KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.01
Dear Alan Hughes:

Order No.: 1003075

Specialty Analytical received 18 samples on 3/11/2010 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.01
Dear Alan Hughes:

Order No.: 1003144

Specialty Analytical received 13 samples on 3/23/2010 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard

CASE NARRATIVE

Report Revision 1.

At the request of the client, the full list of compounds for EPA 8260B are reported.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.01
Dear Alan Hughes:

Order No.: 1003196

Specialty Analytical received 17 samples on 3/31/2010 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

Project Name: URIC
Project #: 8006.31.01
Workorder #: 1003288

Dear Ms. Meri Gibson

The following report includes the data for the above referenced project for sample(s) received on 3/12/2010 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

**LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1003288**

Ten 6 Liter Summa Canister (SIM Certified) samples were received on March 12, 2010. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Sample collection date was incomplete on the Chain of Custody for sample SG4-3.5. The year of collection was assumed to be 2010.

Sample SG6-3.5 was placed on hold per the client's request.

Sample SG6-3.5 was received with significant vacuum remaining in the canister. The residual canister vacuum resulted in elevated reporting limits.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

- B - Compound present in laboratory blank greater than reporting limit (background subtraction not

performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

RE: URIC / 8006.31.02
Dear Merideth D'Andrea:

Order No.: 1010138

Specialty Analytical received 6 samples on 10/20/2010 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard
Project Manager

CLIENT: Maul, Foster & Alongi
Project: URIC / 8006.31.02
Lab Order: 1010138**CASE NARRATIVE**

Report Revision 1.

At the request of the client, the full list of compounds for EPA 8260B are reported.

ANALYTICAL QC SUMMARY REPORT

TestCode: 8260_W

Sample ID: CCV-26886	SampType: CCV	TestCode: 8260_W	Units: µg/L	Prep Date:	Run ID: 5973J_101025A						
Client ID: ZZZZZ	Batch ID: 26886	TestNo: SW8260B		Analysis Date: 10/26/2010	SeqNo: 704895						
Analyte	Result	PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	RPD Ref Val	%RPD	RPDLimit	Qual
1,1-Dichloroethene	43.3	1.00	40	0	108	80	120	0	0		
1,2-Dichloropropane	44.71	1.00	40	0	112	80	120	0	0		
Chloroform	41.13	1.00	40	0	103	80	120	0	0		
Ethylbenzene	42.98	1.00	40	0	107	80	120	0	0		
Toluene	41.54	1.00	40	0	104	80	120	0	0		
Vinyl chloride	43.48	1.00	40	0	109	80	120	0	0		

Qualifiers: ND - Not Detected at the Reporting Limit
J - Analyte detected below quantitation limits

S - Spike Recovery outside accepted recovery limits
R - RPD outside accepted recovery limits

B - Analyte detected in the associated Method Blank

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.01

Dear Merideth D'Andrea:

Order No.: 1106174

Specialty Analytical received 5 samples on 6/24/2011 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Cindy Hillyard
Project Manager

 R - RPD outside accepted recovery limits

B - Analyte detected in the associated Method Blank

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.01

Dear Meri DeAndrea:

Order No.: 1106182

Specialty Analytical received 8 samples on 6/27/2011 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Cindy Hillyard
Project Manager

Qualifiers: ND - Not Detected at the Reporting Limit
 J - Analyte detected below quantitation limits

S - Spike Recovery outside accepted recovery limits
 R - RPD outside accepted recovery limits

B - Analyte detected in the associated Method Blank

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

Workorder #: 1106496

Dear Mr. Justin Pounds

The following report includes the data for the above referenced project for sample(s) received on 6/23/2011 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-17 VI are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

**LABORATORY NARRATIVE
EPA Method TO-17
Maul Foster and Alongi Inc.
Workorder# 1106496**

Five TO-17 VI Tube samples were received on June 23, 2011. The laboratory performed the analysis via EPA Method TO-17 using GC/MS in the full scan mode. TO-17 sorbent tubes are thermally desorbed onto a secondary trap. The trap is thermally desorbed to elute the components into the GC/MS system for further separation.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

A sampling volume of 1.00 L was used to convert ng to ug/m³ for the associated Lab Blank.

The recovery of surrogate 1,2-Dichloroethane-d₄ in sample SG11 was outside the laboratory limits of 50-150%.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

RE: Union Ridge / 8006.31.01
Dear Merideth D'Andrea:

Order No.: 1203120

Specialty Analytical received 3 samples on 3/14/2012 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Union Ridge / 8006.31.01
Dear Merideth D'Andrea:

Order No.: 1203158

Specialty Analytical received 4 samples on 3/16/2012 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Union Ridge / 8006.31.01
Dear Merideth D'Andrea:

Order No.: 1203167

Specialty Analytical received 8 samples on 3/19/2012 for the analyses presented in the following report.

REVISED REPORT VERSION 1 . Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Union Ridge / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1206153

Specialty Analytical received 7 sample(s) on 6/20/2012 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French
Lab Director

Case Narrative

WO#: 1206153

Date: 7/3/2012

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Union Ridge / 8006.31.02

One of the batch CCV's had several analytes that exceeded high control limits. The samples associated with this CCV were non-detect for those analytes.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Union Ridge / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1206179

Specialty Analytical received 10 sample(s) on 6/22/2012 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with a prominent loop at the end.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry-URIC / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1210059

Specialty Analytical received 17 sample(s) on 10/8/2012 for the analyses presented in the following report.

REVISED REPORT VERSION 1. Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, written over a white background.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry-URIC / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1212245

Specialty Analytical received 12 sample(s) on 12/21/2012 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is written in a cursive, flowing style.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry-URIC / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1212258

Specialty Analytical received 6 sample(s) on 12/26/2012 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, written over a white background.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1304046

Specialty Analytical received 10 sample(s) on 4/8/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read 'Marty French', written in a cursive style.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1304092

Specialty Analytical received 15 sample(s) on 4/11/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1306010

Specialty Analytical received 10 sample(s) on 6/4/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with a prominent loop at the end.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1306028

Specialty Analytical received 13 sample(s) on 6/5/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is cursive and somewhat stylized.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1309184

Specialty Analytical received 11 sample(s) on 9/27/2013 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French".

Marty French
Lab Director

Case Narrative

WO#: 1309184

Date: 11/20/2013

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.02

Report Revision 1

This report is revised to add a Case Narrative. All data remains unchanged.

Case Narrative

Due to instrument failure, primary analyses for samples 1309184-001 through 1309184-005 and secondary dilution analysis for sample 1309184-008 were performed outside holding time. As the analyses were performed less than 29 hours past holding time, it is unlikely that sample results were significantly impacted.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1309202

Specialty Analytical received 12 sample(s) on 9/30/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Andrew Vidourek:

Order No.: 1312237

Specialty Analytical received 18 sample(s) on 12/26/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Andrew Vidourek:

Order No.: 1312287

Specialty Analytical received 4 sample(s) on 12/31/2013 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1403211

Specialty Analytical received 12 sample(s) on 3/26/2014 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is stylized and cursive.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.02

Dear Merideth D'Andrea:

Order No.: 1403255

Specialty Analytical received 10 sample(s) on 3/28/2014 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is stylized and cursive.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1406215

Specialty Analytical received 15 sample(s) on 6/25/2014 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is cursive and somewhat stylized.

Marty French
Lab Director

Case Narrative

WO#: 1406215

Date: 7/15/2014

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Due to laboratory error Specialty Analytical sample 1406215-010 - 1406215-015 were analyzed outside recommended holding time.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1409080

Specialty Analytical received 22 sample(s) on 9/12/2014 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French".

Marty French
Lab Director

Case Narrative

WO#: 1409080

Date: 9/23/2014

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Report Revision 1.

This report has been corrected to include results between the method detection limit (MDL) and the reporting limit (RL).

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1412025

Specialty Analytical received 2 sample(s) on 12/4/2014 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is stylized and cursive.

Marty French
Lab Director

Case Narrative

WO#: 1412025

Date: 1/6/2015

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Report Revision 1.

This report revision includes corrected results for fixed gases. Original results were incorrectly reported for some samples that were below the Practical Quantitation Limit (PQL). Revised results are now reported as not detected at the PQL.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1412058

Specialty Analytical received 12 sample(s) on 12/5/2014 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is stylized and cursive.

Marty French
Lab Director

Case Narrative

WO#: 1412058

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Report Revision 1.

This report revision includes corrected results for fixed gases. Original results were incorrectly reported for some samples that were below the Practical Quantitation Limit (PQL). Revised results are now reported as not detected at the PQL.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1412084

Specialty Analytical received 9 sample(s) on 12/9/2014 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is stylized and cursive.

Marty French
Lab Director

Case Narrative

Date: 1/6/2015

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Report Revision 1.

This report revision includes corrected results for fixed gases. Original results were incorrectly reported for some samples that were below the Practical Quantitation Limit (PQL). Revised results are now reported as not detected at the PQL.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1503066

Specialty Analytical received 22 sample(s) on 3/9/2015 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French".

Marty French
Lab Director

Case Narrative

WO#: 1503066

Date: 3/17/2015

Specialty Analytical

CLIENT: Maul Foster & Alongi
Project: Park Laundry / 8006.31.05

Tetrachloroethene was detected above the MDL (0.310 and 0.250 ug/L, respectively) in the Method Blank and Trip Blank associated with samples MW01-030415, MW02-030415, MW08-030415, MW04-030515, MW06-030515, MW14-030515, and MW19-030615. As this indicates low level contamination in the analytical system during this batch, all associated tetrachloroethene results that are less than five times the highest associated blank detection should be considered non-detects.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05/01

Dear Merideth D'Andrea:

Order No.: 1506114

Specialty Analytical received 15 sample(s) on 6/11/2015 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is cursive and somewhat stylized.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1509125

Specialty Analytical received 14 sample(s) on 9/16/2015 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is cursive and somewhat stylized.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1509155

Specialty Analytical received 9 sample(s) on 9/18/2015 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, with the first name being more prominent.

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.05/01

Dear Merideth D'Andrea:

Order No.: 1512289

Specialty Analytical received 15 sample(s) on 12/24/2015 for the analyses presented in the following report.

REVISED REPORT: Please see case narrative for information on revision.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Marty French
Lab Director

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Park Laundry / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1603240

Specialty Analytical received 21 sample(s) on 3/24/2016 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read 'Marty French', written in a cursive style.

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: URIC / 8006.31.05

Dear Merideth D'Andrea:

Order No.: 1609073

Specialty Analytical received 22 sample(s) on 9/12/2016 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "Marty French". The signature is fluid and cursive, written over a white background.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

Notes and Definitions

Qualifiers:

Notes and Conventions:

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. Results listed as 'wet' or without 'dry' designation are not dry weight corrected.
RPD	Relative Percent Difference
MDL	If MDL is not listed, data has been evaluated to the Method Reporting Limit only.
WMSC	Water Miscible Solvent Correction has been applied to Results and MRLs for volatiles soil samples per EPA 8000C.
Batch QC	In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) is analyzed to demonstrate accuracy and precision of the extraction and analysis.
Blank Policy	<p>Apex assesses blank data for potential high bias down to a level equal to ½ the method reporting limit (MRL), except for conventional chemistry and HCID analyses which are assessed only to the MRL. Sample results flagged with a B or B-02 qualifier are potentially biased high if they are less than ten times the level found in the blank for inorganic analyses or less than five times the level found in the blank for organic analyses.</p> <p>For accurate comparison of volatile results to the level found in the blank; water sample results should be divided by the dilution factor, and soil sample results should be divided by 1/50 of the sample dilution to account for the sample prep factor.</p> <p>Results qualified as reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. B and B-02 qualifications are not applied to J qualified results reported below the MRL.</p>
---	QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
***	Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

APPENDIX E

DATA VALIDATION MEMORANDUMS

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for reconnaissance soil and groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in March, 2010.

Specialty Analytical (SA), in Clackamas, Oregon performed the analyses. SA report numbers 1003038rev2, 1003041rev1, 1003049rev1, 1003075rev1, 1003144rev1, and 1003196rev1 were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds (VOCs)	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014), and appropriate laboratory and method-specific (SA, 2010; USEPA, 1986).

In report 1003038rev2, some USEPA Method 8260B results exceeded upper instrument calibration ranges. Results were qualified by the reviewer with “J” as estimated.

Report	Sample	Component	Original Result (ug/kg)	Qualified Result (ug/kg)
1003038rev2	GP52-S-12.5	1,1,2-Trichloroethane	266 E	266 J
1003038rev2	GP56-S-0.5	Acetone	471 E	471 J

E = the result exceeds the upper instrument calibration range.
 J = the result is an estimated value.
 ug/kg = micrograms per kilogram.

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

In report 1003038rev2, samples GP54-S-0.5, GP54-S-5.0, GP56-S-0.5, and GP56-S-5.0 were analyzed for USEPA Method 8260B 6 days after the 14 day holding time, due to request for analysis after the holding time had been exceeded. Associated detected sample results were qualified by the reviewer, with “J” for detected results and “UJ” for non-detect results.

Report	Sample	Component	Original Results	Qualified Results
1003038rev2	GP54-S-0.5	VOCs	Detect	J
			Non-detect	UJ
	GP54-S-5.0	VOCs	Detect	J
			Non-detect	UJ
	GP56-S-0.5	VOCs	Detect	J
			Non-detect	UJ
	GP56-S-5.0	VOCs	Detect	J
			Non-detect	UJ

In report 1003049rev1, sample B8-S-16.5 was analyzed for USEPA Method 8260B tetrachloroethene 1 day after the 14 day recommended holding time. The result was qualified by the reviewer with “J” as estimated.

Report	Sample	Component	Original Results (ug/L)	Qualified Results (ug/L)
1003049rev1	B8-S-16.5	Tetrachloroethene	4370	4370 J

Remaining extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies.

In report 1003038rev2, the USEPA Method 8260B batch 25116 method blank had a detection of naphthalene above the reporting limit of 1.00 micrograms per liter (ug/L), at 3.55 ug/L. Associated sample results less than five times the method blank concentration were qualified by the reviewer with “U” as non-detect at the reported values.

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1003038rev2	GP44-W-13.0	Naphthalene	1.62 B	1.62 U
1003038rev2	GP41-W-12.5	Naphthalene	1.38 B	1.38 U
1003038rev2	GP52-W-12.5	Naphthalene	1.51 B	1.51 U

In reports 1003049rev1 and 1003075rev1, the USEPA Method 8260B batch 25158 method blank had a detection of bromochloromethane above the reporting limit of 10.0 ug/L, at 10.64 ug/L. All associated samples were non-detect; thus, no results were qualified.

All remaining method blanks were non-detect for all target analytes to method reporting limits.

Continuing Calibration Blanks

CCBs were provided for some analyses.

In reports 1003038rev2 and 1003049rev1, the USEPA Method 8260B CCB analyzed on 3/12/2010 had a detection for benzene above the reporting limit, at 0.43 ug/L. In report 1003049rev1, sample GP60-W-14.5 had a detection of benzene above the reporting limit, at 0.450 ug/L that was analyzed on the same day. Remaining samples associated with the CCB did not report benzene; thus, no additional data qualifications were made.

In report 1003049rev1, the USEPA Method 8260B CCB analyzed on 3/12/2010 had a detection of benzene above the reporting limit of 0.300 ug/L, at 0.43 ug/L. An associated sample analyzed on 3/12/2010 was qualified by the reviewer with “U” as non-detect in the following table.

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1003049rev1	GP60-W-14.5	Benzene	0.450	0.450 U

All remaining CCBs were non-detect.

Trip Blanks

Trip blanks were submitted with samples for reports 1003038rev2, 1003049rev1, 1003075rev1, and 1003196rev1, and analyzed for USEPA Method 8260B. The trip blanks were non-detect for all target analytes.

Equipment Rinsate Blanks

Equipment blanks were submitted for USEPA Method 8260B analysis with samples for reports 1003144rev1 and 1003196rev1. The equipment blanks were non-detect for all target analytes.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. Surrogate percent recovery exceedances between 70% and 130% were considered minor and were not qualified by the reviewer. Batch quality control surrogate percent recovery exceedances were not qualified.

In report 1003038rev2, USEPA Method 8260B surrogates 1,2-dichloroethane-d4, dibromofluoromethane, and toluene-d8 exceeded upper percent recovery acceptance limits for sample GP50-S-12.5, at 162%, 146%, and 139%, respectively. Associated sample results were non-detect; thus, no results were qualified.

In report 1003049rev1, the USEPA Method 8260B surrogate 1,2-dichloroethane-d4 exceeded the upper percent recovery acceptance limit for samples GP33-S-0.5 (137%), GP38-S-0.5 (133%), GP26-S-11.0 (134%), GP30-S-0.5 (131%), and GP30-S-5.0 (133%). Remaining surrogate results were within percent recovery acceptance limits; thus, no results were qualified.

All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. MS/MSD percent recovery exceedances between 70% and 130% were considered minor and were not qualified by the reviewer.

All remaining MS/MSD results were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

An LCS is spiked with target analytes to provide information on laboratory accuracy. The LCS samples were extracted and analyzed at the required frequency. LCS percent recovery exceedances between 70% and 130% were considered minor and were not qualified by the reviewer.

All remaining LCS results were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. Field duplicates were submitted for analysis with report 1003038rev2 (GP28-W-14.0/GP28W-14.0-DUP) and 1003144rev1 (B9-W-75.0/B9-W-75.0 DUP) was submitted for analysis. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. Analytes were within the acceptance criteria with the following exceptions in the table below.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used routine reporting limits for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data package was reviewed for transcription errors, omissions, and anomalies.

In report 1003049rev1, the trip blank was not recorded on the chain of custody. No action was required by the reviewer.

In report 1003196rev1, samples B10-S-50.0 and B11-S-82.0 were not recorded on the chain of custody prior to submittal to the laboratory. The laboratory noted on the chain of custody that the samples were submitted on hold. No action was required by the reviewer.

No additional issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for soil gas samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in March, 2010.

Air Toxics Ltd. (AT), in Folsom, California performed the analyses. AT report number 1003288 was reviewed. The analyses performed are listed below.

Analysis	Reference
Chlorinated volatile organic compounds (cVOCs)	USEPA TO-15 SIM Modified/Full scan

SIM = selected ion monitoring.
USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014), and appropriate laboratory and method-specific guidelines (AT, 2010; USEPA, 1986, 1999).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. All method blanks were non-detect for all target analytes to method reporting limits.

Trip Blanks

Trip blanks were not submitted for analysis. Trip blanks are not required for USEPA Method TO-15 SIM modified/full scan.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within percent recovery acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. MS/MSDs are not required for soil vapor methods, so they were not analyzed for these reports.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. AT did not report laboratory duplicate RPD results. The reviewer confirmed that detected laboratory duplicate results had acceptable RPDs.

Sample	Component	Field Sample Result (ug/m3)	Laboratory Duplicate Result (ug/m3)	RPD (%)
SG9-3.5	Vinyl chloride	0.094	0.084	11.2
SG9-3.5	Tetraachloroethene	3.5	3.4	2.9

LABORATORY CONTROL SAMPLE RESULTS

An LCS is spiked with target analytes to provide information on laboratory accuracy. The LCS samples were extracted and analyzed at the required frequency. All LCS results were within acceptance limits for percent recovery.

CCV RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

AT used the target RLs for non-detect results. Samples requiring dilutions because of high analyte concentrations and/or matrix interferences had elevated RLs. Most RLs were elevated because of canister dilution caused by residual canister vacuum.

DATA PACKAGE

The data package was reviewed for transcription errors, omissions, and anomalies.

In report 1003288, AT issued the laboratory report with the chain of custody as a separate file.

In report 1003288, the sample collection date for SG4-3.5 was recorded as 3/10 on the chain of custody. The sample collection date was correctly reported by AT as 3/10/10.

No additional issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc., project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in October 2010.

Specialty Analytical (SA), in Clackamas, Oregon, performed the analyses. SA report number 1010138 was reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 1999), and appropriate laboratory and method-specific guidelines (SA, 2010; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. No analytes were detected above the reporting limits in the method blanks.

Trip Blanks

Trip blanks were not submitted for this sampling event.

Equipment Rinse Blanks

Equipment rinse blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory accuracy. The LCS samples were extracted and analyzed at the required frequency. All LCS analytes were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used routine reporting limits for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data package was reviewed for transcription errors, omissions, and anomalies. None were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc., project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in June 2011.

Specialty Analytical (SA), in Clackamas, Oregon, performed the analyses. SA report numbers 1106146, 1106174, and 1106182 and Air Toxics Ltd. (ATL) report number 1106496_d were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B
Volatile organic compounds in air	USEPA TO-17

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008), and appropriate laboratory and method-specific guidelines (ATL, 2011; SA, 2010; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. No analytes were detected above the reporting limits in the method blanks.

Trip Blanks

Trip blanks were not submitted for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. ATL sample 1106496-01A had a high surrogate recovery, but all of the analytes were non-detects. All other surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory accuracy. The LCS samples were extracted and analyzed at the required frequency. All LCS analytes were within acceptance limits for percent recovery.

REPORTING LIMITS

SA and ATL used routine reporting limits for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. None were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. project team on the Union Ridge Investment Company site at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in March 2012.

Specialty Analytical (SA), in Clackamas, Oregon, performed the analyses. SA report numbers 1203120rev1, 1203158rev1, and 1203167rev1 were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds (PCE, TCE, and breakdown products)	USEPA 8260B

PCE = tetrachloroethene.

TCE = trichloroethene.

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008), and appropriate laboratory and method-specific guidelines (SA, 2012; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. No target analytes were detected in the method blanks above the method detection limits (MDLs).

Trip Blanks

Trip blanks were not submitted for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences.

LABORATORY CONTROL SAMPLE RESULTS

An LCS is spiked with target analytes to provide information on laboratory accuracy. The LCS samples were extracted and analyzed at the required frequency. All LCS analytes were within acceptance limits for percent recovery.

REPORTING LIMITS

As the client requested, SA used MDLs for non-detect results.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. None were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. project team on the Union Ridge Investment Company site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in June 2012.

Specialty Analytical (SA) performed the analyses. SA report numbers 1206153 and 1206179 were reviewed. The analyses performed are listed below.

Analysis	Reference
Low-level volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate method-specific guidelines (USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

In report 1206153, the tetrachloroethene result for sample MW15-061912 by USEPA Method 8260B was qualified “J,” as estimated, because of high surrogate recoveries.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately. Temperature on receipt was not recorded on the chain of custody for report 1206179.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. All laboratory method blanks were non-detect.

Trip Blanks

Trip blanks were submitted for all sample groups. The trip blanks were analyzed for volatile organic compounds, using USEPA Method 8260B. The trip blanks were non-detect for all analytes.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The laboratory appropriately documented and qualified surrogate outliers. The reviewer took no action based on minor surrogate outliers or surrogate percent recoveries that were outside of acceptance limits because of dilutions necessary to quantify high concentrations of target analytes present in the samples, or because of matrix interferences that prevented accurate quantitation of surrogate recovery.

In report 1206153, USEPA Method 8260B surrogates 1,2-dichloroethane-d4, 4-bromofluorobenzene, and dibromofluoromethane were above the upper acceptance limits for sample MW15-061912. Dibromofluoromethane was additionally flagged as an estimate, as it was above the instrument calibration. The sample was non-detect for all analytes except tetrachloroethene, which has been qualified as an estimate in the following table:

Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
MW15-061912	Tetrachloroethene	9.84	9.84 J

µg/L = micrograms per liter.

In report 1206153, USEPA Method 8260B surrogates 1,2-dichloroethane-d4 and dibromofluoromethane for the method blank were slightly below the lower acceptance limit. The laboratory control sample (LCS), matrix spike (MS), and matrix spike duplicate (MSD) associated with this method blank were within acceptance limits for all surrogates, so the data were not qualified. The continuing calibration blank (CCB) analyzed on June 25, 2012, was above acceptance limits for 1,2-dichloroethane-d4, 4-bromofluorobenzene, and dibromofluoromethane. All CCB analytes were non-detect, so the data were not qualified.

All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. In cases of MS/MSD exceedances, the laboratory appropriately documented and qualified the outliers. Various recovery results were outside acceptance limits because of one or more of the following:

- The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.
- Matrix interferences prevented accurate quantitation of the spike recovery.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. No laboratory duplicate samples were analyzed.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS and laboratory control sample duplicate (LCSD) are spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. No field duplicate samples were submitted.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. For report 1206153, the CCVs from June 22, 2012, and June 25, 2012, were both above acceptance limits for several analytes. The samples associated with these CCVs were non-detect for these analytes, so the data were not qualified.

In report 1206179, USEPA Method 8260B, the CCV is above the upper acceptance limit for vinyl chloride. The laboratory appropriately documented this exceedance. All samples are non-detect for vinyl chloride, so the results were not qualified.

REPORTING LIMITS

SA used routine reporting limits for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. The chain of custody for report 1206153 does not have recorded trip blank information. No additional issues were found. The chain of custody for 1206179 has an incorrect trip blank collection date of May 29, 2012. The collection date is shown correctly on the report as June 21, 2012.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in October 2012.

Specialty Analytical (SA) performed the analyses. SA report number 1210059rev1 was reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2012; USEPA, 1986).

Results for tetrachloroethene (PCE) for samples MW05-100412 and MWDUP-100412 were qualified with a “J,” as estimated, because of field duplicate relative percent difference (RPD) exceedances.

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blank was associated with all samples prepared in the analytical batch. Naphthalene was detected in the method blank. All samples were non-detect for naphthalene, so no data qualifications were made.

Trip Blanks

A trip blank (Trip Blank_100512) was submitted for this sampling event. The trip blank was non-detect.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

Naphthalene was detected in the provided continuing calibration blank. The associated samples were non-detect for naphthalene, so no data qualifications were made.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The reviewer took no action based on minor surrogate outliers. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance/quality control for samples with surrogate outliers was within acceptance limits. All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and RPDs.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

An LCS is spiked with target analytes to provide information on laboratory precision and accuracy. An LCS sample was extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-100412/MWDUP-100412). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria except for PCE, which was qualified with a “J,” as estimated, for these two samples.

Component	Field Sample Result (µg/L)	Field Duplicate Result (µg/L)	% RPD
PCE	2400	1400	53

µg/L = micrograms per liter.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All recoveries were within acceptance limits.

REPORTING LIMITS

SA used routine reporting limits for non-detect results.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies.

The chain of custody for work order 1210059 requests PCE, trichloroethene, and associated breakdown products, but the full list of USEPA Method 8260B analytes was reported. The full list was requested by the project manager after the samples were received by the laboratory.

SA originally issued report 1210059, which was revised to include method detection limits and reissued as 1210059rev1.

No additional issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | FORMER PARK LAUNDRY
SITE

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in December 2012.

Specialty Analytical, Inc. (SA) performed the analyses. SA report numbers 1212245rev1 and 1212258rev1 were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2012; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately. Temperature on receipt was not recorded on the chain of custody for report 1212245rev1.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch.

The laboratory method blanks showed no detections above the method reporting limits (MRLs).

Report 1212245rev1 showed detections of some analytes, in the laboratory method blank and in the associated samples, below the MRL but above the method detection limit (MDL). Associated sample detections above the level found in the method blank were not qualified. Associated sample detections below the level found in the method blank were qualified as “UJ” and reported as not detected (at or below the levels found in the method blank). When a laboratory method blank detection was exceeded by a trip blank detection from the same sample delivery group, any associated sample detections were qualified based on the trip blank exceedance. Qualifications based on method blank detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1212245rev1	MW08-121812	trans-1,2-dichloroethene	0.110 J	0.160 UJ
1212245rev1	MW01-121812	trans-1,2-dichloroethene	0.140 J	0.160 UJ
1212245rev1	MW10-121912	trans-1,2-dichloroethene	0.120 J	0.160 UJ

NOTES:
 J = estimated.
 µg/L = micrograms per liter.

Trip Blanks

Trip blanks were submitted with both sample delivery groups. In report 1212245rev1, the trip blank (Trip Blank_121912) had detections below the MRL for cis-1,2-dichloroethene and trans-1,2-dichloroethene. In report 1212258rev1, the trip blank (Trip Blank-122112) had several detections below the MRL. Associated samples with detections at or below the levels in the trip blanks were qualified as “UJ” and reported as not detected (at or below the levels found in the trip blank). Qualifications based on trip blank detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1212245rev1	MW14-121912	cis-1,2-dichloroethene	0.510 J	0.530 UJ
1212258rev1	MW04-122112	1,1-dichloroethene	0.220 J	0.220 UJ
1212258rev1	MW04-122112	trans-1,2-dichloroethene	0.190 J	0.250 UJ
1212258rev1	MW09-122112	1,1-dichloroethene	0.130 J	0.220 UJ
1212258rev1	MW09-122112	trans-1,2-dichloroethene	0.190 J	0.250 UJ
1212258rev1	MW15-122112	1,1-dichloroethene	0.180 J	0.220 UJ
1212258rev1	MW15-122112	cis-1,2-dichloroethene	0.630 J	0.640 UJ
1212258rev1	MW16-122112	cis-1,2-dichloroethene	0.540 J	0.640 UJ
1212258rev1	MW16-122112	trans-1,2-dichloroethene	0.210 J	0.250 UJ

The remaining associated samples were either non-detect or had detections greater than the trip blank.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

CCBs were provided. In report 1212245rev1, the CCB for USEPA Method 8260B had detections above the MDL for multiple analytes. In the samples associated with the CCB, the analytes detected were greater than ten times the CCB detections. No results were qualified.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The reviewer took no action based on minor surrogate outliers or surrogate percent recoveries that were outside acceptance limits because of dilutions necessary to quantify high concentrations of target analytes present in the samples.

The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance/quality control for samples with surrogate outliers was within acceptance limits. All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not reported for either report.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW03-122012/MW03-122012-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for

results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used routine reporting limits for non-detect results. The data were reported to MDL. Detections between the MDL and MRL were qualified with "J," as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | FORMER PARK LAUNDRY
SITE

This report reviews the analytical results for groundwater samples and two waste characterization soil samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in April 2013.

Specialty Analytical, Inc. (SA) performed the analyses. SA report numbers 1304046 and 1304092 were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2012; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

Qualifications have been made based on the method blank detection of tetrachloroethene.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch.

The laboratory method blanks showed no detections above the method reporting limits (MRLs).

Reports 1304046 and 1304092 indicated detections of tetrachloroethene in the laboratory method blank, below the MRL but above the method detection limit (MDL). Associated sample detections greater than five times the detections found in the method blank were not qualified. Associated sample detections below the MRL and less than five times the method blank detections were qualified as “UJ” and reported as not detected at the MRL. Qualifications based on method blank detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1304046	MW02-040413	Tetrachloroethene	0.340 J	1.00 UJ
1304046	TRIP BLANK-040813	Tetrachloroethene	0.210 J	1.00 UJ
1304092	MW08-040813	Tetrachloroethene	0.180 J	1.00 UJ
1304092	TRIP BLANK-040413	Tetrachloroethene	0.200 J	1.00 UJ

NOTES:

J = estimated.

µg/L = micrograms per liter.

U = not detected at or above the qualified result.

Trip Blanks

Trip blanks were submitted with both sample delivery groups. In report 1304046, the trip blank (Trip Blank-040413) had a detection below the MRL for tetrachloroethene. In report 1304092, the trip blank (Trip Blank-040813) had a detection of tetrachloroethene below the MRL. Based on these detections below the MRL and the MDL in both blank samples, associated sample detections below the MRL have been qualified as non-detect to the MRL (as noted in method blank section above). Additionally, as a result of the method blank detections for each associated lab report, associated trip blank samples have been qualified as non-detect at the MRL.

The remaining associated samples were either non-detect or had detections greater than the trip blank.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

CCBs were analyzed as part of laboratory quality assurance and quality control. In report 1304046, multiple CCB results for tetrachloroethene by USEPA Method 8260B had detections above the MDL. Based on the sequencing of analytical batches, all reported results associated with CCB were either non-detect or had detections greater than five times those found in the CCBs. No results were qualified.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not reported for either report.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-040513/MW05-040513-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA reported data to MDL. Detections between the MDL and MRL were qualified with "J," as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

Trip Blank-060313	MW18-060413
--	MW19-060413
--	MW20-060413
--	Trip Blank-060413

SDG = sample delivery group.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2013; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately. Temperature on receipt was not recorded on the chain of custody for reports 1306010 and 1306028.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. All laboratory method blanks were non-detect.

Trip Blanks

Trip blanks were submitted with both sample delivery groups. The trip blanks were non-detect for all analytes.

Equipment Rinse Blanks

Equipment rinse blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

CCBs were provided. All laboratory CCBs were non-detect or sample concentrations were more than five times higher than detected CCB values. All detections in CCB were below the method reporting limit (MRL) but above the method detection limit (MDL).

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The reviewer took no action based on minor surrogate outliers. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance/quality control for samples with surrogate outliers was within acceptance limits. All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not included in either report.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-060313/MW05-060313-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria, except for a tetrachloroethene (PCE) result that exceeded RPD limits (shown below). The result has been qualified "J" as estimated.

Component	Field Sample Result (µg/L)	Field Duplicate Result (µg/L)	% RPD
PCE	950	1790	61

µg/L = micrograms per liter.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used routine reporting limits for non-detect results. The data were reported to MDL. Detections between the MDL and MRL were qualified with "J" as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | FORMER PARK LAUNDRY
SITE

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in September 2013.

Specialty Analytical, Inc. (SA) performed the analyses. SA report numbers 1309184rev1 and 1309202 were reviewed. The analysis performed is listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2013; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria, with the exception of several samples analyzed by USEPA Method 8260B slightly outside the recommended holding time. Results for samples MW16-092413, MW15-092413, MW19-092413, MW08-092413, and MW11-092413 are considered estimated, “J,” for detections and “UJ” for non-detect results because of holding time exceedances. As noted by laboratory case narrative in report 1309184rev1, it is unlikely that sample results were significantly impacted as a result of analyses being performed less than 29 hours past holding time.

Additionally, tetrachloroethene for sample MW13-092513 was reanalyzed outside recommended holding time. Results have been qualified “J” as estimated.

Preservation and Sample Storage

The samples were preserved and stored appropriately. Temperature upon receipt was recorded as four and six degrees Celsius in reports 1309184rev1 and 1309202, respectively.

BLANKS

Method Blanks

Laboratory method blank (MB) analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. Furthermore, MBs and continuing calibration blanks (CCBs) were associated with results for the specific analyses sequence (i.e., analysis date).

Neither the laboratory MBs nor the lab CCBs showed detections above the method reporting limits (MRLs).

Report 1309202 showed detections of cis-1,2-dichloroethene, tetrachloroethene, and trichloroethene in the laboratory MB below the MRL but above the method detection limit (MDL). Associated sample detections above the MRL were not qualified. Associated sample detections below the MRL were qualified and reported "U" as not detected at or below the MRL as a result of MB detections. Qualifications based on MB detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1309202	MW20-092713	cis-1,2-Dichloroethene	0.250 J	1.00 U
1309202	MW18-092713	cis-1,2-Dichloroethene	0.250 J	1.00 U
1309202	MW18-092713	Tetrachloroethene	0.210 J	1.00 U
1309202	MW14-092713	cis-1,2-Dichloroethene	0.290 J	1.00 U
1309202	MW14-092713	Tetrachloroethene	0.720 J	1.00 U
1309202	MW14-092713	Trichloroethene	0.860 J	1.00 U
1309202	MW21-092713	Trichloroethene	0.390 J	1.00 U
1309202	MW01-092713	Trichloroethene	0.370 J	1.00 U
1309202	MW02-092713	Tetrachloroethene	0.530 J	1.00 U
1309202	MW03-092713	cis-1,2-Dichloroethene	0.580 J	1.00 U

NOTES:

J = estimated.

µg/L = micrograms per liter.

U = not detected above posted MRL.

Trip Blanks

Trip blanks were submitted with both sample delivery groups. In report 1309184rev1, the trip blank (Trip Blank_092613) had detections below the MRL but above the MDL for cis-1,2-dichloroethene, tetrachloroethene, and trichloroethene. Associated samples with detections similarly below the MRL were qualified "U" as not detected at the MRL. Qualifications based on trip blank detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1309184rev1	MW15-092413	Trichloroethene	0.540 J	1.00 U
1309184rev1	MW19-092413	Trichloroethene	0.500 J	1.00 U
1309184rev1	MW08-092413	cis-1,2-Dichloroethene	0.800 J	1.00 U
1309184rev1	MW08-092413	Tetrachloroethene	0.370 J	1.00 U
1309184rev1	MW11-092413	cis-1,2-Dichloroethene	0.710 J	1.00 U
1309184rev1	MW10-092413	cis-1,2-Dichloroethene	0.760 J	1.00 U
1309184rev1	MW07-092413	cis-1,2-Dichloroethene	0.430 J	1.00 U
1309184rev1	MW17-092413	cis-1,2-Dichloroethene	0.400 J	1.00 U
1309184rev1	MW17-092413	Trichloroethene	0.380 J	1.00 U

The trip blank (Trip Blank-092713) associated with report 1309202 was non-detect for all analytes. Additional analytes (not discussed above) associated with Trip Blank-092613 and all analytes associated with Trip Blank-092713 were either non-detect or had detections greater than the MRL.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

CCB results are used to verify that an instrument is free of contamination during the course of an analysis. CCB results were provided. In report 1309202, the CCB for USEPA Method 8260B had detections above the MDL for multiple analytes. In the samples associated with the CCB, the analytes detected were greater than ten times the CCB detections. No results were qualified based on the CCB detections.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not reported in either report.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-092713/MW05-092713-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. Field duplicate results for tetrachloroethene (68.2% RPD) were outside acceptance limits; thus, results have been qualified “J” as estimated. Qualifications based on field duplicate results are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1309202	MW05-092713	Tetrachloroethene	624	624 J
1309202	MW05-092713-DUP	Tetrachloroethene	1270	1270 J

All other results were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA reported results to the MDL. Detections between the MDL and MRL were qualified with “J,” as estimated. Analytes with blank detections between the MDL and MRL had associated non-detect sample results raised to the MRL.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. The initial 1309184 report did not contain a case narrative concerning the USEPA Method 8260B holding time issues. No other issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | FORMER PARK LAUNDRY
SITE

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in December 2013.

Specialty Analytical, Inc. (SA) performed the analyses. SA report numbers 1312237 and 1312287 were reviewed. The analysis performed is listed below.

Analysis	Reference
Volatile organic compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2013; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately. Temperature upon receipt was recorded as 5 and 6 degrees Celsius in reports 1312237 and 1312287, respectively.

BLANKS

Method Blanks

Laboratory method blank (MB) analyses were performed at the required frequencies. For purposes of data qualification, the MBs were associated with all samples prepared in the analytical batch. Furthermore, MBs and continuing calibration blanks (CCBs) were associated with results for the specific analysis sequence (i.e., analysis date).

Neither the laboratory MBs nor the laboratory CCBs showed detections above the method reporting limits (MRLs).

Report 1312227 (batch R13084) showed detections of cis-1,2-dichloroethene and trichloroethene in the laboratory MB below the MRL but above the method detection limit (MDL). Report 1312287 (batch R13000) showed detections of cis-1,2-dichloroethene, trichloroethene, and vinyl chloride in the laboratory MB below the MRL but above the MDL. Associated sample detections above the MRL were not qualified. Associated sample detections below the MRL were qualified and reported “U,” as not detected at or below the MRL. Laboratory appropriately qualified detections between the MRL and MDL as estimated “J” concentrations. Qualifications based on MB detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1312287	MW19-122013	cis-1,2-Dichloroethene	0.290 J	1.00 U
1312287	MW19-122013	Trichloroethene	0.410 J	1.00 U
1312287	MW19-122013	Vinyl Chloride	0.200 J	1.00 U
1312287	MW15-122013	Trichloroethene	0.200 J	1.00 U
1312287	MW15-122013	Vinyl Chloride	0.190 J	1.00 U
1312287	MW16-122013	Trichloroethene	0.580 J	1.00 U
1312287	MW16-122013	Vinyl Chloride	0.200 J	1.00 U
1312287	MW08-122013	Vinyl Chloride	0.200 J	1.00 U
1312237	MW01-122313	cis-1,2-Dichloroethene	0.190 J	1.00 U
1312237	MW01-122313	Trichloroethene	0.200 J	1.00 U
1312237	MW21-122313	cis-1,2-Dichloroethene	0.180 J	1.00 U
1312237	MW21-122313	Trichloroethene	0.230 J	1.00 U
1312237	MW02-122313	cis-1,2-Dichloroethene	0.200 J	1.00 U
1312237	MW02-122313	Trichloroethene	0.140 J	1.00 U
1312237	MW03-122313	cis-1,2-Dichloroethene	0.280 J	1.00 U
1312237	MW09-122313	cis-1,2-Dichloroethene	0.430 J	1.00 U
1312237	MW14-122313	cis-1,2-Dichloroethene	0.200 J	1.00 U
1312237	MW18-122313	cis-1,2-Dichloroethene	0.140 J	1.00 U
1312237	MW17-122313	cis-1,2-Dichloroethene	0.160 J	1.00 U
1312237	MW17-122313	Trichloroethene	0.140 J	1.00 U
1312237	MW04-122313	cis-1,2-Dichloroethene	0.160 J	1.00 U
1312237	MW04-122313	Trichloroethene	0.440 J	1.00 U
1312237	MW05-122413	cis-1,2-Dichloroethene	0.350 J	1.00 U
1312237	MW05-122413-DUP	cis-1,2-Dichloroethene	0.360 J	1.00 U
1312237	MW07-122413	cis-1,2-Dichloroethene	0.150 J	1.00 U
1312237	MW11-122413	cis-1,2-Dichloroethene	0.170 J	1.00 U
1312237	MW11-122413	Trichloroethene	0.570 J	1.00 U

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1312237	MW10-122413	cis-1,2-Dichloroethene	0.210 J	1.00 U
1312237	MW13-122413	cis-1,2-Dichloroethene	0.380 J	1.00 U

NOTES:

J = estimated.

µg/L = micrograms per liter.

U = not detected above posted MRL.

Trip Blanks

A trip blank was submitted with sample delivery group (SDG) 1312237. Because field sample collection procedures remained constant during December sampling event (reports 1312237 and 1312287) all December data will be evaluated based on a single trip blank.

The trip blank (Trip Blank_122313) had a detection of tetrachloroethene slightly above the MRL. As a result, all sample detections less than two times the MRL were flagged “UJ,” non-detect with an estimated reporting limit. Sample results detected between two and five times the MRL were flagged “J,” and are to be considered estimated. Sample detections below the MRL were flagged “U,” non-detect at the laboratory MRL.

The trip blank (Trip Blank_122313) had a detection below the MRL but above the MDL for vinyl chloride. Vinyl chloride detections below the MRL in SDG 1312287 were evaluated and flagged as a result of MB detections, (Method Blank section above). Associated samples with detections similarly below the MRL were qualified “U,” as not detected at the MRL. Laboratory appropriately qualified detections between the MRL and MDL as estimated “J” concentrations. Qualifications based on trip blank detections are as follows:

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1312237	MW02-122313	Tetrachloroethene	0.340 J	1.00 U
1312237	MW17-122313	Tetrachloroethene	4.83	4.83 J
1312237	MW20-122413	Tetrachloroethene	1.08	1.08 U
1312237	MW06-122413	Tetrachloroethene	4.83	4.83 J
1312287	MW19-122013	Tetrachloroethene	1.92	1.92 U
1312287	MW08-122013	Tetrachloroethene	0.380 J	1.00 U
1312237	MW01-122313	Vinyl Chloride	0.220 J	1.00 U
1312237	MW21-122313	Vinyl Chloride	0.260 J	1.00 U
1312237	MW02-122313	Vinyl Chloride	0.250 J	1.00 U
1312237	MW03-122313	Vinyl Chloride	0.230 J	1.00 U
1312237	MW09-122313	Vinyl Chloride	0.230 J	1.00 U
1312237	MW14-122313	Vinyl Chloride	0.260 J	1.00 U
1312237	MW18-122313	Vinyl Chloride	0.250 J	1.00 U
1312237	MW17-122313	Vinyl Chloride	0.250 J	1.00 U
1312237	MW04-122413	Vinyl Chloride	0.270 J	1.00 U

Report	Sample	Component	Original Result (µg/L)	Qualified Result (µg/L)
1312237	MW05-122413	Vinyl Chloride	0.210 J	1.00 U
1312237	MW05-122413-DUP	Vinyl Chloride	0.190 J	1.00 U
1312237	MW20-122413	Vinyl Chloride	0.230 J	1.00 U
1312237	MW07-122413	Vinyl Chloride	0.230 J	1.00 U
1312237	MW06-122413	Vinyl Chloride	0.220 J	1.00 U
1312237	MW11-122413	Vinyl Chloride	0.220 J	1.00 U
1312237	MW10-122413	Vinyl Chloride	0.240 J	1.00 U
1312237	MW13-122413	Vinyl Chloride	0.240 J	1.00 U

Additional analytes (not discussed above) associated with Trip Blank-122313 were either non-detect or had detections greater than five times the MRL.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

CCB results are used to verify that an instrument is free of contamination during the course of an analysis. CCB results were provided. In reports 1312237 and 1312287, the CCBs for USEPA Method 8260B had detections above the MDL for multiple analytes. No results (i.e., beyond MB qualifications) were qualified based on the CCB detections.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not discussed in either report.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

A laboratory control sample/laboratory control sample duplicate (LCS/LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-122413/MW05-122413-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. Based on RPD criteria, all results were within the acceptance limits.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA reported results to the MDL. Detections between the MDL and the MRL were qualified with "J", as estimated. For analytes with blank detections between the MDL and MRL, associated non-detect sample results were raised to the MRL.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.02 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N Main Avenue in Ridgefield, Washington. The samples were collected in March 2014.

Specialty Analytical, Inc. (SA) performed the analyses. SA report numbers 1403211 and 1403255 were reviewed. The analyses performed are listed below. Some analyses may not have been performed on all samples.

Analysis	Reference
Volatile Organic Compounds	USEPA 8260B

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2014; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. The reviewer confirmed with the laboratory that method blanks were assessed to method detection limits (MDLs), even though only reporting limits (RLs) were shown in the quality control (QC) summary report. If an analyte was detected in a sample and in the associated method blank below the RL but above the MDL, sample detections

below the level found in the method blank were qualified as “U” at the RL. In report 1403255, the USEPA Method 8260B method blank had a detection for tetrachloroethene below the RL, at 0.480 microgram per liter (ug/L). The following results were qualified:

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1403255	MW08-032714	Tetrachloroethene	0.230 J	1.00 U
1403255	MW20-032714	Tetrachloroethene	0.190 J	1.00 U
1403255	MW18-032714	Tetrachloroethene	0.210 J	1.00 U

All remaining laboratory method blanks were non-detect.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for USEPA Method 8260B, as shown in report 1403211, and were assessed by the laboratory to MDLs. The reviewer confirmed with the laboratory that CCBs were assessed to the MDL even though only RLs were shown in the QC summary report. All CCBs were non-detect.

Trip Blanks

A trip blank was recorded on the chain of custody but was not reported. The reviewer confirmed with the laboratory that a trip blank was not submitted with sample delivery group 1403255. At least one sample, MW17-032714, was non-detect for all reported analytes, so no qualification was necessary.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

When appropriate, individual samples were spiked with surrogate compounds to evaluate laboratory performance. All surrogate percent recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All MS/MSD samples were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Laboratory duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not analyzed by the laboratory.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

A laboratory control sample/laboratory control sample duplicate (LCS/LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analyte results were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analyses, as shown in report 1403211 (MW05-032414/MW05-032414-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All field duplicate analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA reported results to the MDL. Detections between the MDL and RL were qualified with "J," as estimated. Analytes with blank detections between the MDL and RL had associated non-detect sample results raised to the RL.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. None were found.

MW06-062314	MW10-062414	MW15-062414	-

Comments:
Samples MW13-062414, MW18-062414, MW15-062414 were analyzed six days after 14-day hold time. Samples MW09-062514, MW14-062514, and Trip Blank were analyzed five days after 14-day hold time. Detections above the MRL qualified with "J" as estimated. Non-detect results rejected and qualified with "UR."

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.05 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in June 2014.

Specialty Analytical, Inc. (SA) performed the analyses. SA report number 1406215 was reviewed. The analyses performed and samples analyzed are listed below. A data validation tracking sheet is attached (DVM_Tracking_Union Ridge_June2014).

Analysis	Reference
VOCs	USEPA 8260B

VOC = volatile organic compound.
USEPA = U.S. Environmental Protection Agency.

SDG = Sample delivery group.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (SA, 2014; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Because of laboratory error, samples MW13-062414, MW18-062414, and MW15-062414 were analyzed for VOCs six days after the recommended 14-day hold time. Samples MW09-062514, MW14-062514, and Trip Blank were analyzed five days after the recommended hold time. All sample detections were qualified as estimated with “J.” Results that were already qualified by the laboratory as estimated because of detection between the method detection limit and the method reporting limit (MRL) were not additionally qualified. Sample detections below the level found in the method blank were qualified as “U” at the RL. All non-detect results were rejected and qualified with “UR.”

Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)

Trip Blank_062514	Vinyl chloride	0.155 U	0.155 UR

ug/L = micrograms per liter.

The remaining extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blank was associated with all samples prepared in the analytical batch. All method blanks were non-detect.

Trip Blanks

A trip blank (Trip Blank_062514) was submitted for this sampling event. The trip blank was non-detect. Because analysis was conducted five days past the recommended 14-day holding time, the non-detect trip blank results have been qualified as rejected (R) in the Holding Times, Preservation, and Sample Storage section above. No additional qualification was necessary.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The reviewer took no action based on minor surrogate outliers. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance and quality control for samples with surrogate outliers were within acceptance limits. All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory precision and accuracy. An LCS sample was extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-062314/MW05-062314-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL, or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCV percent recoveries were within acceptance limits.

REPORTING LIMITS

SA used routine reporting limits for non-detect results.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.04 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for soil samples collected by the Maul Foster & Alongi, Inc., project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected on September 17, 2014.

Apex Laboratories (Apex) and Weck Laboratories, Inc. (Weck) performed the analyses. Apex report number A4I0480, which contains results for analyses subcontracted to Weck, was reviewed. The analyses performed and samples analyzed are listed below. Data validation tracking sheets are attached.

Analysis	Reference
COD	USEPA 410.4 Modified
TOC	SM 5310B Modified

COD = chemical oxygen demand.

TOC = total organic carbon.

SM = Standard Methods for the Examination of Water and Wastewater.

USEPA = U.S. Environmental Protection Agency.

Samples Analyzed
Report A4I0480
GP82-S-27.5
GP83-S-19.0
GP84-S-12.0
GP85-S-17.0
GP86-S-13.0

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2010) and appropriate laboratory and method-specific guidelines (Apex, 2014; USEPA, 1986; Weck, 2014).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

The extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blank was associated with all samples prepared in the analytical batch. All method blanks were non-detect.

Trip Blanks

Trip blanks were not required for this sampling event because samples were not analyzed for volatile organic compounds.

Equipment Rinsate Blanks

Equipment rinsate blanks were not collected for this sampling event. Equipment was decontaminated after each sample was collected.

SURROGATE RECOVERY RESULTS

Surrogates are not required by the analytical methods reported in A4I0480.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory precision and accuracy. An LCS sample was extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. Field duplicate samples were not submitted for analysis.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. Apex and Weck did not report CCV results.

REPORTING LIMITS

Apex and Weck used routine reporting limits for non-detect results.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.05 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in September 2014.

Specialty Analytical, Inc. (SA) performed the analyses. SA report number 1409080rev1 was reviewed. The analysis performed and samples analyzed are listed below. A data validation tracking sheet associated with the analyses, documenting data review, is attached.

Analysis	Reference
VOCs	USEPA Method 8260B

VOC = volatile organic compound.
USEPA = U.S. Environmental Protection Agency.

Samples Analyzed (Report 1409080_rev1)			
MW01-090914	MW05-090914-DUP	MW13-091014	MW04-091114
MW02-090914	MW10-090914	MW15-091014	MW14-091114
MW21-090914	MW08-091014	MW20-091114	MW09-091114
MW03-090914	MW11-091014	MW06-091114	Trip Blank
MW07-090914	MW18-091014	MW19-091114	-
MW05-090914	MW16-091014	MW17-091114	-

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 1986) and appropriate laboratory and method-specific guidelines (SA, 2014; USEPA, 2008).

The data are considered acceptable for their intended use; no results were qualified.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. All laboratory method blanks were non-detect.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for some analyses. All CCBs were non-detect.

Trip Blanks

One trip blank was submitted for this sampling event. No analytes were detected.

Equipment Rinstate Blanks

Equipment rinstate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

Individual samples were spiked with surrogate compounds to evaluate laboratory performance. All surrogate recoveries were within acceptance criteria.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Laboratory duplicate results are used to evaluate laboratory precision. Laboratory duplicate results were not reported for this sampling event.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

Laboratory control sample/laboratory control sample duplicates (LCS/LCSDs) are spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-090914/MW05-090914-DUP) was submitted for analysis. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analyte results were within the acceptance criteria for RPD.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used method detection limits (MDLs) for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. The original report deliverable (pdf) did not include detections between the reporting limit and the MDL; 1409080_rev1 has updated information.

-	TRIP BLANK	-

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 1986) and appropriate laboratory and method-specific guidelines (SA, 2014; USEPA, 2008).

The data are considered acceptable for their intended use; no results were qualified.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. In reports 1412025mdl and 1412084mdl, USEPA Method 9056A blank chloride results were between the method detection limit (MDL) and the reporting limit (RL). Sample results were all greater than ten times the method blank detection; thus, no results were qualified. In report 1412058, the USEPA Method 9056A method blank nitrate result was between the MDL and the RL. All nitrate results in this report were non-detect; thus, no results were qualified. All remaining method blanks were non-detect.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for some analyses. All CCBs were non-detect.

Trip Blanks

Trip blanks were submitted for USEPA Method 8260B analysis, as shown in reports 1412058mdl and 1412084mdl. No analytes were detected in either trip blank.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

Individual samples were spiked with surrogate compounds to evaluate laboratory performance. All surrogate recoveries were within acceptance criteria.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Laboratory duplicate results are used to evaluate laboratory precision. Laboratory duplicate results were reported for some analytes. All laboratory duplicate results were within acceptance criteria for RPD.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

Laboratory control sample/laboratory control sample duplicates (LCS/LCSDs) are spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-120514/MW05-120514-DUP) was submitted for analysis, as shown in report 1412058mdl. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analyte results were within the acceptance criteria for RPD.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. CCVs were reported for some analytes. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used MDLs for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences and for ASTM D1945 Modified permanent gases. The reviewer confirmed with the laboratory that permanent gases cannot be reported to the MDL. Detected results reported between the MDL and the RL were qualified by the laboratory as estimated (J).

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. In reports 1412025mdl, 1212058mdl, and 1412084mdl, the method requested for sulfide analysis (USEPA Method 9056A) does not match the method reported for sulfide analysis (SM 4500-S2 F). Methods were reviewed by the validator; sulfide analysis is not part of the anion suite reported by USEPA Method 9056A, and SM 4500-S2 F is a valid method for sulfide analysis.

The data are considered acceptable for their intended use; no results were qualified.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. In reports 1412025mdl and 1412084mdl, USEPA Method 9056A blank chloride results were between the method detection limit (MDL) and the reporting limit (RL). Sample results were all greater than ten times the method blank detection; thus, no results were qualified. In report 1412058, the USEPA Method 9056A method blank nitrate result was between the MDL and the RL. All nitrate results in this report were non-detect; thus, no results were qualified. All remaining method blanks were non-detect.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for some analyses. All CCBs were non-detect.

Trip Blanks

Trip blanks were submitted for USEPA Method 8260B analysis, as shown in reports 1412058mdl and 1412084mdl. No analytes were detected in either trip blank.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

Individual samples were spiked with surrogate compounds to evaluate laboratory performance. All surrogate recoveries were within acceptance criteria.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Laboratory duplicate results are used to evaluate laboratory precision. Laboratory duplicate results were reported for some analytes. All laboratory duplicate results were within acceptance criteria for RPD.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

Laboratory control sample/laboratory control sample duplicates (LCS/LCSDs) are spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-120514/MW05-120514-DUP) was submitted for analysis, as shown in report 1412058mdl. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analyte results were within the acceptance criteria for RPD.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. CCVs were reported for some analytes. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

SA used MDLs for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences and for ASTM D1945 Modified permanent gases. The reviewer confirmed with the laboratory that permanent gases cannot be reported to the MDL. Detected results reported between the MDL and the RL were qualified by the laboratory as estimated (J).

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. In reports 1412025mdl, 1212058mdl, and 1412084mdl, the method requested for sulfide analysis (USEPA Method 9056A) does not match the method reported for sulfide analysis (SM 4500-S2 F). Methods were reviewed by the validator; sulfide analysis is not part of the anion suite reported by USEPA Method 9056A, and SM 4500-S2 F is a valid method for sulfide analysis.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014) and appropriate laboratory and method-specific guidelines (SA, 2014; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

The analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blank was associated with all samples prepared in the analytical batch.

The USEPA Method 8260B method blank associated with batch R19226 had a tetrachloroethene (PCE) detection below the reporting limit (RL), at 0.310 microgram per liter (ug/L). The trip blank (Trip Blank_030615) also had a detection of PCE below the RL, at 0.250 ug/L. SA indicated in the case narrative that the low-level detections were related to instrument or analytical system contamination and that samples MW01-030415, MW02-030415, MW08-030415, MW04-030515, MW06-030515, MW14-030515, and MW19-030615 were affected. Samples have been qualified as follows: All sample detections were qualified as estimated with “J.” If PCE was detected between the method detection limit (MDL) and the RL, the sample was qualified with “U” as non-detect at the RL. PCE results above the RL that were less than ten times the trip blank result were qualified with “U” as non-detect at the reported value.

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1503066	MW01-030415	PCE	2.00	2.00 U
1503066	MW02-030415	PCE	0.170 J	0.170 U
1503066	MW08-030415	PCE	0.370 J	0.370 U
1503066	MW06-030515	PCE	2.52	2.52 U
1503066	MW14-030515	PCE	0.880 J	0.880 U
1503066	MW19-030615	PCE	0.910 J	0.910 U
1503066	Trip Blank_030615	PCE	0.250 J	0.250 U

The remaining method blank was non-detect for all target analytes.

Trip Blanks

A trip blank (Trip Blank_030615) was submitted for this sampling event and analyzed for cVOCs by USEPA Method 8260B. The trip blank had a detection of PCE below the RL, at

0.25 ug/L. The PCE detection appears to be related to instrument carryover. Samples are qualified in the method blanks section above.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for some analyses. All CCBs were non-detect.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

The reviewer took no action based on minor surrogate outliers. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance and quality control for samples with surrogate outliers were within acceptance limits. All remaining surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory precision and accuracy. An LCS sample was extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-030515/MW05-030515-DUP) was submitted for analysis. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-

detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCV percent recoveries were within acceptance limits.

REPORTING LIMITS

SA reported results to MDLs. SA flagged results reported between the MDL and the RL with “J” as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

MW10-061015	MW09-061115
MW06-061015	Trip Blank
MW14-061115	--

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014) and appropriate laboratory and method-specific guidelines (SA, 2015; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

The analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blank was associated with all samples prepared in the analytical batch.

The USEPA Method 8260B method blank associated with batch R20807 had a tetrachloroethene (PCE) detection below the reporting limit (RL) and was qualified “J” as estimated at 0.250 microgram per liter (ug/L). If a sample showed a concentration of PCE between the method detection limit (MDL) and the RL, the sample was qualified with “U” as non-detect at the RL. PCE results above the RL that were less than ten times the method blank result were qualified with “U” as non-detect at the reported value. PCE results above the RL and more than ten times the method blank results were not qualified.

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1506114	MW14-061115	PCE	0.450 J	1.0 U
1506114	MW18-061015	PCE	0.250 J	1.0 U

The remaining method blank was non-detect for all target analytes.

Trip Blanks

A trip blank (Trip Blank_061115) was submitted for this sampling event and analyzed for cVOCs by USEPA Method 8260B. The trip blank was non-detect for all analytes.

Equipment Rinsate Blanks

Equipment rinsate blanks were not collected for this sampling event.

Continuing Calibration Blanks

Continuing calibration blanks (CCBs) were provided for some analyses. All CCBs were non-detect, except for CCBs associated with batch R20807 at 0.230 J ug/L and batch R20744 at 0.210 J ug/L. Sample results associated with this batch have been evaluated and qualified based on method blank detections and qualifications are illustrated in the method blank section above.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory precision and accuracy. An LCS sample was extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-061115/MW05-061115-DUP) was submitted for analysis. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCV percent recoveries were within acceptance limits.

REPORTING LIMITS

SA reported results to MDLs. SA flagged results reported between the MDL and the RL with "J" as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. No issues were found.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014) and appropriate laboratory and method-specific guidelines (SA, 2015; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. When an analyte was detected in a sample and in the associated method blank, the sample result was qualified if the concentration was less than five times the method blank concentration.

The USEPA Method 8260B method blank associated with batch R21993 (SA Report 1509155) had a tetrachloroethene (PCE) detection below the reporting limit (RL) and was qualified “J” as estimated at 0.280 microgram per liter (ug/L). If a sample showed a concentration of PCE between the method detection limit (MDL) and the RL, the sample was qualified with “U” as non-detect at the RL. PCE results above the RL that were less than ten times the method blank result were qualified with “U” as non-detect at the reported value. PCE results above the RL and more than ten times the method blank results were not qualified.

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1509155	MW17-091715	PCE	0.390 J	1.0 U
1509155	Trip Blank_091715	PCE	0.250 J	1.0 U

The remaining method blank was non-detect for all target analytes.

Trip Blanks

Trip blanks (Trip Blank-091615 and Trip Blank-091715) were submitted for this sampling event and analyzed for cVOCs by USEPA Method 8260B. The trip blank associated with report 1509125 was non-detect for all analytes.

The trip blank included with SA report 1509155 had a PCE detection below the RL and was qualified “J” as estimated at 0.250 ug/L. Similar to the evaluation provided in the Method Blank section above, all results within ten times the trip blank are to be qualified “U” as non-detect at the reported value. Only sample MW17-091715 is affected by the PCE detection in the trip blank. The trip blank is to be considered non-detect for PCE because of method blank detection (laboratory contamination). The trip blank result has been qualified “U” as non-detect at the RL.

Equipment Rinse Blanks

Equipment rinse blanks were not collected for this sampling event.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

A laboratory control sample/laboratory control sample duplicate (LCS/LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate (MW05-091615/ MW05-091615-Dup) was submitted for analysis. MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. CCV percent recoveries were within acceptance limits for the list provided.

REPORTING LIMITS

SA reported results to MDLs. SA flagged results reported between the MDL and the RL with "J" as estimated.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. None were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.05 | DECEMBER 3, 2018 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for groundwater samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected on December 21 through 23, 2015.

Specialty Analytical, Inc. (SA) performed the analyses. SA report number 1512289rev1 was reviewed. The analysis performed is listed below.

Analysis	Reference
cVOCs	USEPA 8260B

cVOC = chlorinated volatile organic compound.
USEPA = U.S. Environmental Protection Agency.

Samples Analyzed	
Report 1512289rev1	
MW15-122115	MW05-122215-DUP
MW16-122115	MW09-122215
MW03-122115	MW07-122215
MW21-122115	MW10-122215
MW06-122215	MW13-122315

MW14-122215	Trip Blank_12232015
MW05-122215	-

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014) and appropriate laboratory and method-specific guidelines (SA, 2015; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. The method blank was non-detect for all target analytes.

Trip Blanks

A trip blank (Trip Blank_12232015) was submitted for this sampling event and analyzed for cVOCs by USEPA Method 8260B. As shown in report 1512289rev1, tetrachloroethene (PCE) was detected in the trip blank between the method detection limit (MDL) and the reporting limit, at 0.270 microgram per liter (ug/L). Associated samples with detections below the reporting limit, qualified by laboratory with "J" for estimated, were qualified with "U" as non-detect at the reporting limit value. Remaining sample detections were above the reporting limit and did not require qualification.

Report	Sample	Component	Original Result (ug/L)	Qualified Result (ug/L)
1512289rev1	MW18-122215	PCE	0.350 J	1.0 U

J = estimated.

Equipment Rinsate Blanks

Equipment rinsate blanks were not collected for this sampling event.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. A laboratory duplicate sample was not reported. Laboratory precision was evaluated with the MS/MSD RPD.

LABORATORY CONTROL SAMPLE RESULTS

A laboratory control sample (LCS) is spiked with target analytes to provide information on laboratory accuracy. The LCS sample was extracted and analyzed at the required frequency. All LCS analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-122215/ MW05-12215-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. For the list of analytes evaluated in laboratory CCVs, all CCV percent recoveries were within acceptance limits.

REPORTING LIMITS

SA reported results to MDLs and reporting limits. SA flagged results reported between the MDL and reporting limit with “J,” as estimated.

DATA PACKAGE

The data package was reviewed for transcription errors, omissions, and anomalies.

The field duplicate sample name was recorded on the chain of custody as MW05-122215 instead of MW05-12215-DUP. The sample name was reported correctly in the final report.

No other issues were found.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014) and appropriate laboratory and method-specific guidelines (SA, 2015; USEPA, 1986).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. If an analyte was detected in a sample and in the associated method blank, the sample result was qualified if the concentration was less than five times the method blank concentration.

In report 1603240 batch R24482 a method blank detection for tetrachloroethene (PCE) of 0.250 microgram per liter was observed. All associated sample results for PCE either were non-detect or were detected at concentrations greater than five times the method blank concentration. Thus no qualifications based on method blank results were made.

All other method blank results were non-detect for all target analytes.

Trip Blanks

Trip blanks were not collected for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not collected for this sampling event.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples.

All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. All recoveries were within acceptance limits for percent recovery and relative percent differences (RPDs).

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

A laboratory control sample/laboratory control sample duplicate (LCS/LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. One field duplicate was submitted for analysis (MW05-032116/MW05-032116-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the method reporting limit (MRL), or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch. For the list of analytes evaluated in laboratory CCVs, all CCV percent recoveries were within acceptance limits.

REPORTING LIMITS

SA reported results to method detection limits (MDLs). SA flagged results reported between the MDL and reporting limit with “J,” as estimated.

DATA PACKAGE

The data package was reviewed for transcription errors, omissions, and anomalies. None were found.

1.0 Objective

The Pneumatic Slug Test Kit is used in conjunction with a groundwater sampler such as the Screen Point 15 or a monitoring well to conduct pneumatic slug tests in saturated formations of unconsolidated soils or sediments. This document identifies the equipment and techniques required to successfully operate the Pneumatic Slug Test Kit (GW1600) and obtain the necessary data to determine the formation hydraulic conductivity.

2.0 Background

2.1 Definitions

Geoprobe®: A brand name of high quality, hydraulically-powered machines that utilize both static force and percussion to advance sampling and logging tools into the subsurface. The Geoprobe® brand name refers to both machines and tools manufactured by Geoprobe Systems®, Salina, Kansas. Geoprobe® tools are used to perform soil core and soil gas sampling, groundwater sampling and testing, soil conductivity and contaminant logging, grouting, and materials injection.

**Geoprobe® is a registered trademark of Kejr, Inc., Salina, Kansas.*

Slug Test: Fetter (1994) defines a slug test as “an aquifer test made by pouring a small instantaneous charge of water into a well or by withdrawing a slug of water from the well” (e.g. with a bailer). The initial change in the water level or head (H_0) is recorded and then the time (seconds) and changing water level (H_t) at each time increment are recorded. The water level changes at each time increment are normalized by the initial change of water level (H_t/H_0) and plotted on semilog graph paper (Fig. 2.1). Information from this graph is then used to calculate the hydraulic conductivity of the formation.

Hydraulic Conductivity (K): Again, Fetter 1994 defines hydraulic conductivity (K) as “a coefficient of proportionality describing the **rate at which water can move through a permeable medium**” (emphasis added). Note that this definition says “can move”. To know the actual flow rate at a location, the groundwater gradient must also be measured. There are two primary reasons why we are interested in the “K-value” of a formation, or portion of a formation. First, this helps us know if the formation is a viable aquifer, that is can it yield enough water for a well. Second, the K-value gives us a measure of how fast contaminants could move through a formation and reach a water supply well. This information can be used to determine the potential ‘risk’ caused by the presence of contaminants in the subsurface for risk based corrective action (RBCA) models (ASTM E 1739) and for evaluating the application of monitored natural attenuation (MNA) as a remedial option (EPA 1998). The formation hydraulic conductivity is also a key piece of information required to properly design many groundwater remediation systems.

2.2 Discussion

Water should not be added to a well located in a contaminated aquifer when performing a slug test. Likewise, as little water as possible should be removed from the well in order to minimize waste handling. Because of this, investigators slug testing for environmental purposes began using “mechanical slugs” to initiate slug tests and pressure transducers to record the data. A pressure transducer is especially needed in fast recovering wells.

A mechanical slug is simply a length of pipe filled with sand, capped on both ends, with a cord on one end to lower and recover the slug from the well. This method (Fig. 2.2) works well in many formations, but usually causes some splashing in the well as the slug is lowered or raised. When the slug test is over in 20 or 30 seconds, as for many sandy aquifers, this splashing ‘noise’ can interfere with the data collection and the results may be useless or questionable at best. This is why pneumatic slug testing was developed (Prosser 1981, Butler 1997).

In pneumatic slug testing the well head is sealed and air pressure is used to displace/lower the water level. As air pressure in the well is increased, the water level falls (Fig. 2.3) until the water pressure 'up' and the air pressure 'down' are equal. Once the water level is stable, a release valve is quickly opened, instantaneously releasing the air pressure. The water level recovers (rising head test) without splashing and the pressure transducer and data logger/computer record the changes in water level and time.

Pneumatic slug testing can provide very high quality data with essentially no "noise" or interference from splashing as is caused by the mechanical slug method. This becomes more important in very high-K formations which yield an oscillatory response to slug testing.

3.0 Required Equipment

The following equipment is required in order to perform a pneumatic slug test with the GW1600 Slug Test Kit. Refer to Figure 3.1 for identification of the major parts included in the GW1600 kit.

Pneumatic Slug Test Kit (GW1600) includes:

Description	Quantity	Part Number
Pneumatic Head Assembly	(1)	17631
Low-Pressure Hose Assembly	(1)	17644
Foot Pump Assembly	(1)	17643
Transducer Assembly	(1)	19345
Data Logger	(1)	GW1610
Integral Data/Power Cable	(1)	19174
Power Cord	(1)	16839
Power Inverter (12VDC to 120VAC)	(1)	SC152
12V Socket Adapter (direct push machine to inverter)	(1)	10138
Data Acquisition Software (CD)	(1)	GW1615
Probe Rod Adapters:		
1.25-inch Pin x 1.5-inch Box	(1)	15813
2.125-inch rod adapter with valve	(1)	19165
Leak Test Fluid (8-ounce bottle)	(1)	12356
Teflon® Tape (1/2-inch x 50 feet roll)	(1)	8819
O-rings:		
1.25-inch Probe Rods	(1)	AT1250R
1.5-inch Probe Rods	(1)	15389
2.125-inch Probe Rods	(1)	AT2100R
Carrying Case*	(1)	19329

*Total weight of the Pneumatic Slug Test Kit and carrying case is approximately 29.8 lbs. (13.5 Kg).

Other materials or equipment that may be required for slug testing with this kit include:

Well or Groundwater Sampler (installed and developed)
 Lap Top Computer (for running data acquisition software)
 Power Supply (120V line current or 12V vehicle battery connection)
 Poly Tubing (TB25L) and Check Valve (GW42) or other device for well development
 Miscellaneous Hand Tools (wrenches, pliers, screw drivers, etc.)

PVC casing adapters will be required for slug testing monitoring wells with PVC casing:

PVC Casing	Adapter Description	Quantity	Part Number
1/2-inch Schedule 80	Bushing, adapts 17558 to 1/2-inch PVC	(1)	17559
3/4-inch Schedule 40	Bushing, adapts 17558 to 3/4-inch PVC	(1)	19424
1-inch Schedule 40	Adapter, connects 17631 to 1-inch PVC	(1)	17558
2-inch Schedule 40	Coupling, adapts 19165 to 2-inch PVC	(1)	2164
Extension Tube, 18-inch, PVC (threads between 17631 and 17558)		(1)	17821

4.0 Groundwater Sampler or Monitoring Well Installation

During the installation of the ground water sampler or monitoring well, the appropriate O-rings must be used on each casing or rod joint to assure that an airtight system is installed for pneumatic slug testing. To help preserve the integrity of the O-rings, first drive the rod to near ground surface, remove the drive cap, then install the O-ring and the next rod. When installing the SP15 sampler, be sure to use the appropriate O-rings on each part of the assembly as specified in the SOP. O-ring kits are available for the SP15 and SP16 groundwater samplers.

Follow the manufacturer's standard operating procedure (SOP) for installation of the sampler or monitoring well. Geoprobe® SOPs are available for the Screen Point 15 and Screen Point 16 Groundwater Samplers (Tech. Bull. No. 95-1500), Dual Tube (DT21) Groundwater Profiler Kit Instructions (Bull. No. 19275) or the Geoprobe® Prepacked Screen Monitoring Well SOPs (Tech. Bull. Nos. 96-2000 or 99-2500). Free copies of these bulletins may be obtained by contacting Geoprobe Systems®.

Standard Guides and Practices are also available from the American Society of Standards and Materials (ASTM D 6001, D 6724, D 6725) to provide further assistance on proper installation practices if needed. These Standards are available by contacting ASTM at 610-832-9585 or via the internet at www.astm.org.

In this Standard Operating Procedure (SOP) the Screen Point 15 groundwater sampler will be used to illustrate how the Pneumatic Slug Test Kit is used to conduct slug testing. The pneumatic slug testing procedures described here will be essentially the same for any Geoprobe® groundwater sampler or monitoring well. Only the adapter for attaching the pneumatic head to the well or sampler will be different.

The SP15 sampler is assembled and advanced to the bottom of the interval to be tested. Geoprobe® extension rods and screen push adapter (GW1535) are used to hold the screen in position as the rods and screen sheath are retracted with the direct push machine (Fig. 4.1). It is important to know the length of screen exposed to the formation so that an accurate K-value can be determined. For this reason, the length of screen to be exposed to the formation is measured and marked off on the extension rods before retraction is started. Approximately 2 inches (50 mm) must be added to the retraction distance to obtain the desired exposed screen length because of the expendable point and solid tip on the screen (Fig. 4.1, inset). Once the screen is in position, the sampler is ready for development.

5.0 Development of Screened Interval

Appropriate well development is absolutely essential in order to obtain representative slug test results from a well or sampler. Without adequate development the K-value determined from slug testing may be more than ten times lower than the true value (Butler 1997). In ASTM Guide D 5521 *well development* is defined as:

- the act of repairing damage to the borehole caused by the drilling process and removing fine grained materials or drilling fluids, or both, from the formation materials so that natural hydraulic conditions are restored ...

While the direct push method of well installation usually does not involve rotary drilling or drilling fluids, formation damage often occurs. This is usually compression of the formation as the tool string is advanced and may include smearing of clays on the borehole wall in formations containing these fine grained materials. In poorly cohesive materials such as saturated sands, reparation of the damage is usually easy and relatively quick. The simple tubing check valve (GW42) and polyethylene tubing are lowered into the screen interval and vigorously oscillated up and down (Fig. 5.1). The vigorous oscillating action both surges the screen interval and purges dislodged fines from the well simultaneously.

Even in what are generally termed “clean sands”, turbid, muddy water is purged from the well. Surging and purging should be conducted throughout the length of the exposed screen to properly develop the entire screen exposed to the formation. For each one-foot (30 cm) of screen length, purging from one to three gallons (4 to 12 liters) of water with the tubing check valve method is usually sufficient to obtain representative results. In sandy formations this may require from 5 to 20 minutes depending on the yield of the formation. When development of the well is complete, repeated slug tests will provide consistent results. Therefore, one way of checking for adequate development is to run three or more slug tests and see if the response curves are consistent and symmetrical. If the results change noticeably with each slug test, further development may be required.

In formations containing a significant proportion of clays, care must be taken in the development process so that clogging of the screen and irreversible well damage do not occur. In some of these formations, purging with a peristaltic pump or bladder pump may be the best option for development. In very low hydraulic conductivity formations, it may be necessary to core the formation across the interval to be screened in order to prevent significant damage to the formation which may not be repaired with usual development methods. One possible method for slug testing in very low-K formations is discussed in Section 13.2 (Slug Tests with the Dual Tube Groundwater Profiler).

FIGURE 5.1:
Surging with tubing and
check valve assembly

6.0 Well Parameters Required for Calculation of Hydraulic Conductivity

Accurate documentation of well construction parameters (Fetter 1994, Butler 1997) and site specific geology are necessary so slug test data can be used to calculate the formation hydraulic conductivity. Without this information the slug test data is of little value. Establish a consistent reference mark for measuring all depths (top of casing or other) and use consistent units. Be sure to accurately document the following well construction parameters (Figure 6.1) and site geologic information:

L_e: Effective Screen Length, this will include length of any artificial sand pack extending above the well screen.

L_s: True Screen Length, only the length of screen exposed to the formation.

L_w: Length of the water column in the well (TD – SWL)

R_s: Screen radius

R_B: Radius of the filter pack or borehole over the screened interval

***R_c**: Casing radius (true internal radius of casing where water level changes occur)

r_t: Radius of transducer cable (required for wells one inch or less in diameter)

T_s: Depth the transducer is submerged below the SWL

SWL: Static water level as measured from reference point

TD: Total depth of well/screen as measured from reference point

h: Saturated thickness of the aquifer

H₀: Initial head change at instant slug test started. For the pneumatic slug test system this may be estimated from the stabilized pressure gauge readout in inches.

Aquifer Type: Is the aquifer confined or unconfined? (Review soil cores, well logs, or DP e-logs to make this determination.)

Formation Type: Give a verbal description of the formation being tested (clay, silt, sand, gravel, silty-sand, etc.) Best if this is described from a sample collected from the interval being tested.

***NOTE**: Casing radius must stay the same over the interval that the water level changes during the slug test or rate of water level change in the well will not be constant and errors in data will occur and results will be inaccurate.

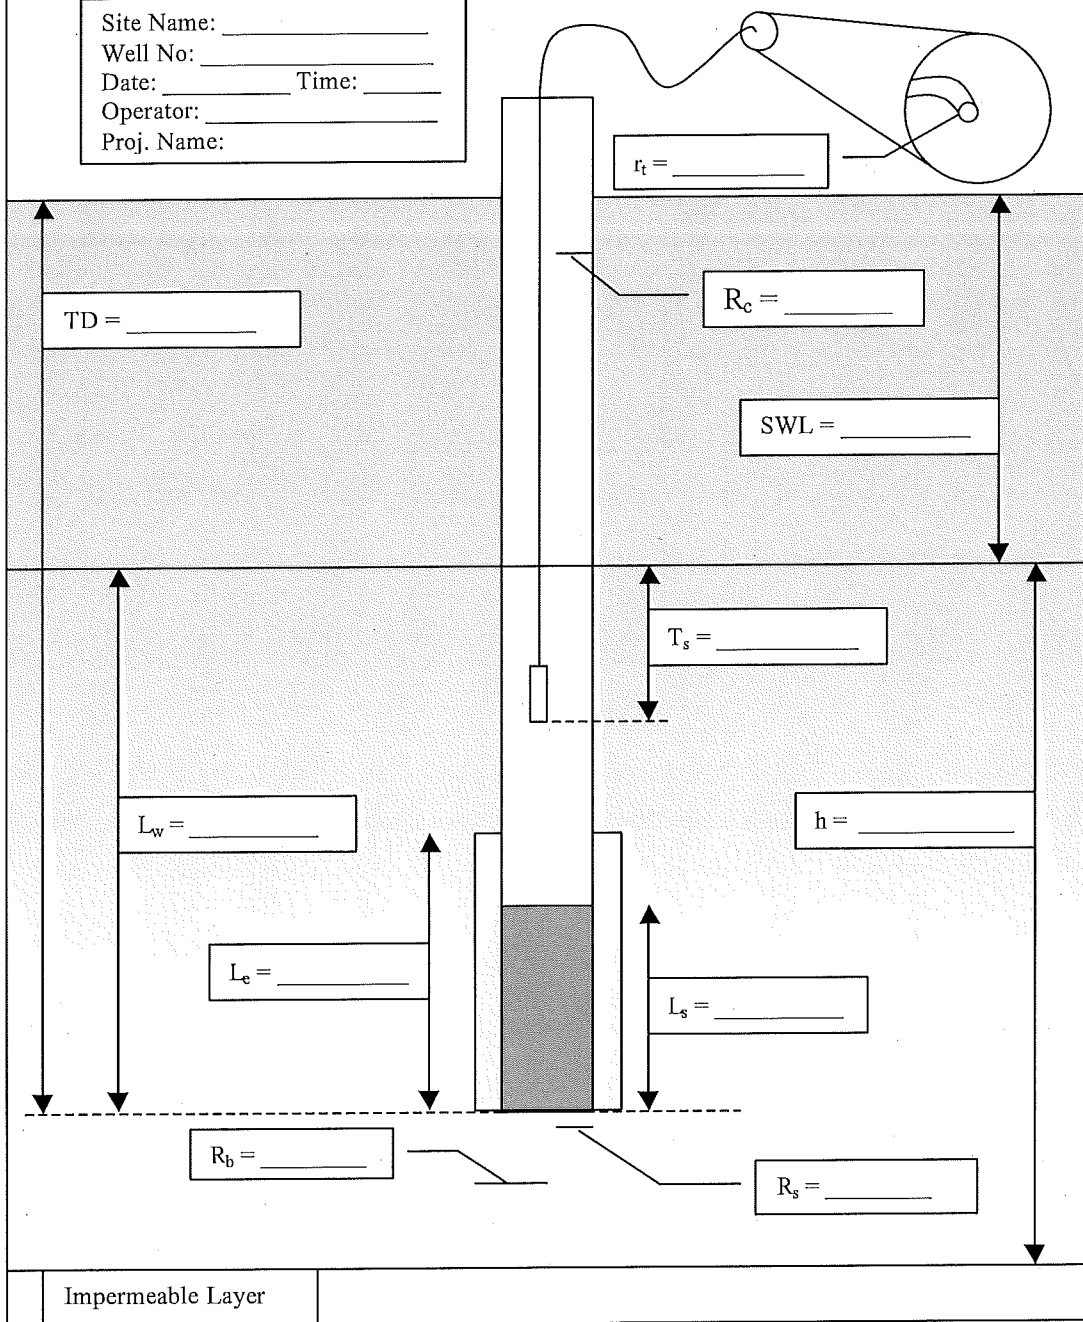

6.1 Correction of Casing Radius

For wells or piezometers less than two inches (50 mm) in diameter the radius of the casing should be corrected for the radius of the transducer cable. In these small wells the transducer cable begins to displace a significant proportion of the well bore and as such will cause a measureable error in the calculated K-value if not corrected for in the model equation. The corrected casing radius (R_{cc}) is calculated as follows:

$$R_{cc} = (R_c^2 - r_t^2)^{1/2} \quad (\text{after Butler et al., 2002})$$

 construction and installation parameters for slug testing

7.0 Installation of the Pneumatic Manifold and Set-up for Slug Testing

Once the well or groundwater sampler is installed and developed, you are ready to install the Pneumatic Manifold Assembly (17631) on the casing or probe rods. The pneumatic manifold (Fig. 7.1) includes all connections, valves, and controls required to conduct pneumatic slug tests. The Pneumatic Head Assembly comes with an adapter that allows it to be connected directly to Geoprobe® 1.25-inch probe rods (Fig. 7.2). Other adapters included with the kit allow the pneumatic head to be attached to 1.5-inch and 2.125-inch Geoprobe® probe rods. Adapters for standard size PVC casings (1/2-, 3/4-, 1-, and 2-inch) are also available that allow for slug testing in direct push installed or conventional design monitoring wells or piezometers.

To install the pneumatic head on the SP15 rod string, use an O-ring (AT1250R) or Teflon® tape to seal the head on the probe rods. If probe rods of a diameter other than the 1.25 inches are being used, the appropriate adapter must be installed to attach the pneumatic head to the rod string. If the pneumatic head is being installed on PVC casing, use the correct adapter for the nominal casing size of the well (see Section 3.0).

7.1 Transducer

The pressure transducer (Fig. 7.3) supplied with the pneumatic slug test kit is vented. A breathable membrane located near the top end of the cable keeps the transducer at ambient atmospheric pressure.

CAUTION: Keep the breathable membrane clean and do not crimp the transducer cable as this will crimp the vent tube and interfere with accurate transducer response.

The specifications of the transducer supplied with the Pneumatic Slug Test Kit are as shown in Table 7.1.

Specification	English Units	Metric Units
Range	10psi g	689.5 millibars or 6.89 x 10 ⁴ Pascals
Transducer diameter	0.39 inches	9.91 mm
Transducer length	4 inches	101.6 mm
Supply current	10 V	10 V
Sensitivity (approximate)	100 mV	100mV
Non-linearity & Hysteresis	± 0.1 % baseline	± 0.1 % baseline
Temperature Compensated Range	28.4 to 86° F	-2 to 30° C
Temperature error band	± 0.5%	± 0.5%
Cable length	100 ft	34.8 m
Cable diameter	0.225 inches	5.71 mm

TABLE 7.1:
Pressure transducer specifications.

Once the pneumatic head is in place the transducer assembly is installed. The transducer itself (Fig. 7.4) is inserted through the port on the top of the pneumatic head and lowered into the well. For most slug testing the transducer is set about 18 to 24 inches (45 to 60 cm) below the static water level.

NOTE: Be sure to cool the transducer to the ambient groundwater temperature before zeroing, usually three to five minutes required.

After zeroing the transducer (see Section 9.3), the 1/4-inch NPT x 1/4-inch tube nylon fitting is threaded into the transducer port. Teflon® tape is used to improve the seal on the threads. Wrap Teflon® tape around the transducer cable at the fitting (Fig. 7.5), lower the fitting cap into place, and thread the cap onto the fitting. The cap will compress the Teflon® tape around the transducer cable and provide an airtight seal.

CAUTION: Do not over tighten the nylon cap as the transducer cable or vent tube may be damaged. Finger tighten and snug as needed to obtain an air-tight fit. Well head pressures generally do not exceed 1 to 2 psi (about 10 to 20 inches of water, 25 to 50 cm of water, or 25 to 50 millibars).

FIGURE 7.4:
The small outside diameter (0.40 inches) of the pressure transducer allows it to be used with Geoprobe® 1.25-inch OD probe rods and 0.5-inch Schedule 80 PVC casing.

FIGURE 7.5:
Wrap Teflon® tape around the transducer cable to promote an airtight seal at the nylon cap.

FIGURE 7.6:
Attach the foot pump to the pneumatic head using the low-pressure hose with quick connects.

7.2 Connecting Pump and Air Hose

The foot pump assembly (17643) included with the pneumatic slug test kit is used to supply air to pressurize the well head. Connect the foot pump to the inlet side of the pneumatic head with the low-pressure hose and quick-connect fittings (Figure 7.6). Typically 30 to 40 psi of air pressure is maintained in the supply hose during slug testing.

CAUTION: The pressure rating of the hose is low (45 psi) do not over-inflate and burst the hose.

You are now ready to connect the transducer to the data logger and the data logger to the laptop computer.

8.0 Data Logger

A single channel data logger (GW1610) and all necessary cables are supplied with the pneumatic slug test kit. Specifications of the data logger are shown in Table 8.1.

Specification	English Units	Metric Units
Size (L x W x H)	7.4 x 4.7 x 2.25 inches	188 x 120.2 x 56.8 mm
Weight	1.49 lbs	0.675 kg
Sensor Port	Twist-on, 8 pin connector, male	
Computer Port	Serial, female RS232 (DB-9)	
Supply Voltage	12 V	
Output Voltage (to transducer)	10 V	
Sampling Frequency	120 Hz	
Available Output Frequencies	1, 2, 10 and 38 Hz	

TABLE 8.1:
Data Logger specifications

The female 8-pin connector on the transducer is connected to the male 8-pin connector on the Data Logger. Next the Data/Power Cable (19174, Fig. 8.1) is connected to the serial port on the data logger and then the serial port on the laptop computer. The small in-line power transformer (Fig. 8.1) is connected to standard line current (115VAC). Line current may be obtained from a generator, small inverter (SC152) plugged into vehicle lighter socket, or conventional wall outlet if available. The same power supply will also operate the laptop computer if needed.

The slug test system is set up and you are now ready to initialize the software and begin data collection.

9.0 Slug Test Data Acquisition Software Version 1.00

Geoprobe Systems® has designed a simple, user friendly software system that allows you to acquire and file the transducer data on a lap top computer. The data files are stored in ASCII format for easy export to spreadsheet and data analysis programs. This is solely a data acquisition software system and does not provide data modeling or K-calculation options. The minimum computer requirements for installation and operation of the Data Acquisition Software are:

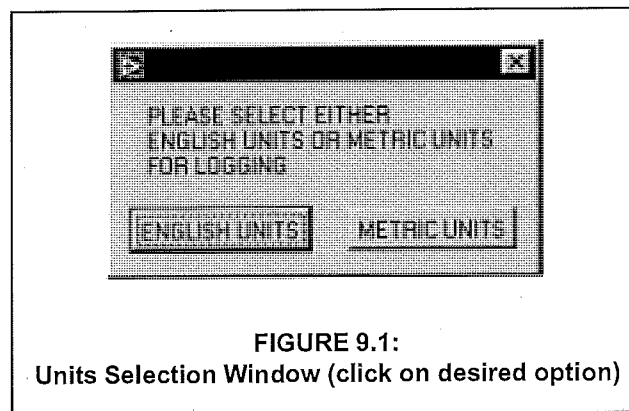

CPU: Pentium 90 MHz
RAM: 16 megabytes minimum
Available Hard Drive Space: 12 megabytes minimum
Operating Software: Windows 95, 98, 2000, NT, ME

9.1 Installation

The Data Acquisition Software comes on a compact disc (CD) with the Pneumatic Slug Test Kit, or can be purchased separately. Simply insert the CD into your computer CD drive, and from the "START" menu in Windows, select the "RUN" option to run the setup program on the CD. Follow the simple on-screen instructions to enter your personal identification information. The software installation should take less than three minutes. The installation will automatically place an icon on your Windows Screen labeled "SLUG TEST". Simply double-click on the icon to start the software. The following information provides a brief summary of the software operation for acquisition of slug test data.

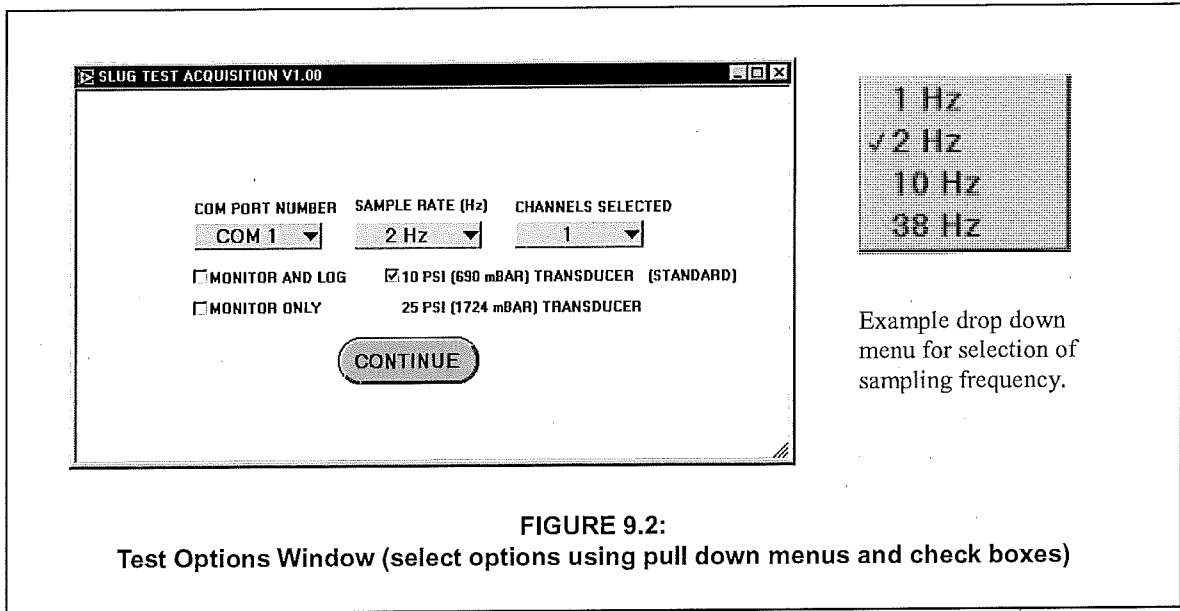

9.2 Selecting Options

After initializing the software by double-clicking on the windows icon, the first window you see will let you select between using either English units or Metric units on the data display (Fig. 9.1). If English units are selected, the water level (head) will be displayed on screen in feet (ft). If Metric units are selected, the head will be displayed in millimeters (mm) of water. Simply click on the desired option.

The next window (Fig 9.2) allows you to specify several options for system operation and data acquisition. Drop-down menus allow you to choose either Com Port 1 or 2 for your computer connection to the data logger, as well as the sampling rate or frequency in Hertz (Hz).

The sample rate determines the number of sample points that will be plotted on screen and saved in your file each second. The default rate is 2 Hz. You may select either 1, 2, 10, or 38 Hz from the drop-down menu.

In formations that are very slow recovering from a slug test (30 minutes or more), a sampling frequency of 1Hz is sufficient. If you are slug testing a very high hydraulic conductivity formation which recovers from a slug test in less than 10 to 20 seconds, you may wish to choose 10Hz or even 38Hz. When you select a higher sampling rate, the baseline will appear more noisy because less averaging is conducted to obtain each data point.

A 10 psi transducer comes with the kit and is the default value for this option.

You may choose to MONITOR ONLY or to MONITOR AND LOG from this screen. The MONITOR ONLY option will allow you to monitor the readout from the transducer, but you can not save the data to a file. The MONITOR AND LOG option will allow you to initially monitor the transducer readout and then begin saving the data to a file when desired.

If you select the MONITOR ONLY option, you will go directly to the MONITOR ONLY MODE screen when you click on the CONTINUE button (Fig 9.3). If you select the MONITOR AND LOG option you will proceed to the SITE INFORMATION screen when you click on the CONTINUE button (Fig. 9.4).

The MONITOR ONLY MODE may be used when first inserting the transducer into the well or sampler to verify that the transducer has cooled to ambient temperature (refer to notes on Figure 9.3). Gently oscillating the transducer up-and-down in the water will also dislodge any air bubbles from the transducer opening (Fig. 9.3).

The SITE INFORMATION window (Fig. 9.4) lets you enter a file name (6 characters) and transducer serial number. Tab between data entry boxes and click on CONTINUE to proceed to the next window.

FIGURE 9.3:
Screen output when running in MONITOR ONLY MODE

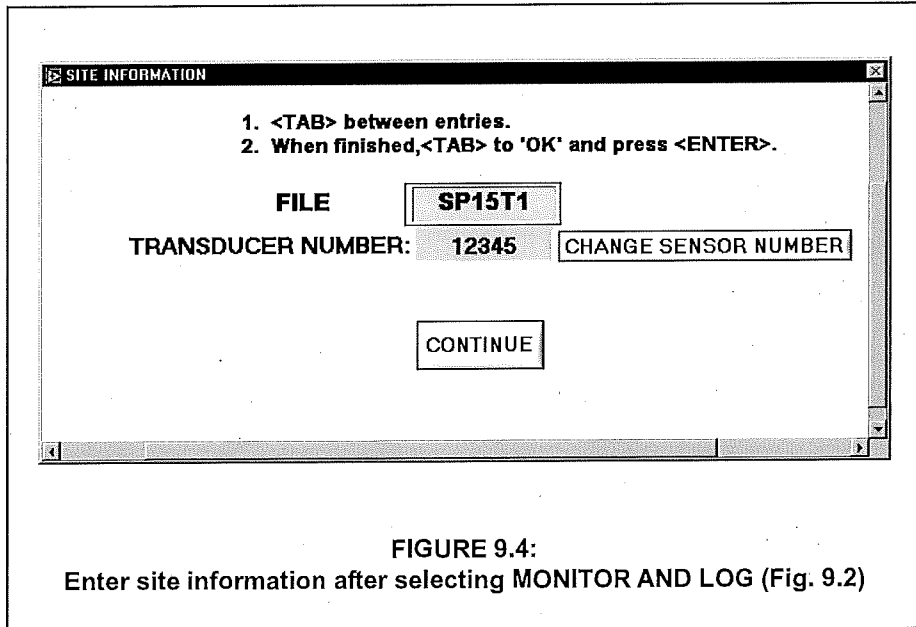

FIGURE 9.4:
Enter site information after selecting MONITOR AND LOG (Fig. 9.2)

9.3 Zero Transducer

Once you click on the CONTINUE button you will proceed to the TRANSDUCER ZERO window (Fig. 9.5). When the software is first initialized, you must zero the transducer before acquiring slug test data. First place the transducer in the groundwater to equilibrate with the ambient temperature. Then the transducer should be removed from the water to zero it at atmospheric pressure. If you cycle back through the software to run additional slug tests in separate files, you may choose to BYPASS the zero option if desired. Simply click on the BYPASS button to do so. It is recommend that the operator zero the transducer initially and then bypass this function if desired as additional files and slug tests are conducted.

FIGURE 9.5
Select or bypass transducer zero function

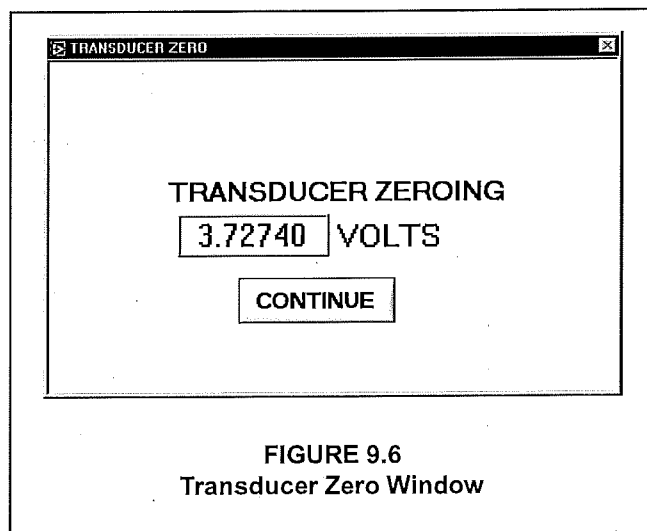

FIGURE 9.6
Transducer Zero Window

When the ZERO TRANSDUCER function is selected, the real-time transducer voltage is displayed in the VOLTS box (Fig. 9.6). Click on the CONTINUE button when the voltage has stabilized and you are ready to proceed with logging the slug test. If you selected a higher sampling rate (e.g. 10 or 38Hz), the voltage readout will be more variable.

9.4 Data Acquisition and Viewing Graph

After clicking on the CONTINUE button in the TRANSDUCER ZERO window, you will enter the Collect-and-Graph window (Figure 9.7). If the transducer is still above the water level, you will observe a very magnified baseline as the data points are plotted and scroll across the screen. Once the transducer is submerged below the water level several inches or more, what at first appeared to be a noisy baseline is seen to be a relatively quiet line at normal operating head/pressure values (Figure 9.8).

Once the transducer is stable and you are ready to start saving data, you may click on the BEGIN SAVING button or press the F1 key on the keyboard. When this is done the word **SAVING** is displayed near the top-center of the window (Figure 9.8). The filename with directory path is displayed in the top-left side of the window.

A mouse click on the HEAD button at the top-right of the window allows you to toggle between a Y-axis in feet of head (or mm of head in metric units) and the transducer voltage readout if desired. Once you have completed your slug test(s), a mouse click on the STOP button or pressing the F5 key will stop data collection and freeze the screen. This will enable you to review the collected data and briefly evaluate your results before continuing with further work.

Figure 9.7
 Real-time transducer data is plotted on the Collect-and-Graph window. The baseline will be greatly magnified and appear noisy when the transducer is above the water level.

Figure 9.8
 Simulated transducer data during a slug test (well head pressurized, stabilization, and release of pressure to initiate the slug test response)

9.5 Exiting Program

When the STOP button (or F5 key) is pressed on the Collect-and-Graph window, the QUIT/CONTINUE button appears in the top-center of the screen. Data collection is halted and the transducer log may now be reviewed without affecting the data file.

Click the QUIT/CONTINUE button when you are finished reviewing the slug test response and are ready to either exit the program or continue with additional slug testing. This brings up the QUIT window shown in Figure 9.9. Click on the YES button if you are ready to quit and exit the program. Click the NO button to go back to the Options window (Figure 9.2) to set up for additional slug test data acquisition.

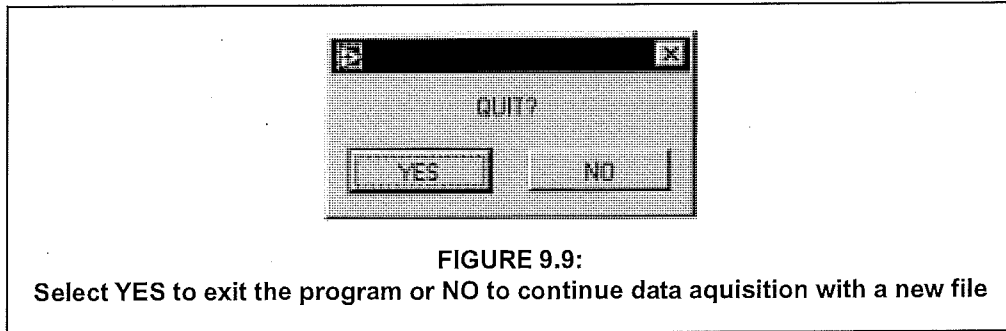

FIGURE 9.9:
Select YES to exit the program or NO to continue data acquisition with a new file

9.6 File Storage and Data Format

Two files are generated each time you enter a file name and click on the BEGIN SAVE button or press the F1 key while in the Collect-and-Graph window (Figure 9.7). The first file is where the time and transducer data are saved and it is denoted as a ".dat" file in the directory. The second file is an information file and it is denoted as a ".inf" file in the directory. Both file types are saved in the C:\dirim95\logfiles*. * directory on the computer hard drive. The data in the *.dat file is saved in columns in the following order:

Time (seconds) Transducer (voltage) Head (feet) Head (millimeters) Pressure (millibars)

The *.inf file saves some basic date and time started/ended information. It also specifies the column format of the data file for future reference if needed. This file may be edited to add information such as site name, location, operator, and client information as needed to meet project specifications. An example *.inf file is shown in Figure 9.10 below.

```
SITE INFORMATION -- SLUG TEST REV. 1.0

10.0 Running a Pneumatic Slug Test

The following summary is a step by step outline of the procedure required to run a pneumatic slug test.

1. Close inlet and release valves and close the pressure regulator on the pneumatic manifold assembly (Fig. 10.1).

NOTE: Adjust zero setting on the pressure gauge if needed.

2. Operate foot pump to pressurize supply hose to ~ 30 to 40psi
3. Open inlet valve on pneumatic head (Fig. 10.1)
4. Slowly open the pressure regulator (Fig. 10.1). From the fully closed position it takes about five revolutions to begin opening the regulator. Observe the pressure gauge on the pneumatic head. Let the pressure in the well head rise slowly to a few inches above the level desired for testing (e.g. if you want to initiate the slug test with H_0 of 10 inches let the gauge rise to about 12 inches).
5. Quickly close the inlet valve and allow the pressure observed from the transducer in the well head (as shown on the computer screen - Fig. 9.8) to return to equilibrium and stabilize. Record the stabilized gauge pressure. Observing the Collect-and-Graph window of the Slug Test software, the readings should return to the levels noted before pressurization was started (Fig. 9.8). For very permeable and porous formations, return to equilibrium (baseline) happens quickly (Fig. 10.2). For moderate to lower-K formations (silty-clayey sands) this may take several minutes (Fig. 10.3). For very low-K formations (silts/clays) it could take hours for the water level to return to equilibrium. In this situation, a mechanical slug test should be conducted to save considerable time.
6. Leak test the fittings on the pneumatic head and connection to the rods with the leak test fluid (12356) or equivalent. Tighten fittings if necessary and retest. If a leak appears to be downhole, tighten the probe rods with a wrench. If the leak persists and is slow relative to well recovery rate, the regulator may be used to stabilize the pressure in the well head. It is preferable to locate and correct the slow leak if possible before continuing with the slug test.

NOTE: For slow leaks the on-screen transducer readout will appear stable because the water level rises as quickly as the air escapes, keeping the readout constant. You must monitor the pressure gauge on the pneumatic head to determine if a slow air pressure drop is occurring.

7. Once the transducer readout is back to equilibrium and stable, you are ready to initiate the slug test. To initiate the slug test, open the release valve as quickly as possible (Fig. 10.1). You should hear a "swoosh" of air venting from the valve if you listen closely.
8. Watch the Collect-and-Graph screen on the computer. You should observe a very rapid drop in the transducer readout (head) as the air is instantaneously released (Figs. 10.2 and 10.3). Then the rise/recovery of the water level to the pre-test equilibrium level (baseline) will occur. Once the water level has returned to the pretest equilibrium level and is stable, the slug test is complete.
9. It is strongly recommended that you run at least three slug tests of different initial head values (H_0) to use for verification of appropriate well performance and development. If the well or sampler is responding properly, the normalized data from all three tests should overlay each other in the normalized data plot. If there is significant deviation between the repeat tests, additional development of the well or sampler may be necessary or other actions may be required to obtain valid data.

FIGURE 10.3:
SP15 slug test in a moderate-K formation

11.0 What the Data Looks Like

Response to slug tests takes on two general forms. The observed responses are comparable to a spring that has been stretched and released. If a large weight is attached to the end of the spring it slowly slides back to the equilibrium point and stops. If a small weight is attached to the spring it may oscillate back-and-forth around the equilibrium point a few times before coming to rest. This first type of behavior is called “overdamped” response and the second is called “underdamped” or oscillatory response (the water level oscillates up-and-down in the well in response to the slug test) (Butler 1997).

Overdamped response (Figs. 10.2 and 10.3) is what is most commonly observed during slug testing and is characteristic of formations that range from fine-grained materials (silts and clays) to sandy materials. The underdamped response (Figure 11.1) is less commonly observed and is characteristic of high hydraulic conductivity formations such as coarse sands and gravels. There is also a special case of critically damped response that lies between the underdamped and overdamped behaviors (Butler 1997, ASTM D 5581).

The portion of the slug test curve and data used in the modeling process to determine the hydraulic conductivity is the response and recovery that begins immediately after the pressure is released (pneumatic slug test initiated) and ends when the water level has returned to its pretest equilibrium pressure (see Figures 10.3, 10.4, and 11.1).

12.0 Data Analysis Methods

The same data analysis methods that are applied to larger-diameter wells are used for the smaller-diameter direct push tools and wells. These conventional analysis methods provide accurate results for the small-diameter tools (Butler et al. 2002) under almost all conditions. However, when tools or wells less than one inch inside diameter are used for slug testing in very high hydraulic conductivity formations ($K > 250\text{ft/day}$, $>8 \times 10^{-2}\text{cm/sec}$), a simple linear correction is applied to determine the K-value (Butler, 2002). Probably just a fraction of the formations to be tested will have K-values exceeding this range.

Two factors must be considered in the selection of the appropriate data analysis method. First, is the formation being tested an unconfined aquifer or a confined aquifer? Second, is the aquifer response overdamped behavior or underdamped and oscillatory in nature? The following is a very brief selection of possible modeling methods that may be appropriate. An authoritative review of slug test data analysis methods is provided by Butler (1997).

Overdamped:

- Unconfined = Bouwer & Rice (1976) method, see also Bouwer (1989)
ASTM D 5912
- Confined = Hvorslev (1951) method
ASTM D 4104

Underdamped:

- Unconfined = Springer and Gelhar (1991) also know as the Hi-K Bouwer & Rice Method (Butler 1997, Butler and Garnett 2001)
- Confined = van der Kamp (1976) method also known as the Hi-K Hvorslev Method (Butler and Garnett 2001)
ASTM D 5785

Critically Damped:

- Confined = Kipp (1985) method
ASTM D 5881

Additional information on slug testing field procedures and data analysis methods is available in any of several ASTM Standard Guides and Practices (ASTM D 4043, D 4044, D 4104, D 5785, D 5881, D 5912). The Standard Guide D 4043 includes a decision tree for selection of the appropriate test and data analysis methods while Standard Method D 4044 provides information on field procedures for slug testing.

The selection and application of the appropriate data analysis method(s) is beyond the scope of this SOP for field techniques. Many literature resources (Butler 1997, Fetter 1994, Freeze and Cherry 1979) and software resources (AQTESOLV, AquiferTest, etc.) are available for guidance in selection and application of the appropriate model to determine the formation hydraulic conductivity, transmissivity, and other formation parameters from the slug test data.

13.0 Pneumatic Slug Testing in Groundwater Profiling Tools and Monitoring Wells

The Pneumatic Slug Test kit can be installed on many of the available Geoprobe® groundwater sampling tools to conduct slug testing. The kit may also be used on PVC casing ranging in size from nominal 1/2-inch to 2-inch. The diagrams below indicate how the pneumatic slug test kit is used with several of the groundwater sampling tools and PVC well casings. Reference the appropriate standard operating procedures or instruction bulletins for details of sampler installation or well construction.

13.1 Slug Tests with the Groundwater Profiler (GW1600)

The Groundwater Profiler (GW1600) may be telescoped through Geoprobe® 2.125-inch rods when fine-grained materials overlay the sandy formation to be sampled and slug tested (Fig. 13.1). The profiler is available with either a 6.0-inch or 12.0-inch (length) stainless steel screen and may be advanced incrementally for sampling and slug testing at multiple depths in one borehole.

The groundwater profiler is advanced with Geoprobe® 1.25-inch rods so the pneumatic head will readily connect to the sampling system for slug testing. Because the 1.25-inch drive rods have an ID of only 0.625 inches, the calculated hydraulic conductivity value must be corrected if the test result indicates a K-value ≥ 200 ft/day (7×10^{-2} cm/sec) (Butler, 2002). Clogging of the exposed screen as it is advanced to multiple depths can be problematic, even in relatively clean sands. Development for slug testing becomes critical.

13.2 Slug Tests with the Dual Tube Groundwater Profiler (GW2100)

The Dual Tube (DT21) Groundwater Profiler system (GW2100) may be used to conduct soil sampling, groundwater sampling, and slug testing (Fig. 13.2) at multiple depths in one probe advancement (Instructional Bulletin No. 19275). The 2.125-inch OD by 1.5-inch ID rods are the outer casing for this system and may be used to conduct slug tests in formations of very high hydraulic conductivity where the K-values exceed 500 ft/day (1.76×10^{-1} cm/sec) (McCall et al. 2002). The pneumatic head adapter (PN 19165) for the 2.125-inch rods, which has a larger diameter release valve, is required for slug testing in very high-K formations.

The Dual Tube (DT21) Groundwater Profiler system (GW2100) may also be used to conduct pneumatic or mechanical slug tests in moderate to low hydraulic conductivity formations (Figure 13.3). When slug testing in cohesive materials with significant proportions of clay, a small coring device should be used to core the formation ahead of the outer rods and cutting shoe. This minimizes damage and compression of the formation allowing for accurate determination of K-values in these sensitive materials. After the pre-core is removed, the DT21 Profiler screen is installed in the core hole. An adapter for nominal 1/2-inch Schedule 80 PVC (PN 17561) is assembled onto 1/2-inch PVC casing and installed in the top of the DT21 profiler screen (Figure 13.3). This reduces the casing ID and significantly increases the recovery rate of the slug test.

In moderate-K formations (e.g. $< 10^{-3}$ cm/sec to $> 10^{-6}$ cm/sec), a PVC casing adapter and bushing (PN 17558 and 17559) may be used to attach the pneumatic head to the PVC casing so pneumatic slug tests may be conducted. In low- to very low-K formations (e.g. less than 10^{-5} cm/sec) polyethylene tubing (TB25L) may be placed over the transducer cable to further reduce the effective casing radius and speed up the slug test recovery rate. In this configuration the transducer and poly-shrouded cable become a mechanical slug-transducer. Mechanical slug testing with this configuration eliminates the need to wait for re-equilibration of the water level needed when pneumatic slug testing is conducted. In these low-K formations this re-equilibration of the water level needed for pneumatic slug testing will more than double the length of the slug test, which may be several hours in length. So use of the mechanical slug-transducer configuration can save over 50% of the time required for slug testing in these low-K formations.

13.3 Slug Tests in Monitoring Wells

Small-diameter direct push installed monitoring wells (Fig. 13.4) and conventional 2.0-inch PVC wells may also be used for slug testing with the Pneumatic Slug Test kit. Adapters and bushings to attach the pneumatic head assembly to nominal 1/2-inch up to 2-inch PVC casing are available (see Section 3.0). Follow the manufacturer's standard operating procedure (Geoprobe® Technical Bulletins 96-2000, 99-2500) or appropriate ASTM Standard Guide (D 6724) or Standard Practices (D 6725 or D 5092) for well installation and construction. Remember that appropriate development (ASTM D 5521) is necessary to obtain representative slug test results and K-values in small- or large-diameter wells. Once the well has been installed and developed, the PVC casing adapter (and bushing if required) is used to attach the pneumatic head assembly to the well casing (Fig. 13.4). Slug testing then follows the same procedures as described in the above sections. Remember that the pneumatic method can not be used in wells where the static water level is within the screen interval or will be lowered into the screen interval during the pressurization of the well head. Under these conditions mechanical slug test methods must be applied.

14.0 Hints and Tips

Development!! Do it or just don't run the slug test.

Do not over-pressurize the well head as this can result in a damaged transducer and/or air in the formation which will result in inaccurate results.

Run multiple tests with varying initial head (H_0) to verify aquifer response and development meet model requirements (e.g. When normalized data for tests with different H_0 are normalized and plotted on semi-log paper the results over lay one another).

Cool transducer to ambient groundwater temperature before zeroing and beginning slug test to prevent baseline drift.

After cooling the transducer in the groundwater, raise it just above the water level to zero at atmospheric pressure.

Watch the air pressure gauge on the pneumatic head to detect slow leaks. The water level will rise in the well as quickly as air escapes from a slow leak. The transducer readout on screen may appear stable when in fact the water level and air pressure in the well are both changing to maintain equilibrium in response to the slow leak.

Use smaller initial head values (H_0) especially in very high-K formations to be sure to get accurate results. In higher-K formations, using a large initial head will result in erroneous well response and incorrect results. Do not use initial head of over 20 inches (~50cm) under most conditions (less is preferable in high-K formations).

For smaller-diameter wells (1-inch or less), be sure to correct the casing radius (r_c) for the transducer cable radius before calculating the hydraulic conductivity. If this correction is not made, errors in the calculated K-value of 10% or greater may occur.

Appendix I: Field Calibration of the Transducer

The transducer, data logger, and software system are designed with a built-in calibration that will calculate a head value in feet and millimeters, and a pressure value in millibars. This internal calibration factor is not exact, but should provide head and pressure values within 10% of the true values. Instrument drift over time is a normal phenomenon and results in these variations. While the precision of the data will be very good over time, the accuracy may shift from the true value due to this instrument drift.

Since the data is normalized (H_i/H_o) for use in modeling and calculation of the hydraulic conductivity, it is not mandatory that the reported head or pressure values be exactly accurate. Normalizing the data removes the units so that modeling is done with simple ratios. It would be possible to use simply the transducer voltage readout and normalize these by the H_o voltage value to obtain the same ratios as calculated with normalized head values originally stated in feet or inches. However, if for your project it is necessary to have accurate as well as precise head data, then a simple field calibration may be conducted prior to running slug tests to obtain an accurate calibration line.

Take a clear plastic four-foot long Macro-Core® soil sample liner or DT21 soil sample liner, cap the bottom, and tape it sealed. Stand the tube upright and fill it to over-running with clean water. (Refer to Sections 7.0, 8.0, and 9.0 for more information on the following actions.) Connect the transducer to the data logger and the data logger to the power supply and laptop computer. Turn on the computer and initialize the slug test software. Let the transducer equilibrate at ambient working temperature. Begin saving the *.dat file in the software (e.g. filename CAL730). With the transducer stabilized at atmospheric pressure, record data for at least one minute. Next, insert the transducer exactly 6 inches (152 mm) below the water level in the water-filled liner. Again take at least one minute of data at this water level. Lower the transducer to depths of 12, 18, 24, 30, and 36 inches (305, 457, 610, 762, and 914 mm) in the water column and leave it at each depth for a minimum of one minute after it has stabilized. Once the information for each depth interval is obtained exit from the file.

This data file may be imported into a spreadsheet or scientific software system for plotting and calculation of the calibration equation. An example of a portion of the raw data file is shown in Table A-1. Plotting this data (Figure A-1) is recommended for visual review and selection of the time intervals to be used to calculate the average transducer reading at each water depth interval and atmospheric pressure. Table A-2 shows the time interval and transducer voltage readouts for each water depth and atmospheric pressure used to calculate the average voltage for that condition. As an example, for the condition of 12 inches of water the plot (Fig. A-1) indicated that the transducer readout was stable from the 550- to 600-second interval. The average voltage over this interval was calculated by summing the voltage readout at each time increment and then dividing by the number of readings (n) summed:

$$(\text{Sum}(V_{550} \text{ to } V_{600}))/n = \text{average voltage for 12 inches of water over the time interval specified.}$$

This same calculation is conducted for each water depth interval monitored for an equal time period so equal weight is given to each depth interval. Then a linear regression analysis is applied to the paired data points (water depth, average voltage) to determine the least squares best fit regression line for calibration of the transducer under ambient conditions (Table A-3). Most spreadsheet and scientific software programs have a function or macro to calculate the regression line parameters and correlation coefficient. Rerunning the field calibration is recommended if the correlation coefficient is less than 0.99. If a correlation coefficient of 0.99 or better can not be obtained, the transducer may need maintenance or possibly replacement if it is considerably of range.

The slope of the regression line and the Y-intercept determined from the least squares fit can now be used to calculate a very accurate head level (see Table A-3) for slug tests run under this calibration. The transducer voltage is multiplied by the slope (m) and the intercept value is added to the result to get the true head reading. If very accurate data is required, calibrations may be conducted daily (or more often) if instrument drift is significant.

Field Calibration of 10psi transducer

TABLE A-1:
 Example of raw data file from field calibration of transducer

10psi Transducer Calibration

FIGURE A-1:
Plot of transducer voltage (raw data) collected during field calibration

Transducer Calibration Factor

Inches of Water	Averaged Transducer Voltage
0	0.005677
6	0.048791
12	0.106326
18	0.162364
24	0.205384
30	0.261221
36	0.314723

Regression Output:

Constant (b)	-0.264402
Std Err of Y Est	0.410288
R Squared	0.999165
No. of Observations	7
Degrees of Freedom	5
X Coefficient (m)	115.4423
Std Err of Coef.	1.492468

Regression Line $Y = mX + b$

where: $Y =$ Inches of water
 $155.44 = m =$ slope of regression line
 $X =$ Transducer voltage
 $-0.2644 = b =$ Y-intercept

Example:

If transducer voltage = 0.1458

Then inches - water = 16.57

TABLE A-3:
Linear regression analysis of average transducer voltage for each water depth (from TABLE A-2) provides calibration data for transducer

SUMMARY

Maul Foster & Alongi, Inc. has prepared this report to summarize the vapor intrusion exposure assessment conducted for the former Park Laundry site in Ridgefield, Washington (the site). Work was coordinated with the Washington State Department of Ecology with input from the Washington State Department of Health.

Buildings on the site were prioritized for sampling, based on identified risk factors for vapor intrusion, such as proximity to groundwater with the highest concentrations of chlorinated solvents, type of building construction, and the identification of preferential exposure pathways. The exposure assessment included sampling in and around approximately ten of the highest-priority buildings in November 2012 and again in July 2013.

Despite the identification of risk factors, the evaluation failed to identify vapor intrusion into any of the buildings on the site. This supports the conclusion that there is currently no indoor air exposure resulting from vapor intrusion on the site. The potential for future exposure on the properties on the site should be considered in the human health risk assessment necessary for completion of the remedial investigation.

1 INTRODUCTION

Maul Foster & Alongi, Inc. (MFA) has prepared this report on behalf of Union Ridge Investment Company (URIC) for the former Park Laundry site in Ridgefield, Washington (the site). Park Laundry was previously located at 122 N. Main Avenue (the Property). A remedial investigation (RI) is being performed pursuant to Agreed Order No. DE 6829 (Washington State Department of Ecology [Ecology], 2009a). The first phases of the RI indicated that volatile organic compounds (VOCs) are present in soil and groundwater on the Property and on neighboring properties. The Property historically was used by Park Laundry, which may have performed dry cleaning operations that resulted in the release of tetrachloroethene (PCE). In a letter dated July 30, 2012, Ecology ordered URIC to develop a plan for approval by Ecology and conduct sampling to assess the potential for vapor intrusion on the site (Ecology, 2012a).

MFA worked with Ecology and the Washington State Department of Health (DOH), to develop an Ecology-approved sampling plan (Sampling Plan) (MFA, 2012b) as part of an overall vapor intrusion assessment strategy consistent with Ecology's draft vapor intrusion guidance (Ecology, 2009b). MFA also provided a supplementary document to clarify the criteria used to select sampling locations at each property (MFA, 2012c). Ecology approved the Sampling Plan and MFA conducted assessment and sampling activities from November 12 through 17, 2012, and again from July 29 through July 31, 2013.

MFA provided Ecology with a data submittal after each of the vapor intrusion sampling events (MFA, 2013a,b). This report summarizes both sampling events and provides conclusions and recommendations based on the exposure assessment results, taking into consideration the groundwater monitoring data, historical soil gas data, and vapor intrusion modeling results.

2 EXPOSURE ASSESSMENT SCOPE AND METHODOLOGY

As recommended in Ecology's draft vapor intrusion guidance (Ecology, 2009b), the vapor intrusion exposure assessment was conducted using a tiered approach, consisting of a preliminary assessment, a Tier I assessment, and a Tier II assessment.

2.1 Preliminary Assessment

The goal of the preliminary assessment was to determine the potential for vapor intrusion on a site. Previous site investigations have identified VOC impacts in the soil and groundwater near occupied buildings, which provided the justification for continuing with a Tier I assessment (Clark County Health, 2006; E&E, 2008; Hahn, 2006; MFA, 2001).

2.2 Tier I Assessment

The Tier I assessment included collecting data to define the nature and extent of contamination in the subsurface and developing preliminary conceptual site models (CSMs) for each building on or within 100 feet of the groundwater plume to identify locations with the greatest potential for vapor intrusion.

2.2.1 Subsurface Characterization

MFA installed groundwater monitoring wells and collected soil samples to characterize the nature and extent of contamination on the site. The results indicated a shallow source of chlorinated VOCs below several properties on the site. MFA and Ecology defined a vapor intrusion study area provided in Figure 1, which generally represents properties above, or within 100 feet of the groundwater plume boundary. The detailed results of the subsurface characterization have been provided in a series of documents previously submitted to Ecology, e.g., Data Submittal for March 2012 Investigation at Former Park Laundry Property (MFA, 2012a).

2.2.2 Preliminary Conceptual Site Model and Sampling Plan Development

MFA developed preliminary CSMs based on information from written building surveys issued to occupants by Ecology and information gathered from a site walk. The purpose of the CSMs was to identify possible exposure pathways and prioritize buildings for sampling based on the potential for vapor intrusion. MFA compiled the information collected from the building surveys and site walk, and then coordinated with Ecology to develop the Sampling Plan with input from DOH. The buildings included in the Sampling Plan were considered to have the highest potential for vapor intrusion on the site, based on factors such as proximity to the groundwater plume, building construction type, and identification of exposure pathways, such as foundation cracks and utility penetrations. Three vacant properties were also included in the Sampling Plan to assess the probability that indoor air could be impacted should a building be constructed in the future.

2.3 Tier II Assessment—Vapor Intrusion Sampling

2.3.1 Sampling Scope and Methodology—November, 2012

Samples were collected in stainless steel Summa canisters and analyzed for PCE and associated breakdown products (trichloroethene [TCE]; 1,1-dichloroethene [1,1-DCE]; cis-1,2-DCE; trans-1,2-DCE; 1,1-dichloroethane [1,1-DCA]; 1,2-DCA; chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency Method TO-15 selected ion monitoring. Analytical data has consistently shown that the only hazardous substance associated with the site is PCE and there is no indication of the presence of associated breakdown products from any of the media analyzed, i.e., groundwater, soil gas, or soil.

Forty-eight samples were collected and analyzed during the 2012 mobilization:

- Twenty-one indoor air samples
- Three crawlspace air samples
- Seven soil gas samples
- Eleven subslab soil gas samples
- Six outdoor background air samples

The sampling scope for properties on the site is summarized in Table 1. Figure 2 shows soil gas, outdoor air, and groundwater sampling locations for 2012 and 2013. Wind roses used to evaluate and select background sampling locations are included in Appendix A.

Table 1
2012 Sampling Summary

ID	Property	Foundation Type	Number of Indoor Air Samples	Number of Subslab Samples	Number of Crawlspace Samples	Number of Soil Gas Samples
1*	117 N. 3rd Ave— Fire Station	Slab-on-grade	3	3	0	1
5*	210 N. Main Ave— Community Center	Slab-on-grade	3	0	0	1
7	116 N. Main Ave— Police Dept.	Slab-on-grade	2	3	0	0
9	121 N. Main Ave— Sportsman Bar & Grill	Crawlspace (inaccessible)	2	0	0	0
10*	127 N. Main Ave— Sales Office	Crawlspace	2	0	1	0
11*	201/205 N. Main Ave— Post Office	Slab-on-grade	3	4	0	1
13*	305 N. Main Ave	Slab-on-grade	2	1	0	1
24*	322 N. 1st Ave	Partial basement, partial crawlspace	2	0	1	1
27*	304 N. 1st Ave	Crawlspace	2	0	1	1
44*	122 N. Main Ave— Former Park Laundry Property, Vacant Lot	N/A	0	0	0	0
45*	126 N. Main Ave— Vacant Lot	N/A	0	0	0	1
46*	Main Ave/Mill Street Intersection— Vacant Lot	N/A	0	0	0	1
*A soil gas sampling port was installed at the property. Soil gas samples were taken only from locations where groundwater was not encountered.						

As described in the Sampling Plan, a two-phase approach was used to assess each property. The preliminary site visit included occupant interviews, an inspection to identify sampling locations, and the removal of potential indoor chemical sources. Information and representative photographs collected during the site survey and occupant interviews are summarized in Appendix B, Field Data Summary.

MFA used a portable gas chromatograph/mass spectrometer (GC/MS) to screen the indoor air in each building to identify potential indoor sources of chlorinated VOCs. Subslab and/or soil gas sampling ports, if applicable, were also installed during the preliminary visit. Samples were collected, consistent with the Sampling Plan, approximately 24 hours after the preliminary visit.

2.3.2 Sampling Scope and Methodology—July 2013

The sampling scope and methodology in 2013 were the same as in 2012, with the following exceptions.

Forty-seven samples were collected and analyzed during the 2013 mobilization:

- Twenty-two indoor air samples
- Two crawlspace air samples
- Nine soil gas samples
- Thirteen subslab soil gas samples
- Two outdoor background air samples

The sampling scope for properties on the site is summarized in Table 2.

Table 2
2013 Sampling Summary

ID	Property	Foundation Type	Number of Indoor Air Samples	Number of Subslab Samples	Number of Crawlspace Samples	Number of Soil Gas Samples
1*	117 N. 3rd Ave— Fire Station	Slab-on-grade	3	3	0	0
5*	210 N. Main Ave— Community Center	Slab-on-grade	3	2	0	1
7	116 N. Main Ave— Police Dept.	Slab-on-grade	2	3	0	0
9	121 N. Main Ave— Sportsman Bar & Grill	Crawlspace (inaccessible)	2	0	0	0
10*	127 N. Main Ave— Sales Office	Crawlspace	2	0	1	0
11*	201/205 N. Main Ave— Post Office	Slab-on-grade	3	4	0	1
13*	305 N. Main Ave	Slab-on-grade	2	1	0	1
24*	322 N. 1st Ave	Partial basement, partial crawlspace	0	0	0	1
27*	304 N. 1st Ave	Crawlspace	2	0	1	1
28*	305 N. 1st Ave	Basement	3	0	0	1
44*	122 N. Main Ave—Former Park Laundry Property, Vacant Lot	N/A	0	0	0	1

ID	Property	Foundation Type	Number of Indoor Air Samples	Number of Subslab Samples	Number of Crawlspace Samples	Number of Soil Gas Samples
45*	126 N. Main Ave—Vacant Lot	N/A	0	0	0	1
46*	Main Ave/Mill Street Intersection—Vacant Lot	N/A	0	0	0	1

*A soil gas sampling port was installed at the property. Soil gas samples were taken only from locations where groundwater was not encountered.

MFA limited the assessment of potential indoor sources of chlorinated VOCs to interviews and a visual inspection instead of using a portable GC/MS.

2.3.3 Refined Conceptual Site Models

MFA refined the CSM for each of the buildings included in the Sampling Plan, based on the information gathered during the visual inspection. The results are provided in Appendix C, Conceptual Site Models, and the content of the CSM is consistent with Section 3.2 of Ecology’s draft vapor intrusion guidance (Ecology, 2009b).

3 EXPOSURE ASSESSMENT SAMPLING CRITERIA

Results from the assessment were compared to screening levels summarized in Table 3.

Table 3
Analytes and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	9.6	96
TCE	79-01-6	0.37	3.7
1,1-DCE	75-35-4	91	910
cis-1,2-DCE	156-59-2	16	160
trans-1,2-DCE	156-60-5	32	320
1,1-DCA	75-34-3	320	3200
1,2-DCA	107-06-2	0.096	0.96
Chloroethane	75-00-3	3	30
Vinyl chloride	75-01-4	0.28	2.8

NOTES:
Screening levels are based on Table B-1 (Ecology, 2009b). Values for PCE and TCE are based on CLARC guidance (Ecology, 2012b).
CAS = Chemical Abstract Service.
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

4 SAMPLING RESULTS

Sampling results are summarized in the attached analytical tables (Tables 4 and 5). Complete laboratory reports and data validation are also provided in Appendices D and E, respectively.

4.1 Soil Gas Samples

4.1.1 November 2012

- PCE was detected in one soil gas sample (Property 45, Vacant Lot at 126 N. Main Avenue) that exceeded the screening level ($96 \mu\text{g}/\text{m}^3$), with a concentration of $2,800 \mu\text{g}/\text{m}^3$.
- TCE was detected in one soil gas sample (Property 11, Post Office) that exceeded the screening level ($3.7 \mu\text{g}/\text{m}^3$), with a concentration of $4.7 \mu\text{g}/\text{m}^3$.
- Vinyl chloride was detected in one soil gas sample (Property 11, Post Office) that exceeded the screening level ($2.8 \mu\text{g}/\text{m}^3$), with a concentration of $4.7 \mu\text{g}/\text{m}^3$.

4.1.2 July 2013

- PCE results exceeded the screening level of $96 \mu\text{g}/\text{m}^3$ in five soil gas samples. Each of the three vacant lots had exceedances, with results ranging from $100 \mu\text{g}/\text{m}^3$ at Property 46, the corner of Main Avenue and Mill Street, to $9,500 \mu\text{g}/\text{m}^3$ at Property 44, the Property. The soil gas result for Property 5, the Community Center, was $250 \mu\text{g}/\text{m}^3$, and the result for Property 28, 305 N. 1st Avenue, was $16,000 \mu\text{g}/\text{m}^3$.
- TCE results exceeded the screening level of $3.7 \mu\text{g}/\text{m}^3$ in one soil gas sample. The soil gas concentration at Property 11, the Post Office, was $5.2 \mu\text{g}/\text{m}^3$. TCE is not a site-related hazardous substance.

4.2 Subslab Samples

4.2.1 November 2012

- No subslab sample results exceeded the screening level for any analytes.
- Helium was detected in three subslab samples, with reported concentrations of 0.24 percent and 0.59 percent (Property 7, Police Department), and 0.38% (Property 11, Post Office).

4.2.2 July 2013

- PCE results exceeded the screening level of $96 \mu\text{g}/\text{m}^3$ in both of the subsurface samples at Property 5, the Community Center, with results of $320 \mu\text{g}/\text{m}^3$ and $750 \mu\text{g}/\text{m}^3$. PCE was not detected in indoor air samples.

4.3 Indoor and Outdoor Air Samples

4.3.1 November 2012

- TCE was detected above the screening level ($0.37 \mu\text{g}/\text{m}^3$) in all three indoor air samples collected from Property 1, the Fire Station, with results between $1 \mu\text{g}/\text{m}^3$ and $1.2 \mu\text{g}/\text{m}^3$. Results from all three subsurface samples at the Fire Station showed that TCE concentrations were either non-detect or estimated to be $0.35 \mu\text{g}/\text{m}^3$ or less.
- 1,2-DCA was detected above the screening level of $0.096 \mu\text{g}/\text{m}^3$ in 15 out of 21 indoor air and two out of six outdoor air (background) samples. Reported indoor air concentrations ranged from $0.074 \mu\text{g}/\text{m}^3$ to $1.5 \mu\text{g}/\text{m}^3$. Reported outdoor air concentrations ranged from $0.056 \mu\text{g}/\text{m}^3$ to $0.81 \mu\text{g}/\text{m}^3$.
- 1,2-DCA was not detected above the screening level or method reporting limit in any subsurface samples, including both subsurface and soil gas.
- Each sample had an initial starting canister pressure of at least -28 inches of mercury. Two samples (1-IA2-111512, collected from upstairs of the Fire Station, and sample 27-CS1-111512, collected from the crawlspace of 304 N. 1st Avenue) were received by the lab with a final canister pressure of 0 inches of mercury.

4.3.2 July 2013

- TCE was detected above the screening level ($0.37 \mu\text{g}/\text{m}^3$) in two of the three indoor air samples collected from Property 1, the Fire Station, with results between $0.47 \mu\text{g}/\text{m}^3$ and $2.2 \mu\text{g}/\text{m}^3$. TCE was not detected in any of the three subsurface sampling locations at the Fire Station.
- TCE was detected above the screening level ($0.37 \mu\text{g}/\text{m}^3$) in one of the three indoor air samples collected from Property 5, the Community Center, with a result of $0.68 \mu\text{g}/\text{m}^3$. TCE was not detected in either of the two subsurface sampling locations at the Community Center.
- TCE was detected above the screening level ($0.37 \mu\text{g}/\text{m}^3$) in one of the two indoor air samples collected from Property 9, the Sportsman Bar & Grill, with a result of $1.3 \mu\text{g}/\text{m}^3$.
- PCE and TCE were both detected in one of the two outdoor air (background) samples, but results were below the screening levels.

- 1,2-DCA was detected above the screening level of 0.096 $\mu\text{g}/\text{m}^3$ in 17 out of 22 indoor air and one out of two outdoor air (background) samples. Reported indoor air concentrations ranged from 0.069 $\mu\text{g}/\text{m}^3$ to 2.6 $\mu\text{g}/\text{m}^3$. Reported outdoor air concentrations ranged from 0.061 $\mu\text{g}/\text{m}^3$ to 0.16 $\mu\text{g}/\text{m}^3$.
- 1,2-DCA was not detected above the screening level or method reporting limit in any subsurface samples, including both subslab and soil gas.

5 DISCUSSION

There appears to be no vapor intrusion into buildings on this site. This conclusion is based on multiple lines of evidence, including the lack of any constituents above screening levels in the indoor air that were simultaneously found in corresponding soil gas or subslab samples.

The presence of PCE above the screening level in the soil gas on the two vacant lots immediately north of the former Park Laundry property (see Figure 1) warrants consideration of possible vapor intrusion into buildings that may be constructed in the future as part of the human health risk assessment.

Although PCE was detected above the soil gas screening level near and below the slab of the Community Center, PCE was not identified in indoor air above the screening level after two rounds of sampling. Similarly, PCE was identified above the screening level in the soil gas near 305 N. 1st Avenue and near the Post Office, but was not detected in the indoor air in either location. TCE and vinyl chloride were also detected above the screening level in the soil gas near the Post Office, but were not above the screening level in the subslab sample or in indoor air.

TCE and 1,2-DCA were the only constituents detected in indoor air above the screening level in any of the buildings. Neither TCE or 1,2-DCA are site-related hazardous substances. TCE appears related to indoor sources, based on the lack of TCE in corresponding subsurface samples. The groundwater level was too high to collect a soil gas sample near the Sportsman Bar & Grill. The general lack of TCE in the subsurface throughout the site makes it unlikely that the result at the Sportsman Bar & Grill is due to vapor intrusion.

There appears to be at least one background source of 1,2-DCA, indicated by the generally consistent concentrations in the indoor air and in some of the background samples, and by the absence of 1,2-DCA above screening levels or the method reporting limit in the soil gas or subslab samples. According to literature sources, 1,2-DCA is an additive to many common products, including leaded gasoline, paints, and adhesives, such as those used in wallpaper glue or carpeting (ATSDR, 2001). The presence of TCE in one of the background samples collected in 2013 suggests that there is either a background source near the site, or that the background sample was sufficiently downwind during the sampling period to be affected by the site contaminants.

Helium detected in three of the subslab samples collected in 2012 indicates the potential infiltration of ambient air, which suggests that the detected constituents in these samples are likely to be underestimated. However, each property with subslab sampling data had at least one sample result with no helium detected. Therefore, the subslab data provide a strong line of evidence on which to base conclusions about the lack of vapor intrusion.

6 RECOMMENDATIONS

Based on the results of the assessment, MFA recommends the following:

1. Communicate the assessment results to building owners and occupants.
2. The potential for future exposure on the properties on the site should be considered in the human health risk assessment necessary for completion of the RI.
3. The indoor air assessment for the site should be considered concluded.

LIMITATIONS

The services undertaken in completing this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

	Mike Murray	Yes	No	Yes	No	No	Yes	Yes	No	Yes
	Andy Vidourek	Yes	No	Yes	No	No	Yes	No	No	No
	Occupancy	2 to 4	Average 40	3 to 4	200 when crowded, average of 60	3	14	One adult, four children	Two adults, one child (13-18)	One adult, one child (13-18)
Occupant Info	Foundation Type	Slab-on-grade	Slab-on-grade	Slab-on-grade	Full crawlspace	Full crawlspace	Slab-on-grade	Slab-on-grade	Partial basement and partial crawlspace	Full crawlspace
	Foundation Notes	Some cracks visible in the slab. See photos.	None	None	None	Full crawlspace with vapor barrier on soil	None	Floating floor above slab in most of living space.	Basement; crawlspace in areas that don't have a basement.	Full crawlspace
	Number of Occupied Floors BELOW Grade	0	0	0	0	0	0	0	1	0
	Occupied Floors BELOW Grade—Notes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Unfinished basement	N/A
	Number of Occupied Floors ABOVE Grade	2	1	1	1	1	1	2	1	1
	Occupied Floors ABOVE Grade—Notes	The main floor is primarily the garage and gym. The upper floor includes the living, eating, and sleeping areas.	None	None	None	None	None	None	None	None
	Depth of Basement Below Grade (ft)	N/A	N/A	N/A	N/A	N/A	N/A	N/A	7-8 ft	N/A
	Basement Size (sq ft)	N/A	N/A	N/A	N/A	N/A	N/A	N/A	300	N/A
	Basement Floor Construction	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Concrete	N/A
	Basement Floor Notes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	No obvious cracks or drains. Concrete slab over former exposed dirt, according to interviews.	N/A
	Foundation Walls	N/A	N/A	N/A	Concrete	Concrete	N/A	N/A	Concrete	Concrete, cinder blocks
	Foundation Walls Notes	N/A	N/A	N/A	None	None	N/A	N/A	No obvious cracks. One penetration.	Combination of cmu and concrete. Will confirm.
	Type of Heating System	Forced-air furnace	Forced-air furnace	Forced-air furnace	Forced-air furnace	Forced-air furnace	Forced-air furnace	Forced-air furnace	Baseboard electric	Other
	Heating System Notes	Forced-air furnace supplies the upstairs area. A ceiling-mounted electric heater supplies the downstairs area.	None	None	Furnace is in the attic and a heat pump is outside	None	None	None	None	Equivalent of a window heating and cooling unit, but installed through the wall. One in the living room, one in kitchen. Five cadet wall heaters.
	Type of Heating Fuel	Natural gas, electric	Natural gas	Natural gas	Natural gas	Natural gas	Natural gas	Natural gas	Electric	Electric
	Heating Fuel Notes	None	None	None	None	None	None	None	None	None
	Ventilation System(s)	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, central furnace, attic exhaust fan, kitchen range hood fan	Bathroom fan, kitchen range hood fan, central furnace, attic exhaust fan	Bathroom fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Kitchen range hood fan	Bathroom fans, kitchen range hood fan(s)
	Ventilation System Notes	There is an automatic exhaust fan that activates anytime the overhead doors are open for 10 or 15 minutes to prevent carbon monoxide buildup. Unknown CFM.	None	Fan in the interview room	None	None	None	None	None	Unknown whether there is an attic fan.
	Basement Sump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	No	N/A
	Sump Pump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
	Water in Sump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
	Basement Sealed?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Neither walls nor floor sealed	N/A
	Existing Radon System in Place?	No	No	No	No	No	No	No	No	No
	Subslab Vapor Barrier in Place?	No	Unknown	Unknown—Probably no vapor barrier, based on the age of slab.	N/A	NA	Unknown	Unknown	Unknown	Unknown
	Location of Floor Drains?	None	Unknown	None	Two locations: 1) under the bar, and 2) in the kitchen	None	Four total—one in each of two bathrooms, one in the custodian room, one in the electrical room	None	Unknown	Unknown
Location of Utility Penetrations?	Location 1	NW area—water line	None. Just bathroom toilet penetrations.	None. Just bathroom toilet penetrations.	Gas comes in above grade in SE corner.	Natural gas line comes through floor in furnace room behind lobby.	Electrical room	No penetrations noted	Water line in basement	Unknown
	Location 2	No other penetrations noted	No penetrations noted	No penetrations noted	No penetrations noted	Floor-mounted heat registers	Custodian room drains	No penetrations noted	No other penetrations noted	Unknown
	Location 3	No other penetrations noted	No penetrations noted	No penetrations noted	No penetrations noted	Drains for bathrooms and sink	No other penetrations noted	No penetrations noted	No other penetrations noted	Unknown
Potential Indoor Sources-Source Materials	Gasoline Storage Cans	Yes	No	No	No	No	No	Unknown	No	No
	Gas-powered Equipment	Yes	No	No	No	No	No	Unknown	No	No
	Paints/Thinners/Strippers	Yes	Unknown	No	Outside in the shed	No	No	Unknown	No	No
	Cleaning Solvents	Yes	Yes	Yes	Yes	Yes	Yes	Unknown	Yes	Yes
	Oven Cleaners	Yes	Unknown	No	Yes	No	No	Unknown	No	No
	Insecticides	Yes	Unknown	No	No	No	No	Unknown	No	No
	Do any occupants smoke?	No	No	No	No	No	No	Unknown	Yes	No
	Notes (last time occupants smoked)	N/A	N/A	N/A	N/A	N/A	N/A	Unknown	Smokes only outside	N/A
	Does the building have an attached garage?	Yes	No	No	No	No	No	Yes	No	No
	Notes (is the car typically in the garage?)	Yes	N/A	N/A	N/A	N/A	N/A	No	N/A	N/A
	Do the occupants have items in the house dry-cleaned?	Yes	No	No	No	No	No	Unknown	No	No
	Dry-clean—if so, how often?	Weekly	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	N/A
	Last time something was dry-cleaned?	Week ago	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	N/A
	Do occupants use solvents at work?	No	Unknown	No	No	No	No	Unknown	No	No
	If so, what types of solvents are used?	N/A	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	N/A
	If so, are clothes washed at work?	N/A	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	N/A
	Have any pesticides or herbicides been applied around the building or in the yard?	Unknown	Unknown	No	No	Presumed yes. Applied by outside landscape contractors.	Outside landscapers applied something in July or August. Rootsall weed killer.	Unknown	No	Yes
	If so, what type? Frequency? Date of application?	Unknown	Unknown	N/A	N/A	Unknown	Unknown	Unknown	N/A	Green eco-friendly applied outside for spiders in the summertime.
	Has there been a fire in the building?	No	No	No	Yes	No	No	Unknown	No	No
	Fire: Notes	N/A	N/A	N/A	Approx. 20 years ago	N/A	N/A	N/A	N/A	N/A
	Painting or staining in the last six months?	No	Unknown	No	No	No	No	Unknown	No	No
	Painting/Staining Notes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Sub-Slab Sampling Ports	Location 1	Near weightlifting equipment	N/A	Outside Chief Greene's office	N/A	N/A	N/A	NW corner of mail room	Laundry room	N/A
	Location 2	Closet under stairs	N/A	Interview room	N/A	N/A	N/A	Central work station	N/A	N/A
	Location 3	East area near door to upstairs	N/A	East hallway	N/A	N/A	N/A	Central east	N/A	N/A

	Basement Floor Notes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	No obvious cracks or drains. Concrete slab over former exposed dirt, according to interviews.	N/A	Cracks in floor
	Foundation Walls	N/A	N/A	N/A	Concrete	Concrete	N/A	N/A	Concrete	Concrete, cinder blocks	Cinder block and concrete
	Foundation Walls Notes	N/A	N/A	N/A	None	None	N/A	N/A	No obvious cracks. One penetration.	Combination of cmu and concrete. Will confirm.	N/A
	Type of Heating System	Forced-air furnace	Forced-air furnace	Forced-air furnace	Ductless heat pump system	Forced-air furnace	Forced-air furnace	Forced-air furnace	Baseboard electric	Other	Forced-air furnace
	Heating System Notes	Forced-air furnace supplies the upstairs area. A ceiling-mounted electric heater supplies the downstairs area.	None	None	Ductless heat pump system installed since last year. It replaced the furnace.	None	None	None	None	Equivalent of a window heating and cooling unit, but installed through the wall. One in the living room, one in kitchen. Five cadet wall heaters.	None
	Type of Heating Fuel	Natural gas, electric	Natural gas	Natural gas	Natural gas	Natural gas	Natural gas	Natural gas	Electric	Electric	Natural Gas
	Heating Fuel Notes	None	None	None	None	None	None	None	None	None	None
	Ventilation System(s)	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fan, central furnace, attic exhaust fan, kitchen range hood fan	Bathroom fan, kitchen range hood fan, central furnace, attic exhaust fan	Bathroom fan, central furnace	Bathroom fan, kitchen range hood fan, central furnace	Bathroom fans, kitchen range hood fan(s)	Bathroom fans, kitchen range hood fan(s)	Bathroom fan(s), kitchen range hood fan(s)
	Ventilation System Notes	There is an automatic exhaust fan that activates anytime the overhead doors are open for 10 or 15 minutes to prevent carbon monoxide buildup. Unknown CFM.	None	Fan in the interview room	None	None	None	None	None	Unknown whether there is an attic fan.	None
	Basement Sump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Sump Pump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Water in Sump?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Basement Sealed?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Neither walls nor floor sealed	N/A	Neither walls nor floor sealed
Existing Radon System in Place?	No	No	No	No	No	No	No	No	No	No	
Subslab Vapor Barrier in Place?	No	Unknown	Unknown—Probably no vapor barrier, based on the age of slab	N/A	NA	Unknown	Unknown	Unknown	Unknown	Unknown	
Location of Floor Drains?	None	Unknown	None	Two locations: 1) under the bar, and 2) in the kitchen	None	Four total—one in each of two bathrooms, one in the custodian room, one in the electrical room	None	Unknown	Unknown	Unknown	
Location of Utility Penetrations?	Location 1	NW area—water line	None. Just bathroom toilet penetrations	None. Just bathroom toilet penetrations	Gas comes in above grade in SE corner.	Natural gas line comes through floor in furnace room behind lobby.	Electrical room	No penetrations noted	Water line in basement	Unknown	No penetrations noted
	Location 2	No other penetrations noted	No penetrations noted	No penetrations noted	No penetrations noted	Floor-mounted heat registers	Custodian room drains	No penetrations noted	No other penetrations noted	Unknown	No penetrations noted
	Location 3	No other penetrations noted	No penetrations noted	No penetrations noted	No penetrations noted	Drains for bathrooms and sink	No other penetrations noted	No penetrations noted	No other penetrations noted	Unknown	No penetrations noted
Potential Indoor Sources—Source Materials	Gasoline Storage Cans	Yes	No	No	No	No	No	Unknown	No	No	Yes
	Gas-powered Equipment	Yes	No	No	No	No	No	Unknown	No	No	Yes
	Paints/Thinners/Strippers	Yes	Unknown	No	Outside in the shed	No	Yes	Unknown	No	No	Yes
	Cleaning Solvents	Yes	Yes	Yes	Yes	Yes	Yes	Unknown	Yes	No	Yes
	Oven Cleaners	Yes	Unknown	No	Yes	No	No	Unknown	No	Yes	No
	Insecticides	Yes	Unknown	No	No	No	No	Unknown	No	No	No
	Do any occupants smoke?	No	No	No	No	No	No	Unknown	Yes	No	Yes
Notes (last time occupants smoked)	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Smokes only outside	N/A	Within 24 hours	
Does the building have an attached garage?	Yes	No	No	No	No	No	No	No	No	No	
Notes (is the car typically in the garage?)	Yes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Do the occupants have items in the house dry-cleaned?	Yes	No	No	No	No	No	Unknown	No	Yes	No	
Dry-clean—if so, how often?	Weekly	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	3-4 times per year	N/A	
Last time something was dry-cleaned?	Week ago	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	N/A	N/A	
Do occupants use solvents at work?	No	Unknown	No	No	No	No	Unknown	No	No	Yes	
If so, what types of solvents are used?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Unknown	
If so, are clothes washed at work?	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Unknown	N/A	No	
Have any pesticides or herbicides been applied around the building or in the yard?	Unknown	Unknown	No	No	Presumed yes. Applied by outside landscape contractors.	Outside landscapers applied something in July or August. Rootsall weed killer.	Unknown	No	Yes	Yes	
If so, what type? Frequency? Date of application?	Unknown	Unknown	N/A	N/A	Unknown	Unknown	Unknown	N/A	Roundup about 1 month ago in front yard	Unknown pesticide used within last month	
Has there been a fire in the building?	No	No	No	Yes	No	No	Unknown	No	No	No	
Fire: Notes	N/A	N/A	N/A	Approx. 20 years ago	N/A	N/A	N/A	N/A	N/A	N/A	
Painting or staining in the last six months?	No	Unknown	No	Yes	No	No	Unknown	No	Unknown	Yes	
Painting/staining notes	N/A	N/A	N/A	Interior was painted April through June, 2013	N/A	N/A	N/A	N/A	May have been painted before new tenant moved in	Painted much of the upstairs in March 2013 (approximately)	
Subslab Sampling Ports	Location 1	Near weightlifting equipment	East by kitchen door	Outside Chief Greene's office	N/A	N/A	NW corner of mail room	Laundry room	N/A	N/A	N/A
	Location 2	Closet under stairs	Central Closet	Interview room	N/A	N/A	Central work station	N/A	N/A	N/A	N/A
	Location 3	East area near door to upstairs	N/A	East hallway	N/A	N/A	Central east	N/A	N/A	N/A	N/A
	Location 4	N/A	N/A	N/A	N/A	N/A	By Safe	N/A	N/A	N/A	N/A
Notes	Property Notes	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed. Two new sub-slab sampling ports were installed in July 2013.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and new changes include recent remodeling and changes to the heating system.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed.	Information from preliminary site visit in Nov. 2012 was reviewed during July 2013 sampling visit, and no changes to property were confirmed.	Access to property for indoor air sampling was not granted during July 2013 sampling event. No updates to property were noted.	New tenant, Maureen Kerwood, confirmed updated property information.	Property was not sampled during November 2012 vapor intrusion sampling event.

APPENDIX D

LABORATORY REPORTS

12/13/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211513A

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513A

Fourteen 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Despite the use of flow controllers for sample collection, the final canister vacuums for samples 1-IA2-111512 and 27-CS1-111512 were measured at ambient pressure in the field. These ambient pressure readings were confirmed by the laboratory upon sample receipt.

Analytical Notes

Dilution was performed on samples 9-IA1-111212 and 9-IA2-111212 due to the presence of high level non-target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

- a-File was requantified
- b-File was quantified by a second column and detector
- r1-File was requantified for the purpose of reissue

WEST PRINTING & GRAPHICS (818) 704-6000

1211513

Mr. Guy Barrett
 October 12, 2012
 Page 5

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
 Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
 CAS = Chemical Abstract Service
 NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/14/2012

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211513B

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513B

Two 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE
NOTES: Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012. CAS = Chemical Abstract Service NE = Not Established $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.				

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/26/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211513C

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513C

Four 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to $< 40\%$ RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to $< 40\%$ RSD
Daily Calibration	$\pm 30\%$ Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Despite the use of flow controllers for sample collection, the final canister vacuum for sample OA2-111512 was measured at ambient pressure in the field. This ambient pressure reading was confirmed by the laboratory upon sample receipt.

Samples OA1-111512, OA3-111612, OA2-111512 and OA2-111612 were removed from "Hold" and placed on "Active" status per client request on December 14, 2012.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE
NOTES: Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012. CAS = Chemical Abstract Service NE = Not Established $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.				

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/10/2013

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211513D

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513D

Fourteen 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Despite the use of flow controllers for sample collection, the final canister vacuums for samples 1-IA2-111512 and 27-CS1-111512 were measured at ambient pressure in the field. These ambient pressure readings were confirmed by the laboratory upon sample receipt.

Analytical Notes

Dilution was performed on samples 9-IA1-111212 and 9-IA2-111212 due to the presence of high level non-target species.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211513A on 12-13-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

WEST PRINTING & GRAPHICS (818) 704-6000

1211513

Mr. Guy Barrett
 October 12, 2012
 Page 5

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
 Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
 CAS = Chemical Abstract Service
 NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/10/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave

Portland OR 97209

Project Name: Park Laundry

Project #: 8006.31.01-05

Workorder #: 1211513E

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513E

Two 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to $< 40\%$ RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to $< 40\%$ RSD
Daily Calibration	$\pm 30\%$ Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211513A on 12-14-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction

not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE
NOTES: Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012. CAS = Chemical Abstract Service NE = Not Established $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.				

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/13/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211513FR1

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211513FR1

Four 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Despite the use of flow controllers for sample collection, the final canister vacuum for sample OA2-111512 was measured at ambient pressure in the field. This ambient pressure reading was confirmed by the laboratory upon sample receipt.

Samples OA1-111512, OA3-111612, OA2-111512 and OA2-111612 were removed from "Hold" and placed on "Active" status per client request on December 14, 2012.

Analytical Notes

There were no analytical discrepancies.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211513C on 12-26-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

THE WORK ORDER WAS RE-ISSUED ON 1/13/13 TO INCLUDE THE MDL VALUES IN THE FINAL REPORT.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE
NOTES: Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012. CAS = Chemical Abstract Service NE = Not Established $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.				

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/13/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.

Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211514A

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211514A

Ten 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action, Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/13/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211514B

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

**LABORATORY NARRATIVE
Modified TO-15
Maul Foster and Alongi Inc.
Workorder# 1211514B**

Ten 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
Initial Calibration	</=30% RSD with 2 compounds allowed out to < 40% RSD	</=30% RSD with 4 compounds allowed out to < 40% RSD
Blank and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Dilution was performed on samples 11-SS2-111512, 11-SS3-111512, and 11-SS4-111512 due to the presence of high level non-target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

- B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).
- J - Estimated value.
- E - Exceeds instrument calibration range.
- S - Saturated peak.
- Q - Exceeds quality control limits.
- U - Compound analyzed for but not detected above the reporting limit.
- UJ- Non-detected compound associated with low bias in the CCV and/or LCS.
- N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

- a-File was requantified
- b-File was quantified by a second column and detector
- r1-File was requantified for the purpose of reissue

121151X

Mr. Guy Barrett
October 12, 2012
Page 5

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/5/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211514C

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Maul Foster and Alongi Inc.
Workorder# 1211514C

Ten 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via Modified ASTM Method D-1946 for Helium in air using GC/TCD. The method involves direct injection of 1.0 mL of sample.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>ASTM D-1946</i>	<i>ATL Modifications</i>
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a $\geq 95\%$ accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections $> 5 X$'s the RL.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:

B - Compound present in laboratory blank greater than reporting limit.

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the detection limit.

M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/13/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211514DR1

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1211514DR1

Ten 6 Liter Summa Canister (SIM Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211514A on 12-13-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

THE WORK ORDER WAS RE-ISSUED ON 1/13/13 TO INCLUDE THE MDL VALUES IN THE FINAL REPORT.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action, Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/14/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211514ER2

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15
Maul Foster and Alongi Inc.
Workorder# 1211514ER2

Ten 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
Initial Calibration	$\leq 30\%$ RSD with 2 compounds allowed out to $< 40\%$ RSD	$\leq 30\%$ RSD with 4 compounds allowed out to $< 40\%$ RSD
Blank and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Dilution was performed on samples 11-SS2-111512, 11-SS3-111512, and 11-SS4-111512 due to the presence of high level non-target species.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211514B on 12-13-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

THE WORK ORDER WAS RE-ISSUED ON 1/14/13 TO INCLUDE THE MDL VALUES IN THE FINAL REPORT.

THE WORK ORDER WAS REISSUED ON 1/14/13 TO APPLY THE REPORTING LIMITS AND ASSOCIATED RESULTS GENERATED FROM THE FULL SCAN TO-15 DATA FILE CONSISTENT WITH WORKORDER 1211515A, RATHER THAN THE LOWER SIM REPORTING LIMITS AND RESULTS GENERATED FROM THE TO-15 SIM DATA FILE. CHANGING THE REPORTING LIMITS FROM SIM TO FULL SCAN CAUSED SOME

PREVIOUSLY REPORTED COMPOUNDS TO BE BELOW THE REPORTING LIMIT AND WERE THEREFORE REPORTED AS "NOT DETECTED".

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Mr. Guy Barrett
October 12, 2012
Page 5

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey© database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/13/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211515A

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15
Maul Foster and Alongi Inc.
Workorder# 1211515A

Nine 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
Initial Calibration	</=30% RSD with 2 compounds allowed out to < 40% RSD	</=30% RSD with 4 compounds allowed out to < 40% RSD
Blank and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Dilution was performed on sample 45-SG1-111512 due to the presence of high level target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV and/or LCS.

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

**Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)**

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey® database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

12/5/2012

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211515B

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Maul Foster and Alongi Inc.
Workorder# 1211515B

Nine 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via Modified ASTM Method D-1946 for Helium in air using GC/TCD. The method involves direct injection of 1.0 mL of sample.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>ASTM D-1946</i>	<i>ATL Modifications</i>
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a $\geq 95\%$ accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections $> 5 X$'s the RL.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:

B - Compound present in laboratory blank greater than reporting limit.

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the detection limit.

M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

**Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)**

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey® database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

1/14/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.
2001 NW 19th Ave
Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01-05
Workorder #: 1211515CR1

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 11/26/2012 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15
Maul Foster and Alongi Inc.
Workorder# 1211515CR1

Nine 1 Liter Summa Canister (100% Certified) samples were received on November 26, 2012. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
Initial Calibration	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	$\leq 30\%$ RSD with 4 compounds allowed out to <math>< 40\%</math> RSD
Blank and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Dilution was performed on sample 45-SG1-111512 due to the presence of high level target species.

This workorder was created to evaluate Trichloroethene (TCE) and 1,2-Dichloroethane (1,2-DCA) in all samples down to the Method Detection Limit to allow for comparison of results to the required screening levels. Please note that this workorder fraction contains only a subset of the requested analytes. The full list evaluated to the Reporting Limit (RL), including TCE and 1,2-DCA, were reported in workorder 1211515A on 12-13-12.

All canisters used for this project have been certified to the RL for the target analytes. Concentrations that are below the level at which the canister was certified may be false positives.

THE WORK ORDER WAS REISSUED ON 1/14/13 TO APPLY THE REPORTING LIMITS AND ASSOCIATED RESULTS GENERATED FROM THE FULL SCAN TO-15 DATA FILE CONSISTENT WITH WORKORDER 1211515A, RATHER THAN THE LOWER SIM REPORTING LIMITS AND RESULTS GENERATED FROM THE TO-15 SIM DATA FILE. CHANGING THE REPORTING LIMITS FROM SIM TO FULL SCAN CAUSED SOME PREVIOUSLY REPORTED COMPOUNDS TO BE BELOW THE REPORTING LIMIT AND WERE THEREFORE REPORTED AS "NOT DETECTED".

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project No. 8006.31.01

SAMPLE ANALYSIS AND QUALITY ASSURANCE

Samples will be analyzed for PCE and associated breakdown products (TCE; 1,1-DCE; cis-1,2-DCE; trans-1,2-DCE; 1,1-DCA; Chloroethane; and vinyl chloride) by Modified U.S. Environmental Protection Agency (USEPA) Method TO-15 selected ion monitoring method to achieve low reporting limits. Eurofins/Air Toxics of Folsom, California, will provide a 6-liter or 1-liter, stainless steel canister (Summa canister) for each sample. Laboratory-specific method reporting limits (MRLs) for VOCs are listed in the following table. The MRLs assume a 6-liter sample size, with the canister dilution factor not incorporated. The dilution factor is determined by the canister size and residual vacuum. For example, a 1-liter sample with a vacuum of 5-inches of mercury would have a MRL approximately 2.4 times higher than the values provided in the following table. If there are high concentrations of nontarget analytes in the samples (e.g., methylene chloride, acetone, toluene), the laboratory may dilute the sample to avoid overloading and damaging its instruments. MFA will coordinate with the laboratory to obtain the lowest possible MRLs.

**Table
Analytes, Reporting Limits, and Screening Levels ($\mu\text{g}/\text{m}^3$)**

Analyte	CAS Number	Reporting Limit	Screening Level—Air	Screening Level—Soil Gas
PCE	127-18-4	0.14	9.6	96
TCE	79-01-6	0.016	0.37	3.7
1,1-DCE	75-35-4	0.04	91	910
cis-1,2-DCE	156-59-2	0.08	16	160
trans-1,2-DCE	156-60-5	0.40	32	320
1,1-DCA	75-34-3	0.08	320	3200
Chloroethane	75-00-3	0.13	3	30
Vinyl chloride	75-01-4	0.03	0.28	2.8
Helium	7440-59-7	81799	NE	NE

NOTES:
Screening levels are based on Table B-1 of Ecology Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action. Values for PCE and TCE are based on CLARC guidance dated September, 2012.
CAS = Chemical Abstract Service
NE = Not Established
 $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter.

MFA will receive the data electronically from the laboratory and the data will be transferred to a GISKey® database. The data will be validated consistent with Ecology and USEPA protocols. To document data reliability, a memorandum will be prepared summarizing

8/20/2013

Mr. Thomas Ashton
Maul Foster and Alongi Inc.

Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01
Workorder #: 1308171

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 8/6/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
Maul Foster and Alongi Inc.
Workorder# 1308171

twenty-two 1 Liter Summa Canister (100% Certified) samples were received on August 06, 2013. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

All Quality Control Limit exceedances and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page.

As per client project requirements, the laboratory has reported estimated values for Vinyl Chloride, 1,2-Dichloroethane, Trichloroethene hits that are below the Reporting Limit but greater than the Method Detection Limit. Concentrations that are below the level at which the canister was certified may be false positives.

Dilution was performed on samples 28-SG1-073013 and 44-SG1-073113 due to the presence of high level target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Here is the list of analytes with our screening values.

For all of the listed analytes, please ensure that the reported concentrations on the issued report(s) are below the screening values listed below. In most cases, the MRL will be below the screening value so the MRL should be reported. However, some samples may need the MDL reported instead, in order to attain a reported value below the screening value. Please use the MRL as the default reported value, unless the MDL is necessary.

Please assess the need to use the MRL or MDL on a sample by sample (and analyte by analyte) basis.

Analyte	Air Screening Values ($\mu\text{g}/\text{m}^3$) for 6-liter canisters	Soil Gas Screening Values ($\mu\text{g}/\text{m}^3$) for 1-liter canisters
1,1-dichloroethane	320	3200
1,1-dichloroethene	91	910
1,2-dichloroethane	0.096	0.96
Chloroethane	3	30
Cis-1,2-dichloroethene	16	160
Tetrachloroethene	9.6	96
Trans-1,2-dichloroethene	32	320
Trichloroethene	0.37	3.7
Vinyl chloride	0.28	2.8
Helium	Please Report to the MRL	Please Report to the MRL

Please give me a call if you have any questions regarding this request.

Regards,

Thomas Ashton

Suite 200
Portland OR 97209

Project Name: Park Laundry
Project #: 8006.31.01
Workorder #: 1308172A

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 8/6/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1308172A

Fourteen 6 Liter Summa Canister (SIM Certified) samples were received on August 06, 2013. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	</=30% RSD with 2 compounds allowed out to < 40% RSD	Project specific; default criteria is </=30% RSD with 10% of compounds allowed out to < 40% RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is </= 30% Difference with 10% of compounds allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

As per project specific client request, the laboratory has reported estimated values for target compound 1,2-Dichloroethane that are below the Reporting Limit but greater than the Method Detection Limit. All the canisters used for this project have been certified to the Reporting Limit for the target analytes included in this workorder. Concentrations that are below the level at which the canister was certified may be false positives.

Dilution was performed on sample 9-IA1-072913 due to the presence of high level non-target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

MFA Project #8006.31.01

Here is the list of analytes with our screening values.

For all of the listed analytes, please ensure that the reported concentrations on the issued report(s) are below the screening values listed below. In most cases, the MRL will be below the screening value so the MRL should be reported. However, some samples may need the MDL reported instead, in order to attain a reported value below the screening value. Please use the MRL as the default reported value, unless the MDL is necessary.

Please assess the need to use the MRL or MDL on a sample by sample (and analyte by analyte) basis.

Analyte	Air Screening Values ($\mu\text{g}/\text{m}^3$) for 6-liter canisters	Soil Gas Screening Values ($\mu\text{g}/\text{m}^3$) for 1-liter canisters
1,1-dichloroethane	320	3200
1,1-dichloroethene	91	910
1,2-dichloroethane	0.096	0.96
Chloroethane	3	30
Cis-1,2-dichloroethene	16	160
Tetrachloroethene	9.6	96
Trans-1,2-dichloroethene	32	320
Trichloroethene	0.37	3.7
Vinyl chloride	0.28	2.8
Helium	Please Report to the MRL	Please Report to the MRL

Please give me a call if you have any questions regarding this request.

Regards,

Thomas Ashton

Project Name: Park Laundry

Project #: 8006.31.01

Workorder #: 1308172B

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 8/6/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1308172B

Two 6 Liter Summa Canister (SIM Certified) samples were received on August 06, 2013. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+/- 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

Samples OA3-073013 and OA3-072913 were removed from "Hold" and placed on "Active" status per client request on 8/14/2013 .

Analytical Notes

As per project specific client request the laboratory has reported estimated values for 1,2-Dichloroethane hits that are below the Reporting Limit but greater than the Method Detection Limit. All The canisters used for this project have been certified to the Reporting Limit for the target analytes included in this workorder. Concentrations that are below the level at which the canister was certified may be false positives.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

MFA Project #8006.31.01

Here is the list of analytes with our screening values.

For all of the listed analytes, please ensure that the reported concentrations on the issued report(s) are below the screening values listed below. In most cases, the MRL will be below the screening value so the MRL should be reported. However, some samples may need the MDL reported instead, in order to attain a reported value below the screening value. Please use the MRL as the default reported value, unless the MDL is necessary.

Please assess the need to use the MRL or MDL on a sample by sample (and analyte by analyte) basis.

Analyte	Air Screening Values ($\mu\text{g}/\text{m}^3$) for 6-liter canisters	Soil Gas Screening Values ($\mu\text{g}/\text{m}^3$) for 1-liter canisters
1,1-dichloroethane	320	3200
1,1-dichloroethene	91	910
1,2-dichloroethane	0.096	0.96
Chloroethane	3	30
Cis-1,2-dichloroethene	16	160
Tetrachloroethene	9.6	96
Trans-1,2-dichloroethene	32	320
Trichloroethene	0.37	3.7
Vinyl chloride	0.28	2.8
Helium	Please Report to the MRL	Please Report to the MRL

Please give me a call if you have any questions regarding this request.

Regards,

Thomas Ashton

Suite 200
Portland OR 97209

Project Name: Park Laundry

Project #: 8006.31.01

Workorder #: 1308173A

Dear Mr. Thomas Ashton

The following report includes the data for the above referenced project for sample(s) received on 8/6/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 SIM are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner
Project Manager

LABORATORY NARRATIVE
Modified TO-15 SIM
Maul Foster and Alongi Inc.
Workorder# 1308173A

Ten 6 Liter Summa Canister (SIM Certified) samples were received on August 06, 2013. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the SIM acquisition mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

<i>Requirement</i>	<i>TO-15</i>	<i>ATL Modifications</i>
ICAL %RSD acceptance criteria	$\leq 30\%$ RSD with 2 compounds allowed out to <math>< 40\%</math> RSD	Project specific; default criteria is $\leq 30\%$ RSD with 10% of compounds allowed out to <math>< 40\%</math> RSD
Daily Calibration	+ - 30% Difference	Project specific; default criteria is $\leq 30\%$ Difference with 10% of compounds allowed out up to $\leq 40\%$; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

As per project specific client request, the laboratory has reported estimated values for target compound 1,2-Dichloroethane that are below the Reporting Limit but greater than the Method Detection Limit. All the canisters used for this project have been certified to the Reporting Limit for the target analytes included in this workorder. Concentrations that are below the level at which the canister was certified may be false positives.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

MFA Project #8006.31.01

Here is the list of analytes with our screening values.

For all of the listed analytes, please ensure that the reported concentrations on the issued report(s) are below the screening values listed below. In most cases, the MRL will be below the screening value so the MRL should be reported. However, some samples may need the MDL reported instead, in order to attain a reported value below the screening value. Please use the MRL as the default reported value, unless the MDL is necessary.

Please assess the need to use the MRL or MDL on a sample by sample (and analyte by analyte) basis.

Analyte	Air Screening Values ($\mu\text{g}/\text{m}^3$) for 6-liter canisters	Soil Gas Screening Values ($\mu\text{g}/\text{m}^3$) for 1-liter canisters
1,1-dichloroethane	320	3200
1,1-dichloroethene	91	910
1,2-dichloroethane	0.096	0.96
Chloroethane	3	30
Cis-1,2-dichloroethene	16	160
Tetrachloroethene	9.6	96
Trans-1,2-dichloroethene	32	320
Trichloroethene	0.37	3.7
Vinyl chloride	0.28	2.8
Helium	Please Report to the MRL	Please Report to the MRL

Please give me a call if you have any questions regarding this request.

Regards,

Thomas Ashton

APPENDIX E

DATA VALIDATION

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | DECEMBER 13, 2012 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for air samples collected by the Maul Foster & Alongi, Inc. project team on the Union Ridge Investment Company site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in November 2012.

Eurofins Air Toxics, Inc. (AT) performed the analyses. AT report numbers 1211513A, 1211513B, 1211513C, 1211513D, 1211513E, 1211513FR1, 1211514A, 1211514B, 1211514C, 1211514DR1, 1211514ER2, 1211515A, 1211515B, and 1211515CR1 were reviewed. The analyses performed are listed below.

Analysis	Reference
Volatile organic compounds in ambient air (chlorinated hydrocarbons)	Modified USEPA TO-15/TO-15 SIM
Permanent gases	Modified ASTM D-1946

ASTM = American Society for Testing and Materials.

SIM = selective ion monitoring.

USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008, 2010) and appropriate laboratory and method-specific guidelines (AT, 2012; USEPA, 1986).

Data validation procedures were modified, as appropriate, to accommodate quality-control requirements for methods not specifically addressed by the functional guidelines.

Soil gas samples were collected under a helium shroud to detect leaks in the collection system. Report 1211514C, indicated helium detections for some samples. All helium detections were below the recommended concentration for resampling (NJDEP, 2012). The samples were also analyzed for USEPA TO-15 (see report 1211514B). USEPA TO-15 results may be biased low when helium is also indicated in the same sample. USEPA TO-15 detections in samples with detectable helium were qualified with a “J,” as estimated.

Sample	Helium (%)	USEPA TO-15 Report	Analyte	Original Result (µg/m ³)	Qualified Result (µg/m ³)
7-SS2	0.59	1211514B	PCE	7.8	7.8 J
7-SS3	0.24	1211514B	PCE	14	14 J
NOTES: µg/ m ³ = microgram per cubic meter. PCE = tetrachloroethene.					

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately, with the following exceptions: in sample delivery groups 1211513A and 1211513C, canisters for samples 1-IA2-111512, 27-CS1-111512, and OA2-111512 were measured at ambient pressure in the field and upon receipt at the laboratory.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. If an analyte was detected in a sample and in the associated method blank, the sample result was qualified if the concentration was less than five times the method blank concentration. All method blank results are either below the reporting limit (RL) and/or associated with non-detect sample results.

If an analyte was detected in a sample and in the associated method blank below the RL but above the method detection limit (MDL), sample detections below the level found in the method blank were qualified as “UJ” and reported as not detected (at or below the levels found in the method blank). Sample detections above the level found in the method blank were not qualified.

In report 1211513D, some analytes were detected in the laboratory method blank and between the RL and MDL. Associated sample detections above the level found in the method blank were not qualified. Associated sample detections below the level found in the method blank were qualified as “UJ” and reported as not detected (at or below the levels found in the method blank).

Report	Sample	Component	Original Result ($\mu\text{g}/\text{m}^3$)	Qualified Result ($\mu\text{g}/\text{m}^3$)
1211513D_d	24-CS1-111512	TCE	0.051 J	0.052 UJ
1211513D_d	27-IA2-111512	TCE	0.050 J	0.052 UJ
NOTE: TCE = trichloroethene.				

All remaining laboratory method blanks were non-detect.

Trip Blanks

Trip blanks were not required for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. MS/MSD samples were not required for these sampling events.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were reported for 1211514C and 1211515B. All relative percent differences were within acceptance limits.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD analytes were within acceptance limits for percent recovery.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. Field duplicates were not submitted for analysis.

CONTINUING CALIBRATION VERIFICATION RESULTS

CCV results are used to demonstrate instrument precision and accuracy through the end of the sample batch. All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

The chain of custody was submitted to the laboratory with an attachment indicating target RLs for all analytes. The target RL for TCE was later adjusted from 0.016 $\mu\text{g}/\text{m}^3$ to 0.11 $\mu\text{g}/\text{m}^3$ because of the type of sample canisters used for this project. AT used the target RLs for non-detect results, except for samples requiring dilutions because of high analyte

concentrations and/or matrix interferences. Most RLs were elevated because of canister dilution caused by residual canister vacuum.

AT reported 1,2-dichloroethane and TCE to the MDL in addendum reports 1211513D, 1211513E, 1211513FR1, 1211514DR1, 1211514ER2, and 1211515CR1. Results reported between the MDL and RL were qualified with a “J” by the laboratory.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies.

The chain of custody for all reports includes instructions to see an attachment for the list of requested analytical compounds. The attachment submitted with the chains of custody is not the final version submitted to the laboratory; it does not include 1,2-dichloroethane. A final version of the attachment that includes 1,2-dichloroethane was submitted to the laboratory.

In report 1211513A, the result for PCE from USEPA Method TO-15 SIM for sample 7-IA2-111512 was reported as estimated, with a “J” qualifier, because of a rounding protocol used by the laboratory. The rounding protocol and data qualification were verified by the reviewer.

Report 1211514D surrogate acceptance limits are incorrectly reported as 0-130 for all samples. The correct limits are 70-130.

No additional issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 8006.31.01 | AUGUST 23, 2013 | UNION RIDGE INVESTMENT COMPANY

This report reviews the analytical results for air samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the former Park Laundry site located at 122 N. Main Avenue in Ridgefield, Washington. The samples were collected in July 2013.

Eurofins Air Toxics, Inc. (AT) performed the analyses. AT report numbers 1308171, 1308172A, 1308172B, and 1308173A were reviewed. The analyses performed and samples analyzed are listed below.

Analysis	Reference
Volatile organic compounds in ambient air (chlorinated hydrocarbons)	Modified USEPA TO-15/Modified USEPA TO-15 SIM

SIM = selective ion monitoring.
USEPA = U.S. Environmental Protection Agency.

11-SS2-073113	-	-	-
11-SS1-073113	-	-	-

SDG = Sample delivery group

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008) and appropriate laboratory and method-specific guidelines (AT, 2013; USEPA, 1986).

Data validation procedures were modified, as appropriate, to accommodate quality-control requirements for methods not addressed by the functional guidelines (i.e., Modified USEPA TO-15).

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. If an analyte was detected in a sample and in the associated method blank, the sample result was qualified if the concentration was less than ten times the method blank concentration. Method reporting limits (MRLs) were elevated to the concentration detected in the samples, and results were qualified as not detected "U" at the elevated MRL.

If an analyte was detected in a sample and in the associated method blank was below the reporting limit but above the method detection limit (MDL), sample detections below the level found in the method blank were qualified as "U" at the reporting limit.

In report 1308171, the USEPA Method TO-15 method blank analyzed on August 18, 2013, on instrument msd3.i showed detections below the MRL for 1,2-dichloroethane and trichloroethene. The samples associated with this method blank were all non-detect, so no qualifications were made. The USEPA Method TO-15 method blank analyzed on

August 18, 2013, on instrument msdj.i showed a detection below the MRL for 1,2-dichloroethane (at 0.40 microgram per cubic meter [$\mu\text{g}/\text{m}^3$]). The samples associated with this method blank were qualified as follows:

Sample	Component	Original Result ($\mu\text{g}/\text{m}^3$)	Qualified Result ($\mu\text{g}/\text{m}^3$)
46-SG1-073013	1,2-dichloroethane	1.2 J	5.0 U

J = estimated.

All remaining laboratory method blanks were non-detect.

Trip Blanks

Trip blanks were not required for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. MS/MSD samples were not reported.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. Laboratory duplicate samples were not reported.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

A laboratory control sample/laboratory control sample duplicate (LCS/LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency.

In report 1308171, the LCSD analyzed on August 18, 2013, on instrument msd3.i exceeded the lower acceptance limit for 1,2-dichloroethane. The LCS had acceptable recovery and the exceedance was minor; thus, no results were qualified.

All remaining LCS/LCSD analytes were within acceptance limits for percent recovery and relative percent differences.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. Field duplicates were not submitted for analysis.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch.

All CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

AT used routine reporting limits for non-detect results, except for 1,2-dichloroethane, trichloroethane, and vinyl chloride, analyzed by Modified USEPA TO-15; and 1,2-dichloroethane, analyzed by Modified USEPA Method TO-15 SIM, which were evaluated to the MDL at the request of the MFA project manager. AT reported MDLs for all results, but only the analytes listed above were evaluated below the MRL. All reporting limits were elevated because of canister dilution caused by residual canister vacuum. Reporting limits were additionally raised for samples that required dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies.

The soil gas and soil gas subslab samples submitted for report 1308171 were collected under a helium shroud to detect leaks in the collection system. Helium was included on the requested compounds list, which was submitted to the laboratory as an attachment for each chain of custody. However, the laboratory did not conduct helium analysis for these samples. The samples were collected in a manner consistent with the project standard operating procedures for soil gas and subslab soil gas sampling. Before collection of each sample, a shut-in test was successfully performed to verify the absence of leakage into the sampling train. Additionally, air purged through the sampling apparatus was analyzed with field detectors to verify the absence of helium. These procedures indicated acceptable sampling system integrity.

Two of the subslab soil gas samples (11-SS2-073113 and 11-SS1-073113) were originally submitted on the chain of custody with samples reported in 1308172A and 1308172B. These two samples were reported with other soil gas samples in report 1308171.

No additional issues were found.

NOTES:
bgs = below ground surface.
J = estimated value.
mg/L = milligrams per liter.
MTCA = Model Toxics Control Act.
MTCA Method A = MTCA standard Method A groundwater screening level values.
MTCA Method B = MTCA standard Method B groundwater screening level values for noncarcinogenic compounds.
N = Nitrogen.
S = Sulfur.
NV = no value.
U = not detected at or above the method detection limit.
^aResults reported to method reporting limit instead of method detection limit.
^bMTCA standard Method B screening level for nitrate; results are reported as nitrate nitrogen.

Table 2.3 Analytical Parameters and Weighting for Preliminary Screening for Anaerobic Biodegradation Processes^{a/}

Analysis	Concentration in Most Contaminated Zone	Interpretation	Value
Oxygen*	<0.5 mg/L	Tolerated, suppresses the reductive pathway at higher concentrations	3
Oxygen*	>5 mg/L	Not tolerated; however, VC may be oxidized aerobically	-3
Nitrate*	<1 mg/L	At higher concentrations may compete with reductive pathway	2
Iron II*	>1 mg/L	Reductive pathway possible; VC may be oxidized under Fe(III)-reducing conditions	3
Sulfate*	<20 mg/L	At higher concentrations may compete with reductive pathway	2
Sulfide*	>1 mg/L	Reductive pathway possible	3
Methane*	<0.5 mg/L	VC oxidizes	0
	>0.5 mg/L	Ultimate reductive daughter product, VC Accumulates	3
Oxidation Reduction Potential* (ORP) against Ag/AgCl electrode	<50 millivolts (mV)	Reductive pathway possible	1
	<-100mV	Reductive pathway likely	2
pH*	5 < pH < 9	Optimal range for reductive pathway	0
	5 > pH >9	Outside optimal range for reductive pathway	-2
TOC	> 20 mg/L	Carbon and energy source; drives dechlorination; can be natural or anthropogenic	2
Temperature*	> 20°C	At T >20°C biochemical process is accelerated	1
Carbon Dioxide	>2x background	Ultimate oxidative daughter product	1
Alkalinity	>2x background	Results from interaction between CO ₂ and aquifer minerals	1
Chloride*	>2x background	Daughter product of organic chlorine	2
Hydrogen	>1 nM	Reductive pathway possible, VC may accumulate	3
Hydrogen	<1 nM	VC oxidized	0
Volatile Fatty Acids	> 0.1 mg/L	Intermediates resulting from biodegradation of more complex compounds; carbon and energy source	2
BTEX*	> 0.1 mg/L	Carbon and energy source; drives dechlorination	2
Tetrachloroethene		Material released	0
Trichloroethene*		Material released	0
		Daughter product of PCE	2 ^{a/}
DCE*		Material released	0
		Daughter product of TCE	2 ^{a/}
		If cis is > 80% of total DCE it is likely a daughter product	
		1,1-DCE can be chemical reaction product of TCA	
VC*		Material released	0
		Daughter product of DCE	2 ^{a/}
1,1,1-Trichloroethane*		Material released	0
DCA		Daughter product of TCA under reducing conditions	2
Carbon Tetrachloride		Material released	0
Chloroethane*		Daughter product of DCA or VC under reducing conditions	2
Ethene/Ethane	>0.01mg/L	Daughter product of VC/ethene	2
	>0.1 mg/L		3
Chloroform		Material released	0
		Daughter product of Carbon Tetrachloride	2
Dichloromethane		Material released	0
		Daughter product of Chloroform	2

* Required analysis. a/ Points awarded only if it can be shown that the compound is a daughter product (i.e., not a constituent of the source NAPL).

NOTES:

Analysis was completed using natural attenuation parameter groundwater data collected on December 4, 2014.

MW03 is the monitoring well with the highest concentrations of PCE. Carbon dioxide and chloride levels are compared to MW21 and MW17 concentrations as representing background levels. TCE and DCE are assumed to be daughter products, as there are no other known sources of those compounds.

TOC data are based on results from borings advanced on September 17, 2014, near the respective monitoring wells.

DCE = dichloroethene.

J = estimated.

mg/kg = milligrams per kilogram.

mg/L = milligrams per liter.

NA = not analyzed.

ND = not detected.

ORP = oxygen-reduction potential.

PCE = tetrachloroethene.

S = Sulfur.

TCE = trichloroethene.

TOC = total organic carbon.

U = not detected at or above the method reporting limit.

ug/L = micrograms per liter.

APPENDIX K

TERRESTRIAL ECOLOGICAL EVALUATION

TERRESTRIAL ECOLOGICAL EVALUATION

The terrestrial ecological evaluation (TEE) process is required at all Model Toxics Control Act (MTCA) sites where there has been a release or threatened release of a hazardous substance that may pose a threat to human health or the environment. The TEE procedure is structured with the intent to protect terrestrial wildlife at industrial and commercial sites, and terrestrial plants, soil biota, and terrestrial wildlife at other sites, as provided under Washington Administrative Code (WAC) 173-340-7490(3)(b).

The site is a flat parcel approximately 25 feet long (north-south) and 100 feet wide (east-west) and is covered with low-growing vegetation (primarily non-native grasses and weeds). The site is zoned as Downtown Mixed Use and is surrounded by commercial properties and paved roads that likely are unattractive to wildlife; a vacant lot with some mature trees is directly north; an alleyway (owned by the City of Ridgefield) and a concrete skate park are directly east; a police station is directly south; and Main Avenue and a restaurant are directly west of the Property (122 N. Main Avenue, Ridgefield, Washington). Adjacent to the railroad corridor, to the west and within 500 feet of the site, are some undeveloped areas with low-growing grasses (see the attached figure); note that an overpass originating at the end of Pioneer Street that will pass through the undeveloped area and across the railroad corridor is currently under development.

Local and migrating populations of birds and wildlife in the area are most likely to utilize the high-quality habitat that the nearby Ridgefield National Wildlife Refuge (RNWR) provides. The higher-quality habitat is located more than 500 feet west of the site along Lake River and the RNWR River "S" Unit and more than 500 feet to the northwest near Carty Lake in the RNWR Carty Unit. Based on Washington State Department of Fish and Wildlife information, threatened/endangered and priority species and habitats are unlikely to be present at or within 500 feet of the site (see Attachment 1).

An initial step in the TEE process is to determine whether a site qualifies for a TEE exclusion. If the site meets at least one of the four exclusionary criteria, then no further evaluation of ecological risk is necessary (WAC 173-340-7491). The four exclusionary criteria are: (1) contamination is present only below the point of compliance (i.e., below 15 feet below ground surface [bgs], provided institutional controls to limit exposure to 0 to 6 feet bgs are not in place or planned), (2) incomplete exposure pathway (i.e., all soil will be covered by physical barriers), (3) type of contamination and proximity to ecological receptors (i.e., the site is located on or near a limited amount of undeveloped land), and (4) all concentrations are below background levels. MTCA does not identify the chemicals of concern at the site (chlorinated volatile organic compounds [VOCs]) as priority contaminants for the TEE, and no MTCA screening values are available for these VOCs. However, according to a review of current literature, concentrations between 0 and 15 feet bgs exceed available U.S. Environmental Protection Agency (USEPA) screening criteria.¹ It

¹ For example, soil concentrations exceed the USEPA Region 5 ecological screening level (ESL) of 9.92 milligrams per kilogram for tetrachloroethene at locations GP52-S-12.5 and B8-S-14.5. Note that these depths (12.5 feet and 14.5 feet, respectively) are below the typical biologically active zone of 0 to 6 feet bgs; however, 0 to 15 feet bgs must be considered, provided institutional controls to limit exposure

is therefore concluded that exclusionary criterion 1 is not met. The site does not meet exclusionary criteria 2 and 3, as it is uncertain whether future development will cover all areas of potential exposure and the site is within 500 feet of more than 1.5 acres of undeveloped land. Chlorinated VOCs are anthropogenic, and exclusionary criterion 4 is not met. Since the site cannot be definitively excluded from the TEE process, a simplified or site-specific TEE is required.

The simplified TEE is intended to identify only those sites that do not have substantial potential for posing a threat of significant adverse effects to terrestrial ecological receptors and that therefore may be removed from further ecological consideration during the remedial investigation and cleanup process (WAC 173-340-7492). MTCA specifies that a simplified TEE applies provided the site is (1) not located on or adjacent to natural areas, (2) not utilized by vulnerable species, (3) less than 10 acres of native vegetation is present in the site vicinity, and (4) there is no risk to significant wildlife populations, as determined by the Washington State Department of Ecology (WAC 173-340-7491). A simplified TEE is appropriate: the site is located in a developed town center with minimal surrounding native vegetation, and no species of concern are identified for the site (see Attachment 1).

WAC 173-340-7492(2) provides the steps necessary for conducting the simplified TEE. The simplified TEE can be ended if any of three criteria (exposure analysis, pathway analysis, and toxicity analysis) are met. MTCA Table 749-1 provides steps for conducting the exposure analysis to determine whether land use at a site and the surrounding area is likely to result in substantial wildlife exposure. If this is demonstrated, MTCA requires no further evaluation and concludes that a site does not pose a substantial threat to potential ecological receptors.

The exposure analysis and site visit were conducted by Maul Foster & Alongi, Inc., on October 31, 2014 (see the attached figure). A photo log of the site is provided as Attachment 2. The completed MTCA Table 749-1, included as Attachment 3, shows that the site is unlikely to pose a threat to ecological receptors and that no further evaluation is necessary. The attached table shows the rationale for the scoring on Table 749-1.

Attachments: Table
Figure
1—Species of Concern Report
2—Site Photographs
3—MTCA Table 749-1

to 0 to 6 feet bgs are not in place or planned. ESLs are developed to support precautionary screening assessments and exceedances do not necessarily indicate unacceptable ecological risk.

TABLE

**Table
Simplified TEE Scoresheet
Former Park Laundry
Union Ridge Investment Company
Ridgefield, Washington**

Line Number	Scoring Parameters	Score	Rationale																				
1	<p>Estimate the area of contiguous (connected) undeveloped land on the site or within 500 feet of any area of the site to the nearest 1/2 acre (1/4 acre if the area is less than 0.5 acre). From the table below, find the number of points corresponding to the area and enter this number in the field to the right.</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td style="text-align: right;">Area (acres)</td> <td style="text-align: left;">Points</td> </tr> <tr> <td style="text-align: right;">0.25 or less</td> <td style="text-align: left;">4</td> </tr> <tr> <td style="text-align: right;">0.5</td> <td style="text-align: left;">5</td> </tr> <tr> <td style="text-align: right;">1.0</td> <td style="text-align: left;">6</td> </tr> <tr> <td style="text-align: right;">1.5</td> <td style="text-align: left;">7</td> </tr> <tr> <td style="text-align: right;">2.0</td> <td style="text-align: left;">8</td> </tr> <tr> <td style="text-align: right;">2.5</td> <td style="text-align: left;">9</td> </tr> <tr> <td style="text-align: right;">3.0</td> <td style="text-align: left;">10</td> </tr> <tr> <td style="text-align: right;">3.5</td> <td style="text-align: left;">11</td> </tr> <tr> <td style="text-align: right;">4.0 or more</td> <td style="text-align: left;">12</td> </tr> </table>	Area (acres)	Points	0.25 or less	4	0.5	5	1.0	6	1.5	7	2.0	8	2.5	9	3.0	10	3.5	11	4.0 or more	12	10	<p>The site is approximately 25 feet long (north-south) and 100 feet wide (east-west) and covered with low-growing vegetation (grasses). The site is surrounded by commercial uses; a vacant lot with some mature trees is directly north; an alleyway owned by the City of Ridgefield (City) and a skate park are directly east; a police station is directly south; and Main Avenue and a restaurant are directly west of the Property. Some undeveloped areas with low-growing grasses are located to the west within 500 feet of the site; these areas are adjacent to the railroad corridor, which likely deters significant wildlife/avian use (see the figure). The figure includes areas considered contiguous with the site, although commercial structures and roads likely inhibit significant wildlife movement between the site and undeveloped areas identified.</p>
Area (acres)	Points																						
0.25 or less	4																						
0.5	5																						
1.0	6																						
1.5	7																						
2.0	8																						
2.5	9																						
3.0	10																						
3.5	11																						
4.0 or more	12																						
2	<p>Is this an industrial or commercial property? If yes, enter a score of 3. If no, enter a score of 1.</p>	3	<p>The site is zoned as Downtown Mixed Use and is surrounded by commercial uses.</p>																				
3	<p>Enter a score in the box to the right for the habitat quality of the site, using the following rating system. High=1, Intermediate=2, Low=3.</p>	3	<p>The site is surrounded by development and consists primarily of non-native grasses and weeds; two trees are located adjacent (to the east) of the property.</p>																				
4	<p>Is the undeveloped land likely to attract wildlife? If yes, enter a score of 1 in the box to the right. If no, enter a score of 2.</p>	2	<p>Higher-quality habitat exists to the east of the site, along Lake River west of the railroad corridor and near Carty Lake to the northwest. The area surrounding the site is primarily developed commercial lots that likely are unattractive to wildlife and undeveloped areas directly adjacent to a railroad corridor. The site is largely devoid of native vegetation and trees that may be attractive to birds.</p>																				
5	<p>Are any of the following soil contaminants present: chlorinated dioxins/furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, pentachlorobenzene? If yes, enter a score of 1 in the box to the right. If no, enter a score of 4.</p>	4	<p>The listed contaminants are not known to be present.</p>																				
<p>Add the numbers in the boxes on lines 2-5 and enter this number in the box to the right. If this number is larger than the number in the box on line 1, the simplified evaluation may be ended.</p>		12	<p>Simplified evaluation ended. Total score exceeds 10.</p>																				
<p>NOTES: Table adapted from Model Toxics Control Act Table 749-1. TEE = terrestrial ecological evaluation.</p>

DISCLAIMER. This report includes information that the Washington Department of Fish and Wildlife (WDFW) maintains in a central computer database. It is not an attempt to provide you with an official agency response as to the impacts of your project on fish and wildlife. This information only documents the location of fish and wildlife resources to the best of our knowledge. It is not a complete inventory and it is important to note that fish and wildlife resources may occur in areas not currently known to WDFW biologists, or in areas for which comprehensive surveys have not been conducted. Site specific surveys are frequently necessary to rule out the presence of priority resources. Locations of fish and wildlife resources are subject to variation caused by disturbance, changes in season and weather, and other factors. WDFW does not recommend using reports more than six months old.

SITE PHOTOGRAPHS

ATTACHMENT 2—PHOTOGRAPHS

Project Name: Union Ridge Investment Company
Project Number: 8006.31.04
Location: 122 N. Main Avenue
Ridgefield, Washington

Photo No. 1

Property looking west
from adjacent skate
park.

Photo No. 2

Property and adjacent
undeveloped lot to the
north: looking
northwest.

ATTACHMENT 2—PHOTOGRAPHS

Project Name: Union Ridge Investment Company
Project Number: 8006.31.04
Location: 122 N. Main Avenue
Ridgefield, Washington

Photo No. 3

Property and adjacent undeveloped lot looking north.

Photo No. 4

Property looking east:
ruderal vegetation.

MTCA TABLE 749-1

Table 749-1

Simplified Terrestrial Ecological Evaluation-Exposure Analysis Procedure

Estimate the area of contiguous (connected) <u>undeveloped land</u> on the site or within 500 feet of any area of the site to the nearest 1/2 acre (1/4 acre if the area is less than 0.5 acre).																						
1) From the table below, find the number of points corresponding to the area and enter this number in the field to the right.																						
	<table border="1"> <thead> <tr> <th style="text-align: center;">Area (acres)</th> <th style="text-align: center;">Points</th> </tr> </thead> <tbody> <tr><td style="text-align: center;">0.25 or less</td><td style="text-align: center;">4</td></tr> <tr><td style="text-align: center;">0.5</td><td style="text-align: center;">5</td></tr> <tr><td style="text-align: center;">1.0</td><td style="text-align: center;">6</td></tr> <tr><td style="text-align: center;">1.5</td><td style="text-align: center;">7</td></tr> <tr><td style="text-align: center;">2.0</td><td style="text-align: center;">8</td></tr> <tr><td style="text-align: center;">2.5</td><td style="text-align: center;">9</td></tr> <tr><td style="text-align: center;">3.0</td><td style="text-align: center;">10</td></tr> <tr><td style="text-align: center;">3.5</td><td style="text-align: center;">11</td></tr> <tr><td style="text-align: center;">4.0 or more</td><td style="text-align: center;">12</td></tr> </tbody> </table>	Area (acres)	Points	0.25 or less	4	0.5	5	1.0	6	1.5	7	2.0	8	2.5	9	3.0	10	3.5	11	4.0 or more	12	10
Area (acres)	Points																					
0.25 or less	4																					
0.5	5																					
1.0	6																					
1.5	7																					
2.0	8																					
2.5	9																					
3.0	10																					
3.5	11																					
4.0 or more	12																					
2) Is this an <u>industrial</u> or <u>commercial</u> property? If yes, enter a score of 3. If no, enter a score of 1		3																				
3) ^a Enter a score in the box to the right for the habitat quality of the site, using the following rating system ^b . High=1, Intermediate=2, Low=3		3																				
4) Is the undeveloped land likely to attract wildlife? If yes, enter a score of 1 in the box to the right. If no, enter a score of 2. ^c		2																				
5) Are there any of the following soil contaminants present: Chlorinated dioxins/furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, pentachlorobenzene? If yes, enter a score of 1 in the box to the right. If no, enter a score of 4.		4																				
6) Add the numbers in the boxes on lines 2-5 and enter this number in the box to the right. If this number is larger than the number in the box on line 1, the simplified evaluation may be ended.		12																				

Notes for Table 749-1

^a It is expected that this habitat evaluation will be undertaken by an experienced field biologist. If this is not the case, enter a conservative score of (1) for questions 3 and 4.

^b **Habitat rating system.** Rate the quality of the habitat as high, intermediate or low based on your professional judgment as a field biologist. The following are suggested factors to consider in making this evaluation:

Low: Early successional vegetative stands; vegetation predominantly noxious, nonnative, exotic plant species or weeds. Areas severely disturbed by human activity, including intensively cultivated croplands. Areas isolated from other habitat used by wildlife.

High: Area is ecologically significant for one or more of the following reasons: Late-[successional](#) native plant communities present; relatively high species diversity; used by an uncommon or rare species; [priority habitat](#) (as defined by the Washington Department of fish and Wildlife); part of a larger area of habitat where size or fragmentation may be important for the retention of some species.

Intermediate: Area does not rate as either high or low.

^c Indicate "yes" if the area attracts wildlife or is likely to do so. Examples: Birds frequently visit the area to feed; evidence of high use b mammals (tracks, scat, etc.); habitat "island" in an industrial area; unusual features of an area that make it important for feeding animals; heavy use during seasonal migrations.
