1.0 EXECUTIVE SUMMARY

Hart Crowser conducted four field sampling trips in the Monte Cristo Mining Area (MCMA) between July 8 and September 30, 2011. Each sampling trip was 5 to 6 days duration. The purpose of these trips was to:

- Locate selected representative mines and prospects that were identified in the Phase I literature review (see Tables 1 and 2, Hart Crowser 2011a);
- Sample potentially impacted soil and waste rock from the mine features we located; and
- Collect background soil samples to enable statistically valid comparisons.

The sampling trips characterized abandoned mine workings located in the three watersheds that form the headwaters of the upper South Fork Sauk River: Weden Creek, Glacier Creek, and Seventysix Gulch.

Sample analytical results are presented in this report along with a Terrestrial Ecological Evaluation (TEE, in Appendix C) that was developed in accordance with WAC 173-340-7493.

We completed a problem formulation screening analysis and literature review to assess risks to terrestrial ecological receptors. The three watersheds were subdivided into five ecological exposure areas based on terrain features and site use.

Seventeen constituents of potential ecological concern (COPECs) were identified based on the TEE, within one or more of the ecological exposure areas. The COPECs include aluminum, antimony, arsenic, barium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, silver, thallium, and zinc.

Ecological Exposure Area 1 (Process Area) had the highest number of COPECs (13), while Area 5 (Weden Creek Watershed) had the fewest COPECs (7). Copper, iron, and zinc were COPECs at all five areas; beryllium and vanadium were not COPECs at any area.

Risk-based criteria (RBCs) for protection of human health and terrestrial receptors are the lowest of:

- Applicable or relevant and appropriate requirements (ARARs);

- Ecological indicator soil concentrations (EISCs); and
- Ecological soil screening levels (EcoSSLs).

Field Work and Findings

The first field trip was a reconnaissance to obtain samples and to identify the most effective approach and logistical constraints for the subsequent sampling efforts. The first trip was described in our reconnaissance report (Hart Crowser 2011d).

During the four sampling trips in 2011, we attempted to locate 18 abandoned mine sites that had not previously been characterized. Twelve mines and/or prospects (collectively referred to as mine features) were located and observed for the presence or absence of vegetation, wildlife, water bodies, and other relevant conditions. Waste rock samples were collected where possible.

We collected 50 background soil samples and 43 samples from waste rock at twelve mine sites in the three watersheds. Discrete samples were collected at an upper depth (0 to 6 inches) and, where possible, a lower depth (6 to 12 inches) at two to three locations on the waste rock pile associated with each adit. In addition, we collected a 30-point, multi-increment sample (MIS) from the Potomac Silver waste rock pile. A summary of conditions at these sites is presented below.

- We found four mine tunnel openings (adits) in the Glacier Creek Watershed that appear to be the mine workings identified as Potomac Silver, IXL Mine, Pusher Lode, and Portland No. 2. At these locations we sampled waste rock piles that had the following approximate volumes:

Table ES-1 – Glacier Creek Watershed Waste Rock Volumes

Mine Adit Name	Estimated Waste Rock Volume (in cubic yards)
Potomac Silver	95
IXL Mine	20
Pusher Lode	3,500
Portland No. 2	100

Antimony, arsenic, copper, mercury, and silver exceeded both the RBC and site-specific background for the discrete samples at all four waste rock piles and the MIS at Potomac Silver (see Table 21). One interesting result was

that for some constituents, the MIS sample had 4 to 50 times greater concentrations than the discrete samples collected from the same waste rock pile.

- We found six mine adits in the Seventysix Gulch Watershed that appear to be the mine workings identified as the Independence of 1776 Mine, Emma Moore No. 1, 74 Mine, Ibex No. 1, O&B Mine, and Congress Mine. At these locations we sampled waste rock piles that had the following approximate volumes:

Table ES-2 – Seventysix Gulch Watershed Waste Rock Volumes

Mine Adit Name	Estimated Waste Rock Volume (in cubic yards)
Independence of 1776 Mine	260
Emma Moore No. 1	90
74 Mine	27
Ibex No. 1	1,250
O&B Mine	3,000 + 1,500
Congress Mine	--

We collected two to six samples from the waste rock pile(s) associated with each adit. The coarse substrate at a number of the locations prevented collecting a lower-depth (6 to 12 inches) sample.

Antimony, arsenic, cadmium, cobalt, copper, iron, lead, manganese, mercury, silver and zinc concentrations for at least five of the six waste rock piles exceeded both the RBC and background (see Table 21).

- We found two mine adits in the Weden Creek Watershed that appeared to be the mine workings identified as Mackinaw Tunnel No. 1 and Mackinaw Tunnel No. 2. At these locations we sampled waste rock piles that had the following approximate volumes:

Table ES-3 – Weden Creek Watershed Waste Rock Volumes

Mine Adit Name	Estimated Waste Rock Volume (in cubic yards)
Mackinaw Tunnel No. 1	46
Mackinaw Tunnel No. 2	35

Waste rock at Mackinaw Tunnel No. 1 exceeded RBC and background for barium, chromium, and nickel. Antimony, arsenic, cadmium, copper, iron, lead, and zinc exceeded both criteria at Mackinaw Tunnel No. 2 (see Table 21).

Documentation on the mine features we visited is available from a variety of sources as noted in our April 20, 2011, report. Some of the mine features had relatively extensive mine workings, whereas other sites were prospects with only limited mine development. Mine claim records exist for all but two of the sites (O&B Mine and Comet Mine) that we visited or attempted to locate for this study, and many of these are patented claims located within the boundaries of National Forest System Lands.

Human and Terrestrial Ecological Receptor Risks

Human health risks are limited to recreational users of the site. Although several of the mine workings are within a quarter mile of Forest Service campgrounds or hiking trails, a significant amount of effort was required to locate and access most of the mine sites we sampled. The location of these mine features relative to existing trails and/or campgrounds is shown on Figures 8A through 8D. Washington's Model Toxics Control Act (MTCA) Method B screening levels likely overestimate risk to recreational users since their exposure duration is much less than the duration for a residential scenario. As shown in the table below, MTCA Method B values are based on a 365-day residential scenario and subsequently have much more conservative cleanup levels than a typical recreational user for this area (e.g., a hiker or camper that spends only a few days to a few weeks each year).

Table ES-4 – Recreational User Scenario Cleanup Levels

Cleanup Level (mg/kg)	MTCA Method B 365 days	Minimum 3 days	Maximum 30 days
Aluminum	--	--	--
Antimony	32	3900	390
Arsenic	0.67	82	8.2
Barium	16000	1900000	190000
Beryllium	160	19000	1900
Cadmium	80	10000	1000
Calcium	--	--	--
Chromium	240	29000	2900
Cobalt	--	--	--
Copper	2960	360000	36000
Iron	24000	2900000	290000
Lead	--	--	--
Magnesium	--	--	--
Manganese	11200	1360000	136000
Mercury	24	2900	290
Nickel	1600	190000	19000
Potassium	--	--	--
Selenium	400	50000	5000
Silver	400	50000	5000
Sodium	--	--	--
Thallium	5.6	680	68
Vanadium	560	68000	6800
Zinc	24000	2900000	290000

Note: Based on the MTCA Equation 740-1.
MTCA default equations are based on a child exposure (16 kg average body weight)

For all three watersheds, we documented mine site-specific observations of terrestrial ecological receptors. Limited vegetation, wildlife or signs of wildlife, and/or macroinvertebrates were observed at all of the mine locations.

Vegetation did not appear to be distressed. Distressed vegetation may be dead, discolored (i.e., yellowing), or withered, or, there may be bare ground in a vegetated area or an area that differs from the surrounding vegetation for no apparent reason. Distressed vegetation can typically be identified during regular site observations.

Additional Observations

Drainage through the waste rock piles and/or mine adit drainage was observed at several sites during sample collection; therefore, we recommend shallow groundwater sampling be considered and as applicable, surface water sampling, as part of future characterization work.

MONTE CRISTO MINING AREA
REMEDIAL INVESTIGATION PHASE 2
SUMMARY REPORT

2.0 INTRODUCTION

This report summarizes our observations and the analytical results of soil samples from selected mine sites in the Monte Cristo Mining Area (MCMA) near Granite Falls, Washington (Figure 1). These mine sites were chosen because they have not been sampled before. Hart Crowser performed this investigation for the Washington State Department of Ecology (Ecology) under Contract No. C1100144F. Work was conducted in general accordance with the Ecology Statement of Work (SOW) and our project Sampling and Analysis Plan (Hart Crowser 2011c).

The objectives of this initial investigation were to:

- Locate selected representative mines and prospects that were identified in the Phase I literature review (see Tables 1 and 2, Hart Crowser 2011a);
- Record observations of the site conditions and document the plants, macroinvertebrates, and animals present at and near each mine feature visited;
- Sample potentially impacted soil and waste rock from the mine features located; and
- Collect background soil samples to enable statistically valid comparisons.

At the mine feature locations, samples were collected from the soil-like fraction of waste rock and/or natural soil near the waste rock that was potentially affected by mining activities. Analytical results were compared to the background soil sample concentrations and Washington's Model Toxics Control Act (MTCA) Method B criteria for protection of human health and soil screening criteria for protection of terrestrial receptors. For purposes of this report, the use of terms such as "tailings" or "waste rock" are for convenience only and are considered to be a soil, consistent with WAC 173-340-200.

Subsurface openings observed for this study may include shafts, adits, prospect pits or trenches, collapsed stopes, tunnels, and/or excavations completed for other purposes. The terms used in this report are based on visual interpretation in the field and may not fully characterize historical site use.

Before we began the field sampling, we performed a Phase I Environmental Site Assessment (Hart Crowser 2011a), which included a review of historical maps and documentation; evaluation of aerial photographs and US Forest Service and US Geological Survey (USGS) maps; and a review of the county tax assessor records. The purpose of this review was to:

- Identify the approximate location of mines and associated features/structures;
- Identify the location of mine claims; and
- Identify potential routes and/or restrictions to access each mine site.

A site reconnaissance was conducted from July 8 through July 13, 2011, and three additional sampling trips were conducted on August 22 through 27, and September 12 through 16 and 26 through 30, 2011. Table 13 summarizes activities completed during these field events in chronological order. Table 14 presents the project team members and their roles and responsibilities for this investigation. Some tables are presented in the text of this report, and others are separate, following the main text.

The presumptive locations of the mine features were determined by using historical mine records to estimate global positioning system (GPS) coordinates. We located and sampled four abandoned mine entries in Glacier Creek Watershed, six in Seventysix Gulch Watershed, and two in Weden Creek Watershed. We also attempted to locate three additional mine features in the Glacier Creek Watershed, four in Seventysix Gulch Watershed, and one in the Weden Creek Watershed, but did not observe any mine workings at these locations. At each location where mine features were not observed, we extended our reconnaissance by 100 to 200 feet around each location, depending on terrain.

3.0 SITE DESCRIPTION AND OPERATIONAL HISTORY

The Monte Cristo Mining Area (MCMA) is located at the headwaters of the South Fork Sauk River (Figure 1). Three smaller watersheds (Glacier Creek, Seventysix Gulch, and Weden Creek) form the headwaters of the South Fork Sauk River approximately 6 miles upstream of Monte Cristo Lake. The MCMA comprises a number of abandoned mines and prospects scattered throughout the three watersheds. Select information on the areas, habitats, mines, prospects, and facilities discussed in this report can be found in Table 15.

The area is a popular destination and is accessible to hikers by a washed-out dirt road which runs south from Barlow Pass on the Mountain Loop Highway. The

road crosses over and follows along the South Fork Sauk River to the Monte Cristo Townsite (Townsite). There is currently no vehicular access to the area.

Historical mine claim survey plats are available through the Bureau of Land Management Land Status and Cadastral Survey Records (provided in Appendix A of the 2011 Phase 1 Spatial Analysis Report, Hart Crowser 2011a). Each watershed is described in further detail below.

Mine entries are notoriously referred to in prohibited sources for this area as "adits" or "tunnels." Since the reason for using one term or another is not always clean, this report follows the same terminology.

3.1 Glacier Creek Watershed

The Glacier Creek Watershed is characterized by rock, snow, and ice. The low-elevation portions of the watershed contain forested areas with a shrub-dominated understory. Forested vegetation is dominated by grand fir, subalpine fir (*Abies lasiocarpa*), and cedar with understory vegetation consisting of blueberry (*Vaccinium* sp.) and huckleberry (*Vaccinium* sp.) with devil's club (*Oplopanax horridus)*, vine maple (*Acer circinatum*), and salmonberry (*Rubus spectabilis*) common near drainages and seeps. High-elevation areas are dominated by rock and seasonal snow and ice which support small forested stands, low-growing shrubs such as mountain-heather (*Phyllodoce* sp. and *Cassiope* sp.), lichen, and moss. Talus slopes and rocky outcrops are common features in this watershed.

Glacier Creek flows in a northerly and westerly direction into the South Fork Sauk River from its headwaters (Figure 1). Snowmelt serves as the primary water source for Glacier Creek. Snowmelt likely enters the creek as surface runoff, groundwater base flow, and seasonal seeps. The following mines/prospects were observed in the field and are shown on Figures 2A through 2C. Additional information on the individual mine features is presented in Tables 1 and 2 of Hart Crowser (2011a).

3.1.1 Potomac Silver

The Potomac Silver Mine claim was located on September 29, 1891, and is identified as Mineral Survey No. 301 on the survey. The claim was surveyed on August 16, 1892, by Alex M. Reynolds.

One 32-foot long adit and one trench are shown on the survey plat (BLM 2011). This survey plat is reproduced as Figure A-8 in Appendix A of the Hart Crowser 2011a. According to the Mineral Resources of the Glacier Peak Rare II Area

Summary Report (Johnson et al. 1983), the Potomac Silver Mine produced gold, silver, copper, lead, and zinc.

The Potomac Silver Mine is located approximately 2 miles up the Glacier Basin Trail from the Townsite and about 100 yards southwest of the trail (see Table 15 for coordinates). The adit's waste rock pile is visible from the trail. The dimensions of the waste rock pile are approximately 51 by 25 by 2 feet (approximately 95 cubic yards [cy]) and followed the slope of the underlying terrain (about 33 degrees). A sketch is presented on the abandoned mine lands (AML) datasheet in Appendix A, along with site photographs.

Seepage and still water were present in the adit at the time of our observations in August 2011. The soil between the tunnel entrance and the waste rock pile was saturated. Based on this observation, it is likely that the water within the adit would flow from the tunnel on a seasonal basis.

A 1-inch steel cable was found northwest of the pile. The cable ran upslope and may have extended to other mine workings. The field team followed the cable up the mountainside for several hundred yards. Additional smaller debris was found on the mountainside. The end of the cable was not located because of time limitations.

3.1.2 IXL Mine

The IXL Mine claim was located on June 26, 1890, and is identified as Mineral Survey No. 157 on the survey. The claim was surveyed from September 14 through 19, 1891, by Richard H. Stretch (BLM 2011).

A tunnel and waste rock dump are identified on the survey plat. According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the IXL tunnel was 24 feet long. The mine produced gold and silver.

The IXL mine is located approximately 2.25 miles up the Glacier Basin Trail from the Townsite, south of the Potomac Silver mine. The IXL tunnel is located about 100 yards southwest of the trail (see Table 15 for coordinates). There is a large boulder field between the trail and the tunnel. The dimensions of the waste rock pile are approximately 28 by 6 feet (approximately 20 cy) with a slope of 38 degrees. The depth of the waste rock pile could not be accurately assessed by the field team. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

Groundwater seepage was observed in the tunnel at the time of our visit in August 2011. The slope between the tunnel and the waste rock pile was steep and very wet. This tunnel was difficult to access and the waste rock pile was difficult to sample because of the steep slope and wet ground.

Vegetation was present on and around the steep slope and waste rock pile. It appeared the emergent vegetation had been disturbed either by an animal or water flowing down the steep slope because it was crushed and flattened in the area adjacent to and upslope of the opening. Dominant vegetation included subalpine fir, which became patchy downslope.

3.1.3 Pusher Lode

The history of the Pusher Lode is relatively unknown. Mine operations and working information is not available. The Pusher Lode claim was located (along with the Philo and Meridian Lodes) on September 27, 1899, and is listed as Mineral Survey No. 1167. The claim was surveyed from July 15 to August 2, 1921, by Frank H. Copp.

A discovery tunnel and two additional tunnels are shown in the Pusher Lode claim on the survey plat for Pusher Lode. Table 2 of the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983) lists some information about the Pusher Lode Mine, notably that the Pusher Lode had mine workings and production from three adits that were 32, 47, and 104 feet long.

The tunnel and waste rock pile are located approximately 3/4 mile up the Glacier Basin Trail from the Townsite. The tunnel was located at the top of a boulder field in an opening of the trees located at the base of a cliff face (see Table 15 for coordinates). The orange waste rock pile is partially visible.

The tunnel dimensions are approximately 5 by 5 by 45 feet. Water was present within the tunnel. The waste rock pile is located southwest of the tunnel opening. The pile dimensions are approximately 105 by 226 feet with an estimated depth of 4 feet (approximately 3,500 cy). Samples collected are described below in Section 4.1.1. A sketch is presented on the AML data sheets in Appendix A, along with site photographs.

3.1.4 Portland No. 1

The history of the Portland No. 1 is also relatively unknown. Mine operation and working information is not available. This claim was located on July 14, 1915, and is listed as Mineral Survey No. 1165. It was surveyed from July 15 to August

2, 1921, by Frank H. Copp. A discovery tunnel and one additional tunnel are shown on the survey plat (Appendix A).

Table 2 of the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983) provides some information about the Portland No. 1 mine. Johnson et al. reports that the area has two adits that were 51 and 65 feet long, which produced silver, gold, copper, lead, and zinc ore.

From the Pusher Lode tunnel, the field team continued southeast across the base of the cliff face to the expected location of Portland No. 1. Progress was difficult because of steep terrain, overgrown vegetation, and time limitations. No mine features were observed at the presumed location of the Portland No. 1 mine or in the immediate area. There was a drainage channel further southeast, and it is possible that the Portland No. 1 mine is located there. This area could be investigated further in a future sampling event.

3.1.5 Portland No. 2

The history of the Portland No. 2 is relatively unknown. Mine operation and working information is not available. This claim was located on July 14, 1915, and is listed as Mineral Survey No. 1165. It was surveyed from July 15 to August 2, 1921, by Frank H. Copp. A discovery tunnel and one additional tunnel are shown on the survey plat (Appendix A).

The Portland No. 2 tunnel is located approximately 2 miles up the Glacier Basin Trail from the Monte Cristo Townsite on the eastern slope of the basin (see Table 15 for coordinates). From this tunnel opening, the field team had a clear view into the Potomac Silver adit across the valley to the west. According to the Portland No. 2 survey plat, there is an additional tunnel on the claim. It appeared there could potentially be another tunnel located further upslope and south of the opening we found; however, due to very steep terrain, we could not explore this further.

The tunnel opening is mostly collapsed, so it was not possible to estimate its depth. Water was dripping from within the opening at the time of our observations in late September 2011. The associated waste rock pile was approximately 63 by 21 by 2 feet (approximately 100 cy) with a 38 degree slope. The waste rock pile had small debris (broken glass, steel cable, and rusted pipe) on it. Samples collected are described below in Section 4.1.1. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.1.6 Meridian and Philo Lodes

The history of the Meridian and Philo Lodes are relatively unknown. Mine operations and working information are not available. Both the Meridian and Philo Lode claims were located (along with the Pusher Lode) on September 27, 1899, and is listed as Mineral Survey No. 1167. The claim was surveyed from July 15 to August 2, 1921, by Frank H. Copp.

These locations were considered a lower priority because of the limited information available on their operational history. The field team did not attempt to hike to these mines. While hiking to other, higher priority locations, the field team did try to spot any areas that looked like tunnel openings or waste rock piles using binoculars from the Glacier Basin Trail, but we did not see any areas that looked promising.

3.2 Seventysix Gulch Watershed

The Seventysix Gulch Watershed is characterized by a predominantly forested landscape interspersed with rock and seasonal snow and ice. Dominant vegetation is similar to the Weden Creek and Glacier Creek Watersheds, and consists of an overstory of Douglas-fir, true firs, hemlock, and cedar with an understory of shrubs. Evidence of historical timber harvest can be observed near established trails. High elevation areas contain a combination of forest stands, talus slopes, and rocky outcrops.

Seventysix Gulch generally flows in a northerly direction into the South Fork Sauk River (Figure 1). Snowmelt serves as the primary water source for Seventysix Gulch, which is reported to go dry during the late summer months (personal communication with Trey, US Forest Service volunteer, July 2011). Groundwater base flow and seasonal seepage likely contribute to surface water flows during the spring and early summer. Silver Lake is located near Poodle Dog Pass on the southwestern ridge of the Seventysix Gulch Watershed, and is a popular destination for recreational users.

3.2.1 Independence of 1776 Mine

This claim was located on July 4, 1889, and is listed as Mineral Survey No. 175. The claim was surveyed from August 27 through September 3, 1891, by Richard H. Stretch.

A tunnel is identified by the Independence of 1776 Mine (hereafter referred to as 76 Mine) survey plat. The 76 Mine produced gold, silver, zinc, and possibly copper. According to the Mineral Resources of the Glacier Peak Rare II Area

Summary Report (Johnson, et al. 1983), the 76 Mine workings and production include three adits that were 19, 151, and 681 feet long. The longer adit is partially caved (Johnson, et al. 1983). Based on a historical letter (Sauers 1971) provided by the Department of Natural Resources (DNR), the 76 Mine is a patented claim.

The 76 Mine is situated between two obvious drainages. The first drainage (north) appears to run toward Comet Mine and contains 12- to 14-foot-high walls starting at the bottom. The southern drainage is less obvious and is expected to meet with the Ranger Claim at higher elevations. The 76 Mine adit is located at the base of the cliffs between these two drainages within thick vegetation (see Table 15 for coordinates). There is a rusty pipe that runs up the hillside from the 76 Mine toward another waste rock pile that we did not visit. We also observed another waste rock pile downslope (to the west) of the 76 Mine adit that we did not visit.

The 76 Mine opening is approximately 5 by 4 feet and had water flowing from the entrance at the time of our observations in mid-September 2011. The entrance runs approximately 15 feet directly into the cliff before curving to the right for about 30 feet. Water was encountered flowing from the mine opening and through a defined channel that bisected the waste rock pile. The water from the mine infiltrates about 20 to 30 feet from the opening. The terrain slopes steeply at approximately 50 degrees. The waste rock pile is approximately 40 by 60 by 3 feet (approximately 260 cy) with some vegetation cover (alder and cedar saplings).

We observed an apparent waste rock pile upslope from the 76 Mine and potentially another adit, but we were not able to access this area due to the steepness and difficulty of the terrain. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.2 Emma Moore Mine

This claim was located on August 31, 1889, and is listed as Mineral Survey No. 171. The claim was surveyed from August 25 through September 8, 1891, by Richard H. Stretch.

The Emma Moore Mine survey plat does not identify any tunnels within the claim. Based on a map provided by the Department of Natural Resources (DNR, Wolff 2010), the Emma Moore Mine is a patented claim involved in a land swap to USFS around 1996. The Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983) indicates the Emma Moore Mine workings included one 41-foot adit. However, the Monte Cristo

Preservation Association (MCPA 2011) provided a map which identifies two Emma Moore tunnels, designated as No. 1 and No. 2. From the GPS coordinates of the sampling locations, it appears that the field team located and sampled Emma Moore No. 1 but mistakenly identified it as Emma Moore No. 2 on the AML and TEE data forms. Emma Moore No. 2 was not located or sampled by Hart Crowser.

The Emma Moore No. 1 adit is on the western slope of the Seventysix Gulch Watershed at an elevation of approximately 4,200 feet above mean sea level (see Table 15 for coordinates)[1]. No surface water was encountered in the drainage. The waste rock pile is downslope of the adit.

The adit opening is approximately 5 by 4 feet. The terrain slope is steep at approximately 40 to 45 degrees. The waste rock pile is approximately 60 by 20 by 2 feet high (approximately 90 cy). Cedars, firs, and grass are established along the walls of the drainage.

Field observations noted that an attempted mine entry appears to be about 40 feet south of Emma Moore No. 1 on the opposite side of the drainage. This opening may be Emma Moore No. 2 and is approximately 10 feet tall by 12 feet wide. Talus slopes from the cliffs above are between the attempted mine entry and the Emma Moore No. 1. A small amount of standing water was observed at the mine opening. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.3 74 Mine

This claim was located on August 31, 1889, and is listed as Mineral Survey No. 170. The claim was surveyed from August 24 through September 8, 1891, by Richard H. Stretch.

A tunnel is identified on the 74 Mine survey plat. According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the 74 Mine workings included one 118-foot-long adit. Based on a historical letter (Sauers 1971) the 74 Mine is a patented claim. According to the map provided by the DNR (Wolff 2010), the 74 Mine was a patented claim involved in a land swap to USFS around 1996.

The 74 Mine adit is located on the south side of a narrow drainage channel at an elevation of about 4,150 feet (see Table 15 for coordinates). The slope leading

[1] All elevations in this report are above mean sea level unless noted otherwise.

up to the adit is extremely steep and slippery due to seepage and water in the drainage channel.

The adit opening is approximately 6 by 4 feet, but length could not be determined. The terrain slope is approximately 43 degrees. A waste rock pile is located downslope of the adit opening, and has dimensions of approximately 20 by 12 by 3 feet (approximately 27 cy). There was limited vegetation on the waste rock. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.4 IBEX No. 1

This claim was located on May 12, 1890, and is listed as Mineral Survey No. 158. The claim was surveyed from August 27 through September 3, 1891, by Richard H. Stretch.

The IBEX No. 1 mine survey plat identifies a 40-foot-long tunnel, but the extent of any other mine workings is relatively unknown. According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the mine workings include one 86-foot-long adit. Based on the map (Wolff 2010) provided by the Department of Natural Resources (DNR), the IBEX No. 1 Mine is a patented claim involved in a land swap to the US Forest Service around 1996.

The IBEX mine is located in the Seventysix Gulch Watershed, approximately 1.4 miles upstream from the confluence of Seventysix Gulch and Glacier Creek. The claim is located approximately 1000 feet east of Seventyxis Creek, up a steep partially vegetated talus slope. The mine adit was found along a cliff band, between two unnamed drainages at approximately 4,200 feet elevation. There is a small, relatively level area at the base of the mine opening, and a small berm that separates the downslope waste rock pile from the mine opening area. The waste rock pile is located below the mine, and is approximately 150 by 75 by 3 feet (approximately 1,250 cy) and is located on a steep (approximately 45 degree) slope. The waste rock pile is bordered by a young to semi-mature stand of trees to the north and a partially vegetated talus slope to the south.

The adit appears to follow a nearly vertical weathered ore vein that is visible above the mine opening. The mine opening is approximately 5 by 5 feet and approximately 93 feet long. A rusted wheelbarrow and a few tin cans were the only visible mining debris. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.5 O&B Mine

The upper and lower tunnels of the O&B Mine were located using directions provided by Woodhouse (1997). The mine is located above the Townsite to the southwest. According to Woodhouse (1997), the mine was recorded with the county auditor on August 11, 1891. Woodhouse (1997) reports that the mine had tunnels on three levels, with one caved-in level. An incomplete Mine Power Survey form indicates that there were four levels. The Mine Power Survey also states that there were no patented claims and 13 unpatented claims in this area (A.H. Reiser, 1940). Historical mine claim survey plats are not available.

The O&B tunnels are located northeast of Silver Lake, immediately north of the Seventysix Gulch Watershed (see Table 15 for coordinates). They are included in this section for convenience.

The field team was able to reach the upper and lower tunnels of the mine. There were at least three distinct waste rock piles in the area: two below the upper tunnel, and one below the lower tunnel.

At the upper tunnel, it appeared that one pile is from the upper tunnel and the second pile (downslope) is from a collapsed tunnel. The upper tunnel waste rock pile was roughly estimated to be 168 by 80 by 6 feet (approximately 3,000 cy) with a slope of 43 degrees. Water was seen flowing downslope along the side of the pile at approximately 0.5 liters per minute (L/min) at the time of our observations in late September 2011. Based on our observations, the water likely infiltrates the subsurface near the toe of the slope of the hillside. Mine feature and waste rock samples collected at the upper tunnel and the associated waste rock pile are discussed below in Section 4.2.1.

Due to time constraints we did not sample the waste rock pile of the collapsed tunnel.

The lower tunnel also had a large waste rock pile that was approximately 200 by 25 by 8 feet (approximately 1,500 cy) with a 30-degree slope. The lower tunnel had water flowing out of the tunnel directly onto and through the waste rock pile at roughly 2 L/min. The water discharging from the tunnel has caused erosion of the waste rock and flows into two separate paths that reconnect toward the bottom of the pile where a small trench has eroded. This waste rock pile and discharging water were observed on September 28, two days after heavy rainfall. Based on the prominent erosion channels, the flow is likely a consistent discharge from the tunnel, and may not be a seasonal flow. Mine feature and waste rock pile samples collected from the lower tunnel pile are

discussed below in Section 4.2.1. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.6 Congress Mine

This claim was located on July 24, 1890, and is listed as Mineral Survey No. 161. The claim was surveyed from August 24 through September 8, 1891, by Richard H. Stretch.

According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the Congress Mine workings and production included one 67-foot-long adit. Based on the DNR map (Wolff 2010), the Congress Mine is a patented claim that was involved in a land swap to the US Forest Service around 1996.

The Congress mine claim is located in the Seventysix Gulch drainage, approximately 1.25 miles upstream from the confluence of Seventysix Gulch and Glacier Creek. The claim is located 800 feet west of Seventysix Gulch at approximately 4,360 foot elevation. One mine adit was found immediately adjacent to an unnamed drainage that runs through the claim. The drainage consists of a canyon (approximately 60 feet wide) that cuts into a steep band of cliffs, terminating at a steep, partially vegetated talus slope uphill from Seventysix Gulch.

The adit was approximately 5 by 5 feet and approximately 60 feet long. The adit appears to follow a vertical weathered ore vein that is visible at the surface. Due to the abundant water adjacent to the mine, it appeared that waste rock was dumped into the drainage and has likely been eroded downslope into Seventysix Gulch. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

3.2.7 Fontenoy Lode

This claim was located on January 2, 1902, and is listed as Mineral Survey No. 755 A&B. The claim was surveyed from December 30, 1903, to November 23, 1904, by FH Whitworth. Surface stripping and five tunnels are identified on the survey plat, but the extent of the Fontenoy Lode mine workings are otherwise unknown. Based on the DNR map (Wolff 2010) the Fontenoy Lode is a patented claim that was involved in a land swap to the US Forest Service around 1996.

Snow cover in the valley prevented access to locate the mine at the time of the reconnaissance in July 2011. The area had between one and five feet of snow

cover on a slope with scattered large boulders and fallen trees. The team attempted to visually locate the tunnel with binoculars, but could not cross the snow to reach a suitable vantage point.

3.2.8 Glacier Mine

This claim was located on July 5, 1889, and is listed as Mineral Survey No. 262 A&B. The claim was surveyed from August 10 through September 30, 1892, by Richard H. Stretch.

Two open cuts and a tunnel are identified by the Glacier Mine and Mill Site survey plat. The extent of the Glacier Mine workings is largely unknown. According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the Glacier Mine workings include one 57-foot-long adit.

The field team attempted to locate a mine opening associated with the Glacier Claim, located in the Seventysix Gulch drainage. No definitive opening could be located within the claim, but a small cave was located south of Glacier Claim in the presumptive location of the Hopeful Mine. The field crew attempted to explore the cave, but the proximity to the waterfall and the steep grade made the ascent very treacherous.

The waterfall is located on the south side of the drainage and extends south and then west up the ridge. The cave can be easily seen from the drainage and is located on the north side of the waterfall.

3.2.9 Comet Mine

According to Woodhouse (1997), the mine was recorded with the county auditor on July 20, 1891, and was active in the late 1890s. Historical mine claim survey plats are not available for the Comet Mine.

According to the Mineral Resources of the Glacier Peak Rare II Area Summary Report (Johnson et al. 1983), the Comet Mine workings and production includes two adits containing 1,038 feet of drifts and crosscuts. Both adits are reported to be partially caved. Although an unknown amount of ore was produced, Woodhouse (1997) states that the ore taken from Comet was mostly arsenopyrite and galena.

Hart Crowser attempted to locate the Comet Mine by ascending the Glacier Claim drainage to reach the mine. The drainage was extremely steep and had very loose rock. The ascent was called off at approximately 4,950 feet elevation

after conditions became too treacherous to continue at about 450 feet below the mine's reported elevation of 5400 feet (Woodhouse 1997). Mining activity was evident on the north side of the gully; cables could be seen running along the canyon walls to a point that may have at one time been occupied by a tram (cable car) support that ran from below the mine to the Townsite.

3.2.10 Sauk Lode

This claim was located on May 19, 1891, and is listed as Mineral Survey No. 322. The claim was surveyed from April 25 through 27, 1893, by Richard H. Stretch.

Upper and lower tunnels are identified by the Sauk Lode survey plat. The extent of the Sauk Lode mine workings is unknown. The survey plat shows a trail that leads to both tunnels, but this trail could not be located; it has likely been overgrown and no longer exists. The field team was able to locate one tunnel (tentatively identified as the lower tunnel) within the Sauk Lode claim.

The Sauk Lode tunnels are located in a drainage channel of the South Fork Sauk River, approximately 1/4 mile southwest of the Monte Cristo Townsite. The lower mine opening is located in a drainage channel at an elevation of approximately 2,800 feet (see Table 15 for coordinates). The opening is about 4 by 4 by 40 feet and curves left.

Due to the tree canopy cover in this area, we were unable to get a GPS signal to pinpoint the location of the Sauk Lode tunnels. The elevation readings varied between 2872 feet and 3081 feet. The team attempted to locate the second Sauk Lode tunnel. We scoured the surrounding area for several hundred yards, both above and below the tunnel, and could not locate the second tunnel. Much of this area has fallen trees and rocks and the lower tunnel may be collapsed and not visible.

The tunnel we observed is located in a drainage channel that had flowing water at the time of our observations in September 2011. There were at least 6 inches to 1 foot of water in the tunnel. Water was flowing from above the tunnel, ponding in front of and inside the opening, and flowing downslope in the drainage channel. The channel discharges to the South Fork Sauk River. Estimated flow at the time of observations was approximately 2 L/min.

Waste rock associated with the Sauk Lode tunnel has apparently been eroded away. There was no clear delineation of a waste rock pile. Some stained rock was present in the drainage channel. What appeared to be rock debris from the

tunnel was present with some vegetation cover, but it was not a well-defined pile. The vegetation did not appear distressed.

3.3 Weden Creek Watershed

The low-elevation portions of the Weden Creek Watershed are characterized by a predominately forested landscape dominated by Western hemlock (*Tsuga heterophylla*), Western redcedar (*Thuja plicata*), Douglas-fir (*Pseudotsuga menziesii*), grand fir (*Abies grandis*), and other true firs. Understory species consist of salmonberry (*Rubus spectabilis*), red alder (*Alnus rubra*), vine maple (*Acer circinatum*), red elderberry (*Sambucus racemosa*), ferns, and grasses, among others. Devil's club (*Oplopanax horridus*) is common, particularly near drainages, seeps, or areas with moist to wet soil conditions. Higher elevation areas are dominated by rock and snow with patchier forest stands.

Weden Creek and its associated tributaries generally flow in a northerly direction into the South Fork Sauk River (Figure 1). Numerous small streams, seeps, and seasonal drainages are present along the basin's ridges and feed into Weden Creek as either surface flows or as groundwater.

3.3.1 Mackinaw Mining Area

The Mackinaw mines consist of sixteen claims located in Section 19, Township 29N, Range 11E, Snohomish County, Washington. The field team attempted to locate three tunnels identified within the Mackinaw mining area: Mackinaw Mine Tunnel No. 1, No. 2, and No. 3.

Historical survey plats are not available for this area. However, there were 16 claims in this area based on the War Minerals Report 156 (DOI 1944). The layout of 12 of these claims in the Mackinaw Mining area is shown on Figure A-21 in Appendix A of the Spatial Analysis report by Hart Crowser (2011a).

The Mackinaw tunnels sites were accessed by a former road that extends up the east side of Weden Creek Valley for approximately 3,000 feet. After about 3,000 feet, the road ends and a trail connects this road with the mine workings about 2,000 feet further up the valley (DMM 1941). There is some variation in the exact location and elevation of the Mackinaw tunnels based on different reports, which were summarized in Hart Crowser (2011d).

The mines are located in a region of extremely rugged terrain. Mackinaw Tunnel No. 1 (Weden 1 samples) is located approximately 1 mile down the former road/trail from the South Fork Sauk River at an elevation of about 2,700 feet (see Table 15 for coordinates).

The opening is 20 by 15 feet and the length could not be measured beyond 6 feet because the tunnel sloped downward. The terrain slope is approximately 35 degrees. A waste rock pile is located immediately downslope of the opening, and has dimensions of 25 by 25 by 2 feet (approximately 46 cy). There was very little water present in the tunnel with no flow at the time of sampling in July 2011. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

Mackinaw Tunnel No. 2 (Weden 2 samples) is located at the southernmost end of the abandoned road/trail adjacent to a drainage channel that discharges into Weden Creek (see Table 15 for coordinates).

The tunnel is approximately 23 by 10 feet, and it appeared the tunnel has collapsed about 10 feet from the entrance. The terrain slope is 35 to 40 degrees. A waste rock pile is located downslope of the opening and appears to be eroding into the drainage channel. The pile dimensions are approximately 35 by 9 by 3 feet (approximately 35 cy). The drainage channel was flowing at the time of sampling and is likely ephemeral during a typical summer. Water was encountered flowing through the waste rock at the time of sampling. Estimated flow through the waste rock at the time of observations (July 2011) was approximately 2 L/min. A sketch is presented on the AML datasheet in Appendix A, along with site photographs.

Due to the terrain and loose, unstable footing, the field team attempted to visually locate Mackinaw Tunnel No. 3 with binoculars. However, we were unable to positively locate it. Ecology's representative Jason Shira was able to locate Tunnel No. 3 during the second sampling trip, but noted that there was very little waste rock material left to sample, likely due to erosion over time.

Based on the locations and elevations of mines observed during the site reconnaissance, it appears that Edward Daily's 1941 report accurately described the Mackinaw Tunnels. Daily's descriptions approximately match the locations and elevations of the mine openings where Weden 1 and Weden 2 samples were collected.

3.4 Ecological Exposure Areas

The overall MCMA was divided into five ecological exposure areas based on terrain features and site use, as part of the Terrestrial Ecological Evaluation (TEE) included as Appendix C of this report. For each ecological exposure area, the TEE identified ecological exposure pathways, and calculated the reasonable maximum soil exposure point concentrations (EPCs) where complete and significant pathways were identified.

The MCMA Site covers approximately 5,800 acres in the three watersheds (Glacier Creek, Seventysix Gulch, and Weden Creek) that comprise the headwaters of the South Fork Sauk River. Delineation of ecological exposure areas (EEAs) was based on wildlife use of the site topography and historical use of the area. For example, the talus slopes forming the ridge separating the Glacier Creek and Seventysix Gulch watersheds may act as a physical barrier to wildlife with a limited home range. In contrast, the lower portions of these watersheds are interconnected and lack the same physical barrier. Different sources of contamination (e.g., tailings versus waste rock) may also affect ecological exposures. For example, the fine-grained texture of tailings—in contrast to the coarse-grained texture of waste rock—could affect the bioavailability of constituents.[2] Five ecological exposure areas were identified (Figure 3) as follows:

- Area 1: Processing Area
- Area 2: Lower Watershed Area
- Area 3: Upper Glacier Creek Watershed
- Area 4: Upper Seventysix Gulch Watershed
- Area 5: Weden Creek Watershed

Area 1 includes the main sources of concentrated ore and processed ore: the Ore Collector, Haulage Ways, and Concentrator. The Ore Collector consists of the collapsed tramway terminal and ore storage facility and contains stockpiled ore (CES 2010). The Haulage Ways are a network of primitive roadways that connected the Ore Collector, Concentrator and Assay Shack. Coarse to fine-grained material spilled during transport along these Haulage Ways and left a thin layer of contaminated soils (CES 2010). The United Companies Concentrator (Concentrator) was a mill that processed approximately 300 tons of ore per day between 1894 and 1912. Tailings, waste rock, and contaminated soil had been identified at the former Concentrator site (CES 2010).

Area 2 comprises the lower elevation portions of the Glacier Creek and Seventysix Gulch watersheds because the available habitats (forested areas with a shrub-dominated understory) are similar and there is no topographic barrier between these portions of the two watersheds.

[2] Gradation of the waste affects potential exposure via incidental ingestion of soil by wildlife, and via potential reactivity that may cause phytotoxicity to plants. Both incidental ingestion during foraging, and incidental ingestion while cleaning of fur or plumage is anticipated to increase as the grain-size of the soil becomes finer. Finer grained particles have more surface area per unit weight compared to coarse-grained particles, which increases reactivity (e.g., oxidation of sulfide minerals that decreases pH and increases solubility and bioavailability of metals).

Areas 3 and 4 are the upper elevations of the Glacier Creek and Seventysix Gulch watersheds, respectively. Both areas had similar topography, vegetation, and relatively unvegetated rocky areas, but geographically are separated by a steep, rocky ridge. Areas 3 and 4 both had open and closed mine entries (typically adits) and waste rock piles as the primary contaminant sources.

Area 5 is the Weden Creek Watershed that is geographically separated from the majority of the historical mining activity near the Townsite. Open and closed adits and waste rock piles are the primary contaminant sources, but mining activity was on a smaller scale and occurred much later into the twentieth century compared to the rest of the MCMA.

4.0 SITE INVESTIGATION ACTIVITIES

Our field activities included the site reconnaissance and three subsequent field sampling trips conducted over the summer and fall of 2011. Details of the sampling trips are discussed below.

We conducted an initial site reconnaissance from July 8 through July 13, 2011. Before the reconnaissance, approximate locations for the mine sites of interest were identified in GIS on a topographic base map using available survey plats and/or sketches along with reported elevations to create a point location. The GPS coordinates for these point locations were loaded onto a handheld GPS and the field team used the coordinates for navigating to the mine sites. The locations are approximate but were deemed sufficient for the intended use as a guide to reach the area of the mine features.

During the site reconnaissance, we took photographs, noted GPS data points, and collected five waste rock samples. Samples were screened with an x-ray fluorescence spectrometer (XRF), and the XRF results were compared to results of total metals analyses (see Hart Crowser 2011d). Due to the relatively poor coefficient correlation (r^2) that ranged from 0.34 to 0.85 depending on constituent, XRF analyses were not used in the subsequent sampling work discussed in this report.

Following the site reconnaissance trip, we conducted three additional field sampling trips. These field sampling trips were conducted on August 22 through 27, and September 12 through 16 and 26 through 30, 2011. Additional mine feature sampling, as well as background soil samples were collected in each watershed. The background and mine feature sample locations are shown on Figures 2A through 2C.

Our objective was to collect 50 background soil samples and as many mine feature samples as possible during the three additional trips. Ten background soil samples were available from prior work by others (CES 2008): eight from Glacier Creek Watershed, two from Seventysix Gulch Watershed, but none from Weden Creek Watershed. We collected 20 background soil samples from the Weden Creek Watershed, 18 from the Seventysix Gulch Watershed, and 12 from the Glacier Creek Watershed.

Based on the surface geology present in each watershed, an equal number of background locations were identified in the four to five surface geology types represented in the watershed (Figure 4). The approximate locations of the background samples were determined based on geology, ecological setting, avoidance of areas with apparent historical disturbance, and accessibility. However, several sample locations had to be modified in the field due to difficulty of accessing the sample location and sometimes difficulty collecting the sample. Locations of the collected background samples are shown on Figures 2A through 2C.

Waste rock at the mine features in this report was predominantly coarse material (gravel, cobble, and boulder size[3]) with varying amounts of soil-like material. Some waste rock was more soil-like than the others and these exceptions are noted in the text. All sample depths in this report refer to the zone below the surficial organic layer (if present), referred to as the O horizon or the duff layer.

During our investigation of the above mine sites, we documented the vegetation, on-site wildlife (reptiles, amphibians, birds, and mammals) or signs of wildlife, and macroinvertebrates in the area around the mine features. We also documented proximity to existing water bodies and wetlands, and looked for readily visible impacts from the existing waste rock pile(s) and areas immediately adjacent to the waste rock pile(s). Details of these observations and findings are discussed in the TEE section of the report (see Appendix C). Photographs were taken at each location to document vegetation, wildlife use, and other relevant site features. Mine feature sketches are presented on the AML datasheets in Appendix A, along with site photographs.

[3] According to the Unified Soil Classification System (ASTM D-2488 and 2487), gravels are defined as 1/6 inch to 3 inches, cobbles are 3 inches to 12 inches, and boulders are the greater than 12-inch size fraction.

4.1 Glacier Creek Watershed

4.1.1 Mine Feature Sampling

We attempted to locate seven mines or prospects within the Glacier Creek Watershed. Samples were collected from four different mines within the watershed. The mine features that were sampled are discussed in the following sections.

Potomac Silver. The Potomac Silver mine is located in the Glacier Creek Watershed and waste rock pile samples are designated Potomac S1, S2, and S3. A multi-increment sample (MIS) was also collected at this location. The MIS was collected because it was reported (Smith et al. 1997 and 2000) that this approach may minimize the effects of sampling variability and subsampling errors. This approach, if applied correctly, may provide a more representative view of mean contaminant concentrations than traditional discrete sampling approaches. The MIS was collected for comparison with discrete samples collected at the same location. Results are compared in Section 6.0 to help determine if future work should include one or both collection methods.

Six discrete samples were collected from three locations of the waste rock pile of the Potomac Silver mine. Analytical results are shown below in Table 1 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 1 – Potomac Silver Analytical Results

Constituent	Risk-based criteria	Background	S-1	S-2 (0-6)	S-2 (6-12)	S-3 (0-6)	S-3 (6-12)

Bold italic	Exceeds both the lowest RBC and site-specific background values listed in Table 19 - COC.
COC	Constituent of concern

At each location, an upper sample was collected from 0 to 6 inches deep, and a lower sample at 6 to 12 inches deep. The first sample location (Potomac S1) was near the top of the waste rock pile. The second sample location (Potomac S2) was in a seep between the waste rock pile and the tunnel opening. Potomac S2 was selected because of the amount of water coming up from the subsurface, which is likely the same water from within the opening. The third location (Potomac S3) was taken from the toe of the waste pile. See Appendix A for the field forms sketch of this area showing the relative location of each sample.

To examine whether discrete samples at the mine features were an accurate representation of constituent concentrations a 30-point MIS was collected in addition to discrete samples at multiple depths at the Potomac Silver Mine.

The Potomac Silver waste rock pile was clearly defined and we arrived at the site early in the day (before noon). With two people collecting the sample, the MIS took approximately two hours to collect.

The MIS was collected from a depth of 0 to 6 inches below the surface of the waste rock pile on a grid across the face of the pile; each point was approximately equidistant from the others. The samples collected at each of the 30 locations were small (about two grams) and were collected by scraping the exposed 6-inch soil profile. The analytical results from the MIS and discrete samples were then compared to determine if the discrete samples were over- or underestimating metal concentrations (Table 21).

IXL Mine. The IXL mine is located in the Glacier Creek Watershed and waste rock pile samples are designated IXL S1 and S2. The historical survey plat identifies a "dump of tunnel" (i.e., waste rock pile) for the IXL Mine claim. The field team was able to locate the IXL Mine and associated waste rock pile.

Samples were collected from two locations on the waste rock pile. The waste rock pile contained a wide range of rock sizes. The waste rock was predominantly soil-like material (less than 1/6 inch) with scattered gravel, cobbles and boulders. Detailed soil descriptions of the waste rock are provided in Table 16.

Four samples were collected from the IXL waste rock pile at two locations. At each location, an upper sample was collected at 0 to 6 inches deep and a lower sample was collected at 6 to 12 inches deep. Analytical results are shown below in Table 2.

Table 2 – IXL Dump of Tunnel Analytical Results

Constituent	Risk-based criteria	Background	S-1 (0-6)	S-1 (6-12)	S-2 (0-6)	S-2 (6-12)

COC	Constituent of concern

A sketch of the waste rock pile and sample locations is provided in Appendix A. The first sample location (IXL 1 0-6 and 6-12) was on the waste rock pile, just downslope of the adit. This sample was near the top of the pile and was selected as an approximate location where water could potentially flow. The second location (IXL 2 0-6 and 6-12) was near the south edge and at the approximate toe of the waste rock pile. Due to vegetation and large boulders, the extent of the pile was difficult to estimate. See Appendix A for the field forms sketch of this area showing the relative locations of each sample.

Pusher Lode. One of the tunnels of the Pusher Lode claim was located in the Glacier Creek Watershed and identified as Pusher Lode (waste rock pile samples designated Pusher S1, S2, and S3). Six samples were collected from three locations on the Pusher Lode waste rock pile. At each location, an upper sample was collected at 0 to 6 inches deep and a lower sample was collected at 6 to 12 inches deep. Analytical results are shown below in Table 3 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 3 – Pusher Lode Analytical Results

A sketch of the waste rock pile and sample locations is provided in Appendix A. The first sample location (Pusher S1) was approximately 20 feet downslope to the northeast of the mine opening (see sketch for details) within an erosional path from the mine opening. The second sample location (Pusher S2) was approximately 15 feet to the northwest and downslope of the mine opening. This location is in the center of a stained area of waste rock. The third sample location was near the toe of the waste rock pile, approximately 45 feet downslope to the northwest of the mine opening. See Appendix A for the field forms sketch of this area showing the relative locations of each sample location.

Portland No. 2. One of the tunnels of the Portland No. 2 claim was located in the Glacier Creek Watershed and identified as Portland No. 2 (waste rock pile samples designated Portland 2 S1 and S2). Due to problems with the GIS layer for survey claims (see Hart Crowser 2011a), we cannot be sure if we located the Portland No. 2 discovery tunnel or the other tunnel shown on the historical survey plat.

Four samples were collected from Portland No. 2 at two locations on the waste rock pile. At each location an upper sample was collected at a depth of 0 to 6 inches and a lower sample was collected at a depth of 6 to 12 inches. Analytical results are shown below in Table 4 and detailed soil descriptions of the waste rock are provided in Table 16.

The first sample location (Portland 2 S1) was near the northeast edge of the waste rock pile, near the top of the pile. The second sample location (Portland 2 S2) was near the south edge of the waste rock pile at the toe of the slope of the pile. See Appendix A for the field forms sketch of this area showing the relative locations of each sample.

4.1.2 Background Sampling

Eight background samples from within the Glacier Creek Watershed had previously been collected by others. Therefore, the field team collected 12 samples from this area. As mentioned above, background sample locations were identified based on geology and soil type, ecological setting, avoidance of areas with apparent historical disturbance, and accessibility. Due to the extreme terrain conditions and difficulty accessing and collecting samples, some locations were modified in the field. Figure 2A shows the locations of background soil samples collected within the Glacier Creek Watershed.

Glacier Creek had many signs of bears (scat and tree markings) and birds but limited signs of other wildlife. At sample locations, typical tree cover included cedar, alder, maple, and fir. Brush cover typically included lady fern, goat's beard, and moss.

Background soil samples were typically collected below a surficial duff (or organic) layer between 1 and 5 inches below ground surface (bgs). The predominant soil type observed was a brown to light brown (some reddish brown), slightly gravelly, silty sand or gray, slightly silty fine sand. Twelve background soil samples were collected from different locations within the Glacier Creek Watershed. Analytical results can be found in Table 18.

4.2 Seventysix Gulch Watershed

4.2.1 Mine Feature Sampling

We attempted to locate ten mines or prospects within the Seventysix Gulch Watershed. Samples were collected from six different mines or prospects within the watershed. The following sections describe the mine features that were sampled.

Independence of 1776 Mine. Three samples were collected from the Independence of 1776 Mine (76 Mine) waste rock pile. The 76 Mine waste rock pile contained a mixture of medium-sized gravel to fine sand. Analytical results are shown below in Table 5 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 5 – Independence of 1776 Mine Analytical Results

The first sample (76 S1) was collected near the top of the waste rock pile, approximately 9 to 10 feet from the mine opening. The sample was collected from a depth of 0 to 6 inches on the southern side of a drainage channel. A lower sample could not be collected from below 6 inches because of bedrock or large cobbles. The second sample location was at the base of the waste rock pile on the northwest edge near the toe, approximately 50 feet downslope of 76 S1 (See Appendix A for field forms sketch). An upper sample was collected from 0 to 6 inches (76 S2), and a lower sample from 6 to 12 inches (76 S3) on the northern side of the drainage channel.

Emma Moore No. 1. Three waste rock samples were collected from the mine feature Emma Moore No. 1. Analytical results are shown below in Table 6 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 6 – Emma Moore No. 1 Analytical Results

Three samples were collected at two locations from Emma Moore No. 1. The first location (Emma 2 S1) was located near the top of the waste rock pile on the northern side of a drainage channel, approximately 10 feet from the mine opening. At the first location an upper sample was collected at a depth of 0 to 6 inches. A lower sample could not be collected at the first location because of bedrock or large cobbles. The second location (Emma 2 S2 and S3) was located at the base of the waste rock pile on the northeast corner of the toe, approximately 50 feet downslope of Emma 2 S1. At the second location, an upper sample was collected at 0 to 6 inches deep and a lower sample was

collected at 6 to 12 inches deep. A sketch of the waste rock pile and sample locations is provided in Appendix A.

74 Mine. The 74 Mine tunnel was located in the Seventysix Gulch Watershed (waste rock pile samples designated 74 S1 and S2).

Samples were collected from two locations on the 74 Mine waste rock pile. Analytical results are shown below in Table 7 and detailed soil descriptions of the waste rock are provided in Table 16.

Each sample was collected from 0 to 6 inches deep. Samples were not collected below 6 inches because of bedrock or large cobbles.

A sketch of the waste rock pile and sample locations is provided in Appendix A. The first sample location (74 S1) was collected from the middle of the toe of the slope of the waste rock pile, before reaching bedrock. The second sample (74 S2) was located approximately 10 feet downslope of the mine opening and 6 feet from the cliff face. This sample was located within an erosional path from the mine opening. The field forms sketch of this area showing the approximate sample locations.

IBEX No. 1. Two waste rock samples were collected from the waste rock associated with the IBEX No. 1 adit. Analytical results are shown below in Table 8 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 8 – Ibex No. 1 Analytical Results

Two samples were collected from the top and bottom of the waste rock pile, samples IBEX-S1-0-6 and IBEX-S2-0-6, respectively. Both samples were collected form 0 to 6 inches bgs. The substrate was not conducive to collecting samples from below 6 inches because of bedrock or large cobbles.

Sample IBEX-S1-0-6 was collected approximately 40 to 45 feet downslope from the mine opening, at the top of the waste rock pile. The second sample, IBEX-S2-0-6, was located at the toe of the waste rock pile, approximately 150 feet downslope from IBEX-S1. The sample was collected from a depth of 0 to 6 inches. A deeper (6-12 inch) sample was not collected due to the extremely coarse material (See Appendix A for field forms sketch).

No water was observed in or immediately adjacent to the mine opening or the waste rock pile. The two drainage channels to the north and south of the mine were both flowing at the time of sampling but may be ephemeral during a typical summer; (this year there was a persistent snowpack in the Cascade Range).

O&B Mine. We located three waste rock piles in the area where we expected to find the "upper" and "lower" tunnels of the O&B Mine. Due to time constraints, we were only able to sample two of the three waste rock piles. We had identified these piles as O&B Upper, Middle (not sampled), and Lower, with the waste rock pile samples designated O&B Upper S1, S2 and S3, and O&B Lower S1 and S2.

Samples were collected from three locations on the upper waste rock pile and two locations on the lower waste rock pile. Analytical results are shown below in Table 9 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 9 – O&B Mine Analytical Results

Constituent	Risk-based criteria	Background	Lower S-1 (0-6)	Lower S-2 (0-6)	Upper S-1 (0-6)	Upper S-2 (0-6)	Upper S-3 (0-6)

Samples were collected from O&B Upper at three locations. At each location, a sample was collected at a depth of 0 to 6 inches. Samples below 6 inches could not be collected because of bedrock or large cobbles.

Samples were collected from O&B Lower at two locations. At each location, a sample was collected at a depth of 0 to 6 inches. Samples could not be collected below 6 inches because of bedrock or large cobbles.

The first location (O&B Upper S1) was near the northwest edge of the top of the pile and was selected in the runoff drainage pathway. The second location

(O&B Upper S2) was also located in the drainage pathway of the waste rock pile further downslope of S1. The third sample for O&B Upper (S3) was located in the middle of a stained area with signs of erosion. See Appendix A for the field forms sketch of this area showing the approximate locations of each sample.

The waste rock pile of O&B Lower had water flowing from the tunnel opening over and through the waste rock pile. The water had caused an erosional channel that split into two separate channels and later reconnected at the bottom of the pile. The first sample of this pile (O&B Lower S1) was collected near the top of the pile, within the eroded area of the channel. The second sample (S2) was collected near the base of the pile, slightly northeast of where the two channels merge together. See Appendix A for the field forms sketch of this area showing the approximate locations of each sample.

Congress Mine. Four waste rock samples were collected from the waste rock at the Congress Mine adit. Analytical results are shown below in Table 10 and detailed soil descriptions of the waste rock are provided in Table 16.

COC	Constituent of concern

Four samples were collected from the waste rock pile of Congress Mine at two locations. At each location an upper sample was collected at a depth of 0 to 6 inches and a lower sample was collected at a depth of 6 to 12 inches.

The first sample location is near the top of the waste rock pile, approximately 10 feet downslope from the mine opening and 8 feet north of the south canyon wall (See Appendix A for field forms sketch). This sample location is slightly downslope of the adit because it appeared that rockfall from above the mine opening had buried the waste rock adjacent to the mine opening. The adit was partially buried by approximately 3 feet of material that was presumed to have fallen from the cliffs above.

The second sample location is at the toe of the waste rock piles, approximately 180 feet downslope from Congress-S1, just before the canyon daylights along the cliff band and the talus slope begins. See Appendix A for the field forms sketch of this area showing the approximate locations of each sample.

The waste rock pile appeared to be actively eroding with waste rock observed downslope of the mine opening, apparently carried downslope by the creek. A trickle of water, less than 4 L/min, was observed falling from the cliffs above the mine opening and flowing into the mine. The berm created by the rockfall at the mine opening prevents the water from escaping the mine. The mine adit was filled with 6 to 12 inches of water. The waste rock pile was extremely loose and was easily displaced while traversing to the mine. The slope of the waste rock pile was approximately 35 to 45 degrees.

The unnamed creek that runs through the canyon appears to bound the south side of the waste rock pile. The drainage channel was flowing at the time of sampling and is likely ephemeral during a typical summer.

4.2.2 Background Sampling

Two background samples were collected by others within the Seventysix Gulch Watershed. Therefore, the field team collected 18 samples from this area. As mentioned above, background sample locations were identified based on geology and soil type, ecological setting, avoidance of areas with apparent historical disturbance, and accessibility. Analytical results can be found in Table 18. Due to the extreme terrain and difficulty accessing and collecting samples, some sample locations were modified in the field. Figure 2B shows the locations of background soil samples collected within the Seventysix Gulch Watershed.

Seventysix Gulch had numerous signs of bears, and we observed one bear and many birds, but few signs of other wildlife. At sample locations, typical tree cover included cedar, alder, maple, and fir. Brush cover typically included lady fern, goat's beard, and moss.

Background sample locations typically had a duff (or organic) layer between 1 and 10 inches bgs, overlying a silt or sand layer. The soil samples typically consisted of dark brown to brown to light brown (some reddish brown), slightly clayey, slightly gravelly, slightly sandy silt or dark brown, grayish brown to light brown, slightly gravelly, silty sand.

4.3 Weden Creek Watershed

4.3.1 Mine Feature Sampling

Two abandoned mines were located in the Weden Creek Watershed and identified as the Mackinaw Tunnel No. 1 (waste rock pile samples designated Weden 1) and the Mackinaw Tunnel No. 2 (waste rock sample designated Weden 2).

Mackinaw Tunnel No. 1. Five waste rock samples were collected from the mine features Weden 1 (Mackinaw Tunnel No. 1) and Weden 2 (Mackinaw Tunnel No. 2). Analytical results are shown below in Table 11 and detailed soil descriptions of the waste rock are provided in Table 16.

Table 11 – Mackinaw Tunnel No. 1 Analytical Results

Four samples were collected from Weden 1; both an upper depth (0 to 6 inches) and lower depth (6 to 12 inches) sample was collected at two locations.

The first sample location (Weden 1 S1) was near the top of the waste rock pile, approximately 5 feet from the back wall of the mine opening before it slopes downward (See Appendix A for field forms sketch). The second location (Weden 1 S2) was located at the base of the waste rock pile on the southwest corner of the toe, approximately 25 feet downslope of Weden 1 S1 (See Appendix A for field forms sketch).

Mackinaw Tunnel No. 2. A single sample was collected from 0 to 6 inches at Weden 2. Analytical results are shown below in Table 12 and a detailed soil description of the waste rock is provided in Table 16.

Table 12 – Mackinaw Tunnel No. 2 Analytical Results

Constituent	Risk-based criteria	Background	S-1 (0-6)	
Antimony	5	8	0.35	
Arsenic	0.62	262.3	*33*

	Exceeds the site-specific background listed in Table 19.
Italic	Exceeds the lowest RBC listed in Table 19.
Bold italic	Exceeds both the lowest RBC and site-specific background values listed in Table 19 - COC.
COC	Constituent of concern

The sample location was in the middle of the waste rock pile, approximately 17 feet downslope of the outer opening near the southern edge of the pile. The waste rock pile was quite narrow, confined by rock walls/ledges on both sides. Additionally, the waste rock pile ended abruptly at the edge of a drainage channel; therefore, sampling the toe of the pile was not feasible. There was no waste rock observed in the channel, but the steep gradient and high flows could potentially move material downstream of the waste rock pile. A sample could not be collected below 6 inches because of water and coarse gravel.

4.3.2 Background Sampling

No background samples had been previously collected within the Weden Creek Watershed. Therefore, the field team collected 20 samples from this area. As mentioned above, background sample locations were identified based on geology and soil type, ecological setting, avoidance of areas with apparent historical disturbance, and accessibility. Analytical results can be found in Table 18. Due to the extreme terrain and difficulty accessing and collecting samples, some sample locations were modified in the field. Figure 2C shows the locations of background soil samples collected within the Weden Creek Watershed.

Other than signs of bears, Weden Creek contained few signs of wildlife. At sample locations, typical tree cover included grand fir, subalpine fir, hemlock, and cedar. Brush cover typically included deer fern and devil's club.

Background soil samples collected on the east side of Weden Creek typically had a large duff (or organic) layer extending to between 5 and 12 inches bgs, underlain by a light reddish-brown, gravelly silty fine sand. Background soil samples collected on the west side of Weden Creek typically had a duff layer between 1 and 12 inches bgs, followed by a brown to light brown, slightly gravelly, fine sandy silt.

5.0 ANALYTICAL RESULTS

Analytical results for the background samples were used to calculate a set of site-specific background concentrations. The background concentrations were evaluated for the site as a whole (all three watersheds) as well as each watershed individually.

Analytical results for the waste rock samples, data from previous investigations, and samples of soils impacted by spilled ore, concentrate, and tailings were analyzed to develop exposure point concentrations (EPCs), i.e., the concentrations that terrestrial ecological receptors (plants, soil biota, and wildlife) would be exposed to. The background data were compared to screening criteria for protection of ecological receptors (EISCs), to identify constituents of potential ecological concern (COPECs). This comparison was accomplished for each of five ecological exposure areas within the MCMA site.

5.1 Background Concentrations

Twenty background soil samples from each of the three watersheds were used to calculate site-specific background concentrations. All background soil sample

locations are shown on Figures 5A through 5C, which includes ten samples collected by CES in 2005 and 50 collected by Hart Crowser in 2011.

Analytical results were compared to assess whether background concentrations should be pooled for all three watersheds or evaluated separately for each watershed. The software and statistical methods recommended in EPA's ProUCL statistical software package were used to determine the background concentrations.[4]

Box plots were created for each constituent in each watershed to determine if the individual watersheds appeared to have different background concentration populations. The box plots were visually examined to determine whether the boxes (which indicate the 25th percentile to the 75th percentile of the data) overlap for the three watersheds; where the boxes do not overlap, it indicates that the natural soil in the watersheds have inherently different concentrations of metals. Most of the box plots did not indicate significant differences in constituent concentrations between the watersheds, and those that did (i.e., thallium) had a high percentage of non-detects.

We also created Q-Q plots for the individual constituents in each watershed to examine the data probability distributions. If the best fit lines were drastically different in shape, this indicates the possibility of multiple background populations. Some of the constituent Q-Q plots showed slight differences in the data distributions, but there was no apparent consistent difference between the watersheds.

Finally, ratios of some constituents: copper, lead, nickel, vanadium, and zinc, were compared for pairs of background areas: Glacier/Seventysix, Glacier/Weden, and Seventysix/Weden. If constituent ratios for two background areas are similar, it suggests that the background areas are similar and can be evaluated as a single, combined background. However, no consistent trends were observed in the ratios of these constituents for the three background areas.

In addition to analyzing each watershed, we also calculated the background concentrations based on different bedrock geology types. There were two obvious bedrock geology groupings: alluvium/glacial drift and igneous volcanics. There was some evidence that these geology types may also be slightly different in the Weden Creek Watershed. However, comparing

[4] ProUCL version 4.00.005 software and supporting documentation are available online at http://www.epa.gov/esd/tsc/software.htm.

background concentrations based on these geology groupings did not reveal consistent differences in constituent concentrations.

Based on the forgoing analyses, we concluded that the three watersheds do not have distinct background concentrations. Because the data do not support calculating separate background concentrations for the purposes of this report, background concentrations were calculated using the pooled data set of 60 background samples[5] across the three watersheds (Table 17). The ProUCL test used was the "Background" using the "With NDs" setting and a confidence level of 0.8. For calculating background, MTCA [WAC 173-340-709(3) states that:

"*For lognormally distributed data sets, background shall be defined as the true upper 90th percentile or four times the true 50th percentile, whichever is lower*" and "*For normally distributed data sets, background shall be defined as the true upper 80th percentile or four times the true 50th percentile, whichever is lower*".

MTCA also allows "Other statistical methods to be used if approved by the department" [of Ecology].[6]

Iron was the only constituent that followed a normal distribution. Antimony, copper, and sodium were non-parametric and aluminum, beryllium, magnesium, selenium, silver, and thallium followed a gamma distribution. The remaining constituents analyzed—arsenic, barium, cadmium, calcium, chromium, cobalt, lead, manganese, mercury, nickel, potassium, vanadium, and zinc—followed a lognormal distribution. A summary of these values for the pooled data set as well as for the individual watersheds are shown in Table 17. ProUCL background concentration output files are provided in Appendix D.

5.2 Ecological Screening Criteria

The site-specific TEE is presented in Appendix C. The TEE consisted of three components including problem formulation where COPECs were initially identified by considering default EISCs and background soil concentrations; evaluation of alternative EISCs; and hazard characterization using the soil concentration data from the mine feature samples.

The calculated background concentrations for most of the constituents exceed MTCA's default ecological indicator screening criteria (i.e., the EISCs presented

[5] Hart Crowser collected 50 samples in 2011, and 10 samples were collected by Cascade Earth Sciences in 2005. See Table 18 for all background analytical results.
[6] For example, Ecology accepted the use of the 90th percentile for gamma and nonparametric distributions for the 2011 Washington State Background Soil Concentration Study (Hart Crowser 2011b).

in Table 749-3, WAC 173-340-900), as shown in Table 18. This is not uncommon in areas that have mineral resources.

Figures 6A through 6C illustrate the background concentrations compared to the EISCs at background sample locations throughout the watersheds (Table 19). A green symbol or green highlighting indicates that a concentration exceeds the lowest EISC, while blue indicates exceedances of the maximum all three EISC (i.e., for plants, soil biota, and wildlife).[7]

For the three watersheds, all of the background sample concentrations for the following constituents exceeded the lowest default EISC:

- Aluminum
- Arsenic
- Mercury
- Selenium
- Vanadium

In addition, chromium, copper, and zinc exceed the lowest EISC for most of the samples.

5.3 Ecological Exposure Areas and Exposure Point Concentrations

We divided the site into five ecological exposure areas (EEAs), considering topographic relief and historical site use (see Section 3.4 and Figure 3). The intended objective of delimiting the EEAs was to improve the soil exposure estimates for particular ecological receptors such as sedentary receptors or receptors that have a home range restricted by topography. Each sample collected from waste rock and potentially impacted soil (e.g., by tailings or concentrate) was assigned to an EEA in the GIS data base. A majority of the mine features did not have a sufficient sample size to run statistical analysis individually, so grouping features into EEAs allowed for statistical analysis to determine exposure point concentrations (EPCs). The reasonable maximum EPCs were then calculated for each of the EEAs using EPA's ProUCL version 4.00.005 statistical software[8] using the upper confidence limit (UCL) option. The UCL option was run using the "with non-detects" mode to accommodate

[7] The issue of whether background exceeds one or more than one of the EISC values may be of significance later in the remedial investigation process, as it may inform development of cleanup alternatives that will be considered in a feasibility study

[8] Available online at http://www.epa.gov/esd/tsc/TSC_form.htm.

data sets containing undetected values.[9] Appendix C contains tables of summary statistics for constituents in each ecological exposure area that were derived using ProUCL. ProUCL output files of general statistics and UCL estimates are provided in Attachment D.

The TEE compared the default EISCs along with background concentrations to the EPCs to identify COPECs for further analysis. Alternative ecological protection screening values obtained from published studies were then evaluated in order to refine the comparison to the default EISCs for each COPEC. These alternative criteria (primarily EPA's EcoSSLs) were, in some cases, identified to replace the default EISCs because they were based on more recent scientific studies, as discussed in Appendix C. The TEE hazard characterization compared the lowest terrestrial ecological screening criterion for each constituent to the EPC in each area of the site to define COPECs.

In most cases, the terrestrial ecological screening criteria were below concentrations that are protective of human health, but not in the case of arsenic and chromium. Table 18 compares the default EISCs, the EcoSSLs and the MTCA Method A and B concentrations that are protective of human health. The lowest of these values in Table 18 (i.e., the lowest of human health ARARs, EISCs and EcoSSLs) are the risk-based criteria (RBCs) for protection of human health and terrestrial ecological receptors.

The lowest RBC values could be considered to be proposed cleanup levels unless the lowest RBC for a particular constituent is less than the background soil concentration, in which case the proposed cleanup level is the background concentration for that constituent. We compared constituents to the lowest RBC to define constituents of concern (COCs). Table 18 indicates that the pooled site-specific background concentration exceeds the lowest RBC value for most constituents of concern: aluminum, antimony, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, vanadium, and zinc.

Results from the comparison of the EPCs to the proposed cleanup level (based on comparison of the lowest RBC and background) are shown on Figures 7A through 7C and Table 20. A yellow/orange symbol or highlighting indicates the EPC exceeds the lowest RBC, while red indicates the EPC exceeds both the lowest RBC and background. Antimony, arsenic, cadmium, copper, iron, lead,

[9] ProUCL recommends the data set contain a minimum of 8 to 10 samples to calculate a UCL. However, ProUCL will calculate a UCL with data sets containing at least five samples, but warns the user that too few samples may be available to calculate a reliable UCL. ProUCL will not calculate a UCL when less than five samples are available. All of our data sets had a minimum of five samples.

mercury, silver and zinc are all identified as COCs for EEAs 1, 2, 3, and 4. EEA 5 had fewer COCs: arsenic, chromium, cobalt, iron, lead, nickel and vanadium. In addition, barium, chromium, cobalt, manganese, selenium and thallium were identified as COCs in at least one of the Areas 1 through Area 4. The difference may be due to geologic differences between the Glacier Creek and Seventysix Gulch watersheds compared to the Weden Creek Watershed (Area 5).

Although a number of COCs were identified in each EEA, it should be noted that the EPCs were identified based on samples from discrete mine waste areas, and are not representative of conditions throughout the watersheds. The nature of exceedances for waste rock and impacted soils at specific mine features is discussed in the following section.

5.4 Mine Features

Concentrations of COCs were also compared to preliminary cleanup values for samples from the individual features that were sampled in 2011 and previously. The following analysis includes soil sample data collected from mine features between 2005 and 2011 (Figures 5A through 5C). Because several of the sites do not have the necessary sample size (n=5) to calculate a ProUCL concentration, values represent the maximum concentration for each mine feature (Figures 8A through 8D; Table 21). All samples were collected as discrete samples with the exception of a composite sample from the Ore Collector (COL-09 (6-6.5)) and a 30-point MIS from Potomac Silver (Potomac 1). These composite samples are presented separately and are not included in the maximum value for those mine features.

Total Metals Analysis

Soil and waste rock sample analytical results are compared to site-specific background and the lowest RBC (defined as the lowest value from the applicable MTCA Method A cleanup levels, MTCA Method B cleanup levels for soil ingestion, soil ingestion and dermal contact combined, and the EISC and EcoSSL criteria for ecological protection of plants, soil biota, and wildlife).

Results of the comparison to screening criteria (lowest RBC) and site-specific background are shown on Figures 8A through 8D, Tables 1 through 12, and Table 21. A yellow/orange symbol or highlighting indicates the maximum COC value at a particular mine feature exceeds the lowest RBC but is below the background concentration, while red indicates a COC value exceeds both the RBC and background.

The concentration of the following constituents exceeded preliminary cleanup values that are based on both the lowest RBC and background (Table 21; Figures 8A through 8D) in samples from at least 25 of the 31 mine features that were sampled:

- Antimony
- Arsenic
- Cadmium
- Copper
- Lead
- Mercury
- Silver
- Zinc

Iron, cobalt, manganese and selenium were also constituents of concern at a large number of the mine features:

- Iron concentrations at 19 mine features exceeded the preliminary cleanup level based on the lowest RBC and background.

- Concentrations at more than half of the mine features exceeded the preliminary cleanup level for cobalt, manganese and selenium.

Other contaminants that exceeded preliminary cleanup levels at various mine features are shown in Table 21.

6.0 CONCLUSIONS

The site reconnaissance and three additional sampling trips were successful in locating abandoned mine workings and sampling waste rock at four locations in Glacier Creek watershed, six locations in Seventysix Gulch watershed, and two locations in the Weden Creek Watershed, for a total of 42 discrete samples and one composite sample. Additionally, the field teams collected 50 background soil samples to determine site-specific background concentrations of COPECs. Chemical analyses of these samples were combined with sample results reported by others to provide an initial risk assessment for terrestrial receptors. Outlined below are some of the findings and data gaps that may need to be addressed in future work.

1. The MCMA is a naturally mineralized area. The TEE found that background soil concentrations exceed EISC for terrestrial receptors for all of the

constituents analyzed with the exception of barium, beryllium, cadmium, silver and thallium.[10] Also, the background concentration exceeded the human health RBC for cadmium. Therefore, background concentrations in the MCMA would largely be the driver for establishing preliminary cleanup levels for protection of terrestrial receptors.

2. We used several statistical tests to see if the three watersheds had significantly different background concentrations. In looking at all the constituents of interest, the results did not indicate it would be more appropriate to use a different background data set for each individual watershed, than to pool the background results for two (e.g., Glacier Creek and Seventysix Gulch) or for all three watersheds. For the purposes of this report, we pooled all 60 background samples.

   All of the waste rock piles sampled had contaminant concentrations that exceeded preliminary cleanup levels for three or more contaminants. The selection of different background values to establish the preliminary cleanup levels (i.e., use of a different background data set for each watershed or use of pooled background data) would not eliminate any waste rock pile from exceeding the preliminary cleanup levels for one or more contaminants.

3. All of the waste rock piles sampled exceed preliminary cleanup levels; however, the extent of potential human health or ecological risk in the remainder of the watersheds has not yet been identified. Although human health risk was not a focus of our work to date, it may be appropriate to assess the exposure pathway in a way that is more consistent with actual site use (i.e., recreational, not residential or worker exposure). We recommend additional remedial investigations focused on better defining the potential impacts of the waste rock piles on human health and the environment, as discussed below.[11]

4. The potential extent of impacted soils downslope of the waste rock piles has not been characterized. We recommend characterizing potentially impacted soils by sampling along transects downslope of selected representative waste rock piles.

5. Although waste rock samples exceed preliminary cleanup levels based on published eco-risk parameters, the uncertainty analysis presented in Section

[10] Calcium, magnesium, potassium, and sodium were also detected at levels that do not produce ecological risk, and these essential nutrients were excluded from the risk assessment.
[11] However, it may be appropriate to locate and characterize the Hopeful and Emma Moore No. 2 Mine sites to better understand potential aquatic impacts as discussed later.

4.2 of Appendix C identifies several areas where the hazard analysis may overstate actual risk. Additional evaluation is recommended using plant and soil biota tissue analyses and/or an area-weighted approach as discussed in Section 6 of Appendix C.

6. The 2011 field sampling included one waste rock site where we compared the results of discrete sampling to a 30-point composite sample as recommended by USGS. Table 21 shows that MIS concentrations were significantly higher than the maximum concentration of the discrete samples for some constituents (i.e., arsenic, iron, and silver) and lower for others (i.e., aluminum, cadmium, and copper). Further, sampling and analysis would be needed to determine the number of discrete samples that would produce a 95UCL-derived EPC that is comparably representative to the MIS results. Both the MIS collection method and the effort required to hike to the remote sites were extremely time consuming, so there may be significantly greater benefit in MIS sampling for cleanup decisions, than for initial characterization. Additionally, several of the mine features did not have clearly defined edges of the waste rock pile(s) for evenly spacing the 30-point composite grid across the entire extent of the pile.

7. During this phase of sampling, Hart Crowser was not tasked with collecting surface water or adit drainage water from any of these mine features. However, we observed drainage from the mine or waste rock pile(s) that likely enters surface water downslope of Potomac Silver Mine, Independence of 1776, 74 Mine, Congress Mine, O&B – lower adit, and Mackinaw Tunnel No. 2. The effect of seepage infiltration from other mine features may impact groundwater and surface water quality. Although we did not visit the Hopeful and Emma Moore No. 2 Mines, they appear to be located near and may impact surface water. It may be appropriate to assess the potential impacts of some or all the sites listed above on aquatic receptors using some combination of the following methods:

   - Groundwater sampling;
   - Rapid bioassessment protocol (RBP);
   - Sediment bioassays; and/or
   - Analyses of dissolved/total metals in the surface water column.

7.0 USE OF THIS REPORT

Work for this project was performed, and this report prepared, in accordance with generally accepted professional practices for the nature and conditions of the work completed, in the same or similar localities, at the time the work was performed. It is intended for the exclusive use of the Washington State

Department of Ecology for specific application to the referenced property. This report is not meant to represent a legal opinion. No other warranty, express or implied, is made.

The information in this report is intended to be used to determine whether the site has released or has a potential to release hazardous substances to the environment at concentrations above Model Toxics Control Act (MTCA) human health or ecological screening levels.

Table 13 – Daily Activities Summary

Day	Activity	Samples Collected
Trip 1	Samplers: Andrew Kaparos, Celina Abercrombie, Michelle Havey	
Day 1 (7/8/11)	Mobilization Travel to Monte Cristo Townsite via helicopter Set up camp	---
Day 2 (7/9/11)	Hiked to Weden Creek Watershed Followed abandoned road on east side of Weden Creek to Mackinaw claims Located Mackinaw Tunnel No. 1 (designated Weden 1)	Weden 1 S1 (0-6 inches) Weden 1 S1 (6-12 inches)
Day 3 (7/10/11)	Hiked to Glacier Creek Watershed Arrived at GPS locations for Pusher Lode and Portland No. 1 Did not locate any mine features	None
Day 4 (7/11/11)	Hiked to Seventysix Gulch Watershed Unable to reach Fontenoy Mine Arrived at GPS locations for Sauk Lode No. 1 and No. 2 Did not locate any mine features	None
Day 5 (7/12/11)	Hiked to Weden Creek Watershed Followed old road on east side of Weden Creek to Mackinaw claims Took additional sample at Weden 1 Found Mackinaw No. 2 further down the abandoned road (designated Weden 2)	Weden 1 S2 (0-6 inches) Weden 1 S2 (6-12 inches) Weden 2 S1 (0-6 inches)
Day 6 (7/13/11)	Picked up from the Townsite Demobilization	---
Day 7 (7/20/11)	XRF readings of air-dried samples Packaged samples for shipment to the lab	---

Table 13 – Daily Activities Summary

Day	Activity	Samples Collected
Trip 2	Samplers: Andrew Kaparos, Michelle Havey, Phil Cordell, Ward McDonald	
Day 1 (8/22/11)	Mobilization Travel to Monte Cristo Townsite via helicopter Set up camp Ran through sample protocol near historic Main Street on the Glacier Basin Trail	---
Day 2 (8/23/11)	Hiked to Weden Creek Watershed for background sample collection; met Jason Shira Followed abandoned road on east side of Weden Creek toward Mackinaw claims One team (MAH/PRC) headed SW from Mackinaw 2 toward Weden Creek Other team (ASK/WDD) headed back toward SFSR along road	W-8;[12] W-16
Day 3 (8/24/11)	Hiked back to Weden Creek Watershed to collect more background samples Both teams collected samples upslope of the abandoned road	W-11; W-12; W-10; W-9; W-13; W-14; W-15
Day 4 (8/25/11)	Hiked up drainage channel directly across the South Fork Sauk River (SFSR) from the Townsite to collect background samples in the Glacier Creek Watershed Both teams traversed across slope heading east into the watershed	G-1; G-2; G-3; G-4; G-5
Day 5 (8/26/11)	Hiked up Glacier Basin Trail past the falls Found the Potomac Silver Mine and collected four discrete and one multi-increment sample Continued further along trail and found the IXL Mine – collected four discrete samples Picked up from the Townsite Demobilization	Potomac 1 (multi-increment sample); Potomac 2 (0-6); Potomac 2 (6-12); Potomac 3 (0-6); Potomac 3 (6-12); IXL 1 (0-6); IXL 1 (6-12); IXL 2 (0-6); IXL 2 (6-12)

[12] Background samples were named with an abbreviation of the watershed name (i.e., “W” for Weden Creek watershed or “76” for Seventysix Gulch Watershed) followed by a unique number.

Day	Activity	Samples Collected
Trip 3	Samplers: Andrew Kaparos, Celina Abercrombie, Michelle Havey, Ward McDonald	
Day 1 (9/12/11)	Mobilization Travel to Monte Cristo via helicopter – one team (ASK/MAH) dropped off at Barlow Pass to collect more background samples in the Weden Creek Watershed; other team (CAA/WDD) dropped off at Townsite to set up camp Sampling team collected samples upslope of the Weden Creek trail on the west side of Weden Creek	W-19; W-18; W-17; W-21; W-22; W-23; W-1; W-6; W-3; W-7; W-2
Day 2 (9/13/11)	Hiked to Seventysix Gulch Watershed Followed unnamed trail up west side of Seventysix Gulch until streambed went dry, then hiked in dry channel One team (ASK/MAH) collected background in upper watershed Other team (CAA/WDD) found 76 Mine on east side of watershed	76-1; 76-3; 76 S-1 (0-6); 76 S-1 (6-12); 76 S-2 (0-6); 76 S-2 (6-12)
Day 3 (9/14/11)	Hiked to Glacier Creek Watershed to collect more background samples One team (ASK/MAH) collected background on north side of Glacier Creek and downstream of the falls Other team (CAA/WDD) collected background on east side of Glacier Creek in the upper watershed	G-11; G-7; G-8; G-9; G-6; G-10; G-12

Table 13 – Daily Activities Summary

Day	Activity	Samples Collected
Day 4 (9/15/11)	Hiked to Seventysix Gulch Watershed Followed unnamed trail up west side of Seventysix Gulch until streambed went dry, then hiked in dry channel to approximately the prominent private cabin adjacent to the channel Both teams ascended adjacent drainage channels on west side of Seventysix Gulch One team (ASK/MAH) found 74 Mine Other team (CAA/WDD) found Emma Moore No. 1 and collected two background samples on the way back to camp	74 S-1 (0-6); 74 S-2 (0-6); Emma 2 S-1 (0-6); Emma 2 S-2 (0-6); Emma 2 S-2 (6-12); 76-2; 76-11
Day 5 (9/16/11)	Hiked up the Poodle Dog Pass Trail to Seventysix Gulch Watershed Both teams collected background samples upslope of the trail Picked up from the Townsite Demobilization	76-10; 76-18; 76-13; 76-17; 76-12; 76-16; 76-9; 76-6; 76-15; 76-5; 76-14; 76-4

Table 13 – Daily Activities Summary

Day	Activity	Samples Collected
Trip 4	Samplers: Andrew Kaparos, Michelle Havey, Phil Cordell, Ward McDonald	
Day 1 (9/26/11)	Mobilization Travel to Monte Cristo Townsite via helicopter Set up camp Inclement weather prevented sampling in the afternoon	---
Day 2 (9/27/11)	Two teams split up: one went to the Glacier Creek Watershed and the other to Seventysix Gulch Watershed ASK/MAH found Pusher Lode northwest of Mystery Mine off the Glacier Basin Trail; collected six samples PRC/WDD attempted to hike to Comet Mine, but the terrain was too dangerous to ascend	Pusher S-1 (0-6); Pusher S-1 (6-12); Pusher S-2 (0-6); Pusher S-2 (6-12); Pusher S-3 (0-6); Pusher S-3 (6-12)
Day 3 (9/28/11)	Both teams hiked to Seventysix Gulch Watershed One team (ASK/MAH) hiked the Poodle Dog Pass trail and headed north-northwest to O&B Mine; collected five samples Other team (PRC/WDD) hiked to Ibex No. 1; collected two samples	Ibex S-1 (0-6); Ibex S-2 (0-6); O&B Upper S-1 (0-6); O&B Upper S-2 (0-6); O&B Upper S-3 (0-6); O&B Lower S-1 (0-6); O&B Lower S-2 (0-6)
Day 4 (9/29/11)	Two teams split up: one went to the Glacier Creek Watershed and the other to Seventysix Gulch Watershed ASK/MAH found Portland No. 2 northeast and directly across the valley from Potomac Silver Mine off the Glacier Basin Trail; collected three samples PRC/WDD hiked to Congress Mine in Seventysix Gulch; collected two samples	Congress S-1 (0-6); Congress S-1 (6-12); Portland No. 2 S-1 (0-6); Portland No. 2 S-1 (6-12); Portland No. 2 S-2 (0-6)

Table 13 – Daily Activities Summary

Day	Activity	Samples Collected
Day 5 (9/30/11)	Followed the SFSR downstream from the Townsite along the south bank to the first drainage channel; then headed up the slope and traversed across toward the second drainage channel Both teams made a second attempt to find and sample the upper and lower Sauk Lodes slightly downstream from the Townsite on the south side of SFSR Found one opening tentatively identified as the Sauk Lode Lower tunnel, but no sufficient material to sample Picked up from the Townsite Demobilization	---

Table 14 – Project Team Roles and Responsibilities

Project Role	Personnel Assignment	Roles/Responsibilities
Ecology Project Manager	Jason Shira Ecology (509) 454-7834	Client Project Manager
Program Manager	Mike Bailey Hart Crowser (206) 324-9530	Ensures that all work is carried out in accordance with contractual obligations and the Delivery Order statement of work. Assists the Project Manager as needed with technical decisions and in resolving issues. Final reviewer.
Project/Task Manager	Michelle Havey Hart Crowser (206) 324-9530	Overall responsibility for execution of the Work Plan. Coordinate with Client, Field Manager, and Program Manager as necessary to resolve issues.
Corporate Health and Safety Officer (HSO)	Anne Conrad Hart Crowser (206) 324-9530	Overall responsibility for review and answering questions regarding health and safety.
Field Manager and Site Safety Coordinator (SSC)	Michelle Havey Hart Crowser (206) 324-9530	Ensures that explorations are conducted and samples are collected in accordance with project specifications. Coordinates field activities with Project and Program Managers.
Mine Information Research	Andrew Kaparos Hart Crowser (206) 324-9530	Determines location of mine, access route, and ownership.
Project Chemist	Roger McGinnis Hart Crowser (206) 324-9530	Performs laboratory coordination and data quality review to assure analytical methods and data are consistent with project needs and data quality objectives.
Laboratory Services	Kristine Allen TestAmerica (253) 922-2310	Analyzes soil samples.

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
Glacier Creek Watershed			
Potomac 1	Thirty-point composite sample located along the Potomac Silver waste rock pile approximately 15 feet east of the mine opening	~4,400	Loose, moist, light brown, sandy gravel (fine to coarse). USCS descriptor: GW
Potomac 2 (0-6)	Located near the seep of Potomac Silver approximately 4 feet downslope of the mine opening (0-6 inch depth)	~4,420	Loose, wet, dark gray-brown, silty sand (fine to medium). USCS descriptor: SM
Potomac 2 (6-12)	Located near the seep of Potomac Silver approximately 4 feet downslope of the mine opening (6-12 inch depth)	~4,420	Loose, wet, dark gray-brown, silty sand (fine to medium). USCS descriptor: SM
Potomac 3 (0-6)	At the bottom of Potomac Silver wasterock pile approximately 50 east of the mine opening (0-6 inch depth)	~4,400	Loose, wet, red-brown, silty sand (fine). USCS descriptor: SM
Potomac 3 (6-12)	At the bottom of Potomac Silver wasterock pile approximately 50 east of the mine opening (6-12) inch depth)	~4,400	Loose, wet, red-brown, silty sand (fine). USCS descriptor: SM
IXL 1 (0-6)	Located upgradient of the IXL waste rock pile approximately 12 feet northeast of the mine opening (0-6 inch depth)	4,560	Loose, wet, dark brown to red brown, sandy silt with abundant organics. USCS descriptor: ML
IXL 1 (6-12)	Located upgradient of the IXL waste rock pile approximately 12 feet northeast of the mine opening (6-12 inch depth)	4,560	Loose, wet, dark brown to red brown, sandy silt with abundant organics. USCS descriptor: ML
IXL 2 (0-6)	At the toe of the IXL waste rock pile upgradient from the boulder field and approximately 60 feet downgradient of the mine opening (0-6 inch depth)	4,520	Loose, moist, reddish brown, silty sand (fine to coarse). USCS descriptor: SM
IXL 2 (6-12)	At the toe of the IXL waste rock pile upgradient from the boulder field and approximately 60 feet downgradient of the mine opening (6-12 inch depth)	4,520	Loose, moist, reddish brown, silty sand (fine to coarse). USCS descriptor: SM

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
Pusher S-1 0-6	Located along the northeast edge of the Pusher Lode waste rock pile approximately 100 feet north of the mine opening. (0-6 inch depth)	3,600	Loose to medium dense, damp to moist, brown, gravelly sandy silt with wood debris. USCS descriptor: ML
Pusher S-1 6-12	Located along the northeast edge of the Pusher Lode waste rock pile approximately 100 feet north of the mine opening. (6-12 inch depth)	3,600	Loose to medium dense, damp to moist, brown, gravelly sandy silt with wood debris. USCS descriptor: ML
Pusher S-2 0-6	Located along the western edge of the Pusher Lode waste rock pile approximately 60 feet to the northwest of the mine opening (0-6 inch depth)	3,600	Loose, moist, reddish brown, very gravelly, sandy silt. USCS descriptor: ML
Pusher S-2 6-12	Located along the western edge of the Pusher Lode waste rock pile approximately 60 feet to the northwest of the mine opening (6-12 inch depth)	3,600	Loose, moist, reddish brown, very gravelly, sandy silt. USCS descriptor: ML
Pusher S-3 0-6	Near the toe of the Pusher Lode waste rock pile approximately 260 feet north of the mine opening (0-6 inch depth)	3,600	Loose to medium dense, damp, reddish brown, gravelly sandy silt. USCS descriptor: ML
Pusher S-3 6-12	Near the toe of the Pusher Lode wasterock pile approximately 260 feet north of the mine opening (6-12 inch depth)	3,600	Loose to medium dense, moist to wet, gray brown, slightly sandy silt. USCS descriptor: ML
Portland 2 S1 0-6	Located along the northeast edge of the Portland 2 waste rock pile approximately 50 feet to the south of the mine opening (0-6 inch depth)	~4,620	Loose to medium dense, damp to moist, brown to dark brown, very gravelly sandy silt. USCS descriptor: ML
Portland 2 S1 6-12	Located along the northeast edge of the Portland 2 waste rock pile approximately 50 feet to the south of the mine opening (6-12 inch depth)	~4,620	Loose to medium dense, damp to moist, brown to dark brown, very gravelly sandy silt. USCS descriptor: ML

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
Portland 2 S2 0-6	Near the southern edge of the Portland 2 wasterock pile approximately 170 feet south of the mine opening (0-6 inch depth)	~4,570	Loose to medium dense, wet, dark brown, very gravelly sandy silt. USCS descriptor: ML
Portland 2 S2 6-12	Near the southern edge of the Portland 2 waste rock pile approximately 170 feet south of the mine opening (6-12 inch depth)	~4,570	Loose to medium dense, wet, dark brown, very gravelly sandy silt. USCS descriptor: ML
Seventysix Gulch Watershed			
76 S-1 0-6	Top of 76 Mine waste rock pile approximately 10 feet west of mine opening (0-6 inch depth)	3,970	Loose, wet, dark brown, silty sandy gravel (fine to coarse). USCS descriptor: GM
76 S-2 0-6	Located below the toe of the 76 Mine waste rock pile approximately 30 feet west of the mine opening (0-6 inch depth)	~3,940	Loose,damp, light brown, silty, very gravelly sand (fine to coarse). USCS descriptor: SM
76 S2 6-12	Located below the toe of the 76 Mine waste rock pile approximately 30 feet west of the mine opening (6-12 inch depth)	~3,940	Loose,damp, light brown, silty, very gravelly sand (fine to coarse). USCS descriptor: SM
Emma 2 S-1 0-6	Located along the north side of the drainage approximately 15 feet downgradient from Emma Moore 2 mine opening within the limited sapling and brush cover (0-6 inch depth)	~4,070	Loose, moist, light brown, silty sand (fine). USCS descriptor: SM
Emma 2 S-2 0-6	At the bottom of the Emma Moore 2 waste rock pile approximately 80 feet below the mine opening and upgradient from the accumulation of boulder sized rocks. (0-6 inch depth)	~4000	Loose, damp, light brown silty sand (fine). USCS descriptor: SM
Emma 2 S-2 6-12	At the bottom of the Emma Moore 2 waste rock pile approximately 80 feet below the mine opening and upgradient from the accumulation of boulder-sized rocks. (6-12 inch depth)	~4000	Loose, damp, light brown silty sand (fine). USCS descriptor: SM

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
74 S-1 0-6	In the middle of the 74 Mine adit drainage near the cliff face, and approximately 40 feet east of the mine opening (0-6 inch depth)	4,140	Medium dense, wet, brown, gravelly, sandy (fine), silt. USCS descriptor: ML
74 S-2 0-6	At the toe of the waste rock pile, adjacent to the bedrock drainage channel (0-6 inch depth)	4,140	Medium dense, wet, brown, gravelly, sandy (fine), silt. USCS descriptor: ML
IBEX S1 0-6	Located approximately 25 feet downgradient to the west of the IBEX mine opening above the waste rock pile. (0-6 inch depth)	4,160	Loose, wet, dark brown, slightly silty, slightly sandy, gravel (fine to coarse) with occasional organics. USCS descriptor: GM
IBEX S2 0-6	At the bottom of the IBEX waste rock pile approximately 80 feet downgradient and to the west of the mine opening (0-6 inch depth)	4,080	Loose, moist, brown, silty sand (fine). USCS descriptor: SM
O+B Upper S1 0-6	Located at the northwest edge of the Upper O&B waste rock pile (0-6 inch depth)	4,530	Medium dense, moist, reddish brown, very gravelly sandy silt. USCS descriptor: ML
O+B Upper S2 0-6	Located along the north edge of the Upper O&B waste rock pile (0-6 inch depth)	~4,500	Loos to medium dense, wet dark reddish brown, very gravelly sandy silt. USCS descriptor: ML
O+B Upper S3 0-6	Located along the O+B Upper waste rock pile southeast of the mine opening (0-6 inch depth)	~4,500	Medium dense, damp to wet, reddish brown, very gravelly sandy silt. USCS descriptor: ML
O+B Lower S1 0-6	Near the top of the O&B Lower waste rock pile south of the mine opening (0-6 inch depth)	4,360	Medium dense, moist to wet, reddish brown, very gravelly, sandy silt. USCS descriptor: ML
O+B Lower S2 0-6	Near the toe of the O&B Lower waste rock pile southeast of the mine opening (0-6 inch depth)	4,360	Medium dense, moist to wet, reddish brown, very gravelly, sandy silt. USCS descriptor: ML

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
Congress S1 0-6	Near the top of the waste rock pile for Congress Mine approximately 10 feet downslope to the east of the mine opening (0-6 inch depth)	4,310	Loose,moist, dark brown, silty, sandy gravel (fine to coarse). USCS descriptor: GM
Congress S1 6-12	Near the top of the waste rock pile for Congress Mine approximately 10 feet downslope to the east of the mine opening (6-12 inch depth)	4,310	Loose,moist, dark brown, silty, sandy gravel (fine to coarse). USCS descriptor: GM
Congress S2 0-6	Near the bottom of the waste rock pile for Congress Mine approximately 200 feet downslope to the east of the mine opening (0-6 inch depth)	4,190	Loose, moist, dark brown, silty, sandy gravel (fine to coarse) with occassional roots. USCS descriptor: GM
Congress S2 6-12	Near the bottom of the waste rock pile for Congress Mine approximately 200 feet downslope to the east of the mine opening (0-6 inch depth)	4,190	Loose, moist, dark brown, silty, sandy gravel (fine to coarse) with occassional roots. USCS descriptor: GM
Weden Creek Watershed			
Weden 1 S1 (0-6)	Top of the Weden 1 waste rock pile near the southeast end of the opening (0-6 inch depth)	2,740	Loose, moist, brown-dark brown, sandy, gravelly (fine to coase) silt. USCS descriptor: ML
Weden 1 S1 (6-12)	Top of the Weden 1 waste rock pile near the southeast end of the opening (6-12 inch depth)	2,740	Loose, moist-wet, brown, sandy, gravelly (fine to coarse) silt. USCS descriptor: ML
Weden 1 S2 (0-6)	At the bottom of the Weden 1 waste rock pile approximately 25 feet downslope and southwest of the opening (0-6 inch depth)	2,730	Loose, moist, brown, sandy silt, very gravelly (fine to coarse). USCS descriptor: ML
Weden 1 S2 (6-12)	At the bottom of the Weden 1 waste rock pile approximately 25 feet downslope and southwest of the opening (6-12 inch depth)	2,730	Loose, moist, brown, sandy, very gravelly (fine to coarse) silt. USCS descriptor: ML

Table 16a – Monte Cristo Mining Area Sample Inventory - Mine Feature Samples

Sample Name	Sample Location	Elevation (feet)	Sample Description
Weden 2 S1 (0-6)	From the middle of the Weden 2 waste rock pile approximately 17 feet downslope of the opening (0-6 inch depth)	3,000	Loose, wet, black, silty, sandy gravel (fine and coarse). USCS descriptor: GW-GM

Table 16b – Monte Cristo Mining Area Sample Inventory - Background Samples

Sample Name	Sample Location Description (0-6 inch depth)	Elevation (feet)	Slope (degrees)	Duff layer (inches)	Sample Description
Glacier Creek Watershed					
G-1	5% canopy cover dominant maples, yellow cedar, and firs	3,530	25	1	Loose, dry to damp, light reddish-brown, silty, gravelly fine sand. USCS descriptor: SM
G-2	65% canopy cover mature Douglas fir dominant	3,560	42	3	Loose, damp, brown to reddish brown, slightly silty, gravelly sand with abundant organics and tree roots. USCS descriptor: SP
G-3	90% canopy cover Douglas fir	3,560	40	5	Loose, damp, grey, slightly silty fine sand. USCS descriptor: SP
G-4	90% canopy cover subalpine fir, Douglas fir dominant	3,530	30	6	Loose, damp to moist, brown to reddish brown, silty, gravelly sand with abundant roots. USCS descriptor: SM
G-5	95% canopy cover	3,050	13	3	Loose, damp, brown, silty fine sand. USCS descriptor: SM
G-6	65% canopy cover dom. subalpine fir and hemlok	3,760	34	5	Loose, dry, brown, slightly gravelly, fine sandy silt. USCS descriptor: ML
G-7	75% canopy cover mature mountain hemlock	3,660	34	9	Loose, dry to damp, light greyish brown to light reddish brown, slightly gravelly fine sandy silt. USCS descriptor: ML
G-8	10% canopy cover subalpine fir, hemlock and cedar	3,680	32	1	Loose, dry, brown, slightly gravelly, fine sandy silt. USCS descriptor: ML
G-9	0% canopy cover	4,230	40		Loose, damp, light brown, silty sand with trace gravel. USCS descriptor: SM
G-10	0% canopy cover	4,300	45		Loose, damp, light brown, gravelly, silty sand. USCS descriptor: SM
G-11	0% canopy cover	4,250	45		Loose, damp, brown, slightly gravelly silty sand. USCS descriptor: SM
G-12	0% canopy cover	4,220	30		Loose, damp, light brown, gravelly, silty sand. USCS descriptor: SM
Seventysix Gulch Watershed					
76-1	5% canopy cover mountain hemlock (25')	3,660	5	2	Dense, damp, brown, slightly gravelly, slightly sandy silt. USCS descriptor: ML
76-2	0% canopy cover	3,620	25		Loose, damp, light brown, gravelly, silty sand. USCS descriptor: SM
76-3	40% canopy cover 40-50' hemlock and subalpine fir	3,900	23	3	Loose to medium dense, dry, brown, gravelly, fine sandy SILT. USCS descriptor: ML

Table 16b – Monte Cristo Mining Area Sample Inventory - Background Samples

Sample Name	Sample Location Description (0-6 inch depth)	Elevation (feet)	Slope (degrees)	Duff layer (inches)	Sample Description
76-4	45% canopy cover subalpine fir, hemlock	3,670	27	7	Medium dense, damp, reddish brown to brown, slightly gravelly, fine sandy silt. USCS descriptor: ML
76-5	85% canopy cover hemlock	3,540	30	10	medium dense, damp to moist, light greyish brown fine sandy silt with wood debris. USCS descriptor: ML
76-6	60% canopy cover subalpine fir, hemlock	3,520	22		Medium dense, moist, brown, silt. USCS descriptor: ML
76-7	90% brush cover huckleberry; 70% canopy cover grand fir	3,300	25	12	Loose, moist, gray silty sand to sandy silt. USCS descriptor: ML
76-8	80% canopy coverage grand and subalpine fir; 30% shrub coverage huckleberry	3,450	18	6	Loose, moist to wet, dark brown, very sandy silt with abundant organics. USCS descriptor: ML
76-9	10% canopy cover grand fir	3,190	35		Loose, moist, dark brown, slightly gravelly, silty sand. USCS descriptor: SM
76-10	30% canopy cover western hemlock	3,180	35		Loose, damp, greyish brown, silty sand. USCS descriptor: SM
76-11	0% canopy cover	3,350	3		Loose, damp, light brown, silty sand. USCS descriptor: SM
76-12	60% canopy cover hemlock, subalpine fir and cedar	3,710	20	4	Medium dense,moist, reddish brown to brown, silt. USCS descriptor: ML
76-13	15% canopy cover mature hemlock	3,730	23	4	Dense, moist to wet, dark brown, slightly sandy silt. USCS descriptor: ML
76-14	10% canopy cover western hemlock	3,420	35		Loose, wet, dark brown, very silty sand to sandy silt. USCS descriptor: SP to SM
76-15	50% canopy cover western hemlock w/grand fir	3,440	30		Loose, wet, dark brown, very silty sand w/scattered gravels. USCS descriptor: SM
76-16	40% canopy cover hemlock	3,490	24	4	Dense, moist, brown, SILT. USCS descriptor: ML
76-17	35% canopy cover grand fir	3,020	20		Loose, damp, light brown, silty sand. USCS descriptor: SM
76-18	20% canopy cover grand fir	2,960	55		Loose, damp, light grayish brown, silty sand. USCS descriptor: SM
Weden Creek Watershed					
W-1	90% canopy cover dominant subalpine fir and hemlock	2,420	12	1	Loose, damp, brown, slightly gravelly, slightly sandy silt. USCS descriptor: ML

Table 16b – Monte Cristo Mining Area Sample Inventory - Background Samples

Sample Name	Sample Location Description (0-6 inch depth)	Elevation (feet)	Slope (degrees)	Duff layer (inches)	Sample Description
W-2	70% canopy cover dominant subalpine fir, subdominant hemlock	2,420	10		Medium dense, damp, reddish brown, slightly gravelly, slightly sandy silt. USCS descriptor: ML
W-3	85% canopy cover solely mature hemlock	2,450	13	3	Loose to medium dense, moist, brown, slightly gravelly, slightly sandy silt. USCS descriptor: ML
W-6	80% canopy cover large open patch just north, 4 large, mature hemlock	2,430	10	1	Loose to medium dense, damp to moist, brown, slightly gravelly, sandy silt with occassional wood fragments. USCS descriptor: ML
W-7	65% canopy cover dominant subalpine fir, subdominant hemlock	2,430	0	2	Loose to medium dense, damp, light greyish brown, slightly gravelly, slightly silty sand. USCS descriptor: SP
W-8	85% canopy cover mature large conifers, tree dominated	2,440	0	8	Loose, moist, brown, slightly silty, slightly sandy gravel. USCS descriptor: GP
W-9	80% canopy cover grand fir and cedar	2,920	43	5	Loose, damp to moist, light reddish brown, slightly gravelly, silty fine sand with abundant organics. USCS descriptor: SM
W-10	90% canopy cover mature conifers	3,060	42	12	Loose,damp, brown to light brown, slightly gravelly, very silty sand with abundant tree roots. USCS descriptor: SM
W-11	70% canopy cover mostly mature grand fir, cedar	2,980	29	8	Loose,moist to damp, gray, sand with trace silt. USCS descriptor: SP
W-12	80% canopy cover grand fir	2,850	23	8	Loose, damp, light reddish brown, slightly gravelly, silty fine sand with abundant organics. USCS descriptor: SM
W-13	60% canopy cover mature cedar, smallish subalpine fir	3,130	29	1.5	Loose, damp, reddish brown, silty, gravelly sand with scattered roots. USCS descriptor: SM
W-14	85% canopy cover grand fir	2,980	30	7	Loose,damp, grey, fine sand to light reddish brown, silty fine sand. USCS descriptor: SP to SM
W-15	60% canopy cover mature conifers, grand fir, subalpine fir	3,050	33	5	Loose, damp, light reddish brown, silty gravelly sand with scatterd organics. USCS descriptor: SM
W-16	70% canopy cover fir	3,000	37		Loose, damp, light reddish brown, slightly gravelly, silty fine SAND with abundant organics. USCS descriptor: SM

Table 16b – Monte Cristo Mining Area Sample Inventory - Background Samples

Sample Name	Sample Location Description (0-6 inch depth)	Elevation (feet)	Slope (degrees)	Duff layer (inches)	Sample Description
W-17	70% canopy cover dominant hemlock, subdominant subalpine fir, cedar and unknown fir	2,560	9	1	Loose, damp, reddish brown, sandy silt. USCS descriptor: ML
W-18	65% canopy cover dominant subalpine fir, subdominant hemlock	2,590	25	5	Loose, damp, brown to light brown, slightly gravelly, slightly sandy silt with occassional wood fragments. USCS descriptor: ML
W-19	85% canopy cover dominant mature subalpine fir and hemlock	2,600	20	1	Medium dense, brown, slightly sandy silt. USCS descriptor: ML
W-21	85% canopy cover dominant hemlock, subdominant subalpine fir	2,610	18	12	Loose, damp, brown, fine sandy silt. USCS descriptor: ML
W-22	80% canopy cover dominant Pacific silver fir, subdominant mountain hemlock	2,530	9	5	Loose to medium dense, damp, brown, sandy, gravelly silt. USCS descriptor: ML
W-23	40% canopy cover dominant subalpine fir	2,420	0	10	Dense, moist, light brown to brown, sandy silt with scattered wood particles. USCS descriptor: ML

Zinc	86	150	140	140	190	160	180	140	160	98	100	96

All values represent the true upper 90th percentile calculated using EPA's ProUCL version 4.00.005 statistical software unless otherwise noted.

[a] Follows a normal distribution, so value represents the true upper 80th percentile (MTCA 173-340-709[3(d)]).

[b] Because more than 50% of the measurements in the dataset are below the practical quantitation limit, value represents the maximum concentration (MTCA 173-340-740(7[f(iv)]).

[c] Constituent is an essential element, considered non-toxic under a wide-range of environmental concentrations, and is excluded from

Zinc (Zn)	86	151	--	24,000	22,000	5,970	86	200	360	160	120

Notes:

(a) Lowest potential ARAR from shaded source.

(b) Site-specific background values calculated by pooling 60 background soil samples across three watersheds using proUCL 4.1.

(c) WAC 173-340-740(2), WAC 173-340-900 (Table 740-1). Model Toxics Control Act (MTCA) Method A soil cleanup levels.

(d) WAC 173-340-740(3). MTCA Method B unrestricted land use soil cleanup standards. For carcinogenic constituents, the value presented is the lower of the non-carcinogenic and carcinogenic level calculated using Equations 740-1 and 740-2 for ingestion only. Equations 740-4 and 740-5 for ingestion and dermal contact. Information from CLARC 3.1 was used unless otherwise noted.

(e) WAC 173-340-740(3)(b)(iii)(A); MTCA Method B unrestricted land use soil cleanup standards, groundwater protection. Values calculated using the MTCA three-phase partitioning model WAC 173-340-747(4).

(f) MTCA 173-340-900 (Table 749-3).

(g) EPA Ecological Soil Screening Levels (ECO-SSL) are found at http://www.epa.gov/ecotox/ecossl/.

(h) Based on Arsenic III / Arsenic V.

(i) Based on total Chromium.

(j) Follows a normal distribution, so value represents the true upper 80th percentile (MTCA 173-340-709(3(d))).

(k) Because more than 50% of the measurements in the dataset are below the practical quantitation limit, value represents the maximum concentration (MTCA 173-340-740(7(f(iv))).

(l) Constituent is an essential element, considered non-toxic under a wide-range of environmental concentrations, and is excluded from further evaluation.

-- Not established or not applicable.

This page is intentionally left blank for double-sided printing.

Exceeds the site-specific background listed in Table 19.
Italic Exceeds the lowest RBC listed in Table 19.
Bold italic Exceeds both the lowest RBC and site-specific background values listed in Table 19 - COC.
COC - constituent of concern
[a] Constituent is an essential element, considered non-toxic under a wide-range of environmental concentrations, and is excluded from further evaluation.

IBEX NO. 1

AML Feature Inventory

Feature ID: IBEX

Surveyor(s): PBC, WDM

USGS Quad:

Survey Date: 9/28/11

Directions to Site (from a main road or landmark appearing on map)

Go to IBEX claim up 76 drainage basin.
Head up east side up drainage.
Mine is between two small drainages at base of cliffs.
Both drainages turn into small slot canyons.
Mine is hidden behind relatively young cedar trees

Terrain Slope (Circle where applicable): 1. Flat 2. Vertical 3. Sloped (If sloped, report approx slope angle) slope angle: 44 deg

44° slope → Vertical Cliffs

O & B MINE

AML Feature Inventory

Feature ID: O+B
Surveyor(s): ASK / MAH
USGS Quad:
Survey Date: 9/28/11

Directions to Site (from a main road or landmark appearing on map)

Take trail in Fig Gulch towards Silver Lake. When you reach Poodle Dog Pass head NW along ridgeline above Silver Lake to a small pond. Past the small pond, follow drainage channel downslope to larger unnamed lake. Continue around the lake on shoreline to the left and upslope. When reaching a large boulder/rock field to the west, travel up the rock fields to reach the middle & upper & lower O+B waste rock piles.

Terrain Slope (Circle where applicable): 1. Flat 2. Vertical (3. Sloped) (If sloped, report approx slope angle) slope angle: 43 deg

APPENDIX B
CHEMICAL DATA QUALITY REVIEW AND LABORATORY REPORTS

APPENDIX B
CHEMICAL DATA QUALITY REVIEW AND LABORATORY REPORTS

CHEMICAL DATA QUALITY REVIEW

Ninety-three soil samples were collected during four sampling events in July through September 2011. The samples were submitted for chemical analysis to TestAmerica Seattle (TAS), of Tacoma, Washington. The sample results were reported under TAS Job Numbers 580-27549-1, 580-28356-1, 580-28720-1, and 580-29110-1.

The soil samples were analyzed for the following:

- Total iron, potassium, calcium, and magnesium by EPA Method 6010B;
- Total arsenic, aluminum, antimony, beryllium, cadmium, chromium, copper, lead, manganese, nickel, selenium, silver, thallium, zinc, barium, sodium, vanadium, and cobalt by EPA Method 6020;
- Total mercury by EPA Method 7471A;
- pH by EPA Method 9045C; and
- Percent solids.

One multi-incremental sample (Potomac 1) was submitted and analyzed under TAS Job Number 580-28356-1.

Quality assurance/quality control (QA/QC) reviews of laboratory procedures were performed on an ongoing basis by the laboratories. Hart Crowser reviewed the data, using laboratory quality control results summary sheets and raw data, as required, to ensure they met data quality objectives for the project. Data review followed the Sampling and Analysis Plan/Quality Assurance Project Plan, Monte Cristo Mining Area, dated August 10, 2011, and the format outlined in the National Functional Guidelines for Inorganic Data Review (EPA 2010) modified to include specific criteria of the individual analytical methods. The following elements were reviewed:

- Sampling documentation;
- Holding times and receiving temperatures;
- Reporting limits;
- Laboratory method blanks (metals only);
- Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recoveries (metals only);
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries (metals only);

- Post-digestion spike (PS) recoveries(metals only);
- Serial dilution (metals only); and
- Laboratory duplicate relative percent differences (RPDs).

The data were acceptable for use with qualification as described in the sections below. Full laboratory results are presented at the end of this appendix.

Sample Documentation

Sample W-6 in laboratory job number 580-28720-1 was mislabeled on the chain of custody as W-16. Field notes confirmed that W-16 was collected on August 23, 2011, and was analyzed under laboratory job number 580-28356-1, while W-6 was collected on September 12, 2011, and was analyzed under laboratory job number 580-28720-1.

Holding Times and Receiving Temperatures

The sample coolers and samples were received intact at the laboratory and were within the required 0 to 6 degrees Celsius. Sample holding times were evaluated by comparing the sample collection dates to the sample extraction dates and analysis dates. Holding times were typically met for all samples. Samples from SDGs 580-28356-1, 580-28720-1, and 580-29110-1 were analyzed outside of holding times for pH, and results were qualified as estimated (J).

Reporting Limits

Reporting limits were elevated in some samples because of sample dilution. Such increases in the reporting limits are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument, or that reduces the interferences, thereby enabling quantification of target analytes.

Analyte detections between the method detection limit (MDL) and method reporting limit (RL) were qualified by the laboratory with J. The J qualifier was changed to T to be consistent with the Washington State Department of Ecology Environmental Information Management (EIM) database reporting requirements.

Laboratory Method Blanks

Method blanks were analyzed at the required frequency of at least one for every 20 samples or one per analytical batch, whichever was more frequent. Several method blanks had detections of metals above the MDL but below the RL.

Nickel was detected above the RL in laboratory report 580-28720-1. The laboratory qualified the associated samples with a "B" flag, indicating the compound was found in the blank and the sample. Concentrations in the associated samples were greater than five times the concentrations detected in the method blank and the "B" qualifier was removed. The following table summarizes the method blank detections.

Method Blank Detection

TAS Job Number	Analytical Method	Analyte(s) Detected in Blank	Associated Samples
580-27549-1	EPA 6010B	Potassium Calcium	Weden 1 S1 (0-6), Weden 1 S1 (6-12), Weden 1 S2 (0-6), Weden 1 S2 (6-12), Weden 2 S1 (0-6)

Laboratory Control Sample (LCS)

Laboratory control samples and laboratory control sample duplicates are analyzed by the laboratory to assess the accuracy of the analytical equipment. The LCS and LSCD samples are prepared from analyte-free matrix, which is then spiked with known levels of the analytes of concern. The concentrations are measured and the results are compared to the known spiked levels. All LCS and LCSD recoveries were within control limits. RPDs between the LCS and LCSD were also within control limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

The matrix spike and matrix spike duplicate samples are a portion of a field sample spiked with target analytes and are prepared with each analytical batch used to assess accuracy. Results from these analyses provide information on the extent of any signal suppression or enhancement due to matrix interference. The RPD between MS and MSD recoveries are used to assess precision. The QAPP control limits for MS and MSD recoveries are from 75 to 125 percent and laboratory control limits are from 80 to 120 percent.

MS and MSD recoveries were above or below control limits for several metals. In many cases, recoveries were outside control limits because high levels of the spiked analyte were present in the source sample. Spike recovery limits are not applicable when the sample concentration is greater than four times the spike added, and in these cases the results were not qualified.

Samples without high source concentrations were qualified as an estimate when recoveries were outside of control limits for both the MS and MSD. LCS recoveries were within control limits for all samples, implying MS and MSD failures were because of a matrix effect and, therefore, only the source samples (i.e., the ones that were spiked) were qualified as estimated.

The table below provides the samples that were qualified as estimated (J) because the MS or MSD recoveries were outside of control limits.

Matrix Spike/Matrix Spike Duplicate Recovery

TAS Job Number	Analytical Method	Spiked Sample	Analytes
580-27549-1	EPA 6020	Weden 1 S1 (6-12)	Antimony Chromium Nickel
580-28356-1	EPA 6020	W-12	Antimony Chromium Copper Manganese Zinc
580-28356-1	EPA 6020	G-5	Sodium
580-28356-1	EPA 6010B	Potomac 1	Calcium
580-28356-1	EPA 6020	Potomac 1	Antimony Sodium Zinc
580-28720-1	EPA 6010B	G-11	Calcium
580-28720-1	EPA 6020	76 S-2 0-6	Vanadium
580-28720-1	EPA 6020	76-2	Antimony
580-28720-1	EPA 6020	W-21	Antimony Sodium Zinc
580-29110-1	EPA 6020	PUSHER S-1 0-6	Antimony Arsenic
580-29110-1	EPA 6010B	PORTLAND 2 S1 0-6	Potassium
580-29110-1	EPA 6020	PORTLAND 2 S1 0-6	Antimony

Post-Digestion Spike

The post-digestion spike involves spiking the sample with a known concentration of reagent after completion of the digestion procedures. Post-digestion spikes are not applicable when there are high levels of the analyte in the source sample. There were a few samples with post-spike recoveries outside of control limits that were already qualified as estimated (J) because MS and MSD recoveries were outside control limits. Two samples were qualified due solely to post-spike recoveries. The table below provides the samples that were qualified as estimated (J) because the post-spike recoveries were outside of control limits.

Post-Spike Recovery

TAS Job Number	Analytical Method	Spiked Sample	Analytes
580-28356-1	EPA 6020	Potomac 1	Vanadium
580-29110-1	EPA 6020	PORTLAND 2 S1 0-6	Cadmium

Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. The serial dilution results were acceptable for all samples except those presented in the table below that were qualified as an estimate (J) because the RPD in the serial dilution exceeded the laboratory control limit.

Serial Dilution

TAS Job Number	Analytical Method	Sample	Analytes
580-28356-1	EPA 6020	G-5	Copper Lead Copper

Laboratory Duplicate

Laboratory duplicates were prepared with each analytical batch by extracting a second separate aliquot of a sample. The laboratory duplicates were evaluated to assess analytical precision of the method and potential variability of the sample matrix. Laboratory duplicate RPDs were within control limits.

Designee for
Kristine Allen
Project Manager I
kristine.allen@testamericainc.com
08/04/2011
Revision: 1

TestAmerica Seattle is a part of TestAmerica Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

This report shall not be reproduced except in full, without prior express written approval by the laboratory. The results relate only to the item(s) tested and the sample(s) as received by the laboratory.

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan and meet all requirements of NELAC. All data have been found to be compliant with laboratory protocol, with the exception of any items noted in the case narrative.

CASE NARRATIVE

Client: Hart Crowser, Inc.
Project: Monte Cristo WA. (17800-06)
Report Number: 580-27549-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

Following DoD QSM guidelines, manual integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure, Acceptable Manual Integration Practices, SOP No.: Q-S-002. The reason(s) for manual integration have been documented on the affected chromatogram(s), which is/are provided in the raw data package. The raw data also includes the original chromatogram(s) prior to any manual integration being performed. Manual integrations are detailed in the manual integration summary forms following this narrative.

It should be noted that samples with elevated Limits of Quantitation (LOQs) resulting from a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the LOQs are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument or that reduces the interfererences thereby enabling the quantification of target analytes.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 07/21/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.0 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS (ICP)
Samples Weden 1 S1 (0-6) (580-27549-1), Weden 1 S1 (6-12) (580-27549-2), Weden 1 S2 (0-6) (580-27549-3), Weden 1 S2 (6-12) (580-27549-4) and Weden 2 S1 (0-6) (580-27549-5) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 07/25/2011 and analyzed on 07/26/2011 and 07/27/2011.

Samples Weden 1 S1 (0-6) (580-27549-1)[100X], Weden 1 S1 (6-12) (580-27549-2)[100X], Weden 1 S2 (0-6) (580-27549-3)[100X], Weden 1 S2 (6-12) (580-27549-4)[100X] and Weden 2 S1 (0-6) (580-27549-5)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Calcium and Potassium were detected in method blank MB 580-91183/13-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Recovery values for Iron and Magnesium in the matrix spike / matrix spike duplicate of sample Weden 1 S1 (6-12) (580-27549-2) were outside advisory QC limits due to high concentration of the analytes in the original sample. The analytes present in the original sample are four times greater than the matrix spike concentration; therefore, control limits are not applicable.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICPMS)
Samples Weden 1 S1 (0-6) (580-27549-1), Weden 1 S1 (6-12) (580-27549-2), Weden 1 S2 (0-6) (580-27549-3), Weden 1 S2 (6-12) (580-27549-4) and Weden 2 S1 (0-6) (580-27549-5) were analyzed for total metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 07/25/2011 and analyzed on 07/26/2011.

Recovery values several compounds in the matrix spike/matrix spike duplicate of sample Weden 1 S1 (6-12) (580-27549-2) were outside advisory QC limits due to high concentration of the analyte in the original sample. The analyte present in the original sample is four times greater than the matrix spike concentration; therefore, control limits are not applicable.

Recovery values for several compounds in the matrix spike/matrix spike duplicate of sample Weden 1 S1 (6-12) (580-27549-2) were outside advisory QC limits. Matrix interference is indicated based on acceptable LCS/LCSD recovery and/or RPD.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples Weden 1 S1 (0-6) (580-27549-1), Weden 1 S1 (6-12) (580-27549-2), Weden 1 S2 (0-6) (580-27549-3), Weden 1 S2 (6-12) (580-27549-4) and Weden 2 S1 (0-6) (580-27549-5) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared and analyzed on 07/26/2011.

Recovery values for Mercury in the matrix spike/matrix spike duplicate of sample Weden 2 S1 (0-6) (580-27549-5) were outside advisory QC limits. Matrix interference is indicated based on acceptable LCS/LCSD recovery and/or RPD.

No other difficulties were encountered during the mercury analyses.

All other quality control parameters were within the acceptance limits.

CORROSIVITY (PH)

Samples Weden 1 S1 (0-6) (580-27549-1), Weden 1 S1 (6-12) (580-27549-2), Weden 1 S2 (0-6) (580-27549-3), Weden 1 S2 (6-12) (580-27549-4) and Weden 2 S1 (0-6) (580-27549-5) were analyzed for corrosivity (pH) in accordance with EPA SW-846 Method 9045C. The samples were analyzed on 07/25/2011.

No difficulties were encountered during the pH analyses.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS

Samples Weden 1 S1 (0-6) (580-27549-1), Weden 1 S1 (6-12) (580-27549-2), Weden 1 S2 (0-6) (580-27549-3), Weden 1 S2 (6-12) (580-27549-4) and Weden 2 S1 (0-6) (580-27549-5) were analyzed for percent solids in accordance with EPA SW846 3550C. The samples were analyzed on 07/25/2011.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Hart Crowser, Inc. Job Number: 580-27549-1

Lab Section	Qualifier	Description
Metals		
	B	Compound was found in the blank and sample.
	^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
	F	MS or MSD exceeds the control limits
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	W	PS: Post-digestion spike was outside control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Hart Crowser, Inc. Job Number: 580-27549-1

TestAmerica Seattle is a part of TestAmerica Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

This report shall not be reproduced except in full, without prior express written approval by the laboratory. The results relate only to the item(s) tested and the sample(s) as received by the laboratory.

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan and meet all requirements of NELAC. All data have been found to be compliant with laboratory protocol, with the exception of any items noted in the case narrative.

CASE NARRATIVE

Client: Hart Crowser, Inc.
Project: Monte Cristo 17800-06
Report Number: 580-28356-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) resulting from a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument or that reduces the interferences thereby enabling the quantification of target analytes.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 08/30/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.0 C.

The container label for sample W-16 (580-28356-22) does not list a sample time or date. The Chain of Custody (COC) lists a sample date and time of 8/23/2011 at 15:25. The sample was logged in according to the COC.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TOTAL METALS (ICP)

Samples W-12 (580-28356-1), W-10 (580-28356-2), W-9 (580-28356-3), W-13 (580-28356-4), W-15 (580-28356-5), W-14 (580-28356-6), G-1 (580-28356-7), G-2 (580-28356-8), G-3 (580-28356-9), G-4 (580-28356-10), G-5 (580-28356-11), Potomac 2 (0-6) (580-28356-13), Potomac 2 (6-12) (580-28356-14), Potomac 3 (0-6) (580-28356-15), Potomac 3 (6-12) (580-28356-16), IXL 1 (0-6) (580-28356-17), IXL 1 (6-12) (580-28356-18), IXL 2 (0-6) (580-28356-19), IXL 2 (6-12) (580-28356-20), W-8 (580-28356-21), W-16 (580-28356-22) and W-11 (580-28356-23) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 09/12/2011 and analyzed on 09/13/2011 and 09/14/2011.

Calcium and Iron were detected in method blank MB 580-95118/16-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Samples W-9 (580-28356-3)[100X], W-13 (580-28356-4)[100X], W-15 (580-28356-5)[100X], G-1 (580-28356-7)[100X], G-4 (580-28356-10)[100X], IXL 1 (0-6) (580-28356-17)[100X], IXL 1 (6-12) (580-28356-18)[100X], IXL 2 (0-6) (580-28356-19)[100X], IXL 2 (6-12) (580-28356-20)[100X] and W-8 (580-28356-21)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Iron failed the recovery criteria high for the matrix spike/matrix spike duplicate (MS/MSD) of sample W-12MS (580-28356-1) in batch 580-95314. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Magnesium failed the recovery criteria low for the MS of sample G-5MS (580-28356-11) in batch 580-95314. Iron failed the recovery criteria high. Magnesium failed the recovery criteria low for the MSD of sample G-5MSD (580-28356-11) in batch 580-95314. Iron failed the recovery criteria high. The associated laboratory control sample (LCS) recovery met acceptance criteria. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP/MS)

Samples W-12 (580-28356-1), W-10 (580-28356-2), W-9 (580-28356-3), W-13 (580-28356-4), W-15 (580-28356-5), W-14 (580-28356-6), G-1 (580-28356-7), G-2 (580-28356-8), G-3 (580-28356-9), G-4 (580-28356-10), G-5 (580-28356-11), Potomac 2 (0-6) (580-28356-13), Potomac 2 (6-12) (580-28356-14), Potomac 3 (0-6) (580-28356-15), Potomac 3 (6-12) (580-28356-16), IXL 1 (0-6) (580-28356-17), IXL 1 (6-12) (580-28356-18), IXL 2 (0-6) (580-28356-19), IXL 2 (6-12) (580-28356-20), W-8 (580-28356-21), W-16 (580-28356-22) and W-11 (580-28356-23) were analyzed for total metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 09/12/2011 and analyzed on 09/13/2011 and 09/14/2011.

Barium was detected in method blank MB 580-95113/21-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Samples IXL 1 (0-6) (580-28356-17)[1000X], IXL 1 (6-12) (580-28356-18)[1000X], IXL 2 (0-6) (580-28356-19)[1000X] and IXL 2 (6-12) (580-28356-20)[1000X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Recovery values for several of the matrix spike / matrix spike duplicate (MS/MSD) compounds for sample W-12MS/MSD (580-28356-1) in batch 580-95318 were outside advisory QC limits. Matrix interference is indicated based on acceptable LCS/LCSD recovery and/or RPD. The affected data have been qualified "4" or "F" and are reported. The duplicate relative percent difference (RPD) for several compounds in batch 580-95318 was outside the control limits due to non homogeneity of the sample. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Recovery values for several of the matrix spike / matrix spike duplicate (MS/MSD) compounds for sample G-5MSD (580-28356-11) in batch 580-95318 were outside advisory QC limits. Zinc exceeded the rpd limit.
Matrix interference is indicated based on acceptable LCS/LCSD recovery and/or RPD. The affected data have been qualified "4" or "F" and are reported.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP) WITH MULTI-INCREMENTAL PREPARATION

Sample Potomac 1 (580-28356-12) was analyzed for total metals (ICP) with multi-incremental preparation in accordance with EPA SW-846 Method 6010B. The samples were leached on 09/12/2011, prepared on 09/15/2011 and analyzed on 09/16/2011.

Iron was detected in method blank MB 580-95447/18-A at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Sample Potomac 1 (580-28356-12) required a [10X] and [100X] dilution to put some compounds within the calibration range of the instrument. The reporting limits have been adjusted accordingly.

Iron and Magnesium failed the recovery criteria low for the MS of sample Potomac 1MS (580-28356-12) in batch 580-95537. Calcium failed the recovery criteria high. Calcium, Iron, Magnesium and Potassium failed the recovery criteria high for the MSD of sample Potomac 1MSD (580-28356-12) in batch 580-95537. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the total metals (ICP) with multi-incremental preparation analysis.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP/MS) WITH MULTI-INCREMENTAL PREPARATION

Sample Potomac 1 (580-28356-12) was analyzed for total metals (ICP/MS) with multi-incremental preparation in accordance with draft Guidance on Multi-Increment Soil Sampling and EPA SW-846 Method 6020. The samples were leached on 09/12/2011, prepared on 09/15/2011 and analyzed on 09/16/2011.

Lead was detected in method blank MB 580-95447/18-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Sample Potomac 1 (580-28356-12) required a [100X] and [1000X] dilution to put some compounds within the calibration range of the instrument. The reporting limits have been adjusted accordingly.

Antimony and Arsenic failed the recovery criteria low for the MS of sample Potomac 1MS (580-28356-12) in batch 580-95520. Several compounds failed the recovery criteria high. For the MSD of sample Potomac 1MSD (580-28356-12) in batch 580-95520, Antimony failed the recovery criteria low. Several compounds failed the recovery criteria high. Also, Cadmium and Zinc exceeded the relative percent difference (RPD) limit. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the total metals (ICP/MS) with multi-incremental preparation analysis.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples W-12 (580-28356-1), W-10 (580-28356-2), W-9 (580-28356-3), W-13 (580-28356-4), W-15 (580-28356-5), W-14 (580-28356-6), G-1 (580-28356-7), G-2 (580-28356-8), G-3 (580-28356-9), G-4 (580-28356-10), G-5 (580-28356-11), Potomac 2 (0-6) (580-28356-13), Potomac 2 (6-12) (580-28356-14), Potomac 3 (0-6) (580-28356-15), Potomac 3 (6-12) (580-28356-16), IXL 1 (0-6) (580-28356-17), IXL 1 (6-12) (580-28356-18), IXL 2 (0-6) (580-28356-19), IXL 2 (6-12) (580-28356-20), W-8 (580-28356-21), W-16 (580-28356-22) and W-11 (580-28356-23) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 09/11/2011 and 09/13/2011 and analyzed on 09/13/2011.

Samples IXL 1 (0-6) (580-28356-17)[5X], IXL 2 (0-6) (580-28356-19)[5X] and IXL 2 (6-12) (580-28356-20)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

MERCURY WITH MULTI-INCREMENTAL PREPARATION

Sample Potomac 1 (580-28356-12) was analyzed for mercury with multi-incremental preparation in accordance with Draft Guidance on Multi-Incremental Soil Sampling and EPA SW-846 Method 7471A. The samples were leached on 09/12/2011, and prepared and analyzed on 09/15/2011.

Mercury failed the recovery criteria high for the MSD of sample Potomac 1MSD (580-28356-12) in batch 580-95485. The presence of the '4' qualifier in the report indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the mercury with multi-incremental preparation analysis.

All other quality control parameters were within the acceptance limits.

CORROSIVITY (PH)

Samples W-12 (580-28356-1), W-10 (580-28356-2), W-9 (580-28356-3), W-13 (580-28356-4), W-15 (580-28356-5), W-14 (580-28356-6), G-1 (580-28356-7), G-2 (580-28356-8), G-3 (580-28356-9), G-4 (580-28356-10), G-5 (580-28356-11), Potomac 2 (0-6) (580-28356-13), Potomac 2 (6-12) (580-28356-14), Potomac 3 (0-6) (580-28356-15), Potomac 3 (6-12) (580-28356-16), IXL 1 (0-6) (580-28356-17), IXL 1 (6-12) (580-28356-18), IXL 2 (0-6) (580-28356-19), IXL 2 (6-12) (580-28356-20), W-8 (580-28356-21), W-16 (580-28356-22) and W-11 (580-28356-23) were analyzed for corrosivity (pH) in accordance with EPA SW-846 Method 9045C. The samples were analyzed on 09/11/2011.

No difficulties were encountered during the pH analyses.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS

Samples W-12 (580-28356-1), W-10 (580-28356-2), W-9 (580-28356-3), W-13 (580-28356-4), W-15 (580-28356-5), W-14 (580-28356-6), G-1 (580-28356-7), G-2 (580-28356-8), G-3 (580-28356-9), G-4 (580-28356-10), G-5 (580-28356-11), Potomac 2 (0-6) (580-28356-13), Potomac 2 (6-12) (580-28356-14), Potomac 3 (0-6) (580-28356-15), Potomac 3 (6-12) (580-28356-16), IXL 1 (0-6) (580-28356-17), IXL 1 (6-12) (580-28356-18), IXL 2 (0-6) (580-28356-19), IXL 2 (6-12) (580-28356-20), W-8 (580-28356-21), W-16 (580-28356-22) and W-11 (580-28356-23) were analyzed for percent solids in accordance with EPA Method 160.3 Modified. The samples were analyzed on 09/11/2011.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Hart Crowser, Inc. Job Number: 580-28356-1

Lab Section	Qualifier	Description
Metals		
	B	Compound was found in the blank and sample.
	F	MS or MSD exceeds the control limits
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	W	PS: Post-digestion spike was outside control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	F	RPD of the MS and MSD exceeds the control limits
	V	Serial Dilution exceeds the control limits

Client: Hart Crowser, Inc. Job Number: 580-28356-1

Certification Summary

Client: Hart Crowser, Inc.
Project/Site: Monte Cristo 17800-06

TestAmerica Job ID: 580-28356-1

Laboratory	Authority	Program	EPA Region	Certification ID
TestAmerica Seattle	Alaska	Alaska UST	10	UST-022
TestAmerica Seattle	Alaska	TA-Port Heiden Mobile Lab	10	UST-093
TestAmerica Seattle	California	NELAC	9	1115CA
TestAmerica Seattle	Florida	NELAC	4	E871074
TestAmerica Seattle	L-A-B	DoD ELAP		L2236
TestAmerica Seattle	L-A-B	ISO/IEC 17025		L2236
TestAmerica Seattle	Louisiana	NELAC	6	05016
TestAmerica Seattle	Montana	MT DEQ UST	8	N/A
TestAmerica Seattle	Oregon	NELAC	10	WA100007
TestAmerica Seattle	USDA	USDA		P330-11-00222
TestAmerica Seattle	Washington	State Program	10	C553

Accreditation may not be offered or required for all methods and analytes reported in this package. Please contact your project manager for the laboratory's current list of certified methods and analytes.
