2 0-6 (580-29110-21), CONGRESS S2 6-12 (580-29110-22) and PORTLAND 2 S2 6-12 (580-29110-23) were analyzed for percent solids in accordance with EPA Method 160.3 Modified. The samples were analyzed on 10/06/2011.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Hart Crowser, Inc. Job Number: 580-29110-1

Lab Section	Qualifier	Description
Metals		
	B	Compound was found in the blank and sample.
	F	MS or MSD exceeds the control limits
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	W	PS: Post-digestion spike was outside control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	F	RPD of the MS and MSD exceeds the control limits
	V	Serial Dilution exceeds the control limits

Client: Hart Crowser, Inc. Job Number: 580-29110-1

METALS BATCH WORKSHEET

Lab Name: TestAmerica Seattle Job No.: 580-29110-1

SDG No.:

Batch Number: 97935 Batch Start Date: 10/18/11 10:47 Batch Analyst: Boardway, Peter A

Batch Method: 7471A Batch End Date: 10/18/11 11:30

Batch Notes	
Hydroxylamine Hydrochloride Lot	790508
Balance ID	SEA220
Sulfuric Acid Lot Number	737209
Lot # of hydrochloric acid	807509
Lot # of Nitric Acid	782155
Hood ID or number	06
Hot Block ID number	38008
Potassium Persulfate Lot Number	782098
Potassium Permanganate Lot Number	654649
NaCL Lot #	654642
Oven, Bath or Block Temperature 1	93.5
Pipette ID	20051014
Stannous Chloride Lot Number	790550
ID number of the thermometer	15-041-1A-A
Digestion Tube/Cup Lot #	745282
Uncorrected Temperature	95 Celsius

TERRESTRIAL ECOLOGICAL EVALUATION OF THE MONTE CRISTO MINING AREA

1.0 INTRODUCTION

This terrestrial ecological evaluation (TEE) forms part of the remedial investigation (RI) for the Monte Cristo Mining Area (MCMA) site. This evaluation meets the regulatory requirements for a site-specific TEE under the Model Toxics Control Act (MTCA) (Washington Administrative Code (WAC) 173-340-7493).

This introduction provides a description of the MCMA site. It also describes the regulatory framework and purpose for the TEE.

1.1 Site Description

The MCMA is located at the headwaters of the South Fork Sauk River within the Mt. Baker-Snoqualmie National Forest near Granite Falls, Washington (Figure C-1). Three smaller watersheds (Weden Creek, Glacier Creek, and Seventysix Gulch) form the headwaters of the South Fork Sauk River approximately 6 miles upstream of Monte Cristo Lake. The area is a popular recreational destination and is accessible to hikers by a washed-out dirt road which runs south from Barlow Pass on the Mountain Loop Highway; the road crosses over and follows along the South Fork Sauk River to the Monte Cristo Townsite (Townsite). There is currently no vehicular access to the area.

The MCMA is situated within extremely rugged terrain in the Cascade Mountains, with elevations ranging upward from approximately 2,760 feet above mean sea level at the Townsite. (All elevations are above mean seal level, AMSL, unless noted otherwise.) The high-elevation portion of the MCMA is drained by Glacier Creek and Seventysix Gulch, and the headwaters of both creeks exceed 6,000 feet AMSL. The confluence of these streams at the Townsite marks the beginning of the South Fork Sauk River. The following summary of mining activity is taken from the Cascade Earth Sciences Engineering Evaluation/Cost Analysis dated April 2010 (CES 2010).

The MCMA consists of numerous abandoned base metal and gold mines. The area has a number of potential contaminant sources: open and closed adits, waste rock piles, the remnants of the ore storage facility (Ore Collector) and processing facility (Concentrator), the Assay Shack, and miscellaneous debris. Several of these potential sources are adjacent to either Glacier Creek or

Seventysix Gulch, both of which are tributaries to the South Fork Sauk River (Figures C-2A through C-2C).

Historical mining practices of in-stream disposal and erosion from waste piles has introduced mining waste to surface water. Materials containing hazardous substances associated with mining and milling include waste rock, ore, concentrate, tailings, impacted soil, impacted stream sediment, seeps from mine features (e.g., adits and waste rock dumps), groundwater, and surface water.

Prospecting began in the spring of 1889, with active claim staking and mine development shortly thereafter (CES 2010). A railroad to the Townsite was completed in 1893, and a 300-tons-per-day concentrator was constructed on site. Mining activity was strong until flooding destroyed the rail access in 1897. Rail service was restored in 1900, but production continued only on a limited basis until 1907 with several unsuccessful attempts to restore mining until 1920. A total of 54 mines and prospects, as well as ore transport, storage, and processing facilities were identified within the Monte Cristo Mining District (District) during a study conducted by the US Bureau of Mines (Johnson et al. 1983).

Production records for the District are spotty, but ore production is estimated to have been at least 310,000 tons (Johnson et al. 1983). Over 90 percent of the ore processed at the United Companies Concentrator was extracted from the Mystery/Pride mine complex and Justice/Golden Cord mine complex, but several other adits and claims contributed as well (Amann and Lambeth 2007). Total indicated and inferred gold-silver-copper-lead-zinc resources and restricted marginal reserves in the District were estimated at nearly 51 million tons, of which essentially all came from the large northeast shear zone developed by the Justice/Golden Cord, Mystery/Pride, and New Discovery mines.

Standard underground mining practices were used for all mines in the MCMA (CES 2010). Ore from the Glacier Creek/Basin mines was sent to the Ore Collector for coarse crushing (Figure C-2A). It was then trammed along the haulage way to the United Companies Concentrator (Concentrator) by horse-drawn rail. At the Concentrator, ore went through a series of fine crushers and rolls before being passed through a system of jigs for concentrating. An unknown volume of tailings were discharged to the surrounding land and Glacier Creek.

1.2 Regulatory Framework and Purpose

This ecological assessment evaluates potential hazards to terrestrial ecological receptors from residual constituent concentrations present in soil at the MCMA.

Hazards to aquatic ecological receptors are evaluated elsewhere (CES 2011). A site-specific TEE was deemed the most appropriate method for this assessment. This site-specific TEE was prepared following procedures prescribed in MTCA (WAC 173-340-7493).

A phased approach is used for the MCMA TEE. The first phase of the TEE is contained in this report and includes problem formulation and hazard characterization. In problem formulation, site soil constituent concentrations are compared to MTCA default ecological indicator soil concentrations (EISCs) and natural background concentrations to identify constituents of potential ecological concern (COPECs). Alternative EISCs were then developed for the COPECs using updated information obtained from the scientific literature. In hazard characterization, constituent concentrations in site soils are then compared to the alternative EISCs to refine the COPEC selection process for the site.

This first phase of the TEE uses a literature-based approach to assess ecological hazards. Results of the first phase of the TEE are evaluated in the conclusions and recommendations sections of this report (Sections 5.0 and 6.0) to determine if further assessment is required. Where further assessment is required, a second phase of the TEE may be conducted and may include the collection of additional site-specific data (e.g., tissue samples, bioassays) to refine hazard characterization. The need for, scope, and schedule for a second phase of the TEE will be evaluated following review of the first phase results.

MTCA (WAC 173-340-7490(3)(b)) stipulates that for commercial/industrial properties, the TEE should be protective of terrestrial wildlife (e.g., birds and mammals). For all other land uses, the TEE should be protective of plants, soil biota, and wildlife. Although patented mine claims are present at the site, we understand there are currently no permits in place for future mine development and none of the site land meets the MTCA definition of industrial or commercial property (personal communication with J. Shira, Ecology, December 1, 2011). Therefore, the goal of the site-specific TEE for the MCMA is protection of plants, soil biota, and wildlife.

The standard point of compliance for a TEE extends from the soil surface to a depth of 15 feet (WAC 173-340-7490(4)). MTCA also allows the use of a conditional point of compliance which represents the bioactive soil layer extending from 0 to 6 feet below ground surface (bgs). The conditional point of compliance represents a conservative estimate of the maximum depth of rooting and burrowing soil biota and wildlife. However, site-specific conditions may limit the bioactive soil layer to less than the default bioactive layer of 0 to 6 feet. MTCA provides for the development of site-specific points of compliance for the

TEE based upon analysis of the biological and physical conditions present at the site. Since the potential contaminants of concern discussed later in this report are relatively immobile, and characterization of soil below 6 feet deep would be very difficult due to site access constraints, we assumed for purposes of the RI that a conditional point of compliance of 0 to 6 feet below ground surface would apply to the MCMA site.

For purposes of this site-specific TEE, the term "soil" means a mixture of organic and inorganic solids, air, water, and biota that exists on the earth's surface above bedrock, including waste rock, ore, and tailings associated with mining activities, consistent with WAC 173-340-200.

This site-specific TEE is organized into the following sections:

- 2.0 Problem Formulation – problem formulation identifies the ecological issues to be addressed in the TEE and includes a description of the ecological setting for the site, an assessment of potential exposure, the identification of receptors of concern, an assessment of potential toxicity, and the identification of COPECs

- 3.0 Derivation of Alternative Ecological Indicator Soil Concentrations – describes the methods used to develop alternative EISCs for plants, soil biota, and wildlife for use in hazard characterization

- 4.0 Hazard Characterization – evaluates hazards associated with COPECs at each exposure area and provides a qualitative description of the major sources of uncertainty associated with the hazard characterization

- 5.0 Conclusions – integrates results of the hazard characterization and uncertainty analysis to formulate conclusions on the ecological hazards to terrestrial receptors

- 6.0 Recommendations – provides recommendations for further evaluation of terrestrial ecological hazards, if required

2.0 PROBLEM FORMULATION

The problem formulation for the MCMA site includes the following components:

- A description of the ecological setting of the MCMA site;
- An exposure assessment;
- Identification of ecological receptors of concern;
- A toxicity assessment; and

- The identification of COPECs.

2.1 Ecological Setting

The MCMA is situated in a predominantly forested area characteristic of the Pacific Northwest region. The former mining area contains numerous waterways flowing through forested valleys that transition to rocky ridges and peaks at higher elevations. Terrestrial habitats include vegetated valley bottoms, steep valley walls and cliffs, rocky ridges, alpine meadows, talus fields, lakes, and mountain peaks. These habitat types support a wide variety of wildlife including threatened and endangered species that use the site on a seasonal to permanent basis.

Three main watersheds are located in the MCMA: Glacier Creek, Seventysix Gulch, and Weden Creek (Figure C-1). Each watershed contains one main drainage or waterway with numerous seasonal to permanent and named and unnamed tributaries flowing into the main drainage. Additionally, each of the individual watersheds contains some or all of the terrestrial habitats discussed above, which support diverse flora and fauna despite impacts from former mining activities.

Soil samples were collected at numerous mine sites within the MCMA and potential terrestrial receptor observations (Attachment A) were recorded during field visits. Terrestrial receptor data was collected at four abandoned mine locations in the Glacier Creek watershed, seven in Seventysix Gulch watershed, and two in Weden Creek watershed.

2.1.1 Terrestrial Habitats

The Glacier Creek, Seventysix Gulch, and Weden Creek watershed boundaries generally follow ridgelines, passes, and peaks to form the individual watersheds or basins. Terrestrial habitats observed within the three watersheds comprising the MCMA include, but may not be limited to: valley bottoms, valley walls, ridges, meadows, talus fields, lakes, and mountain peaks (Figures C-3A through C-3C). In addition, disturbed habitat associated with former mines, patents, and prospects in the MCMA are also present within the three watersheds.

Glacier Creek Watershed

The Glacier Creek watershed is located east/northeast from Seventysix Gulch. This watershed is characterized by rock, snow, and ice (Figure C-3A). Small portions of this watershed contain coniferous forest and consist primarily of small forested or shrub stands interspersed with rock and talus. Shrubs and

herbaceous vegetation dominate the lower portion of the basin slopes. Numerous seasonal waterways exist within the eastern portion of the watershed and route snowmelt into Glacier Creek.

Seventysix Gulch Watershed

The Seventysix Gulch watershed is located east/southeast of Weden Creek and is geographically the smallest of the three watersheds. The northern half and low elevation areas of the watershed are predominately forested and dominated by coniferous forest (Figure C-3B). The southern portion of the watershed consists of talus slopes, rocky ridges, lakes, mountain peaks, and glaciers. Vegetation on talus slopes, peaks, and ridges is limited to areas with adequate soil to support plant growth. Shrub species, such as salmonberry (*Rubus spectabilis*) and slide alder (*Alnus sinuata*), are common on talus or rock slopes and ridgelines, and herbaceous vegetation, including a variety of ferns, grasses, and mosses, are typically found on vegetated gravel bars and adjacent to waterways.

Weden Creek Watershed

Most of the Weden Creek watershed is located at the lowest elevation of the three watersheds in the MCMA and is distinguished from the other watersheds by a dominance of forested vegetation including coniferous and deciduous species within valley bottom, talus slope, and ridge habitats. The western and southern portions of this watershed contain talus slope, lakes, rocky ridges, and mountain peaks that generally support forested or shrub vegetation communities with the exception of areas at the highest elevations (Figure C-3C).

Forest habitats provide shelter, food, and migration corridors for small to large mammals, herpetiles, macroinvertebrates, and birds. Forested habitats in the MCMA include riparian areas, young and old coniferous and deciduous forests, and other vegetated habitats with a canopy cover. Forested habitats vary in structural and species diversity. Past mining activities and natural disturbance regimes (e.g., erosion, avalanches) have altered these habitats, leaving impacted portions of the individual watersheds with young alder forest and limited structural diversity. Large portions of the watersheds continue to support intact and structurally diverse forested habitats that are important food sources for small to large mammals such as squirrels, deer, and bears, which rely on the nuts, berries, and plant foliage on a seasonal basis. This habitat type is also crucial for the development of macroinvertebrate populations that support other wildlife populations, such as fish, birds, and amphibians, throughout the area. Shrub and scrub habitats are interspersed among the forested and rocky habitat types and provide increased structural diversity and similar habitat functions as forested habitat types.

Talus slopes are numerous and interspersed with other habitat types throughout the MCMA. Talus is present in many of the seasonal and permanent drainages, at the base of rocky ridges and cliffs, and along ridgelines. These habitats are present from low to high elevation areas, and transition from valley walls and rocky ridges to the valley bottom habitats. Talus slope ranges from sparse to densely vegetated (primarily salmonberry, Indian hellebore [*Veratrum viride*], Devil's club, and alder) to unvegetated. Talus slopes serve as important habitat by providing refuge and food storage functions that support small to medium mammals, such as wolverine, pika, and marmot. Additionally, mammals using talus slope habitat support carnivorous mammal populations.

Disturbed habitat from former mining activities exists in localized areas throughout the three watersheds. Inactive mine features including adits and waste rock piles, among other features, remain. Disturbance as a result of these activities and features ranges from extensive to limited. In general, disturbed habitats from mining activities equal a small percentage (less than 1 percent)of the overall combined or individual watershed areas.

2.1.2 Plants and Animals

Numerous plant and animal species are known or likely to occur on or in the immediate vicinity of the MCMA. Plant species include trees, shrubs, and herbaceous vegetation as well as sensitive or rare plants. Table C2-1 lists plant species observed or likely to occur in the MCMA. Wildlife is relatively abundant throughout the three watersheds, and consists of macro fauna that maintain large to small ranges. Tables C2-2 through C2-5 summarize common bird, mammal, invertebrate, amphibian and reptile species observed or likely to occur in the MCMA.

Glacier Creek Watershed

The Glacier Creek watershed contains dominant vegetation, such as grand fir, subalpine fir (*Abies lasiocarpa*), cedar, and slide alder with an understory of blueberry, huckleberry (*Vaccinium* sp.), and moss. Seasonal to permanent waterways including seeps and lakes generally support a fringe of riparian or wetland vegetation consisting of alder, Devil's club, salmonberry, vine maple, willow (*Salix* sp.), and grasses. These riparian habitats support macroinvertebrate populations, which provide food for fish, reptiles, amphibians, and birds.

Seventysix Gulch Watershed

Dominant vegetation in the Seventysix Gulch watershed consists of Douglas-fir, true firs, hemlock, and cedar with an understory of salmonberry (*Rubus*

spectabilis), vine maple (*Acer circinatum*), red elderberry (*Sambucus racemosa*), Devil's club (*Oplopanax horridus*), ferns, and grasses.

Weden Creek Watershed

The Weden Creek watershed contains dominant vegetation including Western hemlock (*Tsuga heterophylla*), Western redcedar (*Thuja plicata*), Douglas-fir (*Pseudotsuga menziesii*), grand fir (*Abies grandis*), other true firs, and red alder (*Alnus rubra*) with an understory of plants similar to Seventysix Gulch.

Many terrestrial wildlife populations are transitional within a defined home range, and occupy different areas based on food sources, shelter and reproductive needs. Individual mammal and bird species or populations residing in the MCMA likely use multiple watersheds to meet their development needs. Species, such as amphibians and reptiles, maintain a smaller home range, and move to new habitats when food is scarce, natural disaster relocates their population, or to meet other growth and development needs. Use of all three watersheds by large mammals (deer, bear, mountain lion) is evident throughout the MCMA. Evidence of small (pika, mice) and other large mammal use can also be seen throughout the MCMA. In addition, terrestrial birds are often heard but may not be seen and occupy various portions of the site year round.

Common terrestrial wildlife species known to inhabit the site on a seasonal to permanent basis include, but are not limited to: Columbia black-tailed deer (*Odocoileus hemionus*), black bear (*Ursus americanus*), mountain lion (*Felis concolor*), deer mouse (*Peomyscus maniculatus*), pika (*Ochotona princeps*), tailed frog (*Ascaphus truei*), Cascades frog (*Rana cascadae*), Western toad (*Bufo boreas*), harlequin duck (*Histrionicus histrionicus*), northern flicker (*Colaptes aurantus*), northern goshawk (*Accipiter gentilis*), olive-sided flycatcher (*Contopus borealis*), pileated woodpecker (*Dryocopus pileatus*), northern spotted owl (*Strix occidentalis*), willow flycatcher (*Empidonax traillii*), and a variety of terrestrial invertebrates. Lists of common species known or likely to occur in the MCMA are included in Tables C2-1 through C2-5.

Mining-disturbed habitats generally supported more limited plant and animal communities than the surrounding natural habitats. Although field observations of mine and waste rock locations (Attachment A) showed fairly robust vegetation in some localized areas, most disturbed habitats had no to sparse vegetative cover. Few birds or mammals were observed in the disturbed habitats, while no amphibians or reptiles were observed in disturbed habitats. Few terrestrial invertebrates (e.g., spiders, slugs) were observed in disturbed habitats and no subterranean invertebrates (i.e., earthworms) were observed

during excavation of mine feature soil sample pits associated with TEE observations.

2.1.3 Sensitive Species

Federal and state threatened, endangered, and sensitive plant and animal species are known or likely to occur in the MCMA. In addition to threatened, endangered, and sensitive species, several candidate species, monitor species, and species of concern are also expected to occur at or near the site. Sensitive species have been grouped for the three watersheds and Table C2-6 summarizes threatened, endangered, and sensitive species that may occur in the MCMA.

Many of the mammals and birds identified on federal and state lists have wide ranges and are likely present on a seasonal permanent basis depending on a variety of ecological conditions such as food, shelter, and reproductive needs. Limited information is available on the movements of individual species including grizzly bear (*Ursus arctos*), gray wolf (*Canis lupus*), Canada lynx (*Lynx canadensis*), Columbia black-tailed deer (*Odocoileus hemionus*), and wolverine (*Gulo gulo*), among others.

Several sensitive herpetiles (reptiles and amphibians) are documented as occurring within Snohomish County. Of these, tailed frog (*Ascaphus truei*), Cascades frog (*Rana cascadae*), Western toad (*Bufo boreas*), and Oregon spotted frog (*Rana pretiosa*) are expected to occur on or in the vicinity of the MCMA at locations containing aquatic, riparian, and terrestrial characteristics that will support localized populations.

Numerous threatened and sensitive plant species are documented in Snohomish County. Two of these species, boreal bedstraw (*Galium kamtschaticum*) and whitebark pine (*Pinus albicaulis*), are expected to occur as localized populations throughout the county. It is possible that other species are present on or in the immediate vicinity of the MCMA.

2.2 Exposure Assessment

This section delineates the MCMA into ecological exposure areas, describes methods used to calculate the reasonable maximum soil exposure point concentrations (EPCs), and presents a terrestrial ecological conceptual site model (CSM) where complete and significant ecological exposure pathways are identified.

2.2.1 Delineation of Ecological Exposure Areas

The MCMA covers approximately 5,815 acres of the 12,500 acre South Fork Sauk River Watershed. Wildlife use of the MCMA may be affected by factors such as topography and distance. For example, voles potentially inhabiting the Glacier Creek Watershed are unlikely to migrate to the Seventysix Gulch Watershed because the talus slopes forming the ridge between these two watersheds may act as a physical barrier. In addition, different sources of contamination (e.g., tailings versus waste rock) may affect ecological exposures. For example, the fine-grained texture of tailings versus the coarse-grained texture of waste rock conceivably could affect the bioavailability of soil contaminants[1] These three factors (topography, distance, and contaminant source) were used to delineate ecological exposure areas for the MCMA. Five ecological exposure areas were identified (Figures 4A through 4C) as follows:

- Area 1: Processing Area
- Area 2: Lower Watershed Area
- Area 3: Upper Glacier Creek Watershed
- Area 4: Upper Seventysix Gulch Watershed
- Area 5: Weden Creek Watershed

Area 1 includes the main sources of concentrated ore and processed ores, the Ore Collector, Haulage Road, and Concentrator. The Assay Shack is included in Area 1 because of its proximity to these source areas. Areas 2, 3, 4, and 5 have open and closed adits and waste rock piles as the primary contaminant sources. The lower portions of the watersheds are geographically interconnected.

2.2.2 Derivation of Exposure Point Concentrations

Soils data collected from 2005 through 2011 are included in this TEE. Although a few soil samples were collected as early as 2002, most samples were collected between 2005 and 2011. Potential sources of contamination have been in place since at least the 1920s in Glacier Creek and Seventysix Gulch watersheds and since the 1950s in Weden Creek when mining operations ceased. Concentrations of constituents in soil at the MCMA are considered to be relatively stable. Therefore, the historical data collected between 2005 and

[1] Gradation of the waste affects potential exposure via incidental ingestion of soil by wildlife, and via potential reactivity that may cause phytotoxicity to plants. Both incidental ingestion during foraging, and incidental ingestion while cleaning of fur or plumage is anticipated to increase as the grain-size of the soil becomes finer. Finer grained particles have more surface area per unit weight compared to coarse-grained particles, which increases reactivity (e.g., oxidation of sulfide minerals that decreases pH and increases solubility and bioavailability of metals).

2011 were considered suitable for characterizing the soil chemical concentrations at the MCMA.

All 2011 soil samples were either collected from the 0- to 6-inch interval, representing surface soil conditions, or were collected from the 6- to 12-inch interval representing subsurface soil conditions. Although many samples collected before 2011 were also collected from these same intervals, some samples were collected from other subsurface intervals (e.g., 1.5 to 2 feet, 6 to 6.5 feet). Only soil samples collected from intervals starting at less than or equal to 6 feet were used to characterize ecological exposures. The 0- to 6-foot soil interval corresponds to the assumed biologically active zone and represents the conditional point of compliance (WAC 173-340-7490(4)(a)). Data from the 0- to 6-foot interval were pooled to estimate the EPCs for each ecological exposure area.

The soils data used to calculate the reasonable maximum EPCs are shown in Attachment B. Although most soil samples were discrete samples, two samples (COL-09 (6-6.5) and Potomac 1) were composite samples. These composite samples were included in the soils database.

The reasonable maximum EPCs were calculated using EPA's ProUCL version 4.00.005[2] statistical software using the upper confidence limit (UCL) option. The UCL option was run in the "with non-detects" mode to accommodate datasets containing undetected values[3]. ProUCL output files of general statistics and UCL estimates are provided in Attachment C. Attachment C also contains tables of summary statistics for constituents in each ecological exposure area which were also derived using ProUCL.

2.2.3 Ecological Conceptual Site Model (CSM)

The CSM identifies the contaminant sources, release/transport mechanisms, impacted media, routes of exposure, and receptors. A summary CSM was presented in the Phase 1 Spatial Analysis Summary Report (Hart Crowser 2011) and is refined here to characterize the exposure of terrestrial receptors to soil-borne constituents.

---

[2] Available online at http://www.epa.gov/esd/tsc/TSC_form.htm.

[3] ProUCL recommends the dataset contain a minimum of eight to ten samples to calculate a UCL. However, ProUCL will calculate a UCL with datasets containing at least five samples, but warns the user that too few samples may be available to calculate a reliable UCL. ProUCL will not calculate a UCL when less than five samples are available. All of our datasets had a minimum of five samples.

Sources of contamination include waste rock, tailings, and facilities where mining and ore concentrating activities occurred. The primary release mechanisms to soil include wind erosion of fine particles and water erosion. The primary impacted media considered in this evaluation is soil. Plants and soil biota may accumulate constituents from affected soil and then be consumed by animals. Plants and soil biota are secondary impacted media.

Plants primarily accumulate soil-borne constituents in their tissues through direct uptake by roots from the soil. Constituents dissolve in the soil pore water where they can then be absorbed by the roots. Wind-borne dust may accumulate on leaf surfaces.

Soil biota can accumulate soil-borne constituents in their tissues through direct uptake and through the ingestion of soil. Like plants, metals dissolved in soil pore water may be absorbed across the outer membrane of invertebrates and accumulate in their tissues. Some soil invertebrates ingest soil and/or soil organic matter and may absorb dissolved constituents across the gut membrane.

Birds and mammals become exposed to constituents present in soil through two primary exposure pathways:

- Incidental ingestion of soil during foraging or purposeful ingestion of soil to meet nutritional requirements; and
- Ingestion of prey that have accumulated constituents from the soil.

The TEE only considers exposure of birds and mammals to constituents present in soil because the goal of the TEE is to develop soil cleanup levels. Although terrestrial wildlife may drink surface water, this is typically a minor pathway of exposure. Although birds and mammals may be exposed to high levels of bioaccumulative constituents through the consumption of aquatic biota from contaminated areas, this pathway is not considered in the TEE process.

Once ingested, constituents may be dissolved from the mineral soil and then absorbed across the gut membrane of birds and mammals. Likewise, constituents accumulating in plants and soil biota may be dissolved in the gut once they are consumed and subsequently absorbed across the gut membrane.

The inhalation and dermal contact exposure pathways for wildlife may be complete, but they are considered insignificant. This is consistent with EPA's approach for developing the national ecological soil screening levels (EcoSSLs) (EPA 2003f). The rationale for this approach is:

- Burrowing animals could be exposed to relatively high concentrations of volatile organic compounds (VOCs) in their burrows via inhalation. However, none of the constituents at the MCMA are VOCs and the long duration since mining operations ceased (1920) means that the residual volatile fraction of constituents should have already volatilized. Therefore, inhalation of volatilized constituents is not considered to be a significant pathway of exposure.
- Soil particles containing mining-related constituents may be inhaled by wildlife. However, respirable particles are most likely ingested as a result of mucocilliary clearance rather than being inhaled. Evidence (EPA 2003f) suggests that inhalation exposure is less than 0.1 percent of the oral exposure. Therefore, inhalation of constituents associated with particulates is not considered to be a significant pathway of exposure.
- Birds and mammals may be exposed to constituents in soil via dermal contact. However, scientific information to quantify this pathway is lacking. Evidence suggests that dermal exposure is less than 1 to 11 percent of the exposure due to ingestion (EPA 2003f). The contribution of the dermal route to the total dose estimate made by EPA was based on an exposure model for the meadow vole. According to EPA, meadow voles do burrow when excavating nests/resting areas, and when seeking shelter from severe weather. Although not specifically mentioned in the TEE discussion of dermal absorption, EPA also notes that dermal absorption of metals across the skin is considered a minor pathway because metals tend to be strongly bound in the soils and have a relatively low tendency to cross the skin. Therefore, dermal contact with soil-borne constituents is not considered to be a significant pathway of exposure.

Figure C-5 shows the ecological CSM for the terrestrial habitats at the MCMA.

2.3 Receptors of Concern

The default receptors of concern used to evaluate terrestrial ecological hazards under MTCA are plants, soil biota, and wildlife. Plants and soil biota are broad receptor categories. The default MTCA EISCs used to evaluate hazards to these receptors (MTCA Table 749-3) are assumed to be protective of most species of plants and soil biota.

The default MTCA EISCs used to evaluate hazards to wildlife (MTCA Table 749-3) are assumed to be protective of all or most species of birds and mammals. The wildlife EISCs were derived using exposure models for three species: the vole, shrew, and robin (MTCA Table 749-4). The vole is an herbivore and is exposed to constituents through the ingestion of plants that accumulate constituents from the soil as well as direct ingestion of soil. The

shrew and robin are insectivores and are exposed to constituents through the ingestion of soil invertebrates that accumulate constituents from the soil and the direct ingestion of soil. These three species have relatively small home ranges, high food ingestion rates, and forage on prey that is in direct contact with soil (plants and soil biota). Therefore, these three species are assumed to be highly exposed to constituents in soil.

As noted in Section 2.1.2, numerous species of birds and mammals potentially inhabit the MCMA. Upper trophic-level predators such as the weasel and red-tailed hawk have relatively large home ranges and forage on small mammals which are not expected to accumulate high levels of constituents (i.e., metals/metalloids) in their tissues[4]. Likewise, larger herbivores such as deer have large home ranges and are not expected to be as highly exposed as herbivores with small home ranges such as the vole. Other insectivores such as most insect-eating birds (e.g., warblers, wrens, swallows) and bats feed upon invertebrates that may not be highly exposed to constituents in soil (e.g., moths that live and feed on plants) and will not accumulate constituents to levels found in soil-dwelling invertebrates. Therefore, the default MTCA wildlife receptors of concern (vole, shrew and robin) are likely to be more highly exposed to constituents in soil than most other species of birds and mammals.

Several sensitive wildlife species occur within the MCMA (Section 2.1.3). None of these species is expected to be more highly exposed to constituents in soil at the site than the default MTCA receptors. Although MTCA does not require a change in the site-specific TEE methodology when sensitive species may be present, typically, ecological assessments afford additional protection for sensitive species. The potential impact of the presence of sensitive species on the results of the TEE is discussed in the uncertainty section of hazard characterization (Section 4.2).

Based on the preceding discussion, the MTCA default ecological receptors (i.e., plants, soil biota, vole, shrew, and robin) are retained as the receptors of concern for the site-specific TEE of the MCMA.

2.4 Toxicity Assessment

This section includes a description of potential effects of COPECs, the identification of ecological indicator soil concentrations (EISCs) used for

[4] EPA 2007b derived that soil to small mammal bioaccumulation factors (BAFs) for six metals and BAFs ranged from 0.004 to 0.05. Bioaccumulative constituents have bioaccumulation factors greater than one.

identifying COPECs, and the assessment and measurement endpoints used in this site-specific TEE.

2.4.1 Potential Effects of Constituents of Potential Ecological Concern

The COPECs are identified in Section 2.5 for each ecological exposure area and a total of 16 COPECs were identified at one or more ecological exposure areas. These COPECs may affect plants, soil biota, and wildlife in a variety of ways. Several on-line sources of comprehensive ecotoxicological information describe the effects of COPECs on plants, soil biota, and wildlife.

2.4.2 Ecological Indicator Soil Concentrations

EISCs are soil concentrations below which ecological hazards are deemed to be acceptable. EISCs represent threshold concentrations below which adverse impacts to individual organisms are unlikely to occur. The EISCs used in Section 2.5 to identify the COPECs come from MTCA Table 749-3. EISCs were developed for plants, soil biota, and wildlife and the lower of these EISCs was selected as the final EISC to help identify COPECs (Table C2-7).

2.4.3 Assessment and Measurement Endpoints

MTCA supports the use of endpoints to help frame the approach for the site-specific TEE. An endpoint is a characteristic of an ecological component that may be affected by exposure to a hazardous substance. The EPA defines two types of endpoints: assessment and measurement (EPA 1997b). An assessment endpoint is an explicit expression of the environmental value that is to be protected. A measurement endpoint is a measurable ecological characteristic that is related to the valued characteristics chosen as the assessment endpoint and is a measure of biological effects. The assessment and measurement endpoints identified for the MCMA TEE are shown in Table C2-8.

2.5 Identification of Constituents of Potential Ecological Concern

COPECs were identified for each ecological exposure area by comparing the EPCs (Section 2.2.2) to the default EISCs (Section 2.4.2) and natural background. The EPCs for each constituent had to exceed the corresponding EISC and natural background to be identified as a COPEC.

2.5.1 Natural Background Comparison Methods

Background comparisons were made to test the hypothesis that the mean/median concentrations of constituents in soil samples from the ecological exposure areas identified in Section 2.2.1 were less than or equal to the mean/median concentrations in samples from natural background areas. The software and statistical methods recommended in EPA's ProUCL statistical software package were used to make the background comparisons[5].

Nonparametric hypothesis testing methods were used for making the background comparisons. Nonparametric methods were selected because:

- They can be used on data sets with normal and non-normal distributions.
- They have good performance for a wide variety of data distributions.
- They are not unduly affected by outlier observations.
- They can handle data sets with nondetect values.

Following EPA's ProUCL recommendations, the nonparametric Wilcoxon-Mann-Whitney (WMW) test was used when less than 40 percent of the samples from

[5] ProUCL version 4.00.005 software and supporting documentation are available online at http://www.epa.gov/esd/tsc/software.htm.

either the MCMA or background data sets contained nondetect values[6]. However, the WMW test was not used on data sets with multiple detection limits. A two-sample WMW test in the "Full" mode was run on data sets with all detections, while a two-sample WMW test in the "with NDs" mode was run on data sets with non-detections > 0 percent and < 40 percent. A two-sample Gehan test was used when 40 percent or more of the samples from either the MCMA or background areas were nondetect values ("with NDs" mode). The Gehan test was also used when multiple detection limits were present in either the MCMA or background data sets. Table C2-9 shows the process used for selecting the background test statistic for each constituent at each ecological exposure area.

ProUCL background comparison output files are provided in Attachment D.

2.5.2 Constituent of Potential Ecological Concern

The COPECs for each ecological exposure area are identified in Tables C2-10 through C2-14.

Table C2-15 presents a summary of the COPECs. A total of 17 COPECs were identified at one or more ecological exposure areas and include aluminum, antimony, arsenic, barium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, silver, thallium, and zinc. Ecological exposure Area 1 (Process Area) had the highest number of COPECs (13), while Area 5 (Weden Creek Watershed) had the fewest COPECs (7). Copper, iron, and zinc were COPECs at all five areas, while beryllium and vanadium were not COPECs at any area.

3.0 DERIVATION OF ALTERNATIVE ECOLOGICAL INDICATOR SOIL CONCENTRATIONS

This section identifies alternative EISCs for plants, soil biota, and wildlife. These alternative EISCs are used to refine the hazard estimates for each ecological exposure area in the hazard characterization (Section 4.0).

[6] Although ProUCL recommends the Quantile test be run in parallel with the Wilcoxon-Mann-Whitney test, the Quantile test is only used to detect a shift to the right in the right tails of the site and background data sets. Since the Quantile test has several statistical limitations that may apply to MCMA site data sets, it was not used in the background comparisons.

3.1 Alternative Indicator Soil Concentrations for Plants and Soil Biota

The MTCA default EISCs for plants and soil biota (MTCA Table 749-3) come from the Oak Ridge National Laboratory (ORNL) toxicological benchmarks for plants (Efroymson et al. 1997a) and soil biota (e.g., earthworms) (Efroymson et al. 1997b). For both plants and soil biota, ORNL conducted literature searches to identify appropriate toxicity studies (Efroymson et al. 1997a, 1997b). The general criteria used to identify acceptable toxicity studies were:

1) The methodology was clearly stated (especially concentrations of applied chemicals) and followed in the experiment.

2) Results were quantified as measures of growth or yield for plants (e.g., weight, height), measures of metabolic activity or tissue chemical concentration were used if measures of growth or yield were not available for a particular chemical of interest, and measures of survivorship, growth, respiration, reproduction, substrate transformation, or enzyme activity for earthworms.

3) Results were presented in numeric form or graphical presentations of data were clearly interpretable.

4) An unambiguous reduction existed in the measured parameter within the range of applied concentrations of the chemical of interest.

Growth or yield was selected as ecologically relevant endpoints for plants (Efroymson et al. 1997a). Virtually all of the plant toxicity studies were conducted using agronomic crops (lettuce, radish, beans, wheat, etc.). Growth, reproduction, or activity was selected as the ecologically relevant endpoints for soil invertebrates (Efroymson et al. 1997b). Toxicity data for earthworms was used to characterize adverse effects to soil biota. A 20 percent reduction in the endpoint was considered ecologically significant and was used as the lowest observed adverse effect concentrations (LOAEC). Acceptable LOAEC toxicity values were rank ordered and the approximate 10th percentile of the distribution was selected as the benchmark. Confidence in each benchmark was ranked as low ($n \leq 10$), medium ($n > 10$ and $n \leq 20$), or high ($n>20$) where n is the number of LOAECs used to derive the benchmark.

Table C3-1 shows the default MTCA EISCs for plants and soil biota obtained from ORNL (Efroymson et al. 1997a, 1997b). Table C3-1 also shows the confidence associated with each EISC and most EISCs were assigned a low confidence.

The most recent and comprehensive sets of EISCs for plants and soil biota were derived by EPA as part of the EcoSSLs program. The EcoSSLs are concentrations of constituents in soil that are protective of ecological receptors that commonly come into contact with soil or ingest biota that live in or on soil. These values can be used to identify those COPECs in soils that may require further evaluation in a baseline ecological risk assessment.

EPA (2003a) conducted a comprehensive literature search to identify and acquire potentially relevant toxicology literature for use in setting EcoSSLs for plants and soil invertebrates. Once the literature was assembled, the following process was used to derive EcoSSLs for plants and soil invertebrates (EPA 2003b):

1) Toxicity studies were reviewed and scored using nine experimental quality criteria. Each criterion was scored 0, 1, or 2 with 2 being the highest score. A minimum score of 10 was required to conclude the study was acceptable.

2) A minimum of three acceptable toxicity values were required to derive an EcoSSL.

3) Only toxicity data for ecologically relevant endpoints was used. Endpoint preference was reproduction > population > growth. However, most of the plant toxicity studies used the endpoint of biomass production.

4) If data for more than one toxicity parameter were reported for a study, a preferred toxicity value was selected based on the following hierarchy: effects concentration 20 (EC20) > maximum allowable threshold concentration (MATC) > effects concentration 10 (EC10), where EC20 and EC10 are effect concentrations for 20 and 10 percent of the population and the MATC is the maximum acceptable threshold concentration. The MATC was calculated as the geometric mean of the No Observed Adverse Effect Concentrations (NOAEC) and the LOAEC.

5) The EcoSSL was calculated as the geometric mean of at least three acceptable toxicity values.

EPA used toxicity studies on earthworms, potworms, springtails, and nematodes to characterize adverse effects on soil invertebrates. Virtually all of the plant toxicity studies were conducted using agronomic crops (lettuce, radish, beans, wheat, etc.).

Kapustka et al. (2006) updated the plant EcoSSLs for cobalt and nickel in a study sponsored by the EPA to fill some data gaps identified in the earlier EcoSSLs.

Although the EcoSSLs from the Kapustka study have not been formally adopted as the national EcoSSLs by EPA, their study used multiple test soils, multiple plant species, and a rigorous experimental design. Therefore, the plant EcoSSLs for cobalt and nickel derived by Kapustka et al. (2006) were selected as alternative EISCs.

The process used by EPA to derive the EcoSSLs for plants and soil invertebrates is considered to be scientifically defensible and state of the art. Therefore, EPA's EcoSSLs for plants and soil invertebrates are selected as alternative EISCs and are shown in Table C3-1.

3.2 Alternative Indicator Soil Concentrations for Wildlife

MTCA uses three surrogate wildlife receptors to derive EISCs protective of wildlife: the vole, shrew, and robin (WAC 173-340 Table 749-4). Exposure models are used to derive the EISC for each surrogate species and the lowest EISC was selected as the wildlife EISCs presented in Table 749-3 of MTCA. The general model used to derive the wildlife EISCs is shown in Equation 1.

Equation 1:

$$EISC = \frac{TRV}{[(FIR \times P \times BAF) + (SIR \times RGAF)]}$$

Where:

EISC = ecological indicator soil concentration (mg/kg)
TRV = toxicity reference value (mg/kg /day)
FIR = food ingestion rate (kg dry food/kg body weight/day)
P = proportion of contaminated food in diet (unitless)
BAF = bioaccumulation factor (unitless)
SIR = soil ingestion rate (kg dry soil/kg body weight/day)
RGAF = gut absorption factor for constituent in soil (unitless)

MTCA assumes a default RGAF value of one for deriving wildlife EISCs (WAC 173-340 Table 749-5). The RGAF is expressed as the proportion of gut absorption of a constituent in soil relative to the gut absorption of the constituent in food and is a measure of relative bioavailability. Soils have long been known to affect the bioavailability of constituents which may bind to the solid phases of soil to varying degrees (NRC 2003). However, limited published information exists that characterizes the bioavailability of metals in soil to wildlife (birds and mammals). In addition, the relatively low pH measured in MCMA soil may affect the bioavailability of metals in the soil. Therefore, it is not possible to

justify the use of alternative RGAFs and the default RGAF of one is used to derive alternative wildlife EISCs.

MTCA uses P values of 0.50 for the shrew, 1.0 for the vole, and 0.52 for the robin (WAC 173-340 Table 749-4). The P value for the shrew is based on a published article analyzing the proportion of ground-dwelling prey measured in the diet of shrews, while the P value for the robin is based on a published article evaluating the proportion of feeding events occurring at ground level (Ecology 2000). The site-specific diets of shrews and robins vary with season and prey availability. For example, EPA (1993) characterizes the diet of robins in the western United States as consisting primarily of invertebrates during the spring and summer and consisting primarily of fruit during the fall and winter. Therefore, it is not possible to justify the use of alternative P values for shrew and robin at the MCMA site. The P value for the vole is based on the assumption that all the plants consumed are growing in soil from the site. This is a reasonable assumption and use of an alternative P value for the vole cannot be justified.

Although EPA derived EISCs protective of wildlife, these values are not appropriate for use in Washington State because they were not derived in a manner consistent with the TEE process. Besides using somewhat different receptor species, EPA used TRVs for birds and mammals that represented no observed adverse effects levels (NOAELs), while MTCA used lowest observed adverse effects levels (LOAELs) as the TRVs. EPA's EcoSSL TRV datasets for birds and mammals are considered the most recent and comprehensive available. Furthermore, EPA derived state of the art values for three wildlife exposure parameters: FIRs, SIRs, and BAFs.

Alternative values for four model parameters are evaluated in Sections 3.2.1 (TRVs), 3.2.2 (BAFs), and 3.2.3 (FIRs and SIRs).

Alternative wildlife EISCs cannot be calculated before hazard characterization because many of the plant and earthworm BAFs are based upon regression equations that require the input of site-specific soil EPCs (see Section 3.2.2). Therefore, alternative wildlife EISCs are presented in the hazard characterization for each ecological exposure area (Section 4.0, Tables C4-1 through C4-5).

3.2.1 Alternative Wildlife Toxicity Reference Values

The ORNL's Toxicological Benchmarks for Wildlife report (Sample et al. 1996) was the source of most of the wildlife TRVs shown in MTCA Table 749-5 (Ecology 2000). The LOAEL values were selected from Sample et al. (1996) and used to derive the wildlife EISCs shown in MTCA Table 749-3. Sample et al.

(1996) reviewed the toxicological data from several sources and selected the most appropriate value for each constituent. The rationale for selecting a specific toxicity study as the basis of TRV derivation was not specifically stated, but preference was given to studies using reproduction and development endpoints, chronic exposure periods, and multiple exposure levels.

The ORNL TRVs for mammalian species of wildlife were selected from studies conducted primarily on laboratory rodents, and TRVs for avian species were selected from laboratory studies on domestic and wild birds. Many toxicity studies reported exposure as constituent concentrations in food or water that were converted to a dose using estimates of food and water ingestion rates for the test animals. In cases where the toxicity study did not represent chronic exposure, the TRVs were adjusted using uncertainty factors.

The selected source for alternative bird and mammal TRVs is EPA's EcoSSL documents[7]. This approach is consistent with recent Ecology recommendations (Sloan 2011). The toxicological data used by EPA to derive the wildlife TRVs is relatively current, comprehensive, and is state of the art. EPA conducted comprehensive literature surveys and identified ecotoxicity publications meeting specific scientific criteria for use in deriving TRVs for birds and mammals (EPA 2003c). A preliminary review of each article was conducted to determine if the article contains data suitable for TRV derivation. For example, studies based on acute exposure, reporting results for dead animals, using mixtures of constituents, studies lacking experimental controls, studies not reporting a test duration, and studies reporting data from research not conducted by the author were deemed unsuitable. Each study was then reviewed in detail and scored using ten data quality criteria (EPA 2007a). Total scores range from 0 to 100 and a minimum score of 66 was required for acceptance of the study. Finally, NOAEL and LOAEL TRVs were derived for each study and expressed as a daily dose of constituent (mg/kg - day).

The alternative bird and mammal TRVs were based on LOAEL toxicity data following MTCA methodology (WAC 173-340-7493(4)(a)). Toxicity data for growth, reproduction, and survival endpoints were used. A minimum of three acceptable toxicity values were needed to derive an alternative TRV consistent with EPA EcoSSL methodology (EPA 2003c, 2007a). Only bounded LOAEL values[8] were used because studies that did not report a NOAEL were

[7] Available online at http://www.epa.gov/ecotox/ecossl/.

[8] Bounded toxicity data are data that include both NOAEL and LOAEL values. Studies that report a LOAEL, but not a NOAEL are limited by the fact that the range between the NOAEL and LOAEL are unknown and, therefore, it is difficult to interpret the LOAEL value. EPA (2007a) uses the bounded toxicity data concept in developing wildlife TRVs for the EcoSSL Program.

considered unacceptable. The tenth percentile value of the selected LOAELs was selected as the alternative TRV. The tenth percentile value is considered sufficiently protective and reduces uncertainties associated with toxicity values occurring at the extremes of the data distribution (i.e., data outliers).

The default MTCA TEE process used body scaling to adjust the mammalian TRVs from the toxicity test species (e.g., a mouse or rat) to the surrogate receptor (i.e., the vole and shrew) (Ecology 2000). Body scaling was not applied to birds because scientific data were insufficient to support body scaling. EPA did not use body scaling to adjust TRVs for mammals or birds for the derivation of the EcoSSLs (EPA 2007a). Furthermore, most of the toxicological data used by EPA for EcoSSL mammalian TRVs were based on studies using mice and rats whose body weight is similar to the vole and shrew. It is concluded that body scaling would have little effect on the alternative TRV. Therefore, body scaling was not applied to the derivation of alternative mammalian TRVs for the MCMA TEE[9].

Alternative bird and mammal TRVs are shown in Table C3-2. Supporting information showing how these TRVs were derived is provided in Attachment E.

3.2.2 Alternative Bioaccumulation Factors

The MTCA model used to derive wildlife EISCs (Equation 1) requires input of constituent-specific BAF values. MTCA provides default BAFs for plants and soil biota in MTCA Table 749-5 and their derivation is explained in the Technical Addendum to MTCA Sections 7490-7493 (Ecology 2000). The plant BAFs were obtained from EPA's Technical Support Document for the Land Application of Sewage Sludge (EPA 1992). The default plant BAFs were calculated as the geometric mean of uptake factors for forage grasses reported in EPA (1992). The soil concentration was estimated from an application rate reported in kg/ha divided by two. For metals/metalloids that were not addressed by EPA (1992), a default plant BAF of 1.01 was assumed based on the BAF for molybdenum, which was the highest value reported for a metal/metalloid constituents by EPA (1992). The MTCA default soil biota BAFs were derived from selected publications for individual constituents. These studies were typically conducted using earthworms and if more than one value was available, the average value was used as the default soil biota BAF. For metal/metalloid constituents for which a study was not found, a default soil BAF of 4.6 was used based on the

[9] Since the alternative TRVs for birds and mammals were calculated as the tenth percentile of acceptable LOAELs for growth, reproduction, and survival, the alternative TRVs cannot be associated with a single study or test species. Therefore, body scaling cannot be applied to the alternative TRVs.

BAF for cadmium, which was the highest value of any metal/metalloid constituent found.

EPA selected a different set of plant and soil biota BAFs for use in developing the national EcoSSLs for wildlife (EPA 2007b). Soil-to-biota bioaccumulation uptake equations, both as simple ratios (BAFs) or as regression equations, have recently been developed from published data for earthworms (Sample et al. 1998, 1999) and terrestrial plants (Bechtel-Jacobs 1998). Databases of bioaccumulation data from acceptable published sources were presented and bioaccumulation equations were developed in these three publications. Bioaccumulation equations presented in these reports were selected by EPA as the primary means for estimating concentrations of inorganic contaminants in wildlife dietary items. If both a chemical-specific BAF and a chemical-specific regression equation were available for a given constituent, the regression equation was selected for application provided the equation was significant (i.e., the slope differed significantly [$p<0.05$] from 0) and the coefficient of determination (R^2) was greater than or equal to 0.2. Regression equations are considered better predictors of bioaccumulation because bioaccumulation is often shown to be non-linear. If these criteria were not met, the median BAF was used to estimate bioaccumulation.

The BAFs and bioaccumulation equations selected by EPA (2007b) are considered more up to date and robust than the default MTCA BAFs and were selected as alternative methods for estimating bioaccumulation of constituents into plants and soil biota. The alternative bioaccumulation equations are shown in Table C3-3.

3.2.3 Alternative Wildlife Exposure Parameter Values

Exposure parameters required to calculate EISCs for FIR, P, BAF, SIR and gut RGAF (see Equation 1). Alternative BAFs are described in Section 3.2.2. The default P and RGAF values are retained for calculating alternative wildlife EISCS for reasons stated in Section 3.2. The default values for FIR and SIR for the shrew, vole and robin (MTCA Table 749-4) were selected from published sources (Ecology 2000). The default FIR and SIR values for the vole and robin come from EPA's Wildlife Exposure Factors Handbook (EPA 1993), which provides a compendium of acceptable values. The FIR and SIR values for the shrew were obtained from the published scientific literature.

EPA used the shrew, vole, and woodcock to help derive the EcoSSLs protective of birds and mammals (EPA 2007b). Although the woodcock occupies the same feeding guild as the robin (i.e., avian insectivore), it can weigh twice as much as

a robin and is not native to Washington State (EPA 1993). Therefore, the woodcock is not a suitable alternative receptor for the robin.

EPA (2007b) reviewed the scientific literature for data on FIR for the shrew and vole. High end estimates (estimated to be the 90th percentile, assuming a normal distribution) were calculated for each study. The arithmetic mean of the high-end estimates of FIR was selected as the high end point estimate FIR (n=3 for the vole and n=5 for the shrew). For the SIR, EPA (2007b) estimated a high-end value for each species using a four-variable equation (Equation 2). Input parameter values for the four variables that characterized their distributions were obtained from published scientific literature. A Monte Carlo simulation using the input parameter values for the four variables was used to estimate the 90th percentile SIR[10].

Equation 2:

$$P_s = \frac{(b - y + a \times y)}{(a \times y - c + b)}$$

Where:

P_s = proportion of soil in diet (g soil per g dry mass diet)
a = digestibility of food (g absorbed per g dry mass ingested)
b = concentration of acid-insoluble ash in food (g per g dry mass)
c = concentration of acid-insoluble ash in soil (g per g dry mass)
y = concentration of acid-insoluble ash in scat (g per g dry mass)

EPA's FIR and SIR values for the shrew and vole (EPA 2007b) were derived in a more rigorous manner than the default MTCA values and are selected as alternative exposure parameter values for the derivation of alternative EISCs. The MTCA default and EPA alternative wildlife exposure parameter values are shown in Table C3-4.

4.0 HAZARD CHARACTERIZATION

This section includes a hazard evaluation where hazard estimates are refined using the alternative EISCs developed in Section 3.0 and an uncertainty analysis.

[10] The SIR is calculated by multiplying the 90th percentile P_s by the FIR.

4.1 Hazard Evaluation

COPECs were identified in Section 2.5.2 by comparing soil EPCs for each ecological exposure area to MTCA default EISCs and natural background. Potential ecological hazard estimates are refined in this section by comparing the EPCs for the COPECs to the alternative EISCs for plants, soil biota, and wildlife developed in Section 3.0. Hazard quotients (HQs) were calculated by dividing the EPC by the alternative EISC. Constituents with HQs greater than one are considered to pose a potential ecological hazard[11].

Tables C4-1 to C4-5 present the EPCs for the COPECs, alternative EISCs, and HQs for each ecological exposure area. Results show that many of the COPECs identified in Section 2.5.2 pose a potential ecological hazard.

Mercury and thallium were not evaluated by EPA as part of the EcoSSL program. Since no further hazard evaluation was possible, results of the COPEC screening (Section 2.5) were used to evaluate ecological hazards from mercury and thallium.

Aluminum was identified as a COPEC in Ecological Exposure Area 5 (see Table C2-14). EPA (2003d) determined that the measurement of total aluminum in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. EPA recommends evaluating the potential ecological hazards associated with aluminum based on the measured soil pH. Aluminum is considered to pose a potential ecological hazard only when the soil pH is less than 5.5. Table C4-6 shows the median pH at Area 5 is 5.9, which is above the EPA threshold of 5.5 and above the median background pH of 4.87. This information indicates that aluminum does not pose an ecological hazard in Area 5.

Iron was identified as a COPEC in ecological exposure areas 1, 2, 3, 4, and 5 (Tables C2-10, C2-11, C2-12, C2-13, and C2-14, respectively). EPA (2003e) determined that the measurement of total iron in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. EPA recommends that site-specific measurements of soil pH and Eh (oxidation/reduction potential) be used to help evaluate the bioavailability and toxicity of iron. In well-aerated soil with a pH between 5 and 8, iron is not expected to be toxic to plants (plants being the most sensitive ecological receptor). Table C4-6 shows the median pH of Ecological Exposure Area 4 is 5.395 and Area 5 is 5.9, which are above the EPA pH threshold value of 5.0 and above the median natural background pH of

[11] As demonstrated in Section 2.5.2, all COPECs have concentrations above natural background.

4.87. This information indicates that iron is not a hazard to plants at Areas 4 and 5. However, iron poses a potential hazard to plants and Ecological Exposure Areas 1, 2, and 3 because the median pH at these areas is below EPA's threshold and the median natural background.

Another perspective for reviewing the ecological hazards is to group them by receptor. Table C4-7 shows that arsenic, copper, lead, and zinc have HQs above one for plants at most ecological exposure areas and HQs are highest for arsenic. Table C4-8 shows that antimony, copper, lead, and zinc pose hazards to soil biota at most areas. Table C4-9 shows that arsenic and lead pose hazards to the vole at most areas, but HQs are highest for arsenic. Table C4-10 shows that antimony, arsenic, cadmium, copper, and lead pose hazards to shrew at most areas, but HQs are highest for antimony, arsenic, cadmium, and lead. Table C4-11 shows that cadmium, copper, and lead pose hazards to robins at most areas, but HQs are highest for lead.

4.2 Uncertainty Analysis

Assumptions exist in many steps of the TEE process that lead to uncertainties in the evaluation. Understanding these uncertainties can help with interpreting the results of the evaluation and enhance remedial decision making. This uncertainty analysis provides a qualitative evaluation of the direction and magnitude of potential sources of uncertainty associated with the site-specific TEE for the MCMA. Uncertainties were grouped into exposure, toxicity, and hazard characterization categories.

4.2.1 Uncertainties Associated with Exposure

The analytical samples used to characterize ecological exposure to site soil were typically collected from locations on or close to known or suspected sources. This high-biased sampling will result in overestimated exposures within each ecological exposure area, but not for the discrete mine waste piles. The magnitude of uncertainty when using this high-biased sampling design is expected to be relatively large.

The size of soil data sets used to calculate EPCs at the MCMA site was acceptable[12] in all but one case. The Area 5 – Weden Creek Watershed

[12] EPA's ProUCL Technical Guide (available online at http://www.epa.gov/esd/tsc/TSC_form.htm) recommends a minimum of eight samples be used for calculating a UCL. However, ProUCL will calculate the UCL for datasets having five, six, seven, or more samples, but caveats the results with the statement "A sample size of n=5 may not be adequate enough to compute meaningful and reliable test statistics and estimates."

Ecological Exposure Area had between five and eight samples per constituent and several constituents had non-detected values. Small sample sizes can adversely affect the estimation of upper confidence levels and EPCs. The magnitude and direction (i.e., underestimation or overestimation) of uncertainty associated with the low number of soil samples in Area 5 is unknown, but expected to be small.

Consistent with MTCA, this TEE assumed that wildlife receptors will use the contaminated portions of each ecological exposure area 100 percent of the time. Most of the source areas (i.e., waste rock piles, tailings piles, and adits) contain little or no vegetation and support a sparse population of soil invertebrates (see Section 2.1). Although the lack of plant and soil invertebrate communities may suggest potential toxicity, it is also likely that other substrate characteristics (i.e., low nutrient levels and low water holding capacity) negatively impact the establishment and maintenance of these communities. These areas provide minimal cover and food resources for most species of birds and mammals that may use the MCMA. These species will preferentially use the adjacent undisturbed habitats where cover, food, and birthing/rearing sites are more plentiful. The limited potential use of the source areas by wildlife reduces their potential exposures and consequent hazards. Expected low wildlife use of the source areas results in a moderate overestimation of hazards to wildlife.

The MTCA TEE process assesses wildlife risks by estimating constituent exposures through the direct ingestion of food and soil. Although wildlife may also become exposed to constituents through inhalation and dermal routes, the ingestion route is considered to contribute most to overall exposure. Although wildlife exposures via the inhalation and dermal routes were not quantified in this TEE and may result in an underestimation of total exposure and risk, the magnitude of this uncertainty is considered to be small.

The wildlife exposure factors used in hazard characterization were food and soil ingestion rates for the shrew, robin, and vole. Default MTCA exposure factors were used for the robin, but alternative exposure factors for the shrew and vole were obtained from EPA (2007b). These values are considered representative for these species, although the actual rates in the field will vary with factors such as season, prey type, prey availability, breeding status, weather conditions, and distance traveled to acquire food. However, use of the literature-based exposure factors is expected to have little influence on the alternative EISCs and subsequent hazard estimates.

The BAFs used in hazard characterization came from EPA's EcoSSL (EPA 2007b). Most of these BAFs were derived from regression equations comparing plant or earthworm tissue concentrations to co-located soil concentrations. The

earthworm BAFs were based on results of field studies at a variety of sites having different sources and concentrations of constituents. BAFs derived from field studies are expected to be representative of sites with a variety of soil characteristics. However, soil conditions at the MCMA site are unusual because of the depressed soil pH associated with the oxidation of mine wastes. Depressed soil pH can increase the bioavailability of some constituents (e.g., copper, zinc), while depressing the bioavailability of other constituents (e.g., arsenic). The magnitude and direction of this uncertainty is unknown.

The BAFs for soil biota were derived for earthworms (EPA 2007b). As described in Section 2.1, earthworms were not observed at the MCMA site and are not expected to be present. The use of BAFs derived for earthworms to estimate the bioaccumulation potential in other soil invertebrates (e.g., beetles, grasshoppers, and ants) is highly uncertain. Due to the lack of information on BAFs for these other soil invertebrates, the magnitude and direction of this uncertainty is largely unknown.

The BAFs for plants (EPA 2007b) were based on published data that included both field and laboratory studies. The laboratory studies included testing of field-collected soil and soil spiked with the constituent. Studies using spiked soil applied the constituent in a highly bioavailable form (e.g., cadmium chloride). BAFs derived from field collected samples and laboratory studies using field collected soil samples are considered to be more representative of BAFs at other field sites. Use of BAFs derived from laboratory tests using constituents applied in a highly bioavailable form are likely to overestimate bioavailability compared to field conditions where constituents are expected to have reached equilibrium with the soil matrix (i.e., the highly bioavailable fraction is assumed to have attenuated and the residual fraction is in equilibrium with the solid and liquid phases of the soil). As impacted soil ages and weather the bioavailable fraction of the constituent (i.e., water soluble fraction) is leached out and a higher proportion of the residual fraction is bound to the solid phase where it is not bioavailable. The magnitude of overestimation of plants BAFs using spiked soil studies is unknown.

This TEE conservatively assumed the gut absorption of constituents associated with ingested soil by wildlife is 100 percent. This assumption will result in an overestimation of exposure and hazards to wildlife. For example, EPA (2007c) estimated the relative bioavailability of soil lead to humans to be about 60 percent. However, since soil ingestion typically accounts for a relatively small proportion of the total exposure (i.e., due to food ingestion), the magnitude of this uncertainty is expected to be modest.

4.2.2 Uncertainties Associated with Toxicity

One major uncertainty in this hazard evaluation is associated with the use of alternative EISCs protective of plants and soil invertebrates. These literature-based toxicity values were often derived using laboratory toxicity tests where plants and invertebrates were exposed to highly bioavailable forms of the constituents (e.g., cadmium chloride). The chemical forms in site soil are expected to be quite different resulting in lowered bioavailability relative to the highly bioavailable forms. However, the depressed pH of soil at the MCMA will also affect bioavailability of many constituents. The complex interactions of soil properties make it difficult to assess the relative bioavailability and, hence, toxicity of constituents at the MCMA site to plants and soil biota.

Alternative plant EISCs were not available for antimony, barium, or chromium. The default MTCA plant EISC for antimony is 5 mg/kg (MTCA Table 749-3). The antimony EPCs for Ecological Exposure Area 1 is 4,301 mg/kg, Area 2 is 71.9 mg/kg, Area 3 is 3,827 mg/kg, and Area 4 is 675.4 mg/kg and exceeds the default EISC. Therefore, hazards to plants from antimony may have been underestimated by a large degree. The default MTCA plant EISC for barium is 500 mg/kg (MTCA Table 749-3) and the EPC for Ecological Exposure Area 1 is 294.3 mg/kg. So it is unlikely that hazards to plants from barium were underestimated. The default MTCA plant EISC for chromium is 42 mg/kg (MTCA Table 749-3) based on Washington State background. The chromium EPCs for Ecological Exposure Area 1 is 54.3 mg/kg and Area 5 is 104 mg/kg, so it appears unlikely that chromium poses a hazard to plants at these areas.

Alternative soil biota EISCs were not available for arsenic, chromium, or silver. The default MTCA soil biota EISC for arsenic is 60 mg/kg (MTCA Table 749-3). Since the arsenic EPCs for Ecological Exposure Areas 1, 2, 3, and 4 range from 12,730 to 38,158 mg/kg, it is likely hazards to soil biota from arsenic were underestimated. The default MTCA soil biota EISC for chromium is 42 mg/kg (MTCA Table 749-3) based on Washington State background. The chromium EPCs for Ecological Exposure Area 1 is 54.3 mg/kg and Area 5 is 104 mg/kg, so it appears unlikely that chromium poses a hazard to soil biota at these areas. There is no default MTCA soil biota EISC for silver (MTCA Table 749-3), so uncertainties are unknown.

The alternative wildlife TRVs used in hazard characterization came from the EPA's EcoSSL Program. The wildlife TRV databases developed by EPA are the most comprehensive and current available. The selected alternative TRVs are considered to be reasonable estimates of the thresholds for toxic effects. However, most of the toxicity data used to derive the TRVs were based on studies of domestic and/or laboratory species (e.g., chickens and quail for birds;

mice and rats for mammals). Extrapolation of this data to receptors used in this TEE (i.e., shrew, vole, and robin) is uncertain. Although the direction of this uncertainty is unknown, the magnitude of this uncertainty is considered to be small.

Alternative avian TRVs were not available for antimony and arsenic and, therefore, hazards to the robin from these constituents could not be assessed. Since antimony and arsenic have relatively large HQs for mammals, it is likely that hazards to the robin were underestimated to a fairly high degree for these constituents.

Potential hazards to plants from iron were assessed indirectly by evaluating soil pH. A number of soil properties besides pH affect the bioavailability and toxicity of iron to plants (e.g., Eh, complexing of iron with other chemicals) (EPA 2003e). Since these properties were not evaluated, the direction and magnitude of the uncertainty associated with the hazard evaluation using soil pH cannot be ascertained.

4.2.3 Uncertainties Associated with Hazard Characterization

This assessment evaluated hazards from mining-related constituents at specific locations where concentrations were expected to be highest (i.e., source areas). One major uncertainty concerns the goal of this assessment. As stated in Section 1.2, the overarching goal is the protection of plants, soil biota, and wildlife. This goal is consistent with the MTCA TEE procedures (WAC 173-340-7490(3)). However, EPA more specifically states that the goal of ecological risk assessment is typically the protection of populations of plants and animals (EPA 1997b). Organisms that are potentially exposed to constituents at MCMA source area locations are part of populations that inhabit much bigger areas. For example, assume that local populations of receptors of concern are delimited within the boundaries of each ecological exposure area. For Area 5 (Weden Creek), which covers approximately 2,700 acres, no more than 0.02 acres have been affected by mining activities. For sedentary species (e.g., plants) and species with small home ranges (e.g., voles), less than 0.001 percent of each population inhabiting Area 5 will be exposed to elevated metals concentrations. Reduced reproduction or increased mortality in 0.001 percent of the population of plants or voles is unlikely to have a significant impact on the local population viability. Likewise, most individuals of wider ranging animal species inhabiting Area 5 (e.g., robins) will have limited exposure to mining-related impacted soil, so impacts to local populations of these species are unlikely to be significant. Therefore, results of this TEE likely overestimate hazards to populations of plants and animals. One possible exception to this generalization is Area 1 (Process

Area) which is relatively small and has a greater proportion of mining-impacted soil.

For species protected under the Endangered Species Act or other applicable laws, the goal of the ecological hazard assessment is typically extended to the protection of individuals. MTCA defines protection of a population as extended to protection of an individual because "effect on individuals are generally considered to be relevant to the health of populations", MTCA Concise and Explanatory Statement 01-09-043. Section 2.1 indicates that several species may inhabit the MCMA, which are protected under these laws. Results of this TEE should be protective of individual organisms because the EISCs used to assess hazards represent threshold concentrations below which adverse impacts to individuals are unlikely to occur.

5.0 CONCLUSIONS

Results of the hazard evaluation and uncertainty analysis are integrated here to formulate conclusions for the site-specific TEE for the MCMA site.

Hazardous constituents are identified in Table C5-1. Multiple constituents are potentially hazardous to plants, soil biota, and wildlife in Ecological Exposure Areas 1, 2, 3, and 4. Ecological Exposure Area 5 has only three hazardous constituents: copper and nickel are potentially hazardous to plants and chromium is potentially hazardous to wildlife.

This phase of the site-specific TEE relied on a literature-based approach to estimate exposures, toxicity, and hazards. With the exception of the site-specific soil data, all other elements of the TEE were obtained from the scientific literature. Information presented in Section 4.2 shows there is considerable uncertainty associated with hazard estimates using literature-based information.

The major conclusions of the site-specific TEE organized by receptor group are:

Plants

- Antimony, arsenic, and lead likely pose hazards to plants living on source areas (i.e., tailings, waste rock and ore piles as well as mine adit areas) in Ecological Exposure Areas 1, 2, 3, and 4. Cadmium, cobalt, copper, iron, manganese, mercury, nickel, selenium, thallium, and zinc may pose hazards to plants living on source areas in one or more ecological exposure areas.
- Local populations of plants (i.e., populations living within each ecological exposure area) are unlikely to be adversely impacted by exposure to constituents associated with source areas.

Soil Biota

- Antimony and arsenic likely pose hazards to soil biota living on source areas (i.e., tailings, waste rock and ore piles as well as mine adit areas) in Ecological Exposure Areas 1, 3, and 4. Cadmium, copper, lead, manganese, selenium, and zinc may pose hazards to soil biota living on source areas in one or more ecological exposure areas.
- Local populations of soil biota (i.e., populations living within each ecological exposure area) are unlikely to be adversely impacted by exposure to constituents associated with source areas.

Wildlife

- Antimony, arsenic, cadmium, and lead likely pose hazards to wildlife living on source areas (i.e., tailings, waste rock and ore piles as well as mine adit areas) in several ecological exposure areas (antimony in Areas 2 and 3; arsenic in Areas 1,2,3, and 4; cadmium in Area 4; lead in Area 1, 3, and 4). Chromium, copper, selenium, and zinc may pose hazards to wildlife living on source areas in one or more ecological exposure areas.
- Local populations of wildlife (i.e., populations living within each ecological exposure area) are unlikely to be adversely impacted by exposure to constituents associated with source areas.

6.0 RECOMMENDATIONS

Conclusions of this site-specific TEE for the MCMA site (Section 5.0) indicate that several constituents may pose hazards to plants, soil biota, and wildlife living on source areas within each ecological exposure area. However, hazards to local populations of plants, soil biota, and wildlife are unlikely to be significant. In this section, we explore additional methods that could be used to refine the ecological hazard estimates and reduce uncertainty in a possible second phase of the site-specific TEE.

MTCA describes the evaluation methods which could be used in a site-specific TEE (WAC 173-340-7493(3)).

One of the main uncertainties associated with the first phase of the TEE concerns the estimation of soil EPCs and hazards to receptor populations. Currently, available soil samples were collected from known or suspected source areas and should represent the highest constituent concentrations in each ecological exposure area. Although some plants, soil biota, and possibly wildlife may live directly on these source areas, they are members of much larger local populations that inhabit much larger contiguous areas. An improved estimate of

the exposure of local populations to constituents could be obtained by integrating exposure across each ecological exposure area. This could be accomplished using existing site and background soil data to generate area-weighted exposure estimates.

Background soil samples were collected from within the MCMA and represent soil concentrations in areas unimpacted by mining activities. Probability distribution techniques, such as Monte Carlo analysis, could be used to generate constituent concentration populations from which modeled sample concentrations could be obtained representing the background and site subpopulations. Using estimates of the areal extent of impacted and unimpacted soil in each ecological exposure area, further analyses could model a set of area-weighted soil concentration samples representing the entire ecological exposure area. For example, if 10 percent of an ecological exposure area was impacted, 10 percent of the sample would be randomly selected from the impacted area population distribution and 90 percent from the unimpacted population distribution. The modeled sample results would then be used to generate an EPC more representative of ecological exposures across the ecological exposure area.

One issue to consider for the approach described above is that MTCA stipulates that for monitoring to assess compliance for soil cleanup actions: no single soil sample concentration shall be greater than two times the soil cleanup level and less than 10 percent of the soil sample concentrations shall exceed the soil cleanup level (WAC 173-340-740(7)(e)). Even if the 10 percent criteria could be met at some ecological exposure areas, it is doubtful that the two times criteria could be met. However, it is unclear whether this limitation is applicable to derivation of cleanup levels.

Another main uncertainty concerns the methods used to evaluate hazards to plants and soil biota. The literature-based plant and soil biota EISCs may not be representative of site-specific bioavailability and toxicity and were developed using species not present at the site. Methods available for refining the hazard assessment for plants and soil biota include toxicity tests, community analysis, and tissue analysis. Laboratory toxicity tests using soils collected from the site can be conducted on plants and soil biota to improve hazard estimates. However, toxicity tests using soil samples collected from source areas at the MCMA site have two major drawbacks. First, test results cannot be readily used to identify the cause of a negative response. Second, identifying a suitable reference area would be very difficult. Although source area substrates do contain elevated levels of many constituents, they are also characterized as coarse-grained, having low organic matter, and being excessively well-drained. Not only would it be difficult to find reference material with the same

characteristics but, lacking elevated constituent concentrations, performance of plant and soil biota test organisms would be compromised by soil with these characteristics.

Plant and soil biota community surveys may be helpful in detecting impacts at contaminated sites compared to a reference area. However, finding a comparable reference area for the source areas at the MCMA would be challenging. The intrinsic nature of the source area material also impacts the establishment and maintenance of plant and soil biota communities.

Plant and soil biota tissue sampling and analysis can be a useful tool for evaluating hazards. Results of tissue and co-located soil sampling provide an integrated measure of the bioavailability of soil constituents, which can be extrapolated to other areas of the site by developing site-specific BAFs. Measured tissue concentrations can be compared to published hazardous threshold tissue concentrations and background as a measure of potential impacts to plants and soil biota. This approach was accepted by Ecology for setting soil cleanup levels at the Holden Mine site. However, plant and soil biota tissue thresholds may not be available for all constituents. In addition, results of site-specific tissue analysis can be used to provide a better estimate of wildlife exposure. The literature-based BAFs that were used to estimate wildlife EISCs in the first phase of this TEE are one of the largest sources of uncertainty associated with assessing hazards to wildlife living on the source areas.

Small mammal (e.g., voles, mice, rats) tissue sampling is another method that has been used at other sites to generate improved estimates of exposure and hazards to small mammals. Small mammals are collected from impacted and reference areas and results from their tissue analysis (whole animal or specific organ) can be used as a measure of exposure to constituents. In addition, threshold tissue values exist for several metals above which adverse affects are indicated. However, collection of small mammals is sometimes difficult, a relatively large number of individual animals are required to provide sufficient mass to met analytical requirements, threshold values are available for relatively few metals, and small mammal collection and analysis may expose field and lab staff to hantavirus.

MTCA (WAC 173-340-7493(3)) also lists biomarkers as a possible method for refining hazard estimates. A common biomarker for assessing exposure to metals is the analysis of tissue levels of metallothioneins (MT). Many organisms synthesize MTs to ameliorate the affects of exposure to metals. Although MT analysis has been shown to be an effective tool for assessing exposure, its use for predicting adverse affects is not well understood. Sloan (2011) recently reported the results of MT analysis in earthworms collected from and exposed to

soil at the Tacoma Smelter Plume site. Results failed to show a correlation between soil concentrations of arsenic and lead and MT levels in exposed earthworms.

Refinement of exposure parameter and toxicity values used to derive wildlife EISCs would probably require some additional site-specific field or laboratory investigations. These types of studies are often difficult, time consuming, and yield inconclusive information. Further refinement of exposure parameter and toxicity values using a literature-based approach would likely have little effect on the EISC value.

Based on the preceding discussions, two methods are recommended to refine ecological hazard estimates at the MCMA site:

- use an area-weighted approach for ecological exposure areas to improve soil EPC estimates for local populations of plants, soil biota and wildlife, and
- use plant and soil biota tissue sampling from the site to improve hazard estimates to plants and soil biota and improve exposure estimates for wildlife.

Although the collection of site-specific plant and soil biota tissue samples will improve exposure and hazard estimates, hazard estimates will likely remain unacceptable for some constituents in some ecological exposure areas that are characterized only using soil samples collected from source areas. This is attributable to the high concentrations of some constituents currently found in several source areas (e.g., EPC for arsenic at Area 4 is 38,158 mg/kg) and relatively low concentration range of alternative EISCs (e.g., alternative EISCs for arsenic in Area 4 range from 18 to 493 mg/kg).

TABLES

This page is intentionally left blank
for double-sided printing.

Table C2-1 – Plant Species Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Trees		
Big-leaf maple	*Acer macrophyllum*	Observed
Douglas fir	*Pseudtosuga menziesii*	Observed
Grand fir	*Abies grandis*	Observed
Mountain hemlock	*Tsuga mertensiana*	Observed
Pacific silver fir	*Abies amabilis*	Observed
Red alder	*Alnus rubra*	Observed
Sitka alder	*Alnus sinuata*	Observed
Subalpine fir	*Abies lasiocarpa*	Observed
Western hemlock	*Tsuga heterophylla*	Observed
Western redcedar	*Thuja plicata*	Observed
Yellow cedar	*Chamaecyparis nookatensis*	Observed
Shrubs		
Devil's club	*Oplopanax horridus*	Observed
False azalea	*Menziesia ferruginea*	Observed
Pink mountain-heather	*Phyllodoce empetriformis*	Observed
Red elderberry	*Sambucus racemosa*	Observed
Red huckleberry	*Vaccinium parvifolium*	Observed
Salmonberry	*Rubus spectabilis*	Observed
Scouler's willow	*Salix scouleriana*	Observed
Sitka mountain-ash	*Sorbus sitchensis*	Observed
Sitka willow	*Salix sitchensis*	Observed
Sticky currant	*Ribes viscosissimum*	Observed
Subalpine spiraea	*Spiraea densiflora*	Observed
Thimbleberry	*Rubus parviflorus*	Observed
Unidentified huckleberry	*Vaccinium sp.*	Observed
Vine maple	*Acer circinatum*	Observed
Groundcover/ Herbaceous		
Alaska saxifrage	*Saxifraga ferruginea*	Observed
Bracken fern	*Pteridium aquifolium*	Observed
Bunchberry	*Cornus canadensis*	Observed
Canada thistle	*Cirsium arvense*	Observed
Colonial bentgrass	*Agrostis capillaris*	Observed
Common dandelion	*Taraxicum officianale*	Observed
Common horsetail	*Equisetum arvense*	Observed
Cow parsnip	*Heracleum lanatum*	Observed
Cusick's speedwell	*Veronica cusickii*	Observed
Daffodil	*Narcissus spp.*	Observed
Deer fern	*Blechnum spicant*	Observed
False lily-of-the-valley	*Maianthemum dilatatum*	Observed
False solomon's seal	*Smilacina racemosa*	Observed
Fireweed	*Epilbium angustifolium*	Observed
Foamflower	*Tiarella trifoliata*	Observed
Fringecup	*Tellima grandiflora*	Observed
Goat's beard	*Aruncus dioicus*	Observed
Hairy cats ear	*Hypochaeris radicata*	Observed
Indian hellebore	*Veratrum viride*	Observed
Lady fern	*Athyrium filix-femina*	Observed
Large-leaved avens	*Geum macrophyllum*	Observed
Oak fern	*Gymnocarpium dryopteris*	Observed

Table C2-1 – Plant Species Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Pacific sanicle	*Sanicula crassicaulis*	Observed
Piggyback plant	*Tolmeia menziesii*	Observed
Queen's cup	*Clintonia uniflora*	Observed
Rattlesnake plantain	*Goodyera oblongifolia*	Observed
Red columbine	*Aquilegia formosa*	Observed
Rosy twistedstalk	*Streptopus roseus*	Observed
Sedge	Carex sp.	Observed
Sitka valerian	*Valeriana sitchensis*	Observed
Spiny wood fern	*Dryopteris expansa*	Observed
Sword fern	*Polystichum munitum*	Observed
Unidentified aster	*Aster* sp.	Observed
Unidentified bramble	*Rubus* sp.	Observed
Unidentified grasses	Various species	Observed
Unidentified moss		Observed
Violet	*Viola spp.*	Observed
Western trillium	*Trillium ovatum*	Observed
Western trillium	*Trillium ovatum*	Observed
Wild ginger	*Asarum caudatum*	Observed
Yellow violet	*Viola glabella*	Observed

Table C2-2 – Birds Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
American robin	*Turdus migratorius*	Expected
American crow	*Corvus brachyrhynchos*	Expected
American dipper	*Cinclus mexicanus*	Expected
American redstart	*Wetophaga ruticilla*	Possible
Audubon's warbler	*Dendroica auduboni*	Expected
Bald eagle	*Haliaeetus leucocephalus*	Possible
Band-tailed pigeon	*Columba fasciata*	Possible
Barred owl	*Strix varia*	Expected
Black-backed woodpecker	*Picoides arcticus*	Possible
Black-capped chickadee	*Parus atricapillus*	Expected
Black-chinned hummingbird	*Archilochus alexandri*	Possible
Blue grouse	*Dendragapus obscurus*	Possible
Brown creeper	*Certhia familiaris*	Expected
Calliope hummingbird	*Stellula calliope*	Possible
Cedar waxwing	*Bombycilla cedrorum*	Expected
Chestnut-backed chickadee	*Parus rufescens*	Possible
Common nighthawk	*Chordeiles minor*	Possible
Common raven	*Corvus corax*	Expected
Cooper's hawk	*Accipiter cooperii*	Possible
Dark-eyed junco	*Junco hyemalis*	Expected
Downy woodpecker	*Picoides pubescens (Dendrocopos pubescens)*	Expected
Dusky flycatcher	*Empidonax oberholseri*	Possible
Flammulated owl	*Otus Flammeolus*	Possible
Fox sparrow	*Passerella iliaca*	Expected
Fringed myotis	*Myotis thysanodes*	Possible
Golden eagle	*Aquila chrysaetos*	Possible
Golden-crowned kinglet	*Regulus satrapa*	Expected
Gray jay	*Perisoreus canadensis*	Possible
Great gray owl	*Strix nebulosa*	Expected
Great horned owl	*Bubo virginianus*	Expected
Hairy woodpecker	*Picoides villosus (Dendrocopos villosus)*	Expected
Hammond's flycatcher	*Empidonax hammondii*	Expected
Harlequin Duck	*Histrionicus histrionicus*	Possible
Hermit thrush	*Catharus guttatus (Hylochichla guttata)*	Expected
Long-eared owl	*Asio otus*	Possible
MacGillivray's warbler	*Oporornis tolmiei*	Possible
Marbled murrelet	*Brachyramphus marmoratus*	Expected
Mountain bluebird	*Sialia currucoides*	Possible
Mountain chickadee	*Parus gambeli*	Possible
Northern flicker	*Colaptes auratus (Colaptes cafer)*	Expected
Northern goshawk	*Accipiter gentilis*	Possible
Northwestern crow	*Corvus caurinus*	Expected
Olive-sided flycatcher	*Contopus borealis*	Expected
Orange-crowned warbler	*Vermivora celata*	Possible
Osprey	*Pandion haliaetus*	Possible
Pacific-slope flycatcher	*Empidonax difficilis*	Expected
Pileated woodpecker	*Dryocopus pileatus*	Possible
Pine siskin	*Carduelis pinus (Spinus pinus)*	Expected
Purple finch	*Carpodacus purpureus*	Possible
Pygmy nuthatch	*Sitta pygmaea*	Expected
Pygmy owl	*Glaucidium gnoma*	Expected
Red crossbill	*Loxia curvirostra*	Expected

Table C2-2 – Birds Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Red-breasted nuthatch	*Sitta canadensis*	Expected
Red-breasted sapsucker	*Sphyrapicus ruber*	Possible
Red-tailed hawk	*Buteo jamaicensis*	Expected
Ruby-crowned kinglet	*Regulus calendula*	Expected
Ruffed grouse	*Bonasa umbellus*	Possible
Rufous hummingbird	*Selasphorus rufus*	Expected
Rufous-sided towhee	*Pipilo erythrophthalmus*	Expected
Saw-whet owl	*Aegolius acadicus*	Expected
Sharp-shinned hawk	*Accipiter striatus*	Expected
Song sparrow	*Melospiza melodia*	Expected
Sora	*Porzana carolina*	Expected
Spotted owl	*Strix occidentalis*	Possible
Steller's jay	*Cyanocitta stelleri*	Expected
Swainson's thrush	*Catharus ustulata (Hylocichla ustulata)*	Expected
Three-toed woodpecker	*Picoides tridactylus*	Expected
Townsend's solitaire	*Myadestes townsendi*	Expected
Townsend's warbler	*Dendroica townsendi*	Expected
Turkey	*Meleagris gallopavo*	Possible
Turkey vulture	*Cathartes aura*	Expected
Varied thrush	*Ixoreus naevius*	Expected
Vaux's swift	*Chaetura vauxi*	Expected
Veery	*Catharus fuscescens (Hylocichla fuscescens)*	Possible
Warbling vireo	*Vireo gilvus*	Expected
Western bluebird	*Sialia mexicana*	Possible
Western flycatcher	*Empidonax difficilis*	Possible
Western tanager	*Piranga ludoviciana*	Expected
Western wood pewee	*Contopus sordidulus*	Possible
White-tailed ptarmigan	*Lagopus leucurus*	Expected
White-winged crossbill	*Loxia leucoptera*	Possible
Williamson's sapsucker	*Sphyrapicus thyroideus*	Possible
Willow flycatcher	*Empidonax traillii*	Possible
Winter wren	*Troglodytes troglodytes*	Expected
Yellow warbler	*Dendroica petechia*	Expected
Yellow-bellied sapsucker	*Sphyrapicus varius*	Expected
Yellow-rumped warbler	*Dendroica coronata*	Possible

Table C2-3 – Mammals Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Badger	*Taxidea taxus*	Possible
Beaver	*Castor canadensis*	Possible
Big brown bat	*Eptisicus fuscus*	Possible
Black bear	*Ursus americanus*	Observed
Bobcat	*Lynx rufus*	Expected
Boreal redback vole	*Clethrionomys gapperi*	Possible
California myotis	*Myotis californicus*	Possible
Canada lynx	*Lynx canadensis*	Possible
Cascade golden-mantled ground squirrel	*Citellus sateratus*	Observed
Columbia black-tailed deer	*Odocoileus hemionus columbianus*	Expected
Coyote	*Canis latrans*	Expected
Deer mouse	*Peromyscus maniculatus*	Expected
Douglas squirrel	*Tamiasciurus douglasi*	Observed
Dusky shrew	*Sorex obscurus*	Expected
Fisher	*Martes pennanti*	Possible
Fringed myotis	*Myotis thysanodes*	Possible
Gray wolf	*Canis lupus*	Possible
Grizzly bear	*Ursus arctos*	Possible
Heather vole	*Phenacomys intermedius*	Possible
Hoary marmot	*Marmota caligata*	Expected
Keen's myotis	*Myotis keenii*	Expected
Little brown myotis	*Myotis lucifugus*	Possible
Long-eared myotis	*Myotis evotis*	Expected
Long-legged myotis	*Myotis volans*	Possible
Longtail vole	*Microtus longicaudus*	Possible
Longtail weasel	*Mustela frenata*	Expected
Marten	*Martes americana*	Possible
Masked shrew	*Sorex cinereus*	Expected
Mink	*Mustela vision*	Expected
Montane shrew	*Soex monticolus*	Expected
Mountain beaver	*Aplodontia rufa*	Expected
Mountain goat	*Oreamnos americanus*	Possible
Mountain lion	*Felis concolor*	Expected
Mountain vole	*Microtus montanus*	Expected
Northern flying squirrel	*Glaucomys sabrinus*	Expected
Northern water shrew	*Sorex palustris*	Expected
Opossum	*Didelphis marsupialis*	Possible
Pacific jumping mouse	*Zapus trinotatus*	Possible
Pallid bat	*Antozous pallidus*	Possible
Pika	*Ochotona princeps*	Expected
Porcupine	*Erethizon dorsatum*	Expected
Preble’s shrew	*Sorex preblei*	Possible
Raccoon	*Procyon lotor*	Expected
Red bat	*Lasiurus borealis*	Possible
Red fox	*Vulpes fulva*	Expected
Shorttail weasel	*Mustela erminea*	Possible

Table C2-3 – Mammals Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Silver-haired bat	*Lasionycteris noctivagans*	Possible
Small-footed myotis	*Myotis leibii*	Possible
Snowshoe hare	*Lepus americanus*	Expected
Spotted skunk	*Spilogale putorius*	Possible
Striped skunk	*Mephitis mephitis*	Possible
Townsend vole	*Microtus townsendi*	Possible
Townsend's big-eared bat	*Plecotus townsendii townsendii*	Expected
Townsend's chipmunk	*Eutamias townsendi*	Expected
Trowbridge's shrew	*Sorex trowbridgei*	Possible
Vagrant shrew	*Sorex vagrans*	Possible
Water vole	*Microtus richardsoni*	Expected
Wolverine	*Gulo gulo luteus*	Possible
Yellow pine chipmunk	*Eutamias amoenus*	Expected
Yellow-bellied marmot	*Marmota flaviventris*	Expected
Yuma myotis	*Myotis yumanensis*	Possible

Table C2-4 – Terrestrial Invertebrates Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Alderflies	*Sialis* sp.	Expected
Ants	Order Hymenoptera	Observed
Banana slug	*Ariolimax columbianus*	Expected
Bees	Order Hymenoptera	Observed
Black carpenter ants	*Camponotus pennsylvanicus*	Expected
Black flies	*Simulium* sp.	Observed
Black-foot tightcoil snail	*Pristiloma chirstenella*	Possible
Butterflies and moths	Order Lepidoptera	Observed
Centipedes	Order Chilopoda	Expected
Common black ground beetle	*Pterostichus* sp.	Observed
Daddy-long-legs	Order Opiliones	Expected
Deer fly	*Chrysops* sp.	Observed
Grasshoppers and crickets	Order Orthoptera	Expected
Mayflies	Order Ephemeroptera	Expected
Mites and ticks	Order Acarina	Expected
Spiders	Order Araneae	Observed
Wasps	Order Hymenoptera	Expected
Yellow jackets	*Vespula* sp.	Observed

Table C2-5 – Amphibians and Reptiles Observed or Likely to Occur in the Project Area

Common Name	Scientific Name	Observed/ Expected/ Possible
Amphibians		
Cascades frog	*Rana cascadae*	Expected
Long-toed salamander	*Ambystoma macrodactylum*	Expected
Pacific treefrog	*Hyla regilla*	Possible
Red-legged frog	*Rana aurora*	Possible
Tailed frog	*Ascaphus montanus*	Expected
Western toad	*Bufo boreas*	Expected
Reptiles		
Common garter snake	*Thamnophis sirtalis*	Expected
Northern alligator lizard	*Gerrhonotus coeruleus*	Expected
Rubber boa	*Charina bottae*	Possible
Western skunk	*Eumeces skiltonianus*	Expected

Table C2-6 – Threatened, Endangered, and Sensitive Species Observed or Likely to Occur in the Project Area

Common Name	Species Name	Federal Status	State Status	Observed/ Expected/ Possible
Plants				
Tall agoseris	*Agoseris elata*		Sensitive	Possible
Stalked moonwort	*Botrychium pedunculosum*	Concern	Sensitive	Possible
Alaska harebell	*Campanula lasiocarpa*		Sensitive	Possible
Bristly sedge	*Carex comosa*		Sensitive	Possible
Poor sedge	*Carex magellanica ssp. Irrigua*		Sensitive	Possible
Few-flowered sedge	*Carex pauciflora*		Sensitive	Possible
Several-flowered sedge	*Carex pluriflora*		Sensitive	Possible
Smoky mountain sedge	*Carex proposita*		Threatened	Possible
Long-styled sedge	*Carex stylosa*		Sensitive	Possible
Spleenwort-leaved goldthread	*Coptis aspleniifolia*		Sensitive	Possible
Yellow mountain-avens	*Dryas drummondii*		Sensitive	Possible
Salish fleabane	*Erigeron salishii*		Sensitive	Possible
Black lily	*Fritillaria camschatcensis*		Sensitive	Possible
Boreal bedstraw	*Galium kamtschaticum*		Sensitive	Expected
Creeping snowberry	*Gaultheria hispidula*		Sensitive	Possible
Water lobelia	*Lobelia dortmanna*		Threatened	Possible
Treelike clubmoss	*Lycopodium dendroideum*		Sensitive	Possible
Branching montia	*Montia diffusa*		Sensitive	Possible
Whitebark pine	*Pinus albicaulis*	Candidate		Expected
Pine-foot	*Pityopus californica*		Threatened	Possible
Choris' bog-orchid	*Platanthera chorisiana*		Threatened	Possible
Small northern bog-orchid	*Platanthera obtusata*		Sensitive	Possible
Cooley's buttercup	*Ranunculus cooleyae*		Sensitive	Possible
Pygmy saxifrage	*Saxifraga rivularis*		Sensitive	Possible
Swertia	*Swertia perennis*		Review	Possible
Flat-leaved bladderwort	*Utricularia intermedia*		Sensitive	Possible
Terrestrial Invertebrates				
Beller's ground beetle	*Agonum belleri*	Concern	Candidate	Expected
Johnson' hairstreak	*Callophrys johnsoni*		Candidate	Possible
Reptiles and Amphibians (Herpetiles)				
Western pond turtle	*Actinemys marmorata*	Concern	Endangered	Possible
Tailed frog	*Ascaphus truei*	Concern	Monitor	Expected
Cascades frog	*Rana cascadae*	Concern	Monitor	Expected
Western toad	*Bufo boreas*	Concern	Candidate	Expected
Oregon spotted frog	*Rana pretiosa*	Candidate	Endangered	Expected
Birds				
Northern goshawk	*Accipiter gentilis*	Concern	Candidate	Expected
Olive-sided flycatcher	*Contopus borealis*	Concern		Expected
Pileated woodpecker	*Dryocopus pileatus*		Candidate	Expected
Northern spotted owl	*Strix occidentalis*	Threatened	Endangered	Possible
American peregrine falcon	*Falco peregrinus anatum*	Concern	Sensitive	Expected
Bald eagle	*Haliaeetus leucocephalus*	Sensitive	Concern	Expected
Black-backed woodpecker	*Picoides arcticus*		Candidate	Possible
Golden eagle	*Aquila chrysaetos*		Candidate	Possible
Marbled murrelet	*Brachyramphus marmoratus*	Threatened	Threatened	Possible

Table C2-6 – Threatened, Endangered, and Sensitive Species Observed or Likely to Occur in the Project Area

Common Name	Species Name	Federal Status	State Status	Observed/ Expected/ Possible
Mammals				
Columbia black-tailed deer	*Odocoileus hemionus*	Endangered	Endangered	Expected
Canada lynx	*Lynx canadensis*	Threatened	Threatened	Possible
Fisher	*Martes pennanti*	Candidate	Endangered	Possible
Gray wolf	*Canis lupus*	Endangered	Endangered	Possible
Long-eared myotis	*Myotis evotis*	Concern	Monitor	Possible
Long-legged myotis	*Myotis volans*	Concern	Monitor	Possible
Mountain goat	*Oreamnos americanus*		Priority	Possible
Grizzly bear	*Ursus arctos*	Threatened	Endangered	Possible
Townsend big-eared bat	*Plecotus townsendii townsendii*	Concern	Candidate	Possible
Keen's myotis	*Myotis keenii*		Candidate	Possible
Wolverine	*Gulo gulo*	Candidate	Candidate	Possible

Table C2-7 – Default Ecological Indicator Soil Concentrations

Constituent	Default EISC (mg/kg)[a]			Final Default EISC (mg/kg)[b]
	Plant	Soil Biota	Wildlife	Unrestricted Land Use
Aluminum	50	NA	NA	50
Antimony	5	NA	NA	5
Arsenic[e]	10	60	132	10
Barium	500	NA	102	102
Beryllium	10	NA	NA	10
Cadmium	4	20	14	4
Calcium[d]	--	--	--	--
Chromium	42	42	67	42
Cobalt	20	NA	NA	20
Copper	100	50	217	50
Iron	--	--	--	--
Lead	50	500	118	50
Magnesium[d]	--	--	--	--
Manganese	1,100	NA	1,500	1,100
Mercury	0.3[c]	0.1[c]	5.5[c]	0.1
Nickel	30	200	980	30
Potassium[d]	--	--	--	--
Selenium	1	70	0.3	0.3
Silver	2	NA	NA	2
Sodium[d]	--	--	--	--
Thallium	1	NA	NA	1
Vanadium	2	NA	NA	2
Zinc	86	200	360	86

[a] Ecological indicator soil concentration (EISC) from MTCA Table 749-3.

[b] Final EISCs are the lower of plant, soil biota, and wildlife values. The final EISCs are used to identify COPECs in Section 2.5.

[c] EISC is for inorganic mercury. Inorganic mercury is the dominant form of mercury found in soil, typically contributing between 97 and 99 percent of the total mercury (EPA 1997a).

[d] Constituent is an essential element and considered non-toxic over a wide range of soil concentrations. Constituent is eliminated from further considered in this TEE.

[e] EISC is for arsenic V. Under oxidizing conditions (e.g., well-drained soil), the arsenic V form dominates (Ascar et al. 2008; Kabata-Pendias and Pendias 1984; Zhang and Selim, 2008). It is assumed that soil in the bioactive zone of the MCMA are well-drained.

NA - EISC is not available.

EISC - ecological indicator soil concentration

-- Not evaluated.

Table C2-8 – Endpoints for the Site-specific Terrestrial Ecological Evaluation

Assessment Endpoint	Measurement Endpoint
Maintain growth, survival and reproductive success of wildlife (i.e., birds and mammals)	Compare soil constituent concentrations to:
	a) ecological indicator soil concentrations for wildlife
	b) soil background concentrations
Maintain growth, survival and reproductive success of plants	Compare soil constituent concentrations to:
	a) ecological indicator soil concentrations for plants
	b) soil background concentrations
Maintain growth, survival and reproductive success of soil biota	Compare soil constituent concentrations to:
	a) ecological indicator soil concentrations for soil biota
	b) soil background concentrations

Table C2-9 – Selection of Statistical Test for Background Comparison

Constituent	Background		Ecological Exposure Area 1			Ecological Exposure Area 2			Ecological Exposure Area 3			Ecological Exposure Area 4			Ecological Exposure Area 5

[a] Natural background concentrations were calculated using ProUCL and are presented in Appendix D of the main body of the RI report. They are shown here for comparative purposes only. Background comparisons were made using the hypothesis testing methods described in Section 2.5.1.

[b] Results of natural background comparisons are provided in Appendix D.

EPC - exposure point concentration
EISC - ecological indicator soil concentration
COPEC - constituent of potential ecological concern
NA - not available

Table C2-11 – Constituents of Potential Ecological Concern for Ecological Exposure Area 2

Constituent	Soil EPC (mg/kg)	Default EISC (mg/kg)	EPC Exceeds Default EISC?	Natural Background Concentration (mg/kg)a	Site Exceeds Background?b	COPEC?

COPEC - constituent of potential ecological concern

Table C3-1 – Ecological Indicator Soil Concentrations for Plants and Soil Biota

Constituent	Default EISCs (mg/kg)[a]				Alternative EISCs (mg/kg)[e]			
	Plant	Confidence[g]	Soil Biota	Confidence[g]	Plant	Basis[d]	Soil Biota	Basis[d]
Aluminum	50	Low (n=1)	NA		[b]		[b]	
Antimony	5	Low (n=1)	NA		NA		78	EC_{20} reproduction (n=3)
Arsenic[f]	10	Moderate (n=16)	60	Low (n=1)	18	MATC growth (n=3)	NA	
Barium	500	Low (n=2)	NA		NA		330	EC_{20} reproduction (n=3)
Beryllium	10	Low (n=3)	NA		NA		40	EC_{20} reproduction (n=3)
Cadmium	4	High (n=73)	20	Moderate (n=17)	32	MATC growth (n=13)	140	MATC reproduction and growth, EC_{10} population (n=10)
Calcium[h]	--		--		--		--	
Chromium	42	Washington State natural soil background concentration because ORNL benchmark (1 mg/kg) is less than background	42	Washington State natural soil background concentration because ORNL benchmark (0.4 mg/kg) is less than background	NA		NA	
Cobalt	20	Low (n=1)	NA		30.6[i]		NA	
Copper	100	Low (n=3)	50	High (n=24)	70	MATC reproduction and growth, EC_{20} growth (n=6)	80	MATC reproduction, population, and growth, EC_{10} reproduction (n=10)
Iron	--		--		[c]		[c]	
Lead	50	Moderate (n=17)	500	Low (n=7)	120	MATC growth (n=5)	1,700	MATC reproduction (n=4)
Magnesium[h]	--		--		--		--	
Manganese	1100	Washington State natural soil background concentration because ORNL benchmark (500 mg/kg) is less than background	NA		1,242 [j]	MATC growth (n=4)	1,242 [j]	EC_{20} reproduction (n=3)
Mercury	0.3	Low (n=2)	0.1	Low (n=2)	--		--	
Nickel	30	Moderate (n=14)	200	Low (n=5)	28[i]	EC_{20} growth, MATC growth and reporduction (n=11)	280	MATC reproduction (n=5)
Potassium[h]	--		--		--		--	
Selenium	1	Moderate (n=14)	70	Low (n=1)	0.52	EC_{20} growth and MATC growth (n=8)	4.1	EC_{20} reproduction (n=3)
Silver	2	Low (n=1)	NA		560	MATC growth (n=4)	NA	
Sodium[h]	--		--		--		--	
Thallium	1	Low (n=1)	NA		--		--	
Vanadium	2	Low (n=2)	NA		NA		NA	
Zinc	86	Washington State natural soil background concentration because ORNL benchmark (50 mg/kg) is less than background	200	High (n=21)	160	MATC growth (n=5)	120	MATC population and EC_{10} reproduction (n=6)
Soil pH	--		--		--		--	

[a] Default EISCs come from MTCA Table 749-3.

[b] EPA (2003d) determined that the measurement of total aluminum in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. Potential ecological risks associated with aluminum were identified based on the measured soil pH. Aluminum is considered to pose a potential ecological riosk only when the soil pH is less than 5.5.

[c] EPA (2003e) determined that the measurement of total iron in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. EPA recommends that site-specific measurements of soil pH and Eh (oxidation/reduction potential) be used to help evaluate the bioavailability and toxicity of iron. In well-aerated soil between pH 5 and 8, iron is not expected to be toxic to plants (plants being the most sensitive ecological receptor).

[d] Basis describes endpoints and the number of acceptable toxicity values (n) used to derive EcoSSL.

[e] Alternative EISCs come from EPA's EcoSSL documents for individual constituents and are available online at http://www.epa.gov/ecotox/ecossl/ unless noted otherwise.

[f] The values shown are for arsenic V. Arsenic V is the predominant form of arsenic in aerobic surficial soils which was substantiated by Sloan (2011).

[g] Confidence in the TRV is based on the number of toxicity values used to select the TRV. Confidence is low ($n \leq 10$), medium ($n > 10$ and $n \leq 20$), or high ($n > 20$). Information obtained from Efromyson (1997a, 1997b).

[h] Constituent is an essential element, considered non-toxic under a wide-range of environmental concentrations, and is excluded from further evaluation.

[i] Value from Kapustka et al. 2006

[j] EcoSSL value was below background. Soil cleanup leavels cannot be below background according to MTCA [WAC 173-340-740(5)(c)]; therefore this value represents background

NA - Insufficient data was available from ORNL or EPA to develop a protective soil concentration.

NR - not required

-- = constituent not evaluated by ORNL or EPA

EISC - ecological indicator soil concentration

This page is intentionally left blank for double-sided printing.

Table C3-2 – Alternative Mammal and Bird Toxicity Reference Values

Constituent	Default TRV (mg/kg body weight - day)[a]			Altervative TRV (mg/kg body weight-day)[b]			
	Shrew	Vole	Robin	Mammal		Bird	
				TRV	# Obs	TRV	# Obs

Vanadium	--	--	--	6	7	0.6	28
Zinc	703.3	537.4	131	84.2	15	86.8	34
Soil pH	--	--	--	--	--	--	--

NA - Not available because of insufficient toxicological data.

TRV - Toxicity reference value.

Obs - Number of observations.

-- Not available or not evaluated.

[a] Default TRVs come from MTCA Table 749-5.

[b] Alternative TRVs are the ten[th] percentile of bounded LOAELs for reproduction, growth, and survival from EPA's EcoSSLs documents (available online at http://www.epa.gov/ecotox/ecossl/) (see Appendix DH-1).

[c] Constituent is an essential element, considered non-toxic under a wide range of environmental concentrations, and is excluded from further evaluation.

[d] EPA concluded that aluminum and iron could be toxic to plants and soil inverebrates, but that toxicity was related to soil conditions (e.g., pH) rather than the total aluminum or iron concentration in soil. EPA did not report aluminum or iron as being toxic to birds and mammals.

[e] Value is for arsenic V because it is the dominant form of arsenic in aerobic soils, which is confirmed by Sloan (2011).

Table C3-3 – Alternative Plant and Soil Biota Bioaccumulation Factors

Constituent	Default BAFs[a]		Alternative BAFs and Tissue Concentrations[b]	
	Plant	Earthworm	Plant	Earthworm
Aluminum	1.01	4.6	--	--
Antimony	1.01	4.6	$\ln(C_p) = 0.938 * \ln(C_s) - 3.233$	$C_e = C_s$
Arsenic	0.06	1.16	$C_p = 0.03752 * C_s$	$\ln(C_e) = 0.706 * \ln(C_s) - 1.421$
Barium	1.01	0.36	$C_p = 0.156 * C_s$	$C_e = 0.091 * C_s$
Beryllium	1.01	4.6	$\ln(C_p) = 0.7345 * \ln(C_s) - 0.5361$	$C_e = 0.045 * C_s$
Cadmium	0.14	4.6	$\ln(C_p) = 0.546 * \ln(C_s) - 0.475$	$\ln(C_e) = 0.795 * \ln(C_s) + 2.114$
Calcium[c]	--	--	--	--
Chromium	1.01	0.49	$C_p = 0.041 * C_s$	$C_e = 0.306 * C_s$
Cobalt	1.01	4.6	$C_p = 0.0075 * C_s$	$C_e = 0.122 * C_s$
Copper	0.02	0.88	$\ln(C_p) = 0.394 * \ln(C_s) + 0.668$	$C_e = 0.515 * C_s$
Iron	1.01	4.6	--	--
Lead	0.0047	0.69	$\ln(C_p) = 0.561 * \ln(C_s) - 1.328$	$\ln(C_e) = 0.807 * \ln(C_s) - 0.218$
Magnesium[c]	--	--	--	--
Manganese	1.01	0.29	$C_p = 0.079 * C_s$	$\ln(C_e) = 0.682 * \ln(C_s) - 0.809$
Mercury	0.0854	1.32	--	--
Nickel	0.047	0.78	$\ln(C_p) = 0.748 * \ln(C_s) - 2.223$	NA
Potassium[c]	--	--	--	--
Selenium	0.0065	10.5	$\ln(C_p) = 1.104 * \ln(C_s) - 0.677$	$\ln(C_e) = 0.733 * \ln(C_s) - 0.075$
Silver	1.01	4.6	$C_p = 0.014 * C_s$	$C_e = 2.045 * C_s$
Sodium[c]	--	--	--	--
Thallium	1.01	4.6	--	--
Vanadium	1.01	4.6	$C_p = 0.00485 * C_s$	$C_e = 0.042 * C_s$
Zinc	0.095	3.19	$\ln(C_p) = 0.554 * \ln(C_s) + 1.575$	$\ln(C_e) = 0.328 * \ln(C_s) + 4.449$
Soil pH	--	--	--	--

[a] Values from MTCA Table 749-5 (BAF_{Worm} and K_{plant} values).

[b] Equations are from EPA's EcoSSL program (EPA 2007b). In equations that are a simple ratio, the BAF is the numerical value shown. The regression equations are used to derive tissue concentrations for plants and earthworms using site-specific soil concentrations (EPCs). BAFs are calculated as the exponent of the lognormal plant or earthworm tissue concentration divided by the soil EPC and are integrated into the derivation of alternative EISCs for the vole, shrew, and robin presented in Section 4.1.

[c] Constituent is an essential element, considered non-toxic under a wide-range of environmental concentrations, and is excluded from further evaluation.

BAF - bioaccumulation factor

NA - not available

-- not evaluated

C_s = concentrations in soil (mg/kg)

C_p = concentrations in plant tissue (mg/kg dry weight)

C_e = concentration in earthworm (mg/kg dry weight)

ln = natural log

Table C3-4 – Wildlife Exposure Parameter Values

Exposure Parameter	Default Values[a]			Alternative Values[b]		
	Shrew	Vole	Robin	Shrew	Vole	Woodcock
Proportion of Contaminated Food in Diet (P) (unitless)	0.5	1	0.52	--	--	--
Food Ingestion Rate (FIR) (kg dry food/kg body weight/day)	0.45	0.315	0.207	0.209	0.0875	0.214
Soil Ingestion Rate (SIR) (kg dry soil/kg body weight/day)	0.0045	0.0079	0.0215	0.00627[c]	0.0028[c]	0.035
Home Range (acres)	0.1	0.08	0.6	--	--	--

[a] Values from MTCA Table 749-4.

[b] Values from EPA's EcoSSL Program (EPA 2007b).

[c] Values are calculated as the 90th percentile values for the proportion of soil in diet derived by EPA (2007b) (3.2% for the vole and 3.0% for the shrew) multiplied by the food ingestion rate from EPA (2007b).

-- Values not provided in EPA's EcoSSL Program (EPA 2007b).

- Highlighted cells show values used to calculate alternative EISCs.
- Although home range information is not used to calculate EISCs, it is provided for possible use in the uncertainty analysis (Section 4.2).
- Data for the woodcock are shown for comparative purposes only.

Table C4-1 – Hazards for Ecological Exposure Area 1

COPEC[a]	Soil EPC (mg/kg)	Alternative EISC (mg/kg)					Hazard Quotient

Table C4-3 – Hazards for Ecological Exposure Area Area 3

COPEC[a]	Soil EPC (mg/kg)	Alternative EISC (mg/kg)					Hazard Quotient				
		Plants	Soil Biota	Vole	Shrew	Robin	Plants	Soil Biota	Vole	Shrew	Robin
Antimony	3,827	na	78	3,532.4	155.3	na	na	49	1	25	na
Arsenic	12,730	18	na	493.2	382.8	na	707	na	26	33	na
Cadmium	14.8	32	140	69.1	2.6	4.5	0	0	0	6	3
Copper	524.3	70	80	2,952.9	326.2	313.3	7	7	0	2	2
Iron	94,482	[b]	[b]	[b]	[b]	[b]	[b]	[b]	[b]	[b]	[b]
Lead	16,364	120	1,700	2,816.8	459.2	109.2	136	10	6	36	150
Mercury	1.3	--	--	--	--	--	--	--	--	--	--
Silver	101.7	560	na	na	na	na	0	na	na	na	na
Thallium	3.1	--	--	--	--	--	--	--	--	--	--
Zinc	1,090	160	120	3,920.3	961.4	824.7	7	9	0	1	1

EPC - exposure point concentration

EISC - ecological indicator soil concentration

na - not available; insufficient toxicity data was available for deriving an alternative EISC

-- constituent was not evaluated by EPA in the EcoSSL program

[a] Constituents of potential ecological concern (COPECs) were identified in Section 2.5.

[b] EPA (2003e) determined that the measurment of total iron in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. EPA recommends that site-specific measurements of soil pH and Eh (oxidation/reduction potential) be used to help evaluate the bioavailability and toxicity of iron. In well-aerated soil between pH 5 and 8, iron is not expected to be toxic to plants (plants being the most sensitive ecological receptor).

Table C4-4 – Hazards for Ecological Exposure Area 4

COPEC[a]	Soil EPC (mg/kg)	Alternative EISC (mg/kg)					Hazard Quotient				
		Plants	Soil Biota	Vole	Shrew	Robin	Plants	Soil Biota	Vole	Shrew	Robin

EPC - exposure point concentration

EISC - ecological indicator soil concentration

na - not available; insufficient toxicity data was available for deriving an alternative EISC

-- constituent was not evaluated by EPA in the EcoSSL program

[a] Constituents of potential ecological concern (COPECs) were identified in Section 2.5.

[b] EPA (2003d) determined that the measurement of total aluminum in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. Potential ecological hazards associated with aluminum were identified based on the measured soil pH. Aluminum is considered to pose a potential ecological risk only when the soil pH is less than 5.5.

[c] EPA (2003e) determined that the measurment of total iron in soil is not suitable or reliable for the prediction of potential toxicity and bioaccumulation. EPA recommends that site-specific measurements of soil pH and Eh (oxidation/reduction potential) be used to help evaluate the bioavailability and toxicity of iron. In well-aerated soil between pH 5 and 8, iron is not expected to be toxic to plants (plants being the most sensitive ecological receptor).

Table C4-6 – Summary Statistics for Soil pH

Area	Number of Samples	Soil pH					
		Minimum	Maximum	Mean	Median	Standard Deviation	Coefficient of Variation
Area 1	48	2.98	6.5	4.035	3.79	0.851	0.211
Area 2	31	1.74	7.2	4.573	4.4	1.207	0.264

	Wildlife	Sb, As, Cd, Pb
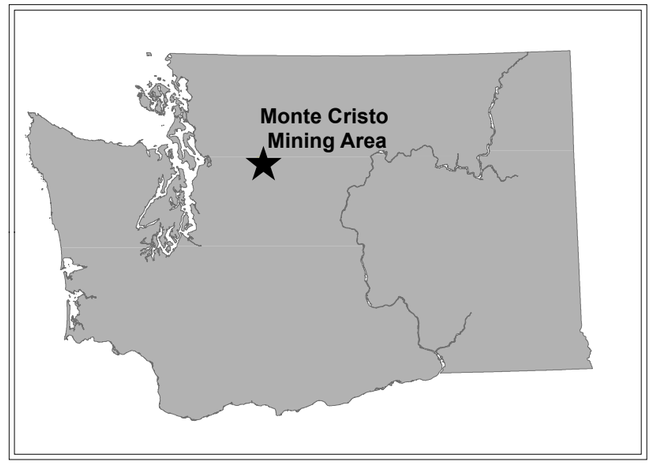
5 Weden Creek Watershed	Plants	Cu, Ni
	Soil Biota	
	Wildlife	Cr



[a] Hazardous constitiuents are COPECs with HQs > 1 (see Section 4.1). In the case of mercury and thallium, alternative EISCs were not available and MTCA default EISCs (see Table 2-7) and natural background were used to make hazard conclusions.

Note: Sb = antimony, As = arsenic, Cd = cadmium, Cr = chromium, Co = cobalt, Cu = copper, Fe = iron, Pb = lead, Mn = manganese, Hg = mercury, Ni = nickel, Se = selenium, Tl = thallium, Zn = zinc

ATTACHMENT A
ECOLOGICAL FIELD SURVEY REPORT AND FIELD FORMS

This page is intentionally left blank
for double-sided printing.

ATTACHMENT A – ECOLOGICAL FIELD SURVEY REPORT AND FIELD FORMS

During our investigation of the above mine sites, we examined the vegetation, on-site terrestrial wildlife (macroinvertebrates, reptiles, amphibians, birds, and mammals), and wildlife in the area around the site. As part of our field investigation, soil excavated for soil samples was thoroughly examined for the presence or absence of earthworms and other subterranean invertebrates. Informal soil pits were also excavated, where possible, within the waste rock and tailings piles encountered at each mine site for the presence of earthworms. However, no earthworms and a limited number of invertebrates (e.g., spiders, centipedes) were observed in the excavated pits and soil samples. We also observed the proximity of the mine or mine feature to existing water bodies and wetlands, readily visible impacts for the existing waste rock (s), and areas immediately adjacent to the waste rock pile(s). The field forms are included at the end of this attachment. Photographs were taken at each location to document vegetation, wildlife use, and other relevant site features.

This section summarizes observations of potential terrestrial receptors in the areas where mine workings were observed.

Glacier Creek Watershed

Four abandoned mines were located in the Glacier Creek watershed and identified as Potomac Silver (waste rock pile samples designated Potomac Silver), Pusher Lode (waste rock pile samples designated Pusher Lode), IXL (waste rock samples designated as IXL), and Portland No. 2 (waste rock samples designated Portland No. 2).

Potomac Silver: On-site vegetation consisted primarily of sparse seedlings and moss. Vegetation on the waste rock pile was patchy and consisted of sparse seedlings at the top of the waste rock pile ranging from approximately 2 to 6 inches in height. Vegetation adjacent to the mine opening and waste rock pile consisted of shrubs dominated by Indian plum (*Oemleria cerasiformis*). No signs of distressed vegetation were observed at this location. Surrounding forested vegetation is dominated by subalpine fir (*Abies lasiocarpa*) and mountain hemlock (*Tsuga mertensiana*).

One spider and one centipede were observed immediately adjacent to the waste rock sample location. Bird calls were heard but no birds were observed on site. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, or mammals) were observed on site or in the immediate vicinity of the

mine. Evidence of wildlife including bear scat, bear and deer tracks, and bird calls were noted near the site.

One surface water body was observed within approximately 150 feet of the mine site. This surface water body is located downgradient of the mine. No surface water was observed flowing from the mine. In addition, no wetlands were observed on or near the site.

On-site soil consisted of silty sand with a well-established duff/organic layer. Soil in the waste rock sample pits was wet in the upper soil horizon. Refer to the field forms on pages C-A-10 through C-A-13.

IXL Mine: On-site vegetation consisted primarily of dense shrubs and emergent vegetation. Vegetation on the waste rock pile was greater than 5 feet in height. Vegetation in the surrounding area was extensive and dominated by a subalpine fir forest. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were recorded on site or in the immediate vicinity of the mine. Evidence of wildlife use in the basin was observed but not near the site.

A stream was observed approximately 200 feet upslope of the mine flowing down into Glacier Creek. Seepage was observed exiting the mine and flowing downslope toward a moist area supporting potential wetlands on the waste rock pile near the adit. The wetland area was located approximately 3 to 6 feet downslope of the adit and was dominated by unidentified shrubs and emergent vegetation.

On-site soil consisted of sandy silt. Abundant duff/organic matter was present on and immediately adjacent to the waste rock pile. Soil in our sample pit was wet throughout the soil profile. Refer to the field forms on pages C-A-15 through C-A-17.

Pusher Lode: On-site vegetation consisted primarily of patchy shrubs. Vegetation on the edge of the waste rock pile was also patchy and dominated by Western redcedar (*Thuja plicata*) saplings generally ranging from approximately 2 to 5 feet in height. Limited vegetation was present adjacent to the mine opening. Vegetation in the surrounding area was extensive and dominated by evergreen forest. No signs of distressed vegetation were observed at this location.

One slug was observed at the waste rock sample location. A small mammal burrow was observed in a tree stump located on the waste rock pile. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on the site or in the immediate vicinity of the mine. Evidence of wildlife use in the basin was observed but not near the mine.

An intermittent stream flowing into Glacier Creek is located near the mine. No surface water was observed exiting the mine. No wetlands were observed on or near the site.

On-site soil consisted of gravel. Limited duff/organic matter was present in the waste rock pile sample pit. Soil in our sample pit was damp to moist throughout the soil profile. Refer to the field forms on pages C-A-19 through C-A-21.

Portland No. 2: On-site vegetation consisted primarily of limited shrubs and herbaceous vegetation including slide alder (*Alnus sinuata*), lady fern (*Athyrium filix-femina*), goat's beard (*Aruncus dioicus*), Indian hellebore (*Veratrum viride*), maidenhair fern (*Adiantum pedatum*), and unidentified grasses. Vegetation on the waste rock pile was limited to shrubs and herbaceous plants generally ranging from approximately 2 inches to 5 feet in height. Limited vegetation was present upslope and downslope of the mine opening. Vegetation in the surrounding area was extensive and dominated by deciduous forest. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site. Evidence of wildlife use near the mine included observations of ladybugs, birds, butterflies, and bear markings east of the waste rock pile. In addition, small mammal (chipmunk and pika) calls were heard in the immediate vicinity of the mine.

Two drainage valleys exist to the east and west of the mine and waste rock pile. An unnamed stream flowing into Glacier Creek is located in the vicinity of the mine. No surface water was observed exiting the mine. No wetlands were observed on or near the site.

On-site soil consisted of gravelly sandy silt. Limited duff/organic matter was present on the waste rock pile. Soil in our sample pit was damp to moist in the upper soil horizon and transitioned to wet conditions at lower depths (6 to 12 inches). Refer to the field forms on pages C-A-23 through C-A-25.

Seventysix Gulch Watershed

Seven abandoned mines were located in the Seventysix Gulch watershed and identified as the Emma Moore 2 (waste rock pile samples designated Emma Moore 2), 74 Mine (waste rock pile samples designated 74 Mine), 76 Mine (waste rock pile samples designated 76 Mine), Congress (waste rock pile samples designated Congress), IBEX (waste rock pile samples designated IBEX), Sauk 1, and O&B (waste rock samples designated O&B).

Independence of 1776 Mine: On-site vegetation consisted primarily of shrubs and herbaceous plants including alder, speedwell (*Veronica* sp.), and unidentified grasses. Vegetation on the tailings pile was sparse and generally ranged from 2 to 5 feet in height. Vegetation adjacent to the mine opening and tailings pile consisted of shrubs dominated by alder. No signs of distressed vegetation were observed at this location.

One black bear was observed in the immediate vicinity of the mine. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicinity of the mine. Evidence of wildlife use including deer tracks and bird calls were documented near the site.

Surface water was observed flowing from the mine opening into a defined drainage channel that bisected the tailings pile. Surface flows were observed approximately halfway downslope of the tailings pile before transitioning to subsurface flow. A small wetland area along the streambank adjacent to the mine opening was observed.

On-site soil consisted of silty sandy gravel with a well-established duff/organic layer near the mine opening. On-site soils at the toe of the tailings pile consisted of silty, very gravelly with a limited duff/organic layer. Soil in the tailings sample pit was wet in the upper soil horizon near the mine opening, and soil was damp throughout the soil profile at the toe of the tailings pile. Refer to the field forms on pages C-A-27 through C-A-32.

Emma Moore No. 1: On-site vegetation consisted primarily of herbaceous plants including unidentified grasses and conifer saplings. Vegetation on the waste rock pile was sparse and generally ranged from approximately 2 inches to 5 feet in height. Vegetation adjacent to the mine opening and waste rock pile was extensive and consisted of mature forest dominated by Western redcedar, Western hemlock (*Tsuga heterophylla*), and conifer saplings. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site. One black bear (*Ursus americanus*) was observed in the immediate vicinity of the mine. Evidence of wildlife including bear scat, bear and deer tracks, and bird and pika (*Ochotona princeps*) calls were observed near the site.

No surface water bodies were observed within 200 feet or more of the mine site. Surface water was present at the mine opening in a depression but no surface water was observed flowing from the mine. In addition, no wetlands were observed on or near the site.

On-site soil consisted of silty sand, and a limited duff/organic layer. Soil in the waste rock sample pits was damp throughout the soil profile. Refer to the field forms on pages C-A-34 through C-A-37.

74 Mine: On-site vegetation consisted primarily of shrubs and herbaceous plants including vine maple (*Acer circinatum*), lady fern, and goat's beard. Vegetation on the waste rock pile was dense within the upper half of the waste rock pile with limited to sparse coverage within the lower half of the waste rock pile. Vegetation generally ranged from 2 to 5 feet in height. Vegetation adjacent to the mine opening and waste rock pile was sparse and consisted of moss and herbaceous plants. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicinity of the mine. Evidence of wildlife including bird calls were heard near the site.

A stream was observed north and adjacent to the waste rock pile and mine opening. No surface water was observed flowing from the mine opening. In addition, no wetlands were observed on or near the site.

On-site soil consisted of gravelly sandy silt with a limited duff/organic layer. Soil in the waste rock sample pits was wet throughout the soil profile. Refer to the field forms on pages C-A-39 through C-A-41.

IBEX No. 1: On-site vegetation consisted primarily of herbaceous plants including bracken fern (*Pteridium aquilinum*) and Western redcedar. Vegetation on the waste rock pile was limited and generally ranged from approximately 12 inches to over 50 feet in height. Vegetation at the mine opening included maidenhair fern transitioning to cedar and bracken fern downslope on the waste rock pile. Vegetation in the vicinity of the mine consisted of forestland. No signs of distressed vegetation were observed at this location.

Spiders and unidentified terrestrial macroinvertebrates were observed within the waste rock sample locations. Deer flies (*Chrysops* sp.), deer tracks, and mammal scat were observed on site. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicinity of the mine.

A stream was observed within 200 feet or more of the mine site. No surface water was observed flowing from the mine. In addition, no wetlands were observed on or near the site.

On-site soil consisted of silty sandy gravel to silty sand. Soil in the waste rock sample pits was moist in the upper soil horizon and transitioned to wet condi-

tions at lower depths (about 12 inches). Refer to the field forms on pages C-A-43 through C-A-45.

O&B Mine: On-site vegetation was limited and consisted primarily of shrubs and herbaceous plants including maidenhair fern, false lily-of-the-valley (*Maianthemum dilatatum*), lady fern, Indian hellebore, unidentified grasses, and moss. Vegetation on the waste rock pile generally ranged from 2 to 5 feet in height. Vegetation adjacent to the mine opening, waste rock pile, and in the vicinity of the mine included alder, hemlock, and dense forestland. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site. Bear markings were observed adjacent to the upper waste rock pile. Bird calls were heard near the shoreline of the lake in the immediate vicinity of the mine.

A lake was observed within 500 feet or more of the mine site. No surface water connection was observed between the lake and the mine site. Wetlands were observed along the shoreline of the lake. No surface water was observed flowing from the mine. No wetlands were observed on site.

On-site soil consisted of silt. Soil in the waste rock sample pits was damp in the upper soil horizon and transitioned to wet conditions at lower depths (about 12 inches). Refer to the field forms on pages C-A-47 through C-A-49.

Congress Mine: On-site vegetation consisted primarily of shrubs and herbaceous plants including alder, maple, fir, cedar, and ferns. Vegetation on the waste rock pile was extensive to limited in areas and generally less than 2 feet in height. Vegetation adjacent to the mine opening and waste rock pile consisted of thistle (*Cirsium* sp.) and maidenhair fern with rocky ridges and cliffs surrounding the drainage channel, which extended downslope from the mine opening. Near the toe of the drainage channel and in low to moderately sloped areas dominant vegetation included alder. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicinity of the mine.

A drainage channel was observed within approximately 30 feet of the mine site. Water was observed dripping down from above the mine opening but no surface water was observed flowing from the mine. In addition, no wetlands were observed on or near the site.

On-site soil consisted of silty sandy gravel. Soil in the waste rock sample pits was moist throughout the soil profile. Refer to the field forms on pages C-A-51 through C-A-53.

Sauk Lode – Lower: On-site vegetation was extensive and consisted primarily of forested and shrub plant communities including subalpine fir, mountain hemlock, fir, maidenhair fern, vine maple, Devil's club (*Oplopanax horridus*), huckleberry (*Vaccinnium* sp.), blackberry (*Rubus* sp.), and moss. Vegetation on the waste rock pile was patchy to dense and generally ranged from approximately 2 to over 50 feet in height. Hemlock and fir trees surround the mine adit. Vegetation in the vicinity of the mine consisted of dense forestland. No signs of distressed vegetation were observed at this location.

No observations of macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site. Bear markings were observed on a tree in the immediate vicinity of the mine.

A stream was observed within 300 feet of the mine site. Surface water was observed within a drainage channel located southwest and downgradient of the mine. The channel was vegetated with moss. No wetlands were observed on or near the site.

No soils samples were taken at this location due to the erosion of on-site soil. Refer to the field forms on pages C-A-55 through C-A-57.

Weden Creek Watershed

Two abandoned mines were located in the Weden Creek watershed and identified as the Mackinaw Tunnel No. 1 (waste rock pile samples designated Weden 1) and the Mackinaw Tunnel No. 2 (waste rock sample designated Weden 2).

Mackinaw Tunnel No. 1: On-site vegetation consisted primarily of herbaceous plants including lady fern, bleeding heart (*Dicentra formosa*), miners lettuce (*Claytonia sibirica*), sword fern (*Polystichum munitum*), and piggyback plant (*Tolmiea menziesii*). Vegetation on the waste rock pile was patchy and generally ranged from approximately 6 inches to 5 feet in height. Vegetation adjacent to the mine opening and waste rock pile consisted of forestland dominated by Western hemlock and salmonberry (*Rubus spectabilis*) within the open area created by the waste rock pile. No signs of distressed vegetation were observed at this location.

Two spiders were observed immediately adjacent to one of the waste rock sample locations. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicin-

ity of the mine. Evidence of wildlife including bear scat, bear and deer tracks, and bird calls were documented near the site.

No surface water bodies were observed within 200 feet or more of the mine site. No surface water was observed flowing from the mine. In addition, no wetlands were observed on or near the site.

On-site soil consisted of silty loam with coarse rock and gravel, and a well-established duff/organic layer. Soil in the waste rock sample pits was moist in the upper soil horizon and transitioned to wet conditions at lower depths (about 12 inches). Refer to the field forms on pages C-A-59 through C-A-61.

Mackinaw Tunnel No. 2: On-site vegetation consisted primarily of herbaceous plants including lady fern, maidenhair fern, bedstraw (*Galium* sp.), salmonberry, currant (*Ribes* sp.), and unidentified grasses. Vegetation on the waste rock pile was sparse and generally ranged from approximately 6 to 15 inches in height. Limited vegetation was present adjacent to the mine opening. The surrounding area contained primarily rock and talus with a few medium-sized trees and small shrubs. No signs of distressed vegetation were observed at this location.

One spider was observed at the waste rock sample location. No observations of other macroinvertebrates or wildlife (reptiles, amphibians, birds, or mammals) were observed on site or in the immediate vicinity of the mine. Evidence of wildlife use in the basin was observed but not near the site.

An unnamed tributary of Weden Creek is located immediately adjacent to the waste rock pile (approximately 40 feet of the mine opening). Because of the proximity of the pile to the tributary, it can be assumed that waste rock material has entered the channel. No surface water was observed exiting the mine. Groundwater flow was observed in the sample pit. No wetlands were observed on or near the site.

On-site soil consisted of coarse rock and gravel. Limited duff/organic matter was present on the waste rock pile. Soil in our sample pit was moist in the upper soil horizon and transitioned to wet conditions below 6 inches where flowing groundwater was observed. Refer to the field forms on pages C-A-63 through C-A-65.

POTOMAC SILVER

TEE Checklist

Site Name	Potomac Silver
Date of Site Visit	8-26-11
Site Location	Glacier Creek Basin
Site Visit Conducted by	MATT

OBSERVED IMPACTS ASSOCIATED WITH THE SAMPLE LOCATION	Finding
Onsite vegetation (None, Limited, Extensive)	Limited
Vegetation in the locality of the site (None, Limited, Extensive)	E
Onsite wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other (None, Limited, Extensive) spider, centipede	L
Wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other in the locality of the site (None, Limited, Extensive)	L
Other readily observable impacts (None, Discuss below)	D
Discussion: open tunnel w/ rock extending downslope, smaller rock @ top w/ larger rocks downslope ~ 30 ft. no vegetation @ opening, sparse seedlings @ top of WK pile moss covered rock ; shrub (photo 4081) immediately adjacent to opening dominant trees - subalpine fir ; mountain hemlock	

SPECIFIC EVALUATION OF ECOLOGICAL RECEPTORS / HABITAT	Finding
Terrestrial – Wooded	
Percentage of site that is wooded 0% on site	90
Dominant vegetation type (Evergreen, Deciduous, Mixed)	E
Prominent tree size at breast height, i.e., four feet (<6", 6" to 12", >12")	>12"
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) – rodent feces @ toe of WK pile, bird calls	birds mammals
Terrestrial - Scrub/Shrub/Grasses	
Percentage of site that is scrub/shrub <5% on site	5-10%
Dominant vegetation type (Scrub, Shrub, Grasses, Other)	S
Prominent height of vegetation (<2', 2' to 5', >5')	P
Density of vegetation (Dense, Patchy, Sparse)	S
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) –	
Terrestrial – Ruderal	
Percentage of site that is ruderal no non-native / weedy dist. sp. observed	
Dominant vegetation type (Landscaped, Agriculture, Bare ground)	
Prominent height of vegetation (0', >0' to <2', 2' to 5', >5')	
Density of vegetation (Dense, Patchy, Sparse)	
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other)	
Aquatic	
Proximity of the site to surface water bodies (streams, lakes, ponds, ditches, dry wash)	~150'

in vicinity

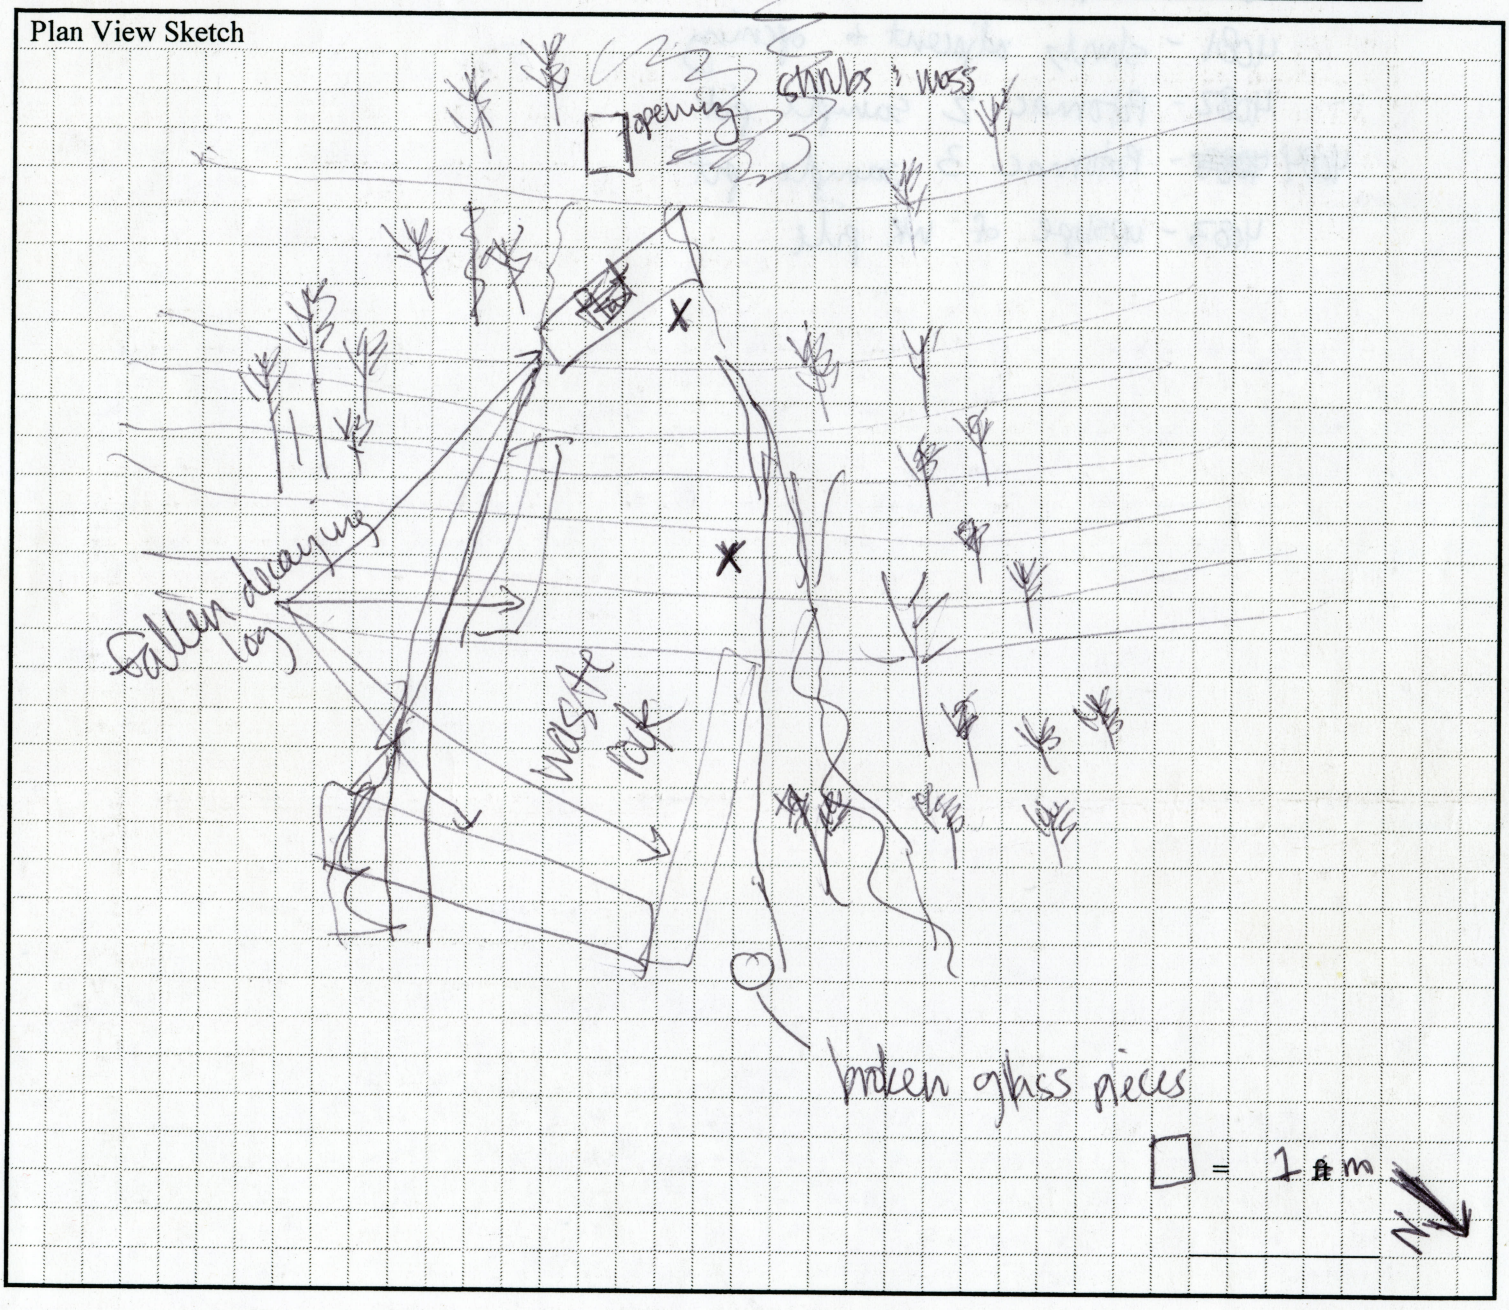
Size (acres) and depth (feet) of suspected wetlands	—

*** P**: Photographic documentation of these features is highly recommended.

SPECIES / HABITATS OBSERVED
well established duff / organic layer
wet, dark grayish brown, silty fine-medium sand



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils.
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters.
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth).
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface.
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil.

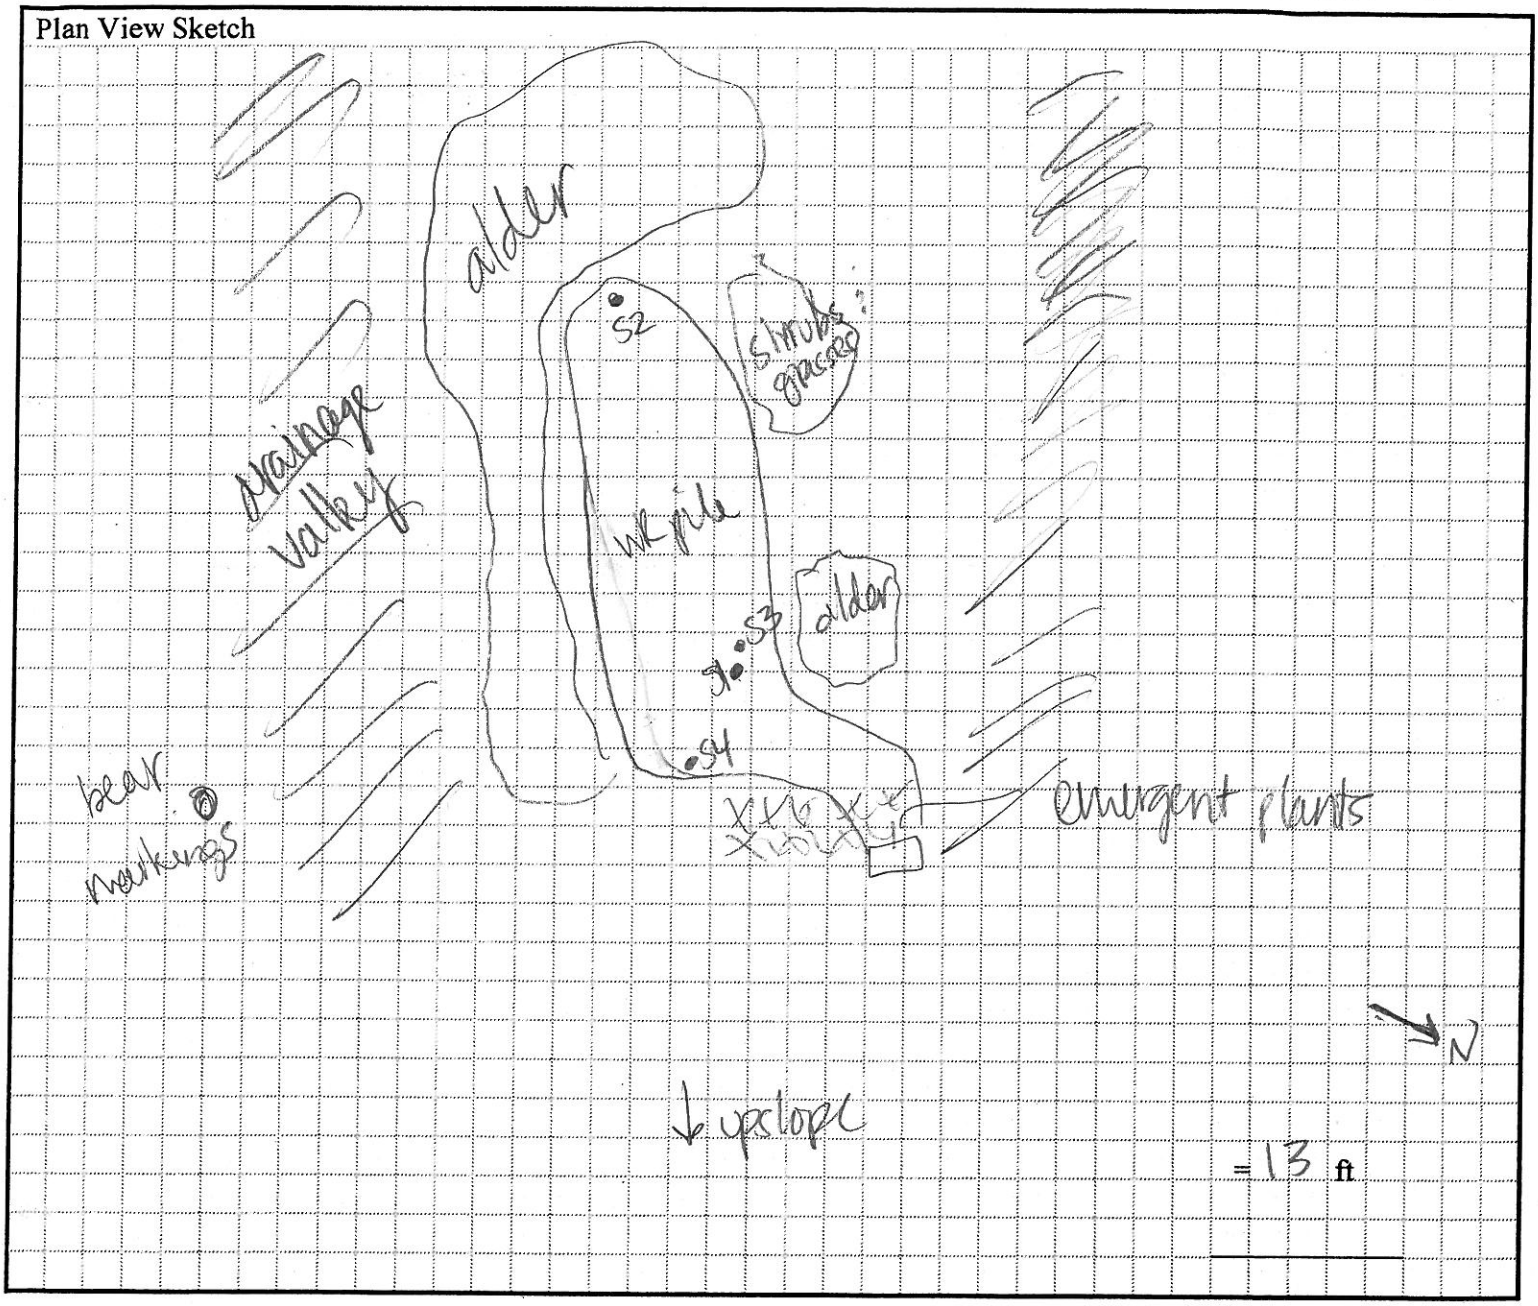
Evidence / observation of wildlife (**M**acroinvertebrates, **R**eptiles, **A**mphibians, **B**irds, **M**ammals, **O**ther) bird calls	B
Bank environment (cover: **V**egetated, **B**are / slope: **S**teep, **G**radual / height (in feet))	bare / 4
Obvious or designated wetlands present (**Y**es / **N**o)	N
Wetlands suspected as site is/has (**A**djacent to water body, in **F**loodplain, **S**tanding water, **D**ark wet soils, **M**ud cracks, **D**ebris line, **W**ater marks)	—
Size (acres) and depth (feet) of suspected wetlands	—

*** P**: Photographic documentation of these features is highly recommended.

SPECIES / HABITATS OBSERVED
Thick alder east and south of WR pile, wet soil near opening with emergent plants
Heard bird calls @ the opening, saw ladybugs, chipmunks, & butterflies near WR pile
Bear markings east of WR pile
No critters in soil



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils.
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters.
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth).
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface.
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil.

INDEPENDENCE OF 1776 MINE (76 MINE)

TEE Checklist

Site Name	76 Mine
Date of Site Visit	9-13-11
Site Location	76 Creek
Site Visit Conducted by	Abercrombie, McDonald

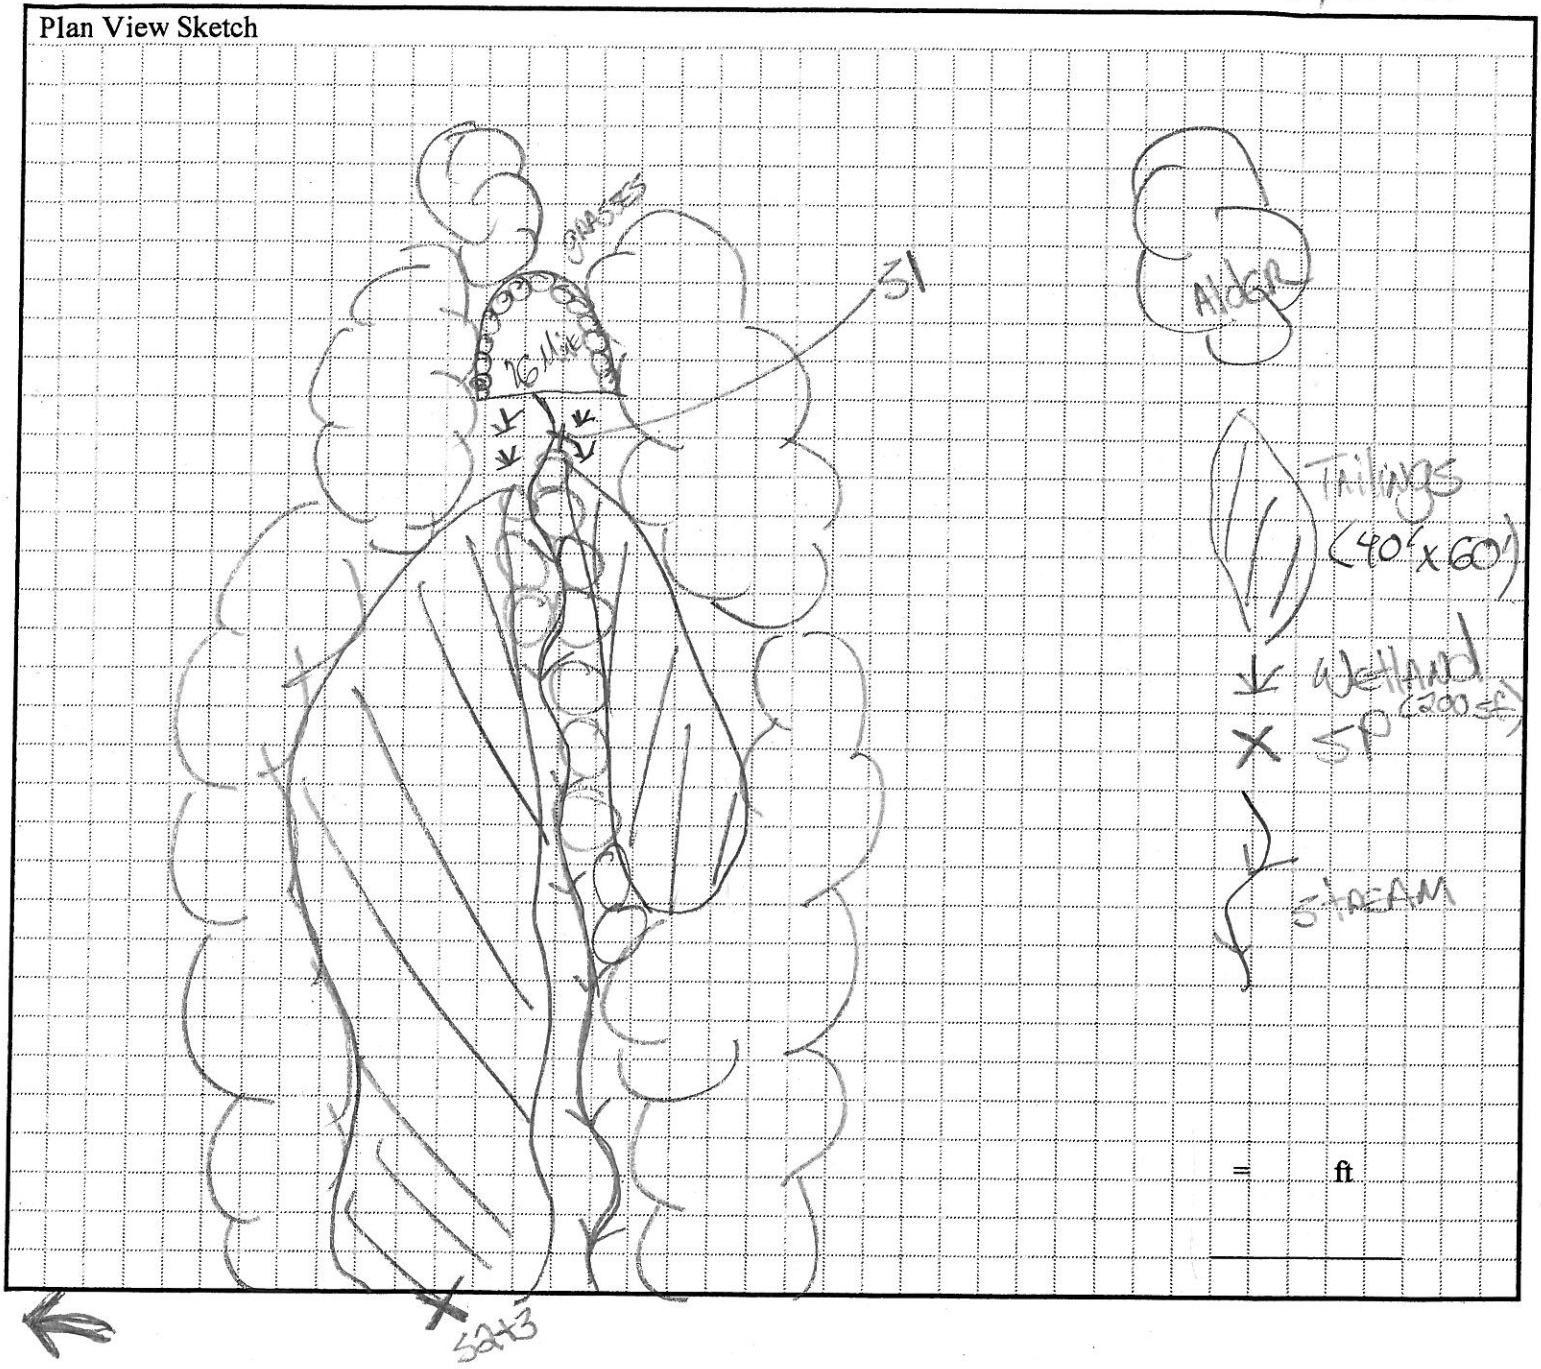
OBSERVED IMPACTS ASSOCIATED WITH THE SAMPLE LOCATION	Finding
Onsite vegetation (None, Limited, Extensive)	L
Vegetation in the locality of the site (None, Limited, Extensive)	E
Onsite wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other (None, Limited, Extensive)	N
Wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other in the locality of the site (None, Limited, Extensive)	L-E
Other readily observable impacts (None, Discuss below)	D
Discussion: Old wood in stream/Adj. to mine opening.	

SPECIFIC EVALUATION OF ECOLOGICAL RECEPTORS / HABITAT	Finding
Terrestrial – Wooded	
Percentage of site that is wooded	
Dominant vegetation type (Evergreen, Deciduous, Mixed)	
Prominent tree size at breast height, i.e., four feet (<6", 6" to 12", >12")	
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) –	
Terrestrial - Scrub/Shrub/Grasses	
Percentage of site that is scrub/shrub	30%
Dominant vegetation type (Scrub, Shrub, Grasses, Other)	Weedy/S/G
Prominent height of vegetation (<2', 2' to 5', >5')	2'-5' & <2'
Density of vegetation (Dense, Patchy, Sparse)	P
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) –	None
Terrestrial – Ruderal	
Percentage of site that is ruderal	
Dominant vegetation type (Landscaped, Agriculture, Bare ground)	
Prominent height of vegetation (0', >0' to <2', 2' to 5', >5')	
Density of vegetation (Dense, Patchy, Sparse)	
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other)	
Aquatic	
Proximity of the site to surface water bodies (streams, lakes, ponds, ditches, dry wash)	0-5'

SPECIFIC EVALUATION OF ECOLOGICAL RECEPTORS / HABITAT	Finding
Type of water bodies (**L**akes, **P**onds, **V**ernal pools, **I**mpoundments, **La**goon, **R**eservoir, **C**anal, **R**ivers, **S**treams, **I**ntermittent **S**treams, **D**ry wash, **D**itches, **C**hannel Waterway)	S
Size (acres), average depth (feet), flow rate (cfs), trophic status of water bodies	2-3 cfs
Source water (**R**iver, **S**tream, **G**roundwater, **I**ndustrial discharge, **S**urface water runoff)	G
Water discharge point (**N**one, **R**iver, **S**tream, **G**roundwater, **W**etlands impoundment)	G, R
Nature of bottom (**M**uddy, **R**ocky, **S**and, **C**oncrete, **O**ther)	M, R
Vegetation present (**S**ubmerged, **E**mergent, **F**loating, **S**crub/shrub, **W**ooded) ON BANK	E
Evidence / observation of wildlife (**M**acroinvertebrates, **R**eptiles, **A**mphibians, **B**irds, **M**ammals, **O**ther)	
Bank environment (cover: **V**egetated, **B**are / slope: **S**teep, **G**radual / height (in feet))	V / 3"
Obvious or designated wetlands present (**Y**es / **N**o)	Y
Wetlands suspected as site is/has (**A**djacent to water body, in **F**loodplain, **S**tanding water, **D**ark wet soils, **M**ud cracks, **D**ebris line, **W**ater marks)	A D W
Size (acres) and depth (feet) of suspected wetlands	<1' 200s+/- RIVERINE

* **P**: Photographic documentation of these features is highly recommended.

SPECIES / HABITATS OBSERVED
DEER + BEAR USE IN VICINITY & LIKELY COUGAR
SALAMANDERS possibly PRESENT IN STREAM
TAILINGS pile split by STREAM draining from MINE
STREAM – SURFACE & SUBSURFACE FLOW



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils. Y-high
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters. Y
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth).
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface.
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil.

74 MINE

TEE Checklist

Site Name	74 Mine
Date of Site Visit	9-15-11
Site Location	southwest drainage in seventysix Gulch
Site Visit Conducted by	AK/MH

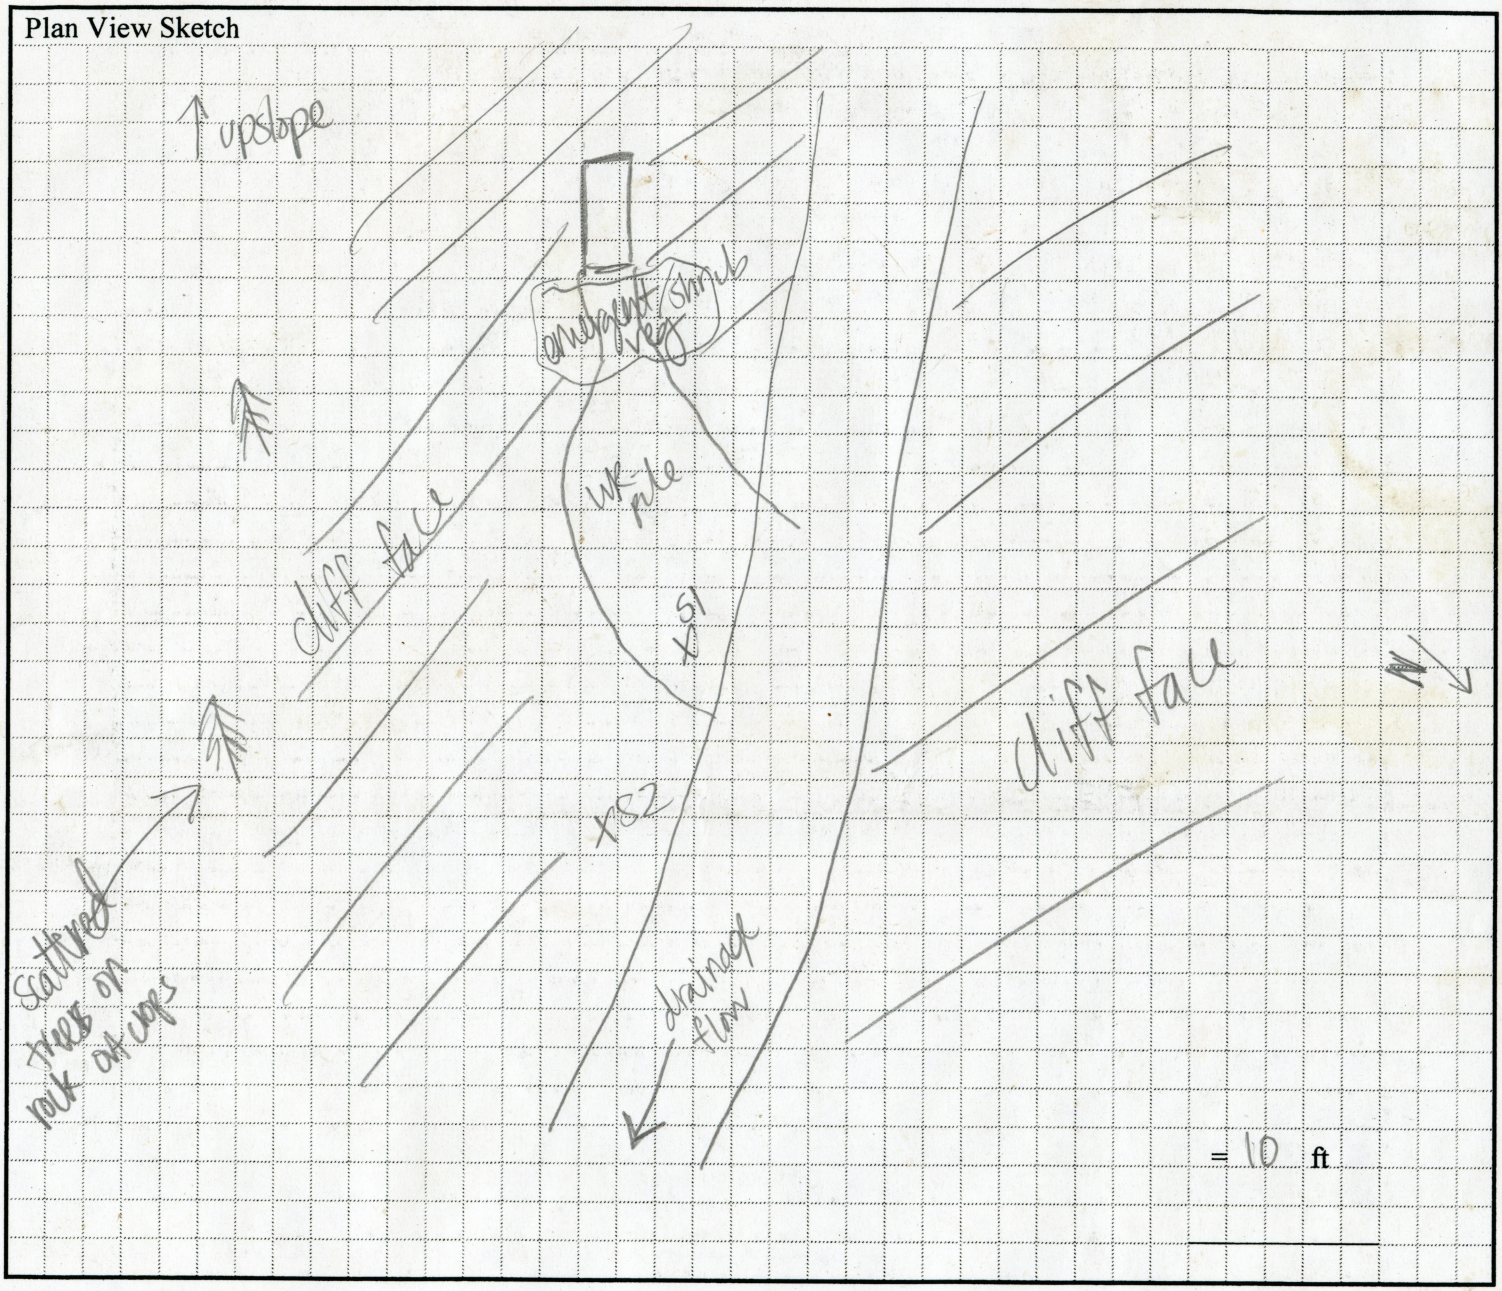
OBSERVED IMPACTS ASSOCIATED WITH THE SAMPLE LOCATION	Finding
Onsite vegetation (None, Limited, Extensive)	L
Vegetation in the locality of the site (None, Limited, Extensive)	L
Onsite wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other (None, Limited, Extensive)	N
Wildlife such as macroinvertebrates, reptiles, amphibians, birds, mammals, other in the locality of the site (None, Limited, Extensive)	L
Other readily observable impacts (None, Discuss below)	
Discussion: lots of shrub vegetation (goat's beard) lady fern, vine maple on upper ½ of WL pile, but very limited on lower ½. Very little veg. in surrounding area b/c mostly bedrock walls some moss & emergent plants in wall crevices	

SPECIFIC EVALUATION OF ECOLOGICAL RECEPTORS / HABITAT	Finding
Terrestrial – Wooded	
Percentage of site that is wooded	0%
Dominant vegetation type (Evergreen, Deciduous, Mixed)	—
Prominent tree size at breast height, i.e., four feet (<6", 6" to 12", >12")	—
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) –	hear birds
Terrestrial - Scrub/Shrub/Grasses	
Percentage of site that is scrub/shrub	50%
Dominant vegetation type (Scrub, Shrub, Grasses, Other)	Sh
Prominent height of vegetation (<2', 2' to 5', >5')	2-35'
Density of vegetation (Dense, Patchy, Sparse)	dense
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other) –	—
Terrestrial – Ruderal	
Percentage of site that is ruderal	0%
Dominant vegetation type (Landscaped, Agriculture, Bare ground)	—
Prominent height of vegetation (0', >0' to <2', 2' to 5', >5')	—
Density of vegetation (Dense, Patchy, Sparse)	—
Evidence / observation of wildlife (Macroinvertebrates, Reptiles, Amphibians, Birds, Mammals, Other)	—
Aquatic	
Proximity of the site to surface water bodies (streams, lakes, ponds, ditches, dry wash)	

SPECIFIC EVALUATION OF ECOLOGICAL RECEPTORS / HABITAT	Finding
Type of water bodies (**L**akes, **P**onds, **V**ernal pools, **I**mpoundments, **Lag**oon, **R**eservoir, **C**anal, **Ri**vers, **S**treams, **I**ntermittent **S**treams, **D**ry wash, **D**itches, **C**hannel Waterway)	DS
Size (acres), average depth (feet), flow rate (cfs), trophic status of water bodies	20 L/min
Source water (**R**iver, **S**tream, **G**roundwater, **I**ndustrial discharge, **S**urface water runoff)	St.
Water discharge point (**N**one, **R**iver, **S**tream, **G**roundwater, **W**etlands impoundment)	St.
Nature of bottom (**M**uddy, **R**ocky, **S**and, **C**oncrete, **O**ther)	bedrock
Vegetation present (**S**ubmerged, **E**mergent, **F**loating, **S**crub/shrub, **W**ooded)	shrub
Evidence / observation of wildlife (**M**acroinvertebrates, **R**eptiles, **A**mphibians, **B**irds, **M**ammals, **O**ther)	hear birds
Bank environment (cover: **V**egetated, **B**are / slope: **S**teep, **G**radual / height (in feet))	
Obvious or designated wetlands present (**Y**es / **N**o)	N
Wetlands suspected as site is/has (**A**djacent to water body, in **F**loodplain, **S**tanding water, **D**ark wet soils, **M**ud cracks, **D**ebris line, **W**ater marks)	—
Size (acres) and depth (feet) of suspected wetlands	—

*** P**: Photographic documentation of these features is highly recommended.

SPECIES / HABITATS OBSERVED
very rocky, steep habitat
no critters in either sample location
can hear birds but no visible sign of mammals in the area
vegetation limited in vicinity - rocky faces had a little moss and a little ground cover w/i the rocky slope



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils.
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters.
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth).
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface.
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil.

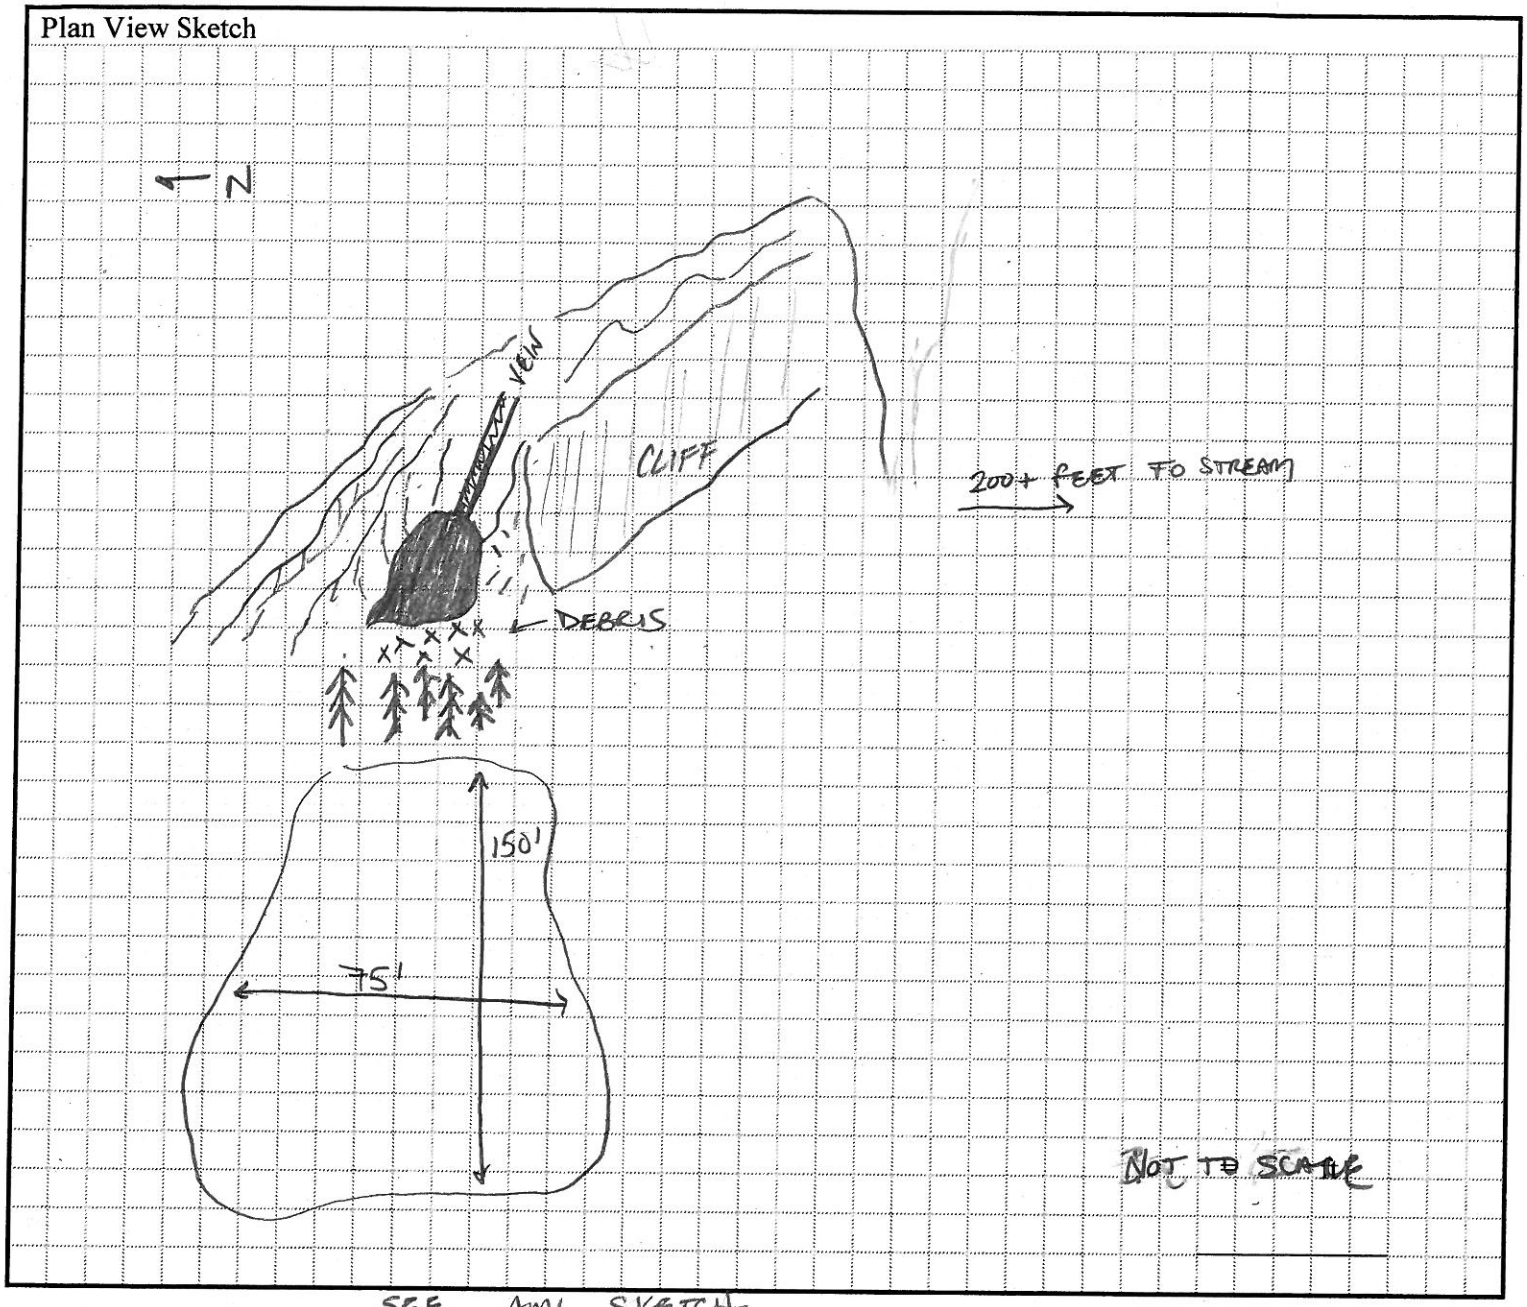
SPECIES / HABITATS OBSERVED
MOIST TO WET, BRN SL. SILTY SANDY GRAVEL
TO SILTY SAND. / NUMEROUS ROCK LEDGES
AROUND MINE AND NEARBY CREEK
SPIDERS / BUGS WITHIN EXCAVATED SOILS



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils.
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters.
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth).
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface.
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil.

Bank environment (cover: **V**egetated, **B**are / slope: **S**teep, **G**radual / height (in feet))	B/S
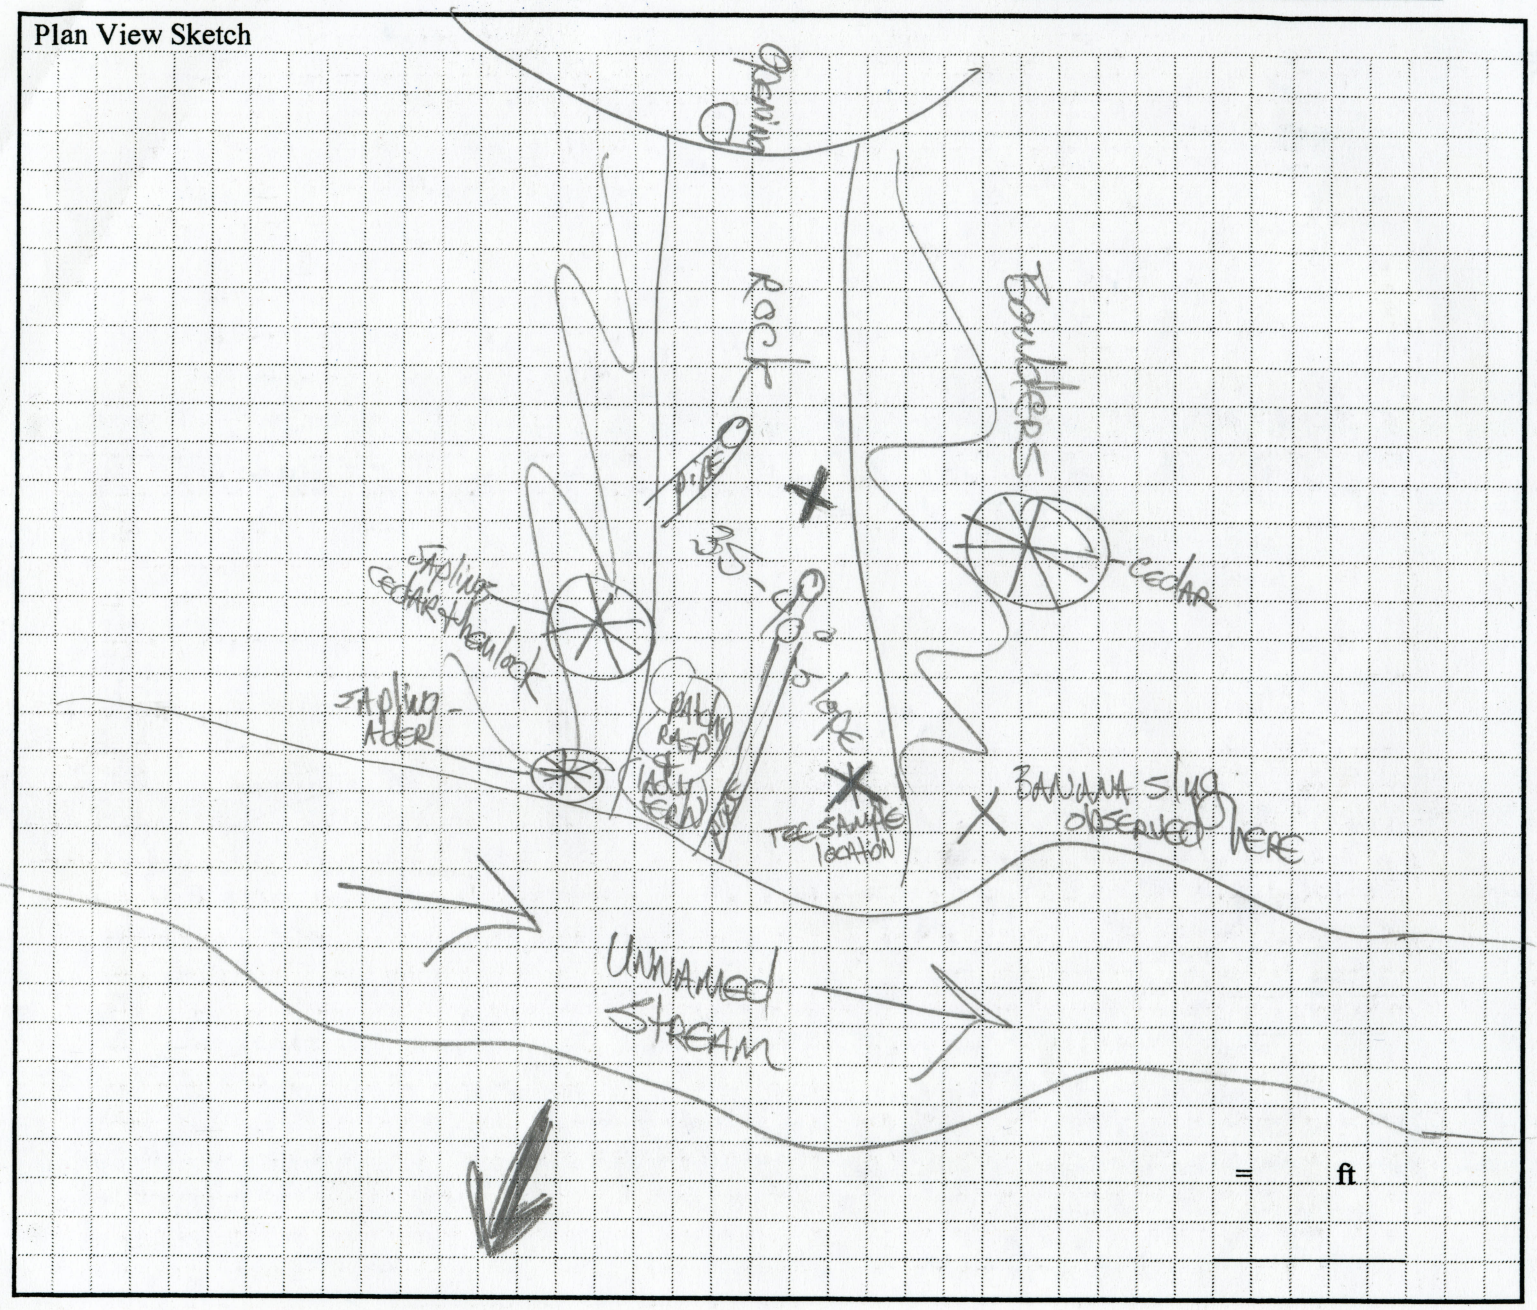
Obvious or designated wetlands present (**Y**es / **N**o)	—
Wetlands suspected as site is/has (**A**djacent to water body, in **F**loodplain, **S**tanding water, **D**ark wet soils, **M**ud cracks, **D**ebris line, **W**ater marks)	—
Size (acres) and depth (feet) of suspected wetlands	—

*** P**: Photographic documentation of these features is highly recommended.

SPECIES / HABITATS OBSERVED
Spider (1) observed.
Rocky substrate w/ 1/2" or less of organic matter.
→ 8-10" max to < 1"
Forested surroundings



When answering the above questions, consider the following:

- Ability of hazardous substances to migrate to surface waters, groundwater, or surficial soils. Y
- Terrestrial organisms may be dermally exposed to water-borne contaminants as a result of wading or swimming in contaminated waters. Aquatic receptors may be exposed through osmotic exchange, respiration or ventilation of surface waters. Y – limited depend. on season
- Contaminants may be taken-up by terrestrial plants whose roots are in contact with surface waters, groundwater, or soils.
- Terrestrial receptors may ingest water-borne contaminants if contaminated surface waters are used as a drinking water source.
- Contaminants may be taken-up by terrestrial and rooted aquatic plants whose roots are in contact with groundwater present within the root zone (~1m depth). Y
- Terrestrial wildlife receptors generally will not contact groundwater unless it is discharged to the surface. Y
- Exposure of terrestrial plants to contaminants present in particulates deposited on leaf and stem surfaces by rain striking contaminated soils (i.e., rain splash).
- Incidental ingestion of contaminated soil could occur while animals grub for food resident in the soil, feed on plant matter covered with contaminated soil or while grooming themselves clean of soil. other food readily available.

AML FEATURE INVENTORY/MONITORING

Feature ID	Weden Creek #2
Date	7/12/11
Weather	Cloudy/L. RAIN

Plan View Sketch

INCLUDE THE FOLLOWING IN THE FIELD SKETCH FOR:

North Arrow
Scale Bar
Photo Location(s) and View Direction(s)
Sample Location(s) and ID(s): Weden 1, S-2
- W-# Water
- S-# Soil
- T-# Tailings
- R-# Rock (Waste)
- O-# Ore
- S-# Other (Describe)

FOOTPRINT(S) OF:
- MILLS
- BUILDINGS
- STRUCTURES
- MINING-RELATED PILES — 4-7' wide × 40' long (streambank)
- OTHER — pipes - 2' dia.

Potential UCL to Use

Use 95% H-UCL 803.6

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Potential UCL to Use

Use 95% H-UCL 2822

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Potential UCL to Use | Use 95% H-UCL 1129

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

99% Chebyshev(Mean, Sd) UCL	197283

Potential UCL to Use

Use 95% H-UCL 94482

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

97.5% Chebyshev(Mean, Sd) UCL	0.996
99% Chebyshev(Mean, Sd) UCL	1.36

Potential UCL to Use Use 95% H-UCL 0.653

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Cobalt - Area 5

General Statistics

Number of Valid Observations 5

Number of Distinct Observations 4

Raw Statistics

Minimum	18
Maximum	33
Mean	24.8
Median	21
SD	6.723
Coefficient of Variation	0.271
Skewness	0.501

Log-transformed Statistics

Minimum of Log Data	2.89
Maximum of Log Data	3.497
Mean of log Data	3.182
SD of log Data	0.267

Warning: There are only 4 Distinct Values in this data

There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.

Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.

However, results obtained using 4 to 9 distinct values may not be reliable.

It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Warning: A sample size of 'n' = 5 may not adequate enough to compute meaningful and reliable test statistics and estimates!

It is suggested to collect at least 8 to 10 observations using these statistical methods!

If possible compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Thallium - Area 5

General Statistics

Number of Valid Observations 5

Number of Distinct Observations 4

Raw Statistics

Minimum	0.13
Maximum	0.23
Mean	0.168
Median	0.14
SD	0.0482
Coefficient of Variation	0.287
Skewness	0.674

Log-transformed Statistics

Minimum of Log Data	-2.04
Maximum of Log Data	-1.47
Mean of log Data	-1.815
SD of log Data	0.278

Warning: There are only 4 Distinct Values in this data

There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.

Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.

However, results obtained using 4 to 9 distinct values may not be reliable.

It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Warning: A sample size of 'n' = 5 may not adequate enough to compute meaningful and reliable test statistics and estimates!

It is suggested to collect at least 8 to 10 observations using these statistical methods!

If possible compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Maximum	192
Mean	99.88
Median	82.5
SD	52.3
Coefficient of Variation	0.524
Skewness	0.74

Log-transformed Statistics

Minimum of Log Data	3.434
Maximum of Log Data	5.257
Mean of log Data	4.474
SD of log Data	0.566

Warning: There are only 8 Values in this data

Note: It should be noted that even though bootstrap methods may be performed on this data set, the resulting calculations may not be reliable enough to draw conclusions

The literature suggests to use bootstrap methods on data sets having more than 10-15 observations.

97.5% Chebyshev(Mean, Sd) UCL	215.3
99% Chebyshev(Mean, Sd) UCL	283.8

Potential UCL to Use

Use 95% Student's-t UCL 134.9

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL. These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002) and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

- Highlighted cells are the 10th percentile value of the toxicological data.
- Bolded values are the number of observations in the dataset.

NA - Insufficient toxicological data were available.

a The alternative TRVs are bounded lowest observed adverse effect levels (LOAELs) for growth, reproduction, and survival endpoints from EPA's EcoSSLs documents (available online at http://www.epa.gov/ecotox/ecossl/).

b EPA (2005a) derived TRVs for two forms of chromium (chomium III and chromium VI) because chromium may exist in either state depending on soil conditions. However, no toxicological data were available for chromium III for mammals and chromium VI for birds. Therefore, the data shown here are for chromium III for birds and chromium VI for mammals.
