### Notes and Definitions

- U This analyte is not detected above the applicable reporting or detection limit.
- J Estimated concentration value detected below the reporting limit.
- D The reported value is from a dilution
- \* Flagged value is not within established control limits.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- [2C] Indicates this result was quantified on the second column on a dual column analysis.

RE: Port of Tacoma Arkema- FS Data Gap Investigation

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

Associated Work Order(s)

----

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclosed Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, Inc.

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

**Terms of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** Unless specified by workorder or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer. Sediment samples submitted under PSDDA/PSEP/SMS protocol will be stored frozen for up to one year and then discarded.

The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** Unless specified by work order or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer. Sediment samples submitted under P-SDDA/PSEP/SMS protocol will be stored frozen for up to one year and then discarded.

# Cooler Receipt Form

ARI Client: Pioneer  
 COC No(s): \_\_\_\_\_ NA  
 Assigned ARI Job No: 17K0066  
 Preliminary Examination Phase:

Project Name: Arkema FS D6 Inv  
 Delivered by: Fed-Ex UPS Courier Hand Delivered Other: \_\_\_\_\_  
 Tracking No: \_\_\_\_\_ NA

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES  NO   
 Were custody papers included with the cooler? ..... YES  NO   
 Were custody papers properly filled out (ink, signed, etc.) ..... YES  NO   
 Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry) 5.6  
 Time: 1600  
 If cooler temperature is out of compliance fill out form 00070F  
 Cooler Accepted by: SF Date: 11/3/17 Time: 1600 Temp Gun ID#: D002565

*Complete custody forms and attach all shipping documents*

## Log-In Phase:

Was a temperature blank included in the cooler? ..... YES  NO   
 What kind of packing material was used? ... Bubble Wrap  Wet Ice  Gel Packs  Baggies  Foam Block  Paper  Other: \_\_\_\_\_  
 Was sufficient ice used (if appropriate)? ..... NA  YES  NO   
 Were all bottles sealed in individual plastic bags? ..... YES  NO   
 Did all bottles arrive in good condition (unbroken)? ..... YES  NO   
 Were all bottle labels complete and legible? ..... YES  NO   
 Did the number of containers listed on COC match with the number of containers received? ..... YES  NO   
 Did all bottle labels and tags agree with custody papers? ..... YES  NO   
 Were all bottles used correct for the requested analyses? ..... YES  NO   
 Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... NA  YES  NO   
 Were all VOC vials free of air bubbles? ..... NA  YES  NO   
 Was sufficient amount of sample sent in each bottle? ..... NA  YES  NO   
 Date VOC Trip Blank was made at ARI ..... NA  YES  NO  10/23/17  
 Was Sample Split by ARI :  NA  YES  Date/Time: \_\_\_\_\_ Equipment: \_\_\_\_\_ Split by: \_\_\_\_\_

Samples Logged by: SF Date: 11/3/17 Time: 1655

## Case Narrative

### Sample receipt

Samples as listed on the preceding page were received November 03, 2017 under ARI workorder 17K0066. For details regarding sample receipt, please refer to the Cooler Receipt Form. Due to the salty nature of the samples many analysis needed dilutions, and multiple runs were reported.

### Volatiles - EPA Method SW8260C

The samples were run within the recommended holding times.

Initial and continuing calibrations were within method requirements.

Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

There were no target compounds detected in the method blank.

The LCS/LCSD percent recoveries and RPD were within control limits.

### Total and Dissolved Hg - EPA Method 7470A

The samples were digested and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

There were no target compounds detected in the method blanks.

The LCS percent recoveries were within control limits.

### Total and Dissolved Metals - EPA Method 6020A

The samples were digested and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The method blank has Nickel detected below the reporting limit, but above the method detection limit. The Nickel has been flagged with a "J" qualifier on the method blank. No further corrective action was taken.

The LCS percent recoveries were within control limits.

### Dissolved Metals - EPA Method 6010C

The samples were digested and analyzed within the recommended holding times.

Pioneer Technologies Corporation  
5205 Corporate Ctr. Ct. SE, Ste A  
Olympia WA, 98503

Project: Port of Tacoma Arkema- FS Data Gap Investigation  
Project Number: 79227  
Project Manager: Troy Bussey Jr.

Reported:  
29-Nov-2017 13:45

Initial and continuing calibrations were within method requirements.

Method blank BFK0238 has Iron and Sodium detected below the reporting limits, but above the method detection limits. The Iron and Sodium have been flagged with a "J" qualifier on the method blank. No further corrective action was taken.

The LCS percent recoveries were within control limits.

#### **Anions - EPA Method 300.0**

The samples were analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

There were no target compounds detected in the method blanks.

The LCS percent recoveries were within control limits.

A matrix spike and duplicate were prepared in conjunction with sample GW-121+80-1-110317-(20). The matrix spike has a O-Phos concentration that exceeds the upper calibration range, and has been flagged with an "E" qualifier. The matrix spike percent recoveries and duplicate RPD were within QC limits.

#### **Alkalinity - Method SM2320**

The samples were prepared and analyzed within the recommended holding times.

There were no target compounds detected in the method blanks.

The SRM percent recovery were within control limits.

#### **Total Dissolved Solids - EPA Method 160.1**

The samples were prepared and analyzed within the recommended holding times.

There were no target compounds detected in the method blank.

The LCS percent recoveries were within control limits.

A duplicate was prepared in conjunction with sampe GW-122+60-1-110317-(20). The duplicate RPD was within QC limits.

#### **Dissolved Organic Carbon - Method SM5310**

The samples were prepared and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

### Notes and Definitions

- U This analyte is not detected above the applicable reporting or detection limit.
- J Estimated concentration value detected below the reporting limit.
- E The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL)
- D The reported value is from a dilution
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- [2C] Indicates this result was quantified on the second column on a dual column analysis.

RE: Port of Tacoma Arkema- FS Data Gap Investigation

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

----

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclosed Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, Inc.

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** Unless specified by workorder or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer. Sediment samples submitted under PSDDA/PSEP/SMS protocol will be stored frozen for up to one year and then discarded.

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** Unless specified by workorder or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer. Sediment samples submitted under PSDDA/PSEP/SMS protocol will be stored frozen for up to one year and then discarded.

**Additional Notes, Discrepancies, & Resolutions:**  
 pw-125 + 00-SW - 11/15/2017, material broken  
 Small 0.5 for (B-1115-17-C20) missing the - (20) on label  
 VOCs in 11 air bubbles marked on pres sheet  
 By: SBR Date: 11/15/2017

Was a temperature blank included in the cooler?  YES  NO

What kind of packing material was used? ... Bubble Wrap  Wet Ice  Gel Packs  Baggies  Foam Block  Paper Other:  YES  NO

Were all bottles sealed in individual plastic bags?  YES  NO

Did all bottles arrive in good condition (unbroken)?  YES  NO

Were all bottle labels complete and legible?  YES  NO

Did the number of containers listed on COC match with the number of containers received?  YES  NO

Did all bottle labels and tags agree with custody papers?  YES  NO

Were all bottles used correct for the requested analyses?  YES  NO

Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)  YES  NO

Were all VOC vials free of air bubbles?  YES  NO

Was sufficient amount of sample sent in each bottle?  YES  NO

Date VOC Trip Blank was made at ARI:  YES  NO

Was Sample Split by ARI:  YES  NO

**Log-In Phase:**

Cooler Accepted by: SBR Date: 11/15/2017 Time: 1700

If cooler temperature is out of compliance fill out form 00070F

Temp Gun ID#: 1700565

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry): 4.4

Time: 1700

Were custody papers properly filled out (ink, signed, etc.)  YES  NO

Were custody papers included with the cooler?  YES  NO

Were intact, properly signed and dated custody seals attached to the outside of to cooler?  YES  NO

## Case Narrative

### Sample receipt

Samples as listed on the preceding page were received November 15, 2017 under ARI workorder 17K0256. For details regarding sample receipt, please refer to the Cooler Receipt Form. Due to the salty nature of the samples many analysis needed dilutions, and multiple runs were reported.

### Volatiles - EPA Method SW8260C

The samples were run within the recommended holding times.

Initial and continuing calibrations were within method requirements.

Internal standard areas were within limits.

Sample PW-128+30-0-DS-111517 has high surrogate percent recovery for 4-Bromofluorobenzene. All other sample surrogate percent recoveries were within control limits. No corrective action was taken.

There were no target compounds detected in the method blank.

The LCS/LCSD percent recoveries and RPD were within control limits.

### Anions - EPA Method 300.0

The samples were analyzed within the recommended holding times.

Due to matrix interference and failing calibrations O-Phos was not performed on the samples.

Initial and continuing calibrations were within method requirements.

There were no target compounds detected in the method blanks.

The LCS percent recoveries were within control limits.

A matrix spike and duplicate were prepared in conjunction with sample EB-111517-(20). The matrix spike percent recoveries and duplicate RPD were within QC limits.

### Alkalinity - Method SM2320

The samples were prepared and analyzed within the recommended holding times.

There were no target compounds detected in the method blanks.

The SRM percent recovery were within control limits.

A duplicate was prepared in conjunction with sample EB-111517-(20). The duplicate RPD was within QC limits.

**Total Dissolved Solids - EPA Method 160.1**

The samples were prepared and analyzed within the recommended holding times.

There were no target compounds detected in the method blank.

The LCS percent recoveries were within control limits.

A duplicate was prepared in conjunction with sampe PW-120+75-ST1-DS-111517-(20). The duplicate RPD was within QC limits.

**Dissolved Organic Carbon - Method SM5310**

The samples were prepared and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

There were no target compounds detected in the method blank.

A matrix spike and duplicate were prepared in conjunction with sample EB-111517-(20). The matrix spike percent recovery and duplicate RPD were within QC limits.

### Notes and Definitions

- U This analyte is not detected above the applicable reporting or detection limit.
- J Estimated concentration value detected below the reporting limit.
- D The reported value is from a dilution
- \* Flagged value is not within established control limits.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- [2C] Indicates this result was quantified on the second column on a dual column analysis.

Subject: Feasibility Study Data Gap Investigation, Former Arkema Manufacturing Site, Tacoma, WA;  
Water Sample Data Validation Review Summary  
Client Project No.: Not Specified  
QA/QC Solutions, LLC Project No.: 092317.1

Dear Troy:

This letter documents the results of the data validation review of the metals (elements) analyses completed on water samples associated with Feasibility Study Data Gap Investigation completed at the Former Arkema Manufacturing Site located in Tacoma, Washington. Details of the investigation completed are provided in the Feasibility Study Data Gap Investigation Work Plan, Former Arkema Manufacturing Site. (Pioneer 2017).

The data reported were validated to verify the laboratory quality assurance and quality control (QA/QC) procedures were documented and that the overall quality of the data reported is sufficient to support its intended purposes. A summary of the overall assessment of data quality, the data set, a summary of the analytical methods used to complete the chemical analyses, a summary of the data validation procedures used, and a summary of the reasons why data were qualified (including other items noted during data validation) is presented below.

### Overall Assessment of Data Quality

Overall, the data reported are of good quality and the results for the applicable QA/QC procedures that were used by the laboratory during the analysis of the samples were generally acceptable. Selected sample results required qualification during data validation because method-specific QA/QC criteria were not met; results maybe qualified for more than one reason. During data validation, the following actions were taken:

- A total of 59 results reported as detected were qualified as estimated (assigned a *J* qualifier).
- A total of 39 results reported as detected were restated as undetected (assigned a *U* qualifier).
- A total of 2 results reported as undetected (*U*) were qualified as undetected and estimated (assigned a *UJ* qualifier).
- No sample results required rejection (*R*).

***\*Note: A total of 1,804 sample results (including field duplicates and equipment rinsate blanks) were reported.***

Analytical data that did not meet method- and/or laboratory-established control limits for applicable quality control measurements were qualified as estimated (*J or UJ*) by the laboratory or during data validation. These qualified data are usable and represent data of good quality and reasonable confidence and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Analytical data that were reported as undetected (*U*) by the laboratory or that were restated as undetected (*U*) during data validation are usable.

## Data Set

The data set consisted of 234 water samples that were collected and submitted to the laboratory and was comprised of the following:

- 59 unfiltered natural samples.
- 159 filtered (field filtered, 0.45 µm) natural samples.
- 2 unfiltered natural field duplicate samples.
- 6 filtered (field filtered, 0.45 µm) natural field duplicate samples.
- 3 unfiltered equipment blank samples.
- 5 filtered (field filtered, 0.45 µm) equipment blank samples.

Samples were collected during the month of October and November 2017. A summary of the samples collected and the analyses completed is presented in Table 1.

***\* Several samples required multiple reanalyses and only data considered reportable during data validation were reported in the electronic data deliverables (EDDs).***

Analyses were completed by Brooks Applied Labs located in Bothell, Washington. A total of 13 work orders summarizing the results of the samples and associated quality control data.

## Analytical Methods

The analytical methods that were used to complete the chemical analyses included the following:

- Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, and Si) by U.S. EPA Method 1638 (modified) (U.S. EPA 1999). The original sample bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C. Quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS).
- Total and dissolved mercury Total and dissolve mercury by U.S. EPA 1631E (U.S. EPA 2002a). Samples were oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS)

detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

- Brooks SOP #BAL-4100 (IC-ICP-MS) for Arsenic Speciation Analysis by IC-ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS) (dissolved phase only) (Brooks SOP). Analyses were completed for arsenite [as As(III)], arsenate [as As(V)], Monomethylarsonic Acids (MMAs), and Dimethylarsinic Acids (DMAs). All analyses were performed by using a laboratory proprietary procedures; Brooks SOP #BAL-4100 was not released for review to QA/QC Solutions, LLC.
- USEPA 1640 Mod (column chelation) for total recoverable metals (Ni and/or Pb) by U.S. EPA Method 1640 (modified) (U.S. EPA 1997). Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to the analytical method. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C. Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS).

Analyses for dissolved metals were field filtered through 0.45 µm filter. These dissolved fractions were analyzed for the following elements. A summary of the samples collected and the analyses completed is presented in Table 1.

## Data Validation Procedures

Data validation procedures included evaluating a summary of the sample results and applicable quality control results that were reported by the laboratory; this level of validation is also referred to as an abbreviated data review (equivalent to "Stage 2B" review per U.S. EPA 2009, which is equivalent to "Level EPA2B" for use with the Washington Department of Ecology EIMS database). The analytical data were validated generally following the applicable guidance and requirements:

- *Guidance on Environmental Data Verification and Validation* (U.S. EPA 2002b)
- *USEPA Contract Laboratory Program, National Functional Guidelines for Superfund Organic Methods Data Review*. Final. OSWER 9240.1-45. USEPA/540/R-08/01 (U.S. EPA 2008).
- *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use*. OSWER No. 9200.1-85. EPA 540-R-08-005. (U.S. EPA 2009).
- *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Superfund Data Review*. Final. OSWER 9240.1-51. EPA 540-R-10-011 (U.S. EPA 2010).
- Method-specific and laboratory-established quality control requirements, as applicable.
- The quality control limits summarized in the *Feasibility Study Data Gap Investigation Work Plan, Former Arkema Manufacturing Site*. (Pioneer 2017).

Data validation procedures were mostly modified to accommodate QA/QC requirements for methods that are not specifically addressed by the USEPA functional guidelines. In this situation, method-specific, laboratory-established, project-specific control limits were used, as necessary, to determine if

qualification of the data was necessary. The laboratory data deliverables that were validated, if present, included the following:

- Case narratives discussing analytical problems (if any) and procedures.
- Chain-of-custody documentation to verify completeness of the data set.
- Results for applicable method blanks and field blanks to determine whether an analyte that was reported as detected in any sample was the result of possible contamination introduced at the laboratory or during field sampling, respectively.
- Results for applicable standard reference material (SRM), laboratory control sample (LCS) (i.e., blank spike), duplicate LCS, matrix spike (MS), and/or matrix spike duplicate (MSD) recoveries to assess analytical accuracy
- Results for applicable laboratory duplicate sample, duplicate LCS, and/or MSD analyses to assess analytical precision.
- Results for the field duplicate samples to provide additional information in support of the quality assurance review.
- Laboratory summaries of analytical results.

Verification of applicable laboratory calculations, transcriptions, review of instrument printouts, and review of bench sheets were not completed during the abbreviated data validation review. There may be analytical problems that could only be identified by completing a thorough review (i.e., 100-percent data validation) of all original instrument printouts and associated analytical quality control results. Verification of all possible factors that could result in the degradation of data quality was not completed nor should be inferred at this time. The laboratory case narratives did not indicate any significant problems with data that were not reviewed during data validation. The adequacy of the sampling procedures was not completed during data validation.

Performance based control limits established by the laboratory and control limits provided in the method protocols were used to evaluate data quality and determine the need for data qualification. Applicable laboratory control limits (e.g., recoveries for surrogate compounds, LCSs and LCS duplicates, and MS/MSDs) were used during data validation. Data qualifiers were assigned during data validation to both hardcopy data sheets and the EDD when applicable QA/QC limits were not met and qualification of the data was warranted. Data qualifiers were assigned following guidance specified by U.S. EPA (2002b, 2009, and 2010) and the quality control requirements specified in the applicable analytical methods.

## Reasons for Data Qualification

The reasons for data qualification and a summary of the qualified data are summarized in Table 2 and included the following:

- A total of 5 results reported as detected at a concentration above the method detection limit (MDL), but less than the reporting limit (RL) were qualified as estimated (*J*).
- A total of 17 results were qualified as estimated (*J*) because the recoveries did not meet applicable control limits.
- One result was qualified as estimated (*UJ*) because the MS/MSD recoveries did not meet applicable control limits.

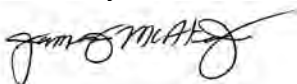

- One result was qualified as estimated (*J*) because the relative percent difference (RPD) did not meet the applicable control limit.
- One result was qualified as estimated (*UJ*) because matrix inference was noted by the laboratory.
- One result was qualified as estimated (*J*) because an incorrect sample was used, as noted by the laboratory.
- One result was qualified as estimated (*J*) because the dissolved concentration was significantly greater than the total concentration.
- A total of 15 mercury results were qualified as estimated (*J*) because of elevated detections in the method blanks.
- A total of 19 results were qualified as estimated (*J*) because the element was present in the associated equipment blank. In this instance, the concentration in the sample was >2x, but <5x the concentration found in the associated equipment blank. When an element was reported as detected in an equipment blank but was either not detected in the samples or the concentrations was >5x the concentration found, no data required qualification.
- A total of 39 results were restated as undetected (*U*) because the element was present in the associated equipment blank. In this instance, the concentration in the sample was <2x concentration found in the associated equipment blank. Results were either restated as undetected up to the concentration found in the associated equipment blank (highlighted in yellow in Table 2) or were restated as undetected at the concentration reported. When an element was reported as detected in an equipment blank but was either not detected in the samples or the concentrations was >5x the concentration found, no data required qualification.

### **General Comments**

There were some quality control items, or general observations, identified during data validation and/or that was noted by the laboratory in the case narratives, but is not discussed herein. However, qualification of the sample results was not required in these instances. Data users should read the laboratory case narratives for additional details.

This concludes the data validation review summary. Should you have any questions regarding the information presented herein, please contact me by telephone at 503.763.6948 or by e-mail at [jjmcateer@msn.com](mailto:jjmcateer@msn.com).

Notes:  
 -(20) - Samples ending with -(20) are dissolved fractions  
 -(21) -Samples ending with -(21) are field duplicate dissolved fractions  
 As(III) - Arsenite Ion - As(O3)3-  
 As(V) - Arsenate Ion - As(O4)3-  
 EB -Samples beginning with EB are equipment blanks  
 HDPE - high density polyethylene  
 FLPE- fluorinated polyethylene  
 J - estimated  
 J-1 - estimated; see case narrative  
 LCS - laboratory control sample  
 M - laboratory duplicate precision (RPD) no within acceptance limit  
 MDL - method detection limit  
 MS - matrix spike  
 MS - matrix spike duplicate  
 R - rejected  
 RE1, RE2, RE3, RE4 - reanalysis (1,2,3, or 4)  
 RL - reporting limit  
 RPD - relative percent differences  
 U - undetected at detection limit shown

|                                |    |
|--------------------------------|----|
| Total results qualified "J" =  | 59 |
| Total results qualified "U" =  | 39 |
| Total results qualified "UJ" = | 2  |
| Total results qualified "R" =  | 0  |

\* Summary of qualified data is for natural and field quality control samples only  
<sup>a</sup>Low bias - concentration reported is exhibits low bias and the actual reporting limit or concentration may be greater than reported  
<sup>b</sup>High bias - result reported exhibits high bias and the actual reporting limit or concentration may be lower than reported  
<sup>c</sup>False positive - compound is likely not present

\* Data users must note that only data considered reportable during data validation has been reported. In several instances, multiple reanalyses may have been completed.  
 \* Data users should note that significant figures in above table are "as reported by the laboratory"; no rounding to more appropriate significant figures was completed during data validation  
 \* Data users should note that concentration highlighted in yellow are to show the restated as undetected concentration was elevated to the concentration found in the associated blank

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Revision 2:

The total recoverable and dissolved metals results for Cu, Ni, and Pb by EPA Method 1640, Mod. have been removed from this report. Instead, the total recoverable and dissolved Cu, Ni, and Pb results are reported using the EPA Method 1638, Mod.

Revision 1:

The sample IDs for the client samples were incorrectly transcribed in the initial report issued on November 28, 2017. In all cases the “**STI**” term in the sample ID should be reported as “**ST1**”. Also, in cases where the chain-of-custody (COC) form lists a suffix of “**(20)**”, the client has instructed that the suffix should be “**-(20)**”. In this revised report, these two changes were made to the sample IDs. No other changes were made with respect to the original report.

Mr. Troy Bussey,

On October 6, 2017, Brooks Applied Labs (BAL) received fourteen (14) water samples in acceptable condition. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], copper [Cu], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], nickel [Ni], lead [Pb], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

The trace metals fraction for sample *PW-120+75-ST1-100517-(20)* arrived in a fluorinated high-density polyethylene (FLPE) bottle. Brooks Applied Labs recommends that samples undergoing trace metals analyses should be contained in a HDPE bottle. The FLPE bottles have not been lot tested for trace metals contamination.

The total mercury (Hg) fraction for sample *PW-130+75-ST1-100617* arrived in a high-density polyethylene (HDPE) bottle. Brooks Applied Labs (BAL) recommends that samples undergoing mercury analyses should be collected FLPE bottles or a glass bottles with FLPE-lined lids.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, and Si) Analysis by EPA Method 1638, Mod.

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

The trace metals fraction for sample *PW-120+75-ST1-100517-(20)* arrived in a fluorinated high-density polyethylene (FLPE) bottle. Brooks Applied Labs recommends that samples undergoing trace metals analyses should be contained in a HDPE bottle. The FLPE bottles have not been lot tested for trace metals contamination.

**Batch B172756**

The dissolved arsenic result was greater than the corresponding total recoverable arsenic result for the client sample *PW-123+25-ST1-100517* (1741002-05 & 1741002-06). Re-analysis confirmed the results for samples 1741002-05 & 741002-06. The container labels were checked and there was no indication of miss-labeling. Since the dissolved arsenic result was in good agreement with the sum of species for the corresponding arsenic speciation sample, the dissolved arsenic result (1741002-06) is reported unqualified. The total recoverable arsenic result for sample 1741002-05 is qualified as estimated “J-1”.

The nickel relative percent difference (RPD) for the laboratory duplicate sample B172756-DUP5 was greater than the control limit of 20%, at 27%. However, secondary criteria were met (i.e. results were ≤ 5x the MRL and within one MRL of each other). Therefore, no data qualification was required.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were ≤ 25% of the native sample concentrations, the recoveries were not reported (**NR**).

**Batch B173137**

The dissolved Mg and Na results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MDL values for total recoverable Mg and Na have been calculated using the standard deviation of the method blanks prepared and analyzed concurrently with the submitted samples. For Mg, the MRL is set by a low calibration standard in the calibration. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

**Total Mercury (Waters) Quantitation by EPA Method 1631E**

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

**Batch B172720**

The total mercury (Hg) fraction for sample *PW-130+75-ST1-100617* (1741002-13) arrived in a high-density polyethylene (HDPE) bottle. Brooks Applied Labs (BAL) recommends that samples undergoing mercury analyses should be collected in FLPE bottles or glass bottles with FLPE-lined lids. HDPE bottles are known to be permeable to mercury. Consequently, the total mercury result for sample *PW-130+75-ST1-100617* should be considered estimated and has been qualified as estimated "J-1". The corresponding dissolved mercury fraction was collected in an appropriate container; the dissolved Hg result for sample *PW-130+75-ST1-100617* is reported without qualification.

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

#### **Batch B172708**

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

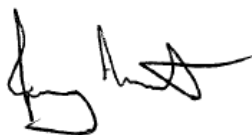

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (**N/C**). Instances where the matrix spike/matrix spike duplicate (MS/MSD) sets were spiked at a concentration less than 25% of the native sample result, the recoveries were not reported (**NR**). Spike recoveries are not a valid indicator of data quality when the analyte concentration in the source sample is greater than the spiking level.

With the exceptions noted above, all data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Jeremy Maute  
Project Manager  
jeremy@brooksupplied.com

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| <b>Sample</b>                    | <b>Lab ID</b> | <b>Report Matrix</b> | <b>Type</b> | <b>Sampled</b> | <b>Received</b> |

## Shipping Containers

### **Cooler - 1741002**

**Received:** October 6, 2017 14:30  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 5.5 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#14

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Mr. Troy Bussey,

On October 13, 2017, Brooks Applied Labs (BAL) received twelve (12) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

Each client sample for arsenic speciation is collected into two (6ml Vacutainers) for anoxic storage. The two fractions for sample GW-3C5-2-101217-17.5-22.5-(20) were significantly different in color; one of the fractions was much darker compared to its corresponding partner. The client was notified. In accordance with the client's instructions, arsenic speciation analysis was performed on the clear fraction for sample GW-3C5-2-101217-17.5-22.5-(20).

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Common Abbreviations

|            |                                     |            |                                    |
|------------|-------------------------------------|------------|------------------------------------|
| <b>AR</b>  | as received                         | <b>MS</b>  | matrix spike                       |
| <b>BAL</b> | Brooks Applied Labs                 | <b>MSD</b> | matrix spike duplicate             |
| <b>BLK</b> | method blank                        | <b>ND</b>  | non-detect                         |
| <b>BS</b>  | blank spike                         | <b>NR</b>  | non-reportable                     |

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Mr. Troy Bussey,

On October 16, 2017, Brooks Applied Labs (BAL) received eleven (11) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                         | Lab ID     | Report Matrix | Type   | Sampled    | Received   |

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On October 17, 2017, Brooks Applied Labs (BAL) received twenty-three (23) water samples in a sealed container with a temperature of 5.0°C. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

The trace metals fractions designated for Column Chelation (EPA Method 1640) analyses arrived in high-density polyethylene (HDPE) bottles that were not lot tested down to levels adjusted to EPA Method 1640 levels, which yield lower MDLs/MRLs compared to EPA Method 1638 analyses. These fractions were collected in HDPE bottles cleaned and lot tested for EPA Method 1638 analyses.

In accordance with the client's instructions, the sample IDs were amended for the two samples listed on the chain-of-custody (COC) form with the suffix ending in "...**Date-(01)-(20)**". In each case the end term in the sample ID was changed from "...**Date-(01)-(20)**" to "...**Date-(21)**" for reporting. This applies to samples 1742020-14 and 1742020-20.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

*Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Pb, and Si) Analysis by EPA Method*

*1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Pb, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

#### **Batch B172756**

Calcium results for samples 1742020-08, 1742020-12, 1742020-14, and 1742020-18 were above the high calibration standard and the passing high calibration standard (HCV recovery = 100%). The samples were re-analyzed at lower dilutions, confirming the results in Batch B172756. Because of poor internal standard recoveries in the re-analyses, calcium results are reported from this batch (B172756). No qualification of data was necessary.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### **Batch B173137**

The dissolved Mg and Na results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MDL values for total recoverable Mg and Na have been calculated using the standard deviation of the method blanks prepared and analyzed concurrently with the submitted samples. For Mg, the MRL is set by a low calibration standard in the calibration. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### *Total Recoverable metals (Ni) Analysis by EPA Method 1640, Mod.*

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to EPA Method 1640. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

**Batch B173101**

The trace metals fractions designated for Column Chelation (EPA Method 1640) analyses arrived in high-density polyethylene (HDPE) bottles that were not lot tested down to levels adjusted to EPA Method 1640 levels, which yield lower MDLs/MRLs compared to EPA Method 1638 analyses. These fractions were collected in HDPE bottles cleaned and lot tested for EPA Method 1638 analyses.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

**Total and Dissolved Mercury Quantitation by EPA Method 1631E**

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

**Batch B172821**

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

**Arsenic Speciation Analysis by IC-ICP-CRC-MS**

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

**Batch B172708**

The MMAs matrix spike and matrix spike duplicate (B172708-MS4/B172708-MSD4) recoveries were below the lower control limit of 75% (each at 17%). A large unknown arsenic peak is present immediately following the identified MMAs peak, suggesting species conversion. Including both peaks, the total recovery of MS4 and MSD4 is 112% and 111%, respectively. The low recoveries for MMAs correlate with the elevated recoveries of the neighboring unknown arsenic peak, suggesting that the sample matrix induces species conversion. No species conversion was observed in the bracketing continuing calibration verification standards (CCVs), demonstrating that the applied method stabilizes these species in solution. Since the low recoveries observed for MMAs in the MS and MSD are therefore attributable to the sample matrix, no corrective actions were required. The reported results are deemed representative of the supplied samples and indicate that the spiked sample matrix favors the unknown arsenic species.

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Jeremy Maute

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                          | Lab ID     | Report Matrix | Type   | Sampled    | Received   |

## Shipping Containers

### Cooler - 1742020

**Received:** October 17, 2017 14:43  
**Tracking No:** n/a via Courier  
**Coolant Type:** Ice  
**Temperature:** 5.0 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#10

**Custody seals present?** Ye  
**Custody seals intact?** Ye  
**COC present?** Ye

# Chain-of-Custody Form

Ship samples to:  
18804 North Creek Parkway, Suite 100  
Bothell, WA 98011

Client: Port of Tacoma (PIONEER/DOF) PO Number: 79224  
 Contact: Troy Bussey (PIONEER) Phone: 360-570-1700  
 Client Project ID: Arkema FS DG Inv Email: busseyt@uspioneer.com  
 Samples Collected By: DG Cooper (DOF) 206-660-3466  
 Special Instructions: Lab anoxic preservation for soil/sediment samples.  
 Submit EDD to PIONEER using PIONEER EDD Format.

Received by: [Signature] For BAL use only Date: 10/17/17  
 Work Order ID: \_\_\_\_\_ Time: 1424

# Chain-of-Custody Form

BAL Report 1742020

Ship samples to:  
18804 North Creek Parkway, Suite 100  
Bothell, WA 98011

Received by: HCH For BAL use only Date: 10 17 17  
Work Order ID: \_\_\_\_\_ Time: 14:24  
Project ID: \_\_\_\_\_

Client: Port of Tacoma (PIONEER/DOF) PO Number: 79224  
Contact: Troy Bussey (PIONEER) Phone: 360-570-1700  
Client Project ID: Arkema FS DG Inv Email: busseyt@uspioneer.com

Mail Invoice to: Port of Tacoma  
PO Box 1837  
Tacoma, WA 98401-1837  
Mail Report to: Troy Bussey (PIONEER)  
5205 Corporate Center Ct. SE, Ste A  
Olympia, WA 98503

Samples Collected By: DG Cooper (DOF) 206-660-3466  
Special Instructions: Lab anoxic preservation for soil/sediment samples.  
Submit EDD to PIONEER using PIONEER EDD Format.

Email Receipt Confirmation? Yes  
BAL PM: Jeremy Maute

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Mr. Troy Bussey,

On October 19, 2017, Brooks Applied Labs (BAL) received eighteen (18) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The client samples GW-4C1-1-101717-(20) and GW-5C14-2-101717-(20) arrived with the shipment but these samples were not listed on the chain-of-custody (COC) forms. The samples were added to the COC (COC, page 2, rows 7 and 8) by Brooks Applied Labs sample reception staff and logged in for arsenic speciation analyses.

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### *Arsenic Speciation Analysis by IC-ICP-CRC-MS*

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). Instances where the matrix spike/matrix spike duplicate (MS/MSD) sets were spiked at a concentration less than 25% of the native sample result, the recoveries were not reported (NR). Spike recoveries are not a valid indicator of data quality when the analyte concentration in the source sample is greater than the spiking level.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute  
Project Manager

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Common Abbreviations

|            |                                     |            |                                    |

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                | Lab ID     | Report Matrix | Type         | Sampled    | Received   |
|-----------------------|------------|---------------|--------------|------------|------------|
| GW-5C13-1-101717-(20) | 1742045-01 | Water         | QC Sample    | 10/17/2017 | 10/19/2017 |

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Mr. Troy Bussey,

On October 23, 2017, Brooks Applied Labs (BAL) received seven (7) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody form.

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). Instances where the matrix spike/matrix spike duplicate (MS/MSD) sets were spiked at a concentration less than 25% of the native sample result, the recoveries were not reported (**NR**). Spike recoveries are not a valid indicator of data quality when the analyte concentration in the source sample is greater than the spiking level.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish extending to the right.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Mr. Troy Bussey,

On October 24, 2017, Brooks Applied Labs (BAL) received fourteen (14) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The client sample GW-7E3-1-102417-(20) was listed on the accompanying chain-of-custody (COC) forms. However, sample GW-7E3-1-102417-(20) was not included with the sample shipment. The client was notified, and BAL was instructed to proceed with the analyses. In accordance with the client's instructions, no results are reported for the client sample GW-7E3-1-102417-(20).

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The As(III) RPD for the laboratory duplicate sample B172942-DUP1 was greater than the control limit of 25%, at 34%. The As(III) result for the parent sample, 1743031-05 should be considered estimated due to poor precision, and has been qualified "M" to reflect this discrepancy.

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

| <b>MDL</b> | method detection limit              | <b>TR</b>  | total recoverable fraction         |
| <b>MRL</b> | method reporting limit              |            |                                    |

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                | Lab ID     | Report Matrix | Type         | Sampled    | Received   |
|-----------------------|------------|---------------|--------------|------------|------------|
| GW-7F2-1-102317-(20)  | 1743031-01 | Water         | Sample       | 10/23/2017 | 10/24/2017 |
| GW-7F3-1-102317-(20)  | 1743031-02 | Water         | Sample       | 10/23/2017 | 10/24/2017 |
| GW-7F1-2-102317-(20)  | 1743031-03 | Water         | Sample       | 10/23/2017 | 10/24/2017 |
| GW-7F4-1-102317-(20)  | 1743031-04 | Water         | Sample       | 10/23/2017 | 10/24/2017 |

## Shipping Containers

### Cooler - 1743031

**Received:** October 24, 2017 14:30  
**Tracking No:** n/a via Courier  
**Coolant Type:** Ice  
**Temperature:** 4.2 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#8

**Custody seals present?** Yes  
**Custody seals intact?** Yes  
**COC present?** Yes

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Revision 1: The sample ID for the client sample 1743049-14 was incorrectly transcribed in the initial report issued on November 16, 2017. In this revised report, the client sample ID for 1743049-14 was corrected (from **GW-BF1-1R-102517-(20)** to **GW-8F1-1R-102517-(20)**), as requested by the client. No other changes were made with respect to the original report.

Mr. Troy Bussey,

On October 26, 2017, Brooks Applied Labs (BAL) received fifteen (15) water samples in acceptable condition. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

#### *Arsenic Speciation Analysis by IC-ICP-CRC-MS*

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

If the native sample result and/or the DUP result is not detected (ND) above the MDL, then the associated RPD is not calculated (N/C). Instances where the matrix spike/matrix spike duplicate (MS/MSD) sets were spiked at a concentration less than 25% of the native sample result, the recoveries were not reported (NR). Spike recoveries are not a valid indicator of data quality when the analyte concentration in the source sample is greater than the spiking level.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish extending to the right.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Common Abbreviations

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

## Shipping Containers

### Cooler

**Received:** October 26, 2017 15:00  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 5.5 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#10

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On October 30, 2017, Brooks Applied Labs (BAL) received eleven (11) water samples in a sealed container with a temperature of 2.0°C. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

*Total Recoverable and Dissolved Metals (Al, As, Ca, Fe, K, Mg, Mn, Na, and Si) Analysis by EPA Method 1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Fe, K, Mg, Mn, Na, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

**Batch B173242**

The sodium spike recoveries for the blank spike samples (B173242-BS1 and B173242-BS2) were greater than the upper control limit of 130% (at 170% and 171%, respectively). The blank spike samples were created at the prep step, prior to the in-bottle oven digest. A certified reference material (B173242-SRM1)

was analyzed in the analytical run. The reference material recovery for total sodium was acceptable at 98%, demonstrating that the analytical method stabilizes sodium in solution. Due to high sodium levels in the source samples, sodium was underspiked in the matrix spike and matrix spike duplicate (MS/MSD) samples. Due to the elevated sodium recoveries in B173242-BS1 and B173242-BS2, all sodium results in this batch are qualified as estimated "J-1" due to a potential high bias.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total Recoverable metals (Cu, Ni, and Pb) Analysis by EPA Method 1640, Mod.

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to EPA Method 1640. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

### **Batch B173101**

The trace metals fractions designated for Column Chelation (EPA Method 1640) analyses arrived in high-density polyethylene (HDPE) bottles that were not lot tested down to levels adjusted to EPA Method 1640 levels, which yield lower MDLs/MRLs compared to EPA Method 1638 analyses. These fractions were collected in HDPE bottles cleaned and lot tested for EPA Method 1638 analyses.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total and Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold

amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

### **Batch B172993**

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

### *Arsenic Speciation Analysis by IC-ICP-CRC-MS*

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

### **Batch B172942**

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Jeremy Maute  
Senior Project Manager  
Brooks Applied Labs  
Jeremy@brooksupplied.com

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                  | Lab ID     | Report Matrix | Type   | Sampled    | Received   |
|-------------------------|------------|---------------|--------|------------|------------|

## Shipping Containers

### **Cooler - 1744007**

**Received:** October 30, 2017 9:38  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 2.0 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#10

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

# Chain-of-Custody Form

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On October 31, 2017, Brooks Applied Labs (BAL) received thirty-three (33) water samples in a sealed container with a temperature of 3.4°C. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The silicon results are operationally defined as nitric acid-soluble [Si]. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. In cases where an analytical bias is observed for (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640, the copper, lead, and/or nickel results are quantified and reported via modified EPA Method 1638. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

The filtered fractions (arsenic speciation, trace metals, and column chelation containers) for sample **GW-131+00-2-102717-(20)** were significantly darker in color compared to the corresponding unfiltered fraction (**GW-131+00-2-102717**). The client was notified. The lighter colored samples yielded results greater than or equal to analyte concentrations in the darker colored (field filtered) fractions in all cases, except for nickel (*see narration in Batch B173242*). Several other analytes (in addition to the target analytes) were monitored and the trend was consistent. Consequently, the “dissolved” basis was retained for the samples with the significantly darker appearance and the lighter colored sample kept the “unfiltered” assignment. Samples 1744028-09 and 1744028-10 were logged in and reported according to the “filtered” versus “unfiltered” assignments designated on the associated sample container labels.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, and Si) Analysis by EPA Method 1638, Mod.

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, Ni, Pb, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

In some cases, higher dilutions were necessary to mitigate matrix interference on the analytical platform. In these instances, the MDLs and MRLs were elevated, and there are some cases where the target MDL/MRLs were not met as a result.

### **Batch B173242**

The nickel spike recovery for the reference material sample (B173242-SRM1) was greater than the upper control limit of 130% (at 170%). The elevated recovery was limited to nickel; other target analytes reference material recoveries were within acceptable limits. Another reference material (B173242-SRM2) was employed and the nickel recovery was acceptable. Nickel recoveries for all blank spike samples and matrix spike/matrix spike duplicate (MS/MSD) samples in the batch were within acceptable ranges, demonstrating that the applied digest stabilizes nickel in solution. Since the nickel spike recovery outlier in B173242-SRM1 may be due to spot contamination, results were compared to re-analyses, and nickel results were in good agreement with results in Batch B173242. Nickel results in Batch B173242 are reported without qualification.

The dissolved nickel result was greater than the corresponding total recoverable nickel result for the client sample **GW-131+00-2-102717** (1744028-09 & 1744028-10). Re-analyses confirmed the results. Nickel results from column chelation (EPA Method 1640 MOD) yielded a similar trend. The container labels were checked and there was no indication of sample IDs getting switched. Since the same samples produced total recoverable results > dissolved results for the remaining target analytes, the nickel values yielded are deemed representative of the supplied samples. Nickel results are reported from Batch B173242 and no data were qualified.

The sodium spike recoveries for the blank spike samples (B173242-BS1 and B173242-BS2) were greater than the upper control limit of 130% (at 170% and 171%, respectively). The blank spike samples were created at the prep step, prior to the in-bottle oven digest. Since the samples had undergone an “in-bottle digest”, it is not possible to redo the digest with new blank spike samples. A certified reference material (B173242-SRM1) was analyzed in the analytical run. The reference material recovery for total sodium was acceptable at 98%, demonstrating that the analytical method stabilizes sodium in solution. However, due to the elevated sodium recoveries in B173242-BS1 and B173242-BS2, all sodium results in this batch are qualified as estimated “J-1” due to a potential high bias.

The matrix spike recovery for silicon in B173242-MSD4 was greater than the lab control limit of 125%, at 126%. The work plan for this project lists an upper control limit of 130% for silicon. Since this recovery is within the limits defined by the project work plan, no corrective action was necessary, and no data were qualified.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

Total Recoverable Metals Analysis by EPA Method 1640, Mod.

A high bias due to the sample matrix was observed for Cu, Ni, and Pb, when compared to EPA Method 1638, Mod results. Consequently, Cu, Ni, and Pb are reported from EPA Method 1638, Mod analyses.

Total and Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

**Batch B172993**

For several samples, it was necessary to use a higher volume of the BrCl preservative in order to oxidize the samples prior to analysis. In these instances, the MDLs and MRLs were elevated, and there are some cases (1744028-10) where the target MDL/MRLs were not met as a result.

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

**Batch B173027**

The sum of arsenic species was greater than the corresponding dissolved arsenic result for the client samples 1744028-10, 1744028-14, 1744028-16, and 1744028-18. Re-analyses confirmed the results. The arsenic speciation fractions were screened for total arsenic, verifying the elevated concentrations. The container labels were checked and there was no indication of sample IDs getting switched. Since re-analyses confirmed, the arsenic speciation results for 1744028-10, 1744028-14, 1744028-16, and 1744028-18 were reported from Batch B173027 and results are deemed representative of the supplied samples.

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

With the exceptions noted above, all data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                  | Lab ID     | Report Matrix | Type   | Sampled    | Received   |

## Shipping Containers

### Cooler #1 - 1744028

**Received:** October 31, 2017 4:30  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 3.4 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#15

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

# Chain-of-Custody Form

BAL Report 1744028

Ship samples to:  
18804 North Creek Parkway, Suite 100  
Bothell, WA 98011

For BAL use only  
Received by: \_\_\_\_\_ Date: 10/31/17  
Work Order ID: \_\_\_\_\_ Time: 16:30  
Project ID: \_\_\_\_\_

Client: Port of Tacoma (PIONEER/DOF) PO Number: 79224  
Contact: Troy Bussey (PIONEER) Phone: 360-570-1700  
Client Project ID: Arkema FS DG Inv Email: busseyt@uspioneer.com

Mail Invoice to: Port of Tacoma  
PO Box 1837  
Tacoma, WA 98401-1837  
Mail Report to: Troy Bussey (PIONEER)  
5205 Corporate Center Ct. SE, Ste A  
Olympia, WA 98503

Samples Collected By: DG Cooper (DOF) 206-660-3466  
Special Instructions: Lab anoxic preservation for soil/sediment samples.  
Submit EDD to PIONEER using PIONEER EDD Format.

Email Receipt Confirmation? Yes  
BAL PM: Jeremy Maute

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On November 2, 2017, Brooks Applied Labs (BAL) received thirty-two (32) water samples in a sealed container with a temperature of 6.8°C. Brooks Applied Labs strongly recommends that all samples submitted for speciation quantitation remain at a temperature of  $\leq 6^{\circ}\text{C}$  to maintain sample integrity prior to analysis.

The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], copper [Cu], iron [Fe], lead [Pb], potassium [K], magnesium [Mg], manganese [Mg], nickel [Ni], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

Water samples for arsenic speciation analyses are collected in anoxic Vacutainers (two for each sample). One of the two Vacutainers for sample GW-5G1-3-110117-(20) was open upon receipt. Upon receipt it was observed that the cap was missing, and no sample was left in the container. However, the other vacutainer for sample GW-5G1-3-110117-(20) did not leak. Analyses were completed on the Vacutainer with the lid intact; there was no impact on data quality.

For sample 1744050-14, a sample ID of GW-5I2-1-110117-(20) was listed on the chain-of-custody (COC) form. The corresponding container was labeled GW-5I1-1-110117-(20). In accordance with the client's instructions, the sample was logged in using the sample ID listed on the COC form (GW-5I2-1-110117-(20)).

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives is monitored for contamination to account for any biases associated with the sample results.

Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) Analysis by EPA Method 1638, Mod.

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

#### **Batch B173243**

The blank spikes are prepared at the prep step and undergo the same preservation and oven digest as the client samples; so, the blank spike recoveries can be used to monitor the efficacy of the in-bottle oven digest on specific target analytes. The blank spikes in Batch B173243 were not spiked with silicon. Blank spike recoveries for other in-bottle oven digest batches associated with this project (not shown) were spiked with silicon and have produced acceptable recoveries. Certified reference materials (B173243-SRM1 and B173243-SRM2) containing known values of silicon were analyzed in the analytical run and the silicon recoveries were acceptable at 111% and 106%, demonstrating that the analytical method stabilizes silicon in solution. Matrix spikes and matrix spike duplicate recoveries were acceptable for silicon. Since silicon blank spikes for this method have historically yielded acceptable recoveries and the reference materials and MS/MSD silicon recoveries were acceptable, demonstrating the absence of any significant matrix induced interference on silicon results within the analytical platform. No corrective action was taken, and no qualification of data was necessary. The silicon results are reported unqualified.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were ≤ 25% of the native sample concentrations, the recoveries were not reported (**NR**).

#### *Total Recoverable metals (Ni and Pb) Analysis by EPA Method 1640, Mod.*

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to EPA Method 1640. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

#### **Batch B173038**

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total and Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

#### **Batch B173045**

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

#### **Batch B173027**

A small arsenic peak of unknown molecular identity eluted near the arsenate peak in sample 1744050-15 and the two peaks (i.e. arsenate and the unknown arsenic species) may be poorly resolved. Consequently, the arsenate result for sample 1744050-15 has been qualified as estimated "J-1".

The sum of arsenic species in the arsenic speciation analyses are compared to the corresponding dissolved arsenic results for a mass balance evaluation. The sum of arsenic species was greater than the corresponding dissolved arsenic values in samples 1744050-04 and 1744050-22. The arsenic results in sample 1744050-04 are close enough to the reporting limit, that the disparities can be explained by the increase in variability for results near and below the MRL. The container labels were inspected and there was no evidence of miss-labeling. Re-analyses confirmed the dissolved arsenic results. The arsenic speciation fractions for samples 1744050-04 and 1744050-22 were subsequently analyzed for total filtered arsenic, confirming the results yielded in the original arsenic speciation analyses. Dissolved arsenic and arsenic speciation results from the original analyses were reported and the results are deemed representative of the supplied samples.

The arsenic speciation results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

With the exception noted above, all data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

| Sample                  | Lab ID     | Report Matrix | Type         | Sampled    | Received   |

## Shipping Containers

### **Cooler - 1744050**

**Received:** November 2, 2017 15:20  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 6.8 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#15

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

# Chain-of-Custody Form

BAL Report 1744050

Received by: Mary For BAL use only Date: 11/2/17

Work Order ID: \_\_\_\_\_ Time: 15:20

Project ID: \_\_\_\_\_

Client: Port of Tacoma (PIONEER/DOF)

PO Number: 79224

Contact: Troy Bussey (PIONEER)

Phone: 360-570-1700

Client Project ID: Arkema FS DG Inv

Email: busseyt@uspioneer.com

Samples Collected By: DG Cooper (DOF) 206-660-3466

Special Instructions: Lab anoxic preservation for soil/sediment samples.  
Submit EDD to PIONEER using PIONEER EDD Format.

Mail Invoice to:

Port of Tacoma  
PO Box 1837  
Tacoma, WA 98401-1837

Mail Report to:

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On November 6, 2017, Brooks Applied Labs (BAL) received twenty (20) water samples in a sealed container with a temperature of 5.1°C. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The silicon results are operationally defined as nitric acid-soluble [Si]. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. In cases where an analytical bias is observed for (copper [Cu], lead [Pb], or nickel [Ni]) analyses by modified EPA Method 1640, the copper, lead, and/or nickel results are quantified and reported via modified EPA Method 1638. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody (COC) forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

At the request of the client, the sample listed on the COC as *GW-IC1-3* was later changed to *GW-IC1-3-110317-(20)*.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives was monitored for contamination to account for any biases associated with the sample results.

*Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) Analysis by EPA Method 1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

In some cases, higher dilutions were necessary to mitigate matrix interference on the analytical platform. In these instances, the MDLs and MRLs were elevated, and there are some cases where the target MDL/MRLs were not met as a result.

### **Batch B173243**

The blank spikes are prepared at the prep step and undergo the same preservation and oven digest as the client samples; so, the blank spike recoveries can be used to monitor the efficacy of the in-bottle oven digest on specific target analytes. The blank spikes in Batch B173243 were not spiked with silicon. Blank spike recoveries for other in-bottle oven digest batches associated with this project (not shown) were spiked with silicon and have produced acceptable recoveries. Certified reference materials (B173243-SRM1 and B173243-SRM2) containing known values of silicon were analyzed in the analytical run and the silicon recoveries were acceptable at 111% and 106%, demonstrating that the analytical method stabilizes silicon in solution. Matrix spikes and matrix spike duplicate recoveries were acceptable for silicon. Since silicon blank spikes for this method have historically yielded acceptable recoveries and the reference materials and MS/MSD silicon recoveries were acceptable, demonstrating the absence of any significant matrix induced interference on silicon results within the analytical platform. No corrective action was taken, and no qualification of data was necessary. The silicon results are reported unqualified.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### *Total Recoverable metals (Ni, and Pb) Analysis by EPA Method 1640, Mod.*

A high bias due to the sample matrix was observed for Cu when compared to EPA Method 1638, Mod results. Consequently, Cu results are reported from EPA Method 1638, Mod analyses. Ni and Pb are reported via by EPA Method 1640, Mod.

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to EPA Method 1640. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

### **Batch B173038**

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total and Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

#### **Batch B173045**

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

#### **Batch B173027**

The sum of arsenic species was greater than the corresponding dissolved arsenic result for the client sample 1745005-04. Re-analyses confirmed both dissolved arsenic and arsenic speciation results. The arsenic speciation fraction was screened for total arsenic, verifying the elevated concentrations. The container labels were checked and there was no indication of sample IDs getting switched. Since re-analyses confirmed, the arsenic speciation results for 1745005-04 are reported from Batch B173027 and results are deemed representative of the supplied samples.

All data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Sample Information

## Shipping Containers

### Cooler - 1745005

**Received:** November 6, 2017 13:35  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 5.1 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#15

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

Collette –

On 1745005, can you please change the Sample ID for “GW-IC1-3” to “GW-IC1-3-110317-(20)”. Thank you.

Respectfully,  
 Troy

**Subject:** Samples Received by Brooks Applied Labs

Hi Troy,

On November 6, 2017, twenty water samples were received by our laboratory and logged in for total and dissolved mercury, arsenic, copper, lead, and nickel (Hg, As, Cu, Pb, Ni) analyses, in addition to dissolved trace metals (Fe, Al, Ca, Mg, Mn, K, Si, Na) analyses and arsenic (As) speciation analyses. The work order is 1745005. I have included in this email an electronic copy of the accompanying chain-of-custody forms.

The samples were received in a cooler with a temperature of 5.1°C and logged in for a 20 day TAT (samples due on 12/05/2017).

Please do not hesitate to contact myself or your project manager, Jeremy, with any questions or comments you may have.

Thank you,

Collette Machado  
Project Coordinator

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On November 16, 2017, Brooks Applied Labs (BAL) received twenty-four (24) water samples in a sealed container with a temperature of 3.1°C. The samples were logged-in for the total recoverable and dissolved metals (aluminum [Al], arsenic [As], calcium [Ca], iron [Fe], potassium [K], magnesium [Mg], manganese [Mg], sodium [Na], and silicon [Si]) analyses via digestion and subsequent analysis by modified EPA Method 1638. The silicon results are operationally defined as nitric acid-soluble [Si]. The samples were logged in for total recoverable and dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. In cases where an analytical bias is observed for (copper [Cu], lead [Pb], or nickel [Ni]) analyses by modified EPA Method 1640, the copper, lead, and/or nickel results are quantified and reported via modified EPA Method 1638. The samples were logged-in for the total mercury [Hg] analysis by EPA Method 1631E. The samples were logged-in for dissolved arsenic speciation analyses, including arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs], according to the chain-of-custody (COC) forms.

The samples submitted for arsenic speciation and dissolved analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives was monitored for contamination to account for any biases associated with the sample results.

*Total Recoverable and Dissolved Metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) Analysis by EPA Method 1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Total recoverable and dissolved metals (Al, As, Ca, Cu, Fe, K, Mg, Mn, Na, and Si) quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

In some cases, higher dilutions were necessary to mitigate matrix interference on the analytical platform. In these instances, the MDLs and MRLs were elevated, and there are some cases where the target MDL/MRLs were not met as a result.

#### **Batch B173175**

The total recoverable and dissolved copper results for the **EB-111517/EB-111517-(20)** samples (1746027-01 and 1746027-02) were greater than the associated MRLs. Method blanks and bracketing CCBs were clean for copper and re-analyses confirmed the results. Copper results were reported from this batch.

The dissolved manganese result for the **EB-111517-(20)** sample (1746027-02) was greater than the associated MRL. Method blanks and bracketing CCBs were clean for manganese and re-analysis confirmed the result. Manganese results were reported from this batch.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Na MRL to 2 times the value of the MDL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**NC**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### **Batch B173378**

The total recoverable arsenic result for the **EB-111517** sample (1746027-01) was greater than the associated MRL. Method blanks and bracketing CCBs were clean for arsenic and re-analysis confirmed the result. Arsenic results were reported from this batch.

The dissolved calcium, potassium, magnesium, sodium, and silicon results for the **EB-111517-(20)** sample (1746027-02) were greater than the associated MRLs. Method blanks and bracketing CCBs were clean for these analytes and re-analysis confirmed the results. Calcium, potassium, magnesium, sodium, and silicon results were reported from this batch.

The blank spike recovery for aluminum in B173378-BS1 was less than the laboratory control limit of 75%, at 74%. The work plan for this project lists a lower control limit of 70% for aluminum. Since this recovery is within the limits defined by the project work plan, no corrective action was necessary, and no data were qualified.

The blank spike recoveries for aluminum and potassium in B173378-BS2 were less than the laboratory control limit of 75%, at 73% and 74%, respectively. The work plan for this project lists a lower control limit of 70% for aluminum and potassium. Since the recoveries were within the limits defined by the project work plan, no corrective action was necessary, and no data were qualified.

The blank spike recovery for aluminum in B173378-BS3 was less than the laboratory control limit of 75%, at 73%. The work plan for this project lists a lower control limit of 70% for aluminum. Since this recovery is within the limits defined by the project work plan, no corrective action was necessary, and no data were qualified.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. BAL requires that the MRL is at least 2 times the value of the corresponding MDL. Due to an elevated MDL, it was necessary to raise the Si MRL to 2 times the value of the MDL. The Fe recovery for the low calibration standard used to set the MRL was less than the lower control limit of 70%. Thus, it was necessary to use the adjacent calibration standard to set the MRL for Fe, resulting in an elevated MRL. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total Recoverable metals (Ni, and Pb) Analysis by EPA Method 1640, Mod.

A high bias due to the sample matrix was observed for Cu when compared to EPA Method 1638, Mod results. Consequently, Cu results are reported from EPA Method 1638, Mod analyses. Ni and Pb are reported via by EPA Method 1640, Mod.

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid ( $\text{HNO}_3$ ) and then prepared according to EPA Method 1640. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

The lead reference materials were less than the MRL. Since the lead recoveries in the reference materials are not valid indicators of data quality, the lead recoveries for the reference materials were not reported.

#### **Batch B173176**

The total recoverable nickel and lead results for the **EB-111517** sample (1746027-01) were greater than the associated MRLs. Method blanks and bracketing CCBs were clean for nickel and lead and re-analyses confirmed the results. Nickel and lead results were reported from this batch.

The dissolved nickel and lead results for the **EB-111517-(20)** sample (1746027-02) were greater than the associated MRLs. Method blanks and bracketing CCBs were clean for these analytes and re-analysis confirmed the results. Nickel and lead results were reported from this batch.

Several cases were observed where the dissolved nickel and lead concentrations were greater than the corresponding total recoverable nickel and lead values. Re-analysis were completed, and in all cases, the results were confirmed. Results are reported as is, and are deemed representative of the supplied samples.

The lead result for sample 1746027-11 (19.1  $\mu\text{g/L}$ ) was significantly greater than the lead result generated via EPA Method 1638, Mod (2.96  $\mu\text{g/L}$ ). This is indicative of an analytical bias due to the matrix for sample 1746027-11. The lead result for sample 1746027-11 is reported via EPA Method 1640, Mod and the result is qualified as estimated "J-1" to indicate a potential positive bias.

The total recoverable and dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to

account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Total and Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

#### **Batch B173158**

Mercury results for the method blanks in batch B173158 were greater than the associated MRL. All associated client sample results less than 10x the method blank hits are qualified as estimated "J-1". These mercury results are potentially biased high. The source of the contamination was determined to be the BrCl used to preserve the client samples. The BrCl solution was removed from circulation. However, the client samples had already been preserved in the containers they were received in; there is no pathway in which the contamination could be mitigated.

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Arsenic Speciation Analysis by IC-ICP-CRC-MS

Arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS).

#### **Batch B173167**

The sum of arsenic species was greater than the corresponding dissolved arsenic result for the client sample 1746027-22. Re-analyses confirmed both dissolved arsenic and arsenic speciation results. The container labels were checked and there was no indication of sample IDs getting switched. Since re-analyses confirmed, the arsenic speciation results for 1746027-22 are reported from Batch B173167 and results are deemed representative of the supplied samples.

With the exceptions noted above, all data was reported without qualification (aside from concentration qualifiers) and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Common Abbreviations

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Result is estimated.   |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>J-M</b> | Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.                       |
| <b>J-N</b> | Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.                                  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.  |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Result is estimated.   |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

## Shipping Containers

### Cooler - 1746027

**Received:** November 16, 2017 9:10  
**Tracking No:** n/a via Customer Drop-Off  
**Coolant Type:** Ice  
**Temperature:** 3.1 °C

**Description:** Cooler  
**Damaged in transit?** No  
**Returned to client?** No  
**Comments:** IR#15

**Custody seals present?** No  
**Custody seals intact?** No  
**COC present?** Yes

Subject: Feasibility Study Data Gap Investigation, Former Arkema Manufacturing Site, Tacoma, WA;  
Brooks Applied Labs 2018 Water Sample Data Validation Review Summary  
Client Project No.: Not Specified  
QA/QC Solutions, LLC Project No.: 091018.1

Dear Troy:

This letter documents the results of the data validation review of the metals (elements) analyses completed on groundwater (GW) and pore water (PW) samples collected in September and October 2018. The data is associated with Feasibility Study Data Gap Investigation completed at the Former Arkema Manufacturing Site located in Tacoma, Washington. Details of the investigation completed are provided in the Feasibility Study Data Gap Investigation Work Plan, Former Arkema Manufacturing Site. (Pioneer 2017).

The data reported were validated to verify the laboratory quality assurance and quality control (QA/QC) procedures were documented and that the overall quality of the data reported is sufficient to support its intended purposes. A summary of the overall assessment of data quality, the data set, a summary of the analytical methods used to complete the chemical analyses, a summary of the data validation procedures used, and a summary of the reasons why data were qualified (including other items noted during data validation) is presented below.

### Overall Assessment of Data Quality

Overall, the data reported are of good quality and the results for the applicable QA/QC procedures that were used by the laboratory during the analysis of the samples were generally acceptable. Selected sample results required qualification during data validation because method-specific QA/QC criteria were not met; results may be qualified for more than one reason. During data validation, the following actions were taken:

- A total of 34 results reported as detected were qualified as estimated (assigned a *J* qualifier).
- No results required restatement as undetected (*U* or *UJ*) or rejection (*R*).

Analytical data that did not meet method- and/or laboratory-established control limits for applicable quality control measurements were qualified as estimated (*J*) by the laboratory or during data validation. These qualified data are usable and represent data of good quality and reasonable confidence and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Analytical data that were reported as undetected (*U*) by the laboratory are usable.

## Data Set

A total 31 groundwater samples and 27 pore water samples (collected using two different sampling methods were collected. The sample counts include natural, field duplicate, and equipment rinsate blank samples). All water samples were field filtered (0.45 µm) and were collected in September and October 2018. A summary of the samples collected and the analyses completed is presented in Table 1.

Analyses were completed by Brooks Applied Labs located in Bothell, Washington. A total of 3 work orders summarizing the results of the samples and associated quality control data.

## Analytical Methods

The analytical methods that were used to complete the chemical analyses included the following:

- Dissolved arsenic was determined using U.S. EPA Method 1638 (modified) (U.S. EPA 1999). The original sample bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). Sample analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85 °C. Quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS).
- USEPA 1640 Mod (column chelation) for dissolved copper, nickel and lead were determined using U.S. EPA Method 1640 (modified) (U.S. EPA 1997). Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to the analytical method. All sample fractions for total recoverable and dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85 °C. Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS).
- Dissolved mercury by U.S. EPA 1631E (U.S. EPA 2002a). Samples were oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

## Data Validation Procedures

Data validation procedures included evaluating a summary of the sample results and applicable quality control results that were reported by the laboratory; this level of validation is also referred to as an abbreviated data review (equivalent to "Stage 2B" review per U.S. EPA 2009, which is equivalent to "Level EPA2B" for use with the Washington Department of Ecology EIMS database). The analytical data were validated generally following the applicable guidance and requirements:

- *Guidance on Environmental Data Verification and Validation* (U.S. EPA 2002b)
- *USEPA Contract Laboratory Program, National Functional Guidelines for Superfund Organic Methods Data Review*. Final. OSWER 9240.1-45. USEPA/540/R-08/01 (U.S. EPA 2008).
- *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use*. OSWER No. 9200.1-85. EPA 540-R-08-005. (U.S. EPA 2009).
- *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Superfund Data Review*. Final. OSWER 9240.1-51. EPA 540-R-10-011 (U.S. EPA 2010).

- Method-specific and laboratory-established quality control requirements, as applicable.
- The quality control limits summarized in the *Feasibility Study Data Gap Investigation Work Plan, Former Arkema Manufacturing Site*. (Pioneer 2017).

Data validation procedures were mostly modified to accommodate QA/QC requirements for methods that are not specifically addressed by the USEPA functional guidelines. In this situation, method-specific, laboratory-established, project-specific control limits were used, as necessary, to determine if qualification of the data was necessary. The laboratory data deliverables that were validated, if present, included the following:

- Case narratives discussing analytical problems (if any) and procedures.
- Chain-of-custody documentation to verify completeness of the data set.
- Sample preparation logs or laboratory summary result forms to verify analytical holding times were met.
- Results for applicable method blanks and field blanks to determine whether an analyte that was reported as detected in any sample was the result of possible contamination introduced at the laboratory or during field sampling, respectively.
- Results for applicable standard reference material (SRM), laboratory control sample (LCS) (i.e., blank spike), duplicate LCS, matrix spike (MS), and/or matrix spike duplicate (MSD) recoveries to assess analytical accuracy
- Results for applicable laboratory duplicate sample, duplicate LCS, and/or MSD analyses to assess analytical precision.
- Results for the field duplicate samples to provide additional information in support of the quality assurance review.
- Laboratory summaries of analytical results.

Verification of 100-percent of all applicable laboratory calculations, transcriptions, review of instrument printouts, and review of bench sheets was not completed during the data validation review. There may be analytical problems that could only be identified by reviewing every instrument printouts and associated analytical quality control results. Confirmation of all possible factors that could result in the degradation of data quality was not completed nor should be inferred at this time. The laboratory case narratives did not indicate any significant problems with data that were not reviewed during data validation. The adequacy of the sampling procedures was not completed during the data validation.

Performance based control limits established by the laboratory and applicable control limits specified in the analytical methods were used to evaluate data quality and to determine if specific data required qualification. Data qualifiers were assigned following guidance specified by U.S. EPA (2002b, 2009, and 2010) and the quality control requirements specified in the applicable analytical methods.

## Reasons for Data Qualification

The reasons for data qualification and a summary of the qualified data are summarized in Table 2 and included the following:

- A total of 34 results reported as detected at a concentration above the method detection limit (MDL), but less than the reporting limit (RL) were qualified as estimated (*J*).

- One result reported as detected was qualified as estimated (*J*) because the MS recovery did not meet applicable control limits.
- One result reported as detected was qualified as estimated (*J*) because the MSD recovery and relative percent difference (RPD) between the MS and MSD recoveries did not meet applicable control limits.
- One result reported as detected was qualified as estimated (*J*) because the laboratory noted the sample arrived in an HDPE bottle rather than the required FLPE container

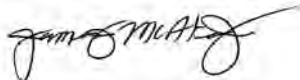

### General Comments

There were some quality control items identified during data validation and/or noted by the laboratory in the case narratives and are not discussed herein. However, qualification of the sample results was not required in these instances.

Data users should read the laboratory case narratives for additional details. Data users should note, however, the elements reported as detected in the equipment rinsate blank FB-PPS-091318-(20) (see BAL Report No. 1837065 are considered as anonymously high compared to the results reported in the associated samples and to all other equipment rinsate blanks. No explanation can be made as this time to determine the results reported for this equipment rinsate blank. No sample results were qualified based on these results and data users should consider this equipment rinsate blank as an outlier.

This concludes the data validation review summary. Should you have any questions regarding the information presented herein, please contact me by telephone at 503.763.6948 or by e-mail at [jjmcateer@msn.com](mailto:jjmcateer@msn.com).

Cordially,

**Notes:**

- (20) - samples are dissolved fractions
- (21) - samples are field duplicate dissolved fractions
- EB or FB - samples are equipment rinsate blanks
- H - container type incorrect
- HDPE - high density polyethylene
- FLPE - fluorinated polyethylene
- J - estimated
- LCS - laboratory control sample
- M - laboratory duplicate precision (RPD) no within acceptance limit MDL - method detection limit
- MS - matrix spike
- MS - matrix spike duplicate
- N - spike recovery not within acceptance criteria
- R - rejected
- RE1: reanalysis
- RL - reporting limit
- RPD - relative percent differences
- U - undetected at detection limit shown
- X - method blank outlier, result may exhibit a positive bias

|                                |    |
|--------------------------------|----|
| Total results qualified "J" =  | 34 |
| Total results qualified "U" =  | 0  |
| Total results qualified "UJ" = | 0  |
| Total results qualified "R" =  | 0  |

<sup>a</sup> Summary of qualified data is for natural and field quality control samples only

<sup>b</sup>Low bias - concentration reported is exhibits low bias and the actual reporting limit or concentration may be greater than reported

<sup>c</sup>High bias - result reported exhibits high bias and the actual reporting limit or concentration may be lower than reported

<sup>d</sup>False positive - compound is likely not present

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On September 14, 2018, Brooks Applied Labs (BAL) received nine (9) water samples in a sealed container with a temperature of 4.5°C. The samples were logged-in for dissolved arsenic [As] analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged in for dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. The samples were logged-in for the dissolved mercury [Hg] analysis by EPA Method 1631E, according to the chain-of-custody (COC) form.

The samples submitted for dissolved analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives was monitored for contamination to account for any biases associated with the sample results.

*Dissolved Metals (As) Analysis by EPA Method 1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Dissolved arsenic quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

**Batch B182470**

Arsenic results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration for most analytes. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these

results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

Dissolved metals (Cu, Ni, and Pb) Analysis by EPA Method 1640, Mod.

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid (HNO<sub>3</sub>) and then prepared according to EPA Method 1640. All sample fractions for dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

**Batch B182471**

The dissolved lead result for the field blank sample, identified as **FB-PPS-091318-(20)** (1837065-09), is greater than the associated MRL. Method blanks and bracketing CCBs were clean for lead and re-analyses confirmed the elevated result. The container label was inspected and there was no evidence of mis-labeling for sample 1837065-09. Consequently, the lead result for 1837065-09 is deemed representative of the supplied sample and lead results were reported from this batch.

Dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride (BrCl) and then analyzed with stannous chloride (SnCl<sub>2</sub>) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

**Batch B182462**

The dissolved mercury fraction for the sample identified as **PW-126+80-ST1-091218-(20)** (1837065-05) arrived in an HDPE container. The method (EPA 1631E) requires samples to be collected in glass or FLPE containers. Upon receipt, the mercury fraction for **PW-126+80-ST1-091218-(20)** (1837065-05) was transferred into an FLPE container. The mercury result for **PW-126+80-ST1-091218-(20)** (1837065-05) should be considered estimated and has been qualified "H" due to a sample collection (i.e. container type) violation.

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

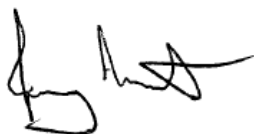

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these

results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Please see narrative for explanation.                                      |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.                               |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Please see narrative for explanation.  |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

RE: Project PTC-OA1701

Client Project: Arkema FS Data Gap

Dear Mr. Bussey,

On October 12, 2018, Brooks Applied Labs (BAL) received thirty-one (31) water samples in a sealed container with a temperature of 3.0°C. The samples were logged-in for dissolved arsenic [As] analyses via digestion and subsequent analysis by modified EPA Method 1638. The samples were logged in for dissolved (copper [Cu], lead [Pb], and nickel [Ni]) analyses by modified EPA Method 1640. The samples were logged-in for the dissolved mercury [Hg] analysis by EPA Method 1631E, according to the chain-of-custody (COC) forms.

The samples submitted for dissolved analyses were filtered in the field by the client.

All samples were received, prepared, analyzed, and stored according to BAL SOPs and EPA methodology. Reagent water for dilutions and sample preservatives was monitored for contamination to account for any biases associated with the sample results.

*Dissolved Metals (As) Analysis by EPA Method 1638, Mod.*

The original bottles were preserved with 1% HNO<sub>3</sub> (v/v) and 1% HCl (v/v). All sample fractions for dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Dissolved arsenic quantitation was performed by inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

**Batch B182794**

The internal standard recoveries for 1841055-21 (57%), B182794-DUP8 (59%), B182794-MS8 (55%), and B182794-MSD8 (55%) were less than the lower control limit of 60%, ran. The matrix quality control sample recoveries were within acceptable limits and the lab dup yielded an acceptable relative percent difference (RPD), demonstrating that the internal standards appropriately corrected for variability in sensitivity within the analytical platform. No corrective actions were necessary. The client sample result and QC sample results with the internal standard recovery outliers were reported without qualification.

Arsenic results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL

is set by a low calibration standard in the calibration for most analytes. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Dissolved metals (Cu, Ni, and Pb) Analysis by EPA Method 1640, Mod.

Samples for column chelation were pH adjusted with 0.2% (v/v) nitric acid ( $\text{HNO}_3$ ) and then prepared according to EPA Method 1640. All sample fractions for dissolved metals analyses were digested in the original sample containers in a laboratory oven for a minimum of 3 hours at 85°C.

Aliquots of prepared sample were analyzed via inductively coupled plasma dynamic reaction cell mass spectrometry (ICP-DRC-MS). The ICP-DRC-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, [brooksapplied.com](http://brooksapplied.com).

#### **Batch B182779**

Dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### **Batch B182835**

Dissolved metals results were not method blank corrected as described in the calculations section of the relevant BAL SOP and were evaluated using reporting limits adjusted to account for sample aliquot size. The MRL is set by a low calibration standard in the calibration. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

#### Dissolved Mercury Quantitation by EPA Method 1631E

All samples are prepared and analyzed in accordance with EPA Method 1631. Samples are oxidized with bromine monochloride ( $\text{BrCl}$ ) and then analyzed with stannous chloride ( $\text{SnCl}_2$ ) reduction, dual gold amalgamation, and cold vapor atomic fluorescence spectroscopy (CVAFS) detection using a Brooks Rand Instrument's MERX-T CVAFS Mercury Automated-Analyzer.

**Batch B182790**

The mercury results were method blank corrected as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample, the recoveries are not considered valid indicators of data quality. However, these results are reported as a demonstration of precision. When the spiking levels were  $\leq 25\%$  of the native sample concentrations, the recoveries were not reported (**NR**).

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report.

Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Jeremy Maute

## Report Information

### Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

|            |   |
|------------|---|
| <b>E</b>   | An estimated value due to the presence of interferences. A full explanation is presented in the narrative.                        |
| <b>H</b>   | Holding time and/or preservation requirements not met. Please see narrative for explanation.                                      |
| <b>J</b>   | Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.                 |
| <b>J-1</b> | Estimated value. A full explanation is presented in the narrative.  |
| <b>M</b>   | Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.                               |
| <b>N</b>   | Spike recovery was not within acceptance criteria. Please see narrative for explanation.  |
| <b>R</b>   | Rejected, unusable value. A full explanation is presented in the narrative.   |
| <b>U</b>   | Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.                               |
| <b>X</b>   | Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated. |

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.
