DATE: June 9, 2017

RE: **METALS SOURCE EVALUATION**
AGRI-TECH AND YAKIMA STEEL FABRICATORS SITE
YAKIMA STEEL FABRICATORS
YAKIMA, WASHINGTON
AGREED ORDER NO. DE 6091
FARALLON PN: 765-001

Farallon Consulting, L.L.C. (Farallon) has prepared this Technical Memorandum on behalf of Yakima Steel Fabricators, Inc. (YSF) for the YSF and Agri-Tech, Inc. (Agri-Tech) properties at 6 and 10½ East Washington Avenue in Yakima, Washington (herein collectively referred to as the Site) (Figure 1). The Site consists of Yakima County Tax Parcel Nos. 19133141009 and 19133141409 (Figure 2). From 2011 through 2014, Farallon conducted a supplemental remedial investigation (RI) of soil and sediment quality to characterize the source, nature, and extent of the constituents of potential concern (COPCs), including arsenic, antimony, cadmium, chromium, copper, lead, manganese, mercury, and zinc, in soil and groundwater on the southern portion of the Site. The purpose of this Technical Memorandum is to evaluate the potential source(s) of metals contamination identified in soil at the Site.

The work described in this Technical Memorandum was performed to meet the requirements of *Agreed Order No. DE 6091* entered into by the Washington State Department of Ecology (Ecology) and YSF pursuant to the authority of the Washington State Model Toxics Control Act (MTCA), as established in Section 050(1) of Chapter 70.105D of the Revised Code of Washington, with an effective date of October 27, 2008 (Agreed Order). The Agreed Order was issued in accordance with the provisions of the MTCA Cleanup Regulations, as established in Chapter 173-340 Washington Administrative Code (WAC). The work scope for completion of the supplemental RI was approved by Ecology and established in the *Feasibility Study Work Plan*,

Agri-Tech and Yakima Steel Fabricators, 6 and 10½ East Washington Avenue, Yakima, Washington dated May 3, 2011, prepared by Farallon (FS Work Plan).

BACKGROUND

Pertinent information regarding current and historical use of the Site and surrounding properties and a summary of previous metals sampling conducted at the Site is presented below. More detailed descriptions of the Site features, ownership and operation, historical Site use, use of surrounding properties, and previous work conducted at the Site are provided in the FS Work Plan and the *Revised Remedial Investigation Report, Agri-Tech and Yakima Steel Fabricators, 6 and 10½ East Washington Avenue, Yakima, Washington* dated June 10, 2004, prepared by Farallon (RI Report).

YSF AND AGRI-TECH SITE USAGE

Two structures currently are present at the Site: one single-story building currently used for steel fabrication and business offices on the YSF property (YSF building); and one single-story warehouse building on the Agri-Tech property (Agri-Tech building). The YSF building is divided into three parts: the western portion is used for steel fabrication and business offices; the central portion is used for steel fabrication and loading finished products; and the eastern portion is used for steel storage. The areas east and south of the YSF building are used for storage of steel and equipment. Currently, the Agri-Tech building is leased by the operator of YSF for use in its steel fabrication operations.

Historical Site uses include the following:

- Operation of a steel fabrication facility on the YSF property from approximately 1980 to the present.
- Operation of a fruit packing supplies and equipment company on the Agri-Tech property from 1982 through 1989.
- Construction of a lime and sulfur formulating plant in 1960 on what currently is the Agri-Tech property. The facility was owned by Yakima Farmers Supply and operated from construction until between approximately 1978 and 1982.

Multiple COPCs, including total petroleum hydrocarbons, carcinogenic polycyclic aromatic hydrocarbons, volatile organic compounds, and pesticides and herbicides, were identified as associated with the former Yakima Farmers Supply operations on the Site. Metals were included as COPCs for the Site by Ecology due to the use of heavy metals on the west-adjacent property owned by BNSF and historically leased to Bay Chemical Company.

Information regarding historical Site activities did not indicate the use or storage of products or materials containing lead, cadmium, zinc, manganese, copper, and other metals identified in soil,

sediment, and groundwater on the southern portion of the Site. However, bulk metal products have been present on the Site related to YSF steel fabrication and/or equipment storage activities.

BAY CHEMICAL SITE USAGE

The property west-adjacent to the Site, Yakima County Tax Parcel No. 19133141010, previously was owned by Northern Pacific Railroad, predecessor of current owner BNSF (Figure 2). This property was leased to Bay Chemical Company, a manufacturer of soil micronutrients, from 1963 to late 1975 or early 1976. The BNSF-leased property makes up a portion of the Former Bay Chemical site (herein referred to as the Bay Chemical site), an Ecology-listed facility. The Bay Chemical Company manufactured liquid zinc sulfate by reacting dry steel mill flue dust and sulfuric acid in wooden mixing tanks. The flue dust was the primary source of zinc for zinc sulfate production. The flue dust was delivered by rail in powdered form and stored in an uncovered stockpile near the rail spur on the northern end of the Bay Chemical site (Figure 2). Residual sludge from the zinc sulfate manufacturing process was removed from the mixing tanks and pumped to a sludge settling pond on the southern end of the Bay Chemical site, less than 100 feet east of the wetland area on the Site (Figure 2).

According to the *Former Bay Chemical Site Remedial Investigation Report, Volume 1* dated March 1997, prepared by ERC/Pacific Groundwater Group (Bay Chemical RI Report), metals associated with the flue dust at the Bay Chemical site included arsenic, antimony, cadmium, chromium, copper, lead, manganese, mercury, and zinc. These metals have been detected in soil and groundwater at the Bay Chemical site and at the Site.

HISTORICAL SITE REMEDIAL INVESTIGATION WORK

This section includes a summary of previously performed evaluations of metals concentrations in Site soil conducted by Farallon and others.

REMEDIAL INVESTIGATION

RI activities were conducted from 1997 through 2002 to characterize the nature and extent of COPCs identified for the Site. As noted above, the selection of COPCs for the Site was based on former Yakima Farmers Supply operations on the Site and on surrounding property use. Ecology identified the west-adjacent Bay Chemical site as a potential source of the metals contamination at the Site due to the documented presence on the Bay Chemical site of flue dust containing high concentrations of heavy metals. Ecology consequently required that the metals identified at the Bay Chemical site be included as COPCs during the Site RI. Metals COPCs identified for the Site by Ecology consisted of arsenic, antimony, cadmium, chromium, copper, lead, mercury, nickel, silver, thallium, and zinc.

Three soil samples were collected at 7.5 and 8 feet below ground surface (bgs) from borings in Area 3, located on the southwestern portion of the Site, and analyzed for metals. Area 3 and the RI soil sampling locations are shown on Figure 3. All three samples contained one or more metals

COPCs at concentrations exceeding background concentrations for the Yakima Basin reported in *Natural Background Soil Metals Concentrations in Washington State* dated October 1994, prepared by Ecology.

2007 AREA 3 INVESTIGATION

Ecology and Environmental Partners, Inc. of Issaquah, Washington (EPI) conducted additional soil sampling in Area 3 on the Site in 2007. Results of the Ecology/EPI metals soil sampling are summarized on Figure 3. Soil sampling depths were shallow, ranging from 0 to 28 inches bgs. Metals COPCs were detected in all soil samples collected from Ecology/EPI test pits at the following maximum concentrations: antimony at 65 milligrams per kilogram (mg/kg); arsenic at 55 mg/kg; cadmium at 330 mg/kg; chromium at 490 mg/kg; copper at 5,560 mg/kg; lead at 27,000 mg/kg; manganese at 12,500 mg/kg; mercury at 14 mg/kg; nickel at 110 mg/kg; silver at 43 mg/kg; and thallium at 39 mg/kg.

SUPPLEMENTAL SITE REMEDIAL INVESTIGATION

In 2008, an Agreed Order was issued to conduct a Feasibility Study (FS) for the Site and address data gaps that Ecology identified in the RI following the Ecology/EPI 2007 soil sampling in Area 3. The Agreed Order directed that the data gaps in the RI be addressed by conducting supplemental RI activities prior to conducting the FS and selecting cleanup alternatives for the Site. The scope of work included supplemental soil sampling to define the lateral and vertical distribution of soil contamination in portions of Area 3 that were not excavated during the BNSF cleanup action; groundwater monitoring and sampling of the existing monitoring well network to assess current groundwater quality; and sediment and soil sampling of the wetland area near the southern boundary of the Site.

Sampling performed in 2007 by Ecology/EPI was limited to depths of up to 28 inches bgs, which was inadequate to define the vertical distribution of COPCs present in all areas tested. Consequently, supplemental RI activities were performed to further define the lateral and vertical distribution of COPCs in Area 3.

Soil Investigation

Supplemental RI work was conducted at the Site between 2011 and 2014. Thirty-one test pits were excavated and soil samples were collected from grids A through N in Area 3 (Figure 4). Soil samples collected from the test pits were analyzed for the following metals COPCs identified in the FS Work Plan: antimony, arsenic, cadmium, copper, lead, manganese, mercury, and zinc. The analytical results are summarized on Figure 4.

The test pits were excavated to depths between 1 and 8 feet bgs. One or more of the target metals were detected in the soil samples at the following maximum concentrations: antimony at 7.1 mg/kg; arsenic at 8.5 mg/kg; cadmium at 2.8 mg/kg; copper at 1,300 mg/kg; lead at 730 mg/kg; manganese at 560 mg/kg; mercury at 0.40 mg/kg; and zinc at 1,700 mg/kg. Sufficient information was collected to estimate the lateral and vertical limits of COPCs in soil at the Site.

Wetland Investigation

A Category III wetland is present near the southern Site boundary (Figure 2). The wetland area originally was a larger pond that was partially filled in during development by YSF in the 1990s. Within the past several years, the pond has transitioned to intermittent standing water along with the growth of reeds and grasses. The estimated footprint of the pond and wetland area is depicted on Figure 4, which was based on a survey performed during completion of the RI Report in 1997. A revised wetland delineation completed by Ecology in August 2016 confirmed that the wetland remains a Category III wetland regardless of the shrinking footprint. Ecology's wetland delineation is documented in the memorandum regarding Yakima Steel Fabricators site (parcel # 19133141009) wetland reconnaissance project SIC code JJ222 from Catherine Reed, PWS, SEA Program to Chris Wend dated September 6, 2016 (Attachment A).

Sampling in this area of the Site included test pits excavated outside the limits of the wetland area, including areas previously excavated during the BNSF cleanup action at grid cells D and E. Soil samples (designated "wetsoil") also were collected at the perimeter of the former pond area and sediment samples (designated "wetsed") were collected from inside the pond area. The pond area had no standing water at the time of sampling. One or more of the target metals were detected in sediment samples from the wetland area test pits at the following maximum concentrations: arsenic at 8.6 mg/kg; cadmium at 88 mg/kg; copper at 149 mg/kg; lead at 1,000 mg/kg; manganese at 570 mg/kg; mercury at 2.4 mg/kg; and zinc at 7,000 mg/kg. Antimony was not detected in samples collected from the wetland area test pits.

BAY CHEMICAL SITE REMEDIAL INVESTIGATION AND CLEANUP WORK

As described above, Bay Chemical Company manufactured soil micronutrients on the west-adjacent property from approximately 1963 to 1973 using zinc in steel mill flue dust as a primary raw material. Investigations conducted at the Bay Chemical site concluded that historical operations resulted in metals-contaminated soil and groundwater at the Bay Chemical site that extended to the surrounding properties, including the Site. An Ecology-approved cleanup action was initiated by BNSF at the Bay Chemical site and conducted from December 2006 to October 2007. Excavation of soil on the Site that was conducted as part of the Ecology-approved cleanup action took place between July 30 and October 5, 2007.

The purpose of the cleanup action was to remove soil with concentrations of arsenic, cadmium, chromium, copper, lead, manganese, and mercury (Bay Chemical site constituents of concern) that exceeded site-specific cleanup levels defined for the Bay Chemical site under a Consent Decree. The area of soil removal included select areas on the western portion of the Site adjacent to the Bay Chemical site. The cleanup extended to the perimeter of the wetland and footprint of the pond on the YSF property but did not include the wetland; the western portions of the YSF and Agri-Tech buildings; and the western edge of the former Yakima Farmers Supply waste pit. The BNSF soil removal area on the Site is depicted in Figure 3.

Excavation at the Bay Chemical site was performed between December 2006 and October 2007 and reportedly continued laterally and vertically until concentrations of the target metals were less than site-specific cleanup levels established for the Bay Chemical site or an impediment to further excavation was encountered. The maximum depth of excavation was 9 feet bgs near the southwestern corner of the YSF building. The estimated excavation depths are depicted on Figure 3.

The cleanup activities performed by BNSF at the Bay Chemical site and the Site resulted in removal of approximately 7,800 cubic yards of soil from the western portion of the Site, based on the *Completion and Compliance Monitoring Report, Bay Chemical Site, Yakima, Washington* dated November 17, 2009, prepared by Farallon (Bay Chemical Completion Report).

METALS SOURCE AREA EVALUATION

The potential sources of metals contamination at the Site were not fully evaluated during the RI. Information regarding historical Site usage does not indicate the use of metals associated with former Yakima Farmers Supply operations. Further, former Yakima Farmers Supply operations were limited to the northern portion of the Site, with no known mechanism for distributing metals across the Site in a manner documented in the investigations performed at the Bay Chemical site and the Site.

Available Site information also does not indicate that YSF steel fabrication operations were the likely source of metals contamination identified, because bulk steel storage would not result in the distribution of metals observed throughout the Site. Similarly, historical information regarding Agri-Tech and subsequent operators does not indicate metals were used or stored at the Agri-Tech property.

Ecology identified the Bay Chemical site as a potential source of the metals contamination at the Site due to the documented presence of flue dust containing high concentrations of heavy metals at that site. Flue dust reportedly was observed in shallow (0 to 5 feet bgs) soil across much of the Bay Chemical site. Investigations at the Bay Chemical site also showed that metals contamination from Bay Chemical Company operations resulted in metals-contaminated soil and groundwater that extended onto the Site, including proximate to the sludge settling pond and drainage ditch at the southern end of the Site. Consequently, the Bay Chemical site was extended to include the western portion of the Site. The Bay Chemical site soil cleanup action, which was performed in September 2007, included excavation of affected areas on the western portion of the Site.

Results of the supplemental RI conducted at the Site between 2011 and 2014 indicated that metals were still present in shallow soil at the southern portion of the Site following the BNSF cleanup. During the supplemental RI, debris was discovered to be mixed with the fill in areas on the southern portion of the Site. The presence of subsurface debris on the southern portion of the Site suggests that historical filling and regrading on the southern portion of the Site in and around the

wetland pond area in the 1990s likely resulted in mixing and redistribution of metals contamination previously present in surficial soil.

To evaluate the potential for the Bay Chemical site to act as the source of metals for affected locations at the Site, Farallon evaluated possible mechanisms for transport of contaminants to the Site; analyzed the distribution of metals in soil at the Site and the Bay Chemical site; and performed ratio analysis of cadmium, lead, and zinc in soil to identify potential correlations between metals at the Site and the sources of metals from the Bay Chemical site. To perform these analyses, Farallon used metals analytical results from the *Revised Remedial Investigation Report, Agri-Tech & Yakima Steel Fabricators, 6 and 10 ½ East Washington Avenue, Yakima, Washington* dated June 15, 2004, prepared by Farallon; the 2007 Ecology/EPI soil sampling; the Farallon 2011 supplemental RI; and the 2009 Bay Chemical Completion Report. The complete data set is provided as Attachment B.

Metals results from Ecology/EPI and Farallon sampling activities are shown on Figures 3 and 4. Primary wind transport directions in the Site vicinity and source area locations on the Bay Chemical site are shown on Figure 5. An oblique aerial photograph showing Site conditions in 1979 is provided on Figure 6. Selected metals results from the complete soil sampling data set are included on Figures 7A and 7B. The samples shown in Figures 7A and 7B include soil samples collected from the Bay Chemical site and the Site prior to the July through October 2007 soil remediation, and soil samples collected following the remediation from areas outside the remediation footprint.

TRANSPORT OF METALS CONTAMINANTS

Although the flue dust was stored on the Bay Chemical site, it also was observed off-site to the south and southeast of the Bay Chemical site, according to the Bay Chemical RI Report. The Bay Chemical RI Report suggested that the off-site presence of the flue dust was the result of surface water and wind transport.

Potential wind transport of contaminants to the Site was evaluated by examining historical aerial photographs and wind data for the Site vicinity. Figure 5 is a 1979 aerial photograph showing the locations of the Site and Bay Chemical site features. At that time, there was a relative lack of vegetation on the Site and the west-adjacent Bay Chemical site.

Figure 6 is an oblique aerial photograph taken by YSF prior to occupancy of the Site in 1979, looking south at the Site from the vicinity of the Yakima Farmers Supply main warehouse. This photograph also shows that little ground cover was present to inhibit potential wind and/or surface water transport of particulates from the Bay Chemical site onto the Site. Wind is considered a potential mechanism for transport of metals contaminants in flue dust from the Bay Chemical site to the Site.

To evaluate potential wind transport, Farallon compiled historical wind data recorded by the National Oceanic and Atmospheric Administration at a meteorological station at the Yakima Air

Terminal, approximately 2.3 miles due west of the Site. Daily wind data were analyzed for a period beginning January 1, 1965, and ending August 9, 2015. Records of the direction-of-origin for the fastest 1- and 2-minute periods of wind each day were tabulated by frequency and used to create rose diagrams that show the number of daily measurements as a bar oriented along the wind's direction of transport. The rose diagrams are presented on Figure 5. The raw wind data used for the transport direction analysis are provided as Attachment C.

As shown in Figure 5, the dominant wind directions at the Site during the periods measured were to the east to southeast (azimuths between approximately 100 and 130 degrees). Figures 5 and 6 also show the historical locations of the Bay Chemical site flue dust stockpile and sludge settling pond relative to the Site. Results of the wind data analysis show that these documented sources of flue dust were located upwind of the Site. As discussed below, the highest concentrations of metals in soil at the Site were found in soil samples collected near the western Site boundary and proximate to the Bay Chemical site source areas that included the flue dust stockpile and sludge settling pond. The prevailing wind direction, the location of these sources of metals upwind of the Site, and the high concentrations of metals found near the Bay Chemical site source areas and boundary suggest that the flue dust from the Bay Chemical site is a source of metals contamination on the Site.

The Bay Chemical RI Report also stated that the former sludge settling pond area was submerged periodically due to a fluctuating water table, exposing the water to soil with "highly elevated" concentrations of metals. The report concluded that this condition resulted in transport of metals-contaminated soil to the Site via surface water flow. This is supported by the distribution of metals depicted on Figure 7A on the southern portion of the Bay Chemical site and the Site where a regional irrigation/drainage ditch is present. According to the Bay Chemical RI Report, stormwater and/or wastewater originating from the Bay Chemical site may have been conveyed to adjacent properties via a network of irrigation ditches located in the vicinity.

METALS DISTRIBUTION IN SOIL

The highest concentrations of metals in Site soil generally occurred in samples collected at less than 4 feet bgs from sampling grids A, B, C, D, and E (Figure 4), which are located along the western boundary of the Site adjacent to the Bay Chemical site. For example, concentrations of zinc in these sampling grids typically were at least one order of magnitude greater than concentrations in the sampling grids further east. The highest zinc concentrations were observed in soil collected at or less than 3 feet bgs from sampling grids D and E on the western portion of the wetlands area. Grids D and E were located immediately east of the former sludge settling pond on the Bay Chemical site (Figure 3). This grouping of the samples with the highest metals concentrations along the western Site boundary is consistent with an off-Site source area to the west.

To further evaluate metals distribution in soil, Farallon used the data set to create color-classified figures depicting cadmium, lead, and zinc concentrations (Figures 7A and 7B). Cadmium, lead, and zinc were selected for mapping for the following reasons:

- The flue dust is known to contain elevated concentrations of these three metals;
- For all three metals, an adequate number of results were available from both the Site and the Bay Chemical site to identify trends in the data;
- Cadmium and lead both were positively correlated with zinc in the soil data provided in the Bay Chemical RI Report;
- Lead previously was identified in the Bay Chemical RI Report as an indicator parameter for the presence of flue dust due to its high correlation with the other metals found in flue dust; and
- Zinc was one of the primary metals present in flue dust and is the primary source of toxicity identified by the bioassay tests performed on Site wetland sediment.

Sampling locations (generally referred to as stations) were digitized using standard georeferencing tools in ArcGIS, and laboratory analytical results were joined to each station using the station's name as a primary key. Soil analytical results were classified into groupings of 0 to 2 feet bgs and 2 to 4 feet bgs. For sampling stations with more than one associated laboratory result (e.g., a soil boring with samples collected at 0, 1, and 1.5 feet), the average of all the sample results, including non-detect method reporting limit values, within the selected depth range was calculated and the resulting value was assigned to that sampling station. Stations with only non-detect results were assigned the lowest reporting limit value. Stations with no data for a specified metal were identified as "No Data" locations for each depth interval and metal.

For each metal, concentrations were interpolated from the available data points using inverse distance weighted averaging. The inverse distance weighted interpolation method estimates individual calculation cell values by calculating a weighted average of the nearest data points proximate to each processing cell. The closer a data point is to the processing cell, the greater weight it is assigned in the averaging process.[1] The resulting interpolated surface was truncated at the extent of the sampling data.

Cadmium, lead, and zinc concentrations in soil between 0 and 2 feet bgs are shown on Figure 7A. Metals concentrations in soil between 2 and 4 feet bgs are shown on Figure 7B. The color-classification breaks were established by comparing the concentrations of each metal in soil to the natural background concentrations (BCs) for the Yakima Basin identified in *Natural Background Soil Metals Concentrations in Washington State* dated October 1994, prepared by Ecology. Natural BCs for the Yakima Basin are:

- 0.93 mg/kg for cadmium;

[1] Conversely, the more distal a data point, the less weight it is assigned in the averaging process.

- 11 mg/kg for lead; and
- 79 mg/kg for zinc.

Each color on the concentration maps represents a range of concentrations that was based on multipliers of the BC values identified above. For example, orange represents concentrations ranging from 10 to 100 times the BC for a given metal.

Soil sample results for samples collected from 0 to 2 feet bgs (Figure 7A) show that on the central portion of the Site, concentrations of cadmium, lead, and zinc generally were one or more orders of magnitude less than concentrations at the adjacent Bay Chemical site. Cadmium, lead, and zinc concentrations in soil between 0 and 2 feet bgs on the Site were lowest on the central and southeastern portions, located farthest from the flue dust stockpile and upwind of the sludge pond area. Cadmium and lead concentrations in these areas ranged from less than background levels to 10 times BC for cadmium, and 5 to 100 times BC for lead. The concentrations of zinc in soil between 0 and 2 feet bgs on the central and southeastern portions of the Site ranged from 2 to 10 times BC, with concentrations rising to more than 100 times BC along the western and southern boundaries of the Site and to over 1,000 times BC near the Bay Chemical site sludge settling pond.

Soil sample results for samples collected from 2 to 4 feet bgs (Figure 7B) show that concentrations of cadmium and lead also were lower in soil samples collected on the central and southeastern areas of the Site than in those collected near the flue dust stockpile and sludge settling pond. Zinc concentrations in soil appeared more uniformly elevated across the Bay Chemical site and the Site. However, similar to what was observed in the 0 to 2 feet bgs soil interval, the lowest observed concentrations of zinc in soil were located on the central portion of the Site and the highest were located near the Bay Chemical site sludge settling pond. Cadmium and lead concentrations on the central and southeastern portions of the Site ranged from less than background levels to 10 times BC for cadmium, and 1 to 100 times BC for lead.

The concentrations of zinc in soil between 2 and 4 feet bgs on the central and southeastern portions of the Site ranged from 10 to 100 times BC. The observed distribution of higher metals concentrations in surficial soils on the Bay Chemical site and near Bay Chemical site features, including the flue dust stockpile, sludge settling pond, and sludge settling drainage ditch, as well as progressively lower concentrations toward the central portion of the Site and the eastern Site boundary, suggest that the sources of the metals contamination are located northwest and west of the Site. The general consistency between shallow (0 to 2 feet bgs) and deeper (2 to 4 feet bgs) results indicates that the distribution of metals is consistent even within portions of the Site that have been regraded.

The metals concentrations depicted on Figures 7A and 7B were evaluated to assess whether a source of metals contamination was present at the Site. A source area generally appears as an area of high concentrations of contaminants, surrounded by areas with progressively lower concentrations as distance from the source area increases. In general, metals concentrations decreased from west to east across the Site, with the lowest observed concentrations on the central

and southeastern portions of the Site. The metals concentrations depicted do not suggest the presence of a source area on the Site. A small area on the Site with elevated concentrations (2 to 5 times BC) of lead and zinc in soil samples between 0 and 2 feet bgs was present at test pit TP-8 on the eastern portion of Area 3 (Figure 7A). This isolated area of elevated metals concentrations without additional contamination that attenuates with distance, and the lack of corresponding cadmium contamination suggests it may be an area of localized contamination of unknown origin.

Metals concentrations depicted on Figure 7A indicate that surficial soil with concentrations exceeding 100 times BCs for cadmium, lead, and zinc was present across broad areas on the northern, north-central, and southern portions of the Bay Chemical site prior to cleanup. This same general distribution is present in the deeper soil shown on Figure 7B, with metals concentrations generally decreasing toward the central and southeastern portions of the Site. The distribution of high metals concentrations in the northern and southern portions of the Bay Chemical site, with an area of marginally lower concentrations between them, suggests the presence of two separate sources of metals contamination on the Bay Chemical site. Historically, the flue dust stockpile source was present on the northern portion of the property; the sludge setting pond source and associated drainage ditch were present on the southern portion of the property.

METALS RATIOS IN SOIL

To further assess the source relationship between metals contaminants at the Bay Chemical site and the Site, metals ratios in soil were evaluated using the same data set that was used to map metals concentrations in soil. The data set included Site metals data from 2007 and 2011, and metals data from the Bay Chemical site presented in the Bay Chemical RI Report and the Bay Chemical Completion Report. The raw data from used for the ratios analysis are provided as Attachment B. Cadmium, lead, and zinc were selected for the ratios analysis for the reasons previously described for evaluation of the metals distribution.

The ratios of cadmium to zinc and lead to zinc were plotted in log-log format for soil samples in the data set that met the following criteria:

- The sample was collected between 0 to 2 feet bgs, or 2 to 4 feet bgs;
- The selected metals were detected at the sampling location;
- The samples were collected from areas considered to be downwind of both Bay Chemical site source areas;
- The samples were collected prior to the August 2007 soil remediation event, or from locations outside the Bay Chemical site remediation boundary; and
- The metals concentrations exceeded the BCs identified for the Yakima Basin in *Natural Background Soil Metals Concentrations in Washington State* dated October 1994, prepared by Ecology.

The resulting metals ratio analyses are presented in Figures 8A, 8B, 9A, and 9B. For purposes of the evaluation, soil samples were further subdivided based on their locations. Site soil samples were assigned to the following groups:

- YSF Central, which included samples collected from the central portion of the Site;
- YSF East, which included samples collected along the eastern boundary of the Site;
- YSF West, which included samples collected along the western boundary of the Site north of the sludge settling pond; and
- YSF Southwest, which included samples collected immediately east and northeast of the sludge settling pond.

The Bay Chemical site samples were assigned to the following groups to account for handling and intermittent activities that may have occurred between source areas on the Bay Chemical site:

- Bay Chemical site source areas, which included the flue dust unloading and stockpile area near the northern rail spur, the sludge settling pond on the southern portion of the Bay Chemical site, and the drainage ditch for the sludge settling pond on the southern boundary of the Site (Figure 2); and
- Bay Chemical site operations areas, which included the portions of the Bay Chemical site adjacent to or between the identified source areas.

These groups provided a geographical index for distance from the Bay Chemical site source areas (i.e., the flue dust stockpile area and the sludge settling pond): the closest non-source samples were collected from the west and southwest sampling areas of the Site, and the most distant samples were collected from the central and eastern sampling areas of the Site.

Figure 8A shows a strong correlation between cadmium and zinc concentrations in soil samples collected from between 0 to 2 feet bgs over several orders of magnitude ($r^2 = 0.8831$), except at the lower end of the plot where concentrations are potentially at or near background levels. The regression includes data from both the Bay Chemical site and the Site, indicating that this correlation holds across site boundaries. The lead to zinc regression in Figure 9A shows more scatter than the cadmium to zinc regression and greater separation between observed concentrations at the Bay Chemical site areas and Site areas; however, a similar trend is observed with a moderate to strongly positive correlation ($r^2 = 0.84$). Correlations between cadmium and zinc (Figure 8B) and between lead and zinc (Figure 9B) in soil samples collected from 2 to 4 feet bgs are similar to or stronger than ($r^2 = 0.9549$ and 0.8654, respectively) in soil samples collected from 0 to 2 feet bgs.

Although concentrations of the metals differ between locations, these strong correlations suggest that metals in soil at the Site originate from the Bay Chemical site. The highest metals concentrations are associated with soil samples collected from the Bay Chemical site source areas, the Bay Chemical site operations area, and YSF southwestern area. Soil samples with the lowest

concentrations of cadmium, lead, and zinc were collected from the central and eastern portions of the Site, furthest from the Bay Chemical site source areas. This distribution suggests that the Bay Chemical site flue dust stockpile area and sludge settling pond are the sources of these metals at the Site, including the wetland area.

SUMMARY AND CONCLUSIONS

Metals, including arsenic, antimony, cadmium, chromium, copper, lead, manganese, mercury, and zinc, were identified as COPCs for the Site during the 2011 through 2014 RI; however, the potential sources of metals contamination identified at the Site had not been fully evaluated at that time. Information regarding historical Site usage did not indicate that operations related to Yakima Farmers Supply, Agri-Tech and its tenants, or YSF included use or storage of the metals COPCs identified in soil throughout the Site. Bulk materials containing metals related to the YSF steel fabrication process historically were stored in Area 3; however, these raw materials were typically bulk steel, which does not include cadmium, lead, or zinc at the concentrations detected at the Site.

The west-adjacent Bay Chemical site is a documented source of cadmium, lead, zinc, and other heavy metals. Ecology identified the Bay Chemical site as a potential source of the metals contamination at the Site due to the documented presence of flue dust containing high concentrations of heavy metals at the Bay Chemical site and the potential for these metals to be transported onto the Site via wind and/or surface water mechanisms. Investigations at the Bay Chemical site showed that metals contamination from the Bay Chemical Company operations resulted in metals-contaminated soil and groundwater that extended throughout the Bay Chemical site as well as the Site at depths ranging from the surface to greater than 6 feet bgs. In 2007, a cleanup action conducted for the Bay Chemical site resulted in the removal of approximately 7,800 cubic yards of contaminated soil from the western portion of the Site to depths of up to 9 feet bgs. However, Site characterization data indicate that not all soil contamination was remediated at the Site at that time.

Potential wind transport of contaminants from the Bay Chemical site to the Site was evaluated by examining historical wind data for the Site vicinity. Results of the evaluation showed that the dominant wind directions at the Site and vicinity were to the east and southeast. The wind data show that the historical Bay Chemical site flue dust stockpile and sludge settling pond, both documented sources of metals contaminants, were located upwind of the Site. Additionally, the highest concentrations of metals contaminants at the Site generally were found in soil samples collected on the upwind (western) side of the Site nearest the Bay Chemical site source areas. The prevailing wind direction, location of documented metals contaminants sources upwind of the Site, and high concentrations of metals found on the upwind Site boundary nearest the Bay Chemical site source areas indicate that a likely source of metals contamination on the Site is flue dust from the Bay Chemical site.

Historical photos of the Site (Figures 5 and 6) showed that there were no physical or natural barriers to interrupt wind and surface water transport of flue dust from the Bay Chemical site onto

the Site until well after flue dust handling ceased in the mid-1970s. Until that time, wind and surface water from the Bay Chemical site likely extended onto the Site. Figure 6 shows soil types similar in appearance to the Bay Chemical site extending onto Area 3 on the Site in 1979, including an absence of vegetation on the northwestern portion of the Site that may be due to the metals contamination.

Metals distributions and metals ratios were analyzed to further evaluate potential sources of the metals contamination in soil at the Site (Figures 7A through 9B). These data collectively indicate that the Bay Chemical site is the most likely source of metals at the Site, including the zinc present on the wetland area resulting in adverse biological effects.

The distributions of the key indicator metals (i.e., cadmium, lead, and zinc) depicted on Figures 7A and 7B are indicative of a source of high concentrations of these metals at the Bay Chemical site, and reflect decreasing concentrations to the east and southeast with increasing distance from source areas. The lower concentrations of these and other metals at the Site are consistent with wind and surface water transport of metals in a mobile, small particulate form such as the metals-laden flue dust known to be present at the Bay Chemical site. Conversely, the isolated occurrence of shallow metals contamination in a limited area, such as the area proximate to test pit TP-8 in grid H, at the Site may be associated with materials storage at YSF.

The distribution of metals in soil on the southern portion of the Site is consistent with surface water drainage distribution associated with runoff from the Bay Chemical site settling pond, as presented in the Bay Chemical RI Report. Seasonal irrigation practices in the region and precipitation would have resulted in overflow from the Bay Chemical sludge settling pond following the natural topographic flow from north to south and into the YSF pond/wetland area and south-adjacent drainage/irrigation ditch. Figure 7A shows that the highest concentrations of cadmium, lead, and zinc were present on the sludge settling pond area and decrease to the south/southeast, following the natural drainage pattern.

Plots of cadmium to zinc and lead to zinc ratios for soil collected at the Bay Chemical site and the Site also suggest that the Bay Chemical site is the source of the metals contamination identified at the Site. The plots show moderate to strongly positive correlations among these metals over several orders of magnitude, including data from both sites, suggesting that metals identified on the Site and on the Bay Chemical site are from the same source.

In summary, evaluation of the transport mechanisms, metals distributions, and metals ratio analyses support a conceptual site model that wind-blown and/or surface water transported flue dust and/or materials from the sludge settling pond from the Bay Chemical site source areas onto the Site. Areas of the Site may require further cleanup depending upon the final cleanup levels negotiated with Ecology during completion of the Cleanup Action Plan for the Site.

LIMITATIONS

GENERAL LIMITATIONS

The conclusions contained in this memorandum are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information.** Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization.** Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report hereof.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Yakima Steel Fabricators, Inc. and currently accepted industry standards. No other warranties, representations, or certifications are made.

LIMITATION ON RELIANCE BY THIRD PARTIES

Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Yakima Steel Fabricators, Inc. to address the unique needs of Yakima Steel Fabricators, Inc. at the Site at a specific point in time. Services have been provided to Yakima Steel Fabricators, Inc. in accordance with a contract for services between Farallon and Yakima Steel Fabricators, Inc., and generally accepted environmental practices for the subject matter at the time this report was prepared.

No other party may rely on this report unless Farallon agrees in advance to such reliance in writing. Any use, interpretation, or reliance upon this report/assessment by anyone other than Yakima Steel Fabricators, Inc. is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

Do not rely on this report/assessment if:

- It was not prepared for you;
- It was not prepared for your project;
- It was not prepared for your specific Site; or
- It was not prepared under an approved scope of work for which you are under contract with Farallon.

RE: Yakima Steel Fabricators Wetland assessment report

Site Name:	Agri Tech Yakima Steel Fabricators
Site Address:	6 & 10 ½ E Washington, Yakima
Facility/Site ID No.:	479
Cleanup Site ID No.:	3639

Dear Mr. Kasper,

Please find enclosed with this letter a full copy of the wetland evaluation report performed by Ecology at the Yakima Steel Fabricators site on August 25, 2016. We now have a designation of the area as a Category III wetland.

Please feel free to include this report as part of the Wetland Appendix in the feasibility study.

Respectfully,

Chris Wend, PhD, PE
Cleanup Project Manager
Toxics Cleanup Program, CRO

DEPARTMENT OF ECOLOGY

Shorelands and Environmental Assistance Program

DATE: September 6, 2016

TO: Chris Wend

FROM: Catherine Reed, PWS, SEA Program

SUBJECT: Yakima Steel Fabricators site (parcel # 19133141009) wetland reconnaissance project SIC code JJ222

On August 25, 2016, we walked around a low-lying "pond" area on the above-referenced parcel in order to answer several questions. Was a wetland present on the site? If so, what is the extent of the wetland area, and what buffers would be required to protect the functional values of the wetland?

The general extent of the wetland was determined by visual observation of wetland conditions in the pond area and by digging one observation hole in a low-lying ditch remnant to the east of the wetland to confirm hydric soil conditions in that moist area. The water source of the pond and ditch appears to be primarily groundwater, and the wetland type is "emergent" based on the kind of vegetation (rushes and cattails) present.

The pond area/wetland is located at the extreme south of the parcel and is primarily confined to an area that is much lower (3 to 5 vertical feet to the pond surface) than the surrounding land elevation. Trees and shrubs that grow adjacent to the pond and the ditch are growing in the buffer, just outside of the wetland. There are berms around the pond wetland, probably composed of fill material from excavation of the wetland sometime in the past. There was also a narrow wetland ditch remnant on the northeast corner of the pond on the east side of the berm as well.

Based on old aerial photos of the site and its vegetation, there is evidence that the wetland area of today is a portion of a much larger historic wetland area, which was either filled or drained over time to accommodate development. The current pond area was likely excavated into an existing wetland area. Therefore, even though this wetland has been altered over time, it is still a "jurisdictional" wetland. This is an important fact when determining how much wetland mitigation may be required for future activities that could impact the wetland.

Since the amount of any mitigation required is based on the wetland's functional values, I completed a wetland rating form for the wetland using Ecology's "Washington State Wetland Rating System for Eastern Washington (2014) methodology. The wetland was rated as a Category III wetland. Ecology would generally recommend 75 to 80 foot buffers to protect wetland functional values based on the wetland being located in a

high-intensity development area, but because the habitat scores of the wetland are so low, if stormwater inputs into the wetland were controlled, then smaller buffers can be considered to protect the functional values. If this wetland were to be filled and wetland mitigation was done, replacement ratios for re-establishment or creation of the wetland would be 2:1 (for every one acre of wetland lost, 2 acres of replacement wetlands would need to be provided).

I hope this information will assist you in working with your client to resolve some of the issues on the site.

Wetland name or number_____

DEPRESSIONAL WETLANDS **Water Quality Functions** - Indicators that the site functions to improve water quality.	Points (only 1 score per box)
D 1.0 Does the wetland unit have the potential to improve water quality?	
D 1.1 Characteristics of surface water flows out of the wetland unit: Wetland has no surface water outlet - points = 5 Wetland has an intermittently flowing outlet points = 3 Wetland has a highly constricted permanently flowing outlet points = 3 Wetland has a permanently flowing surface outlet points = 1	5
D 1.2 The soil 2 inches below the surface (or duff layer) is clay or organic *(use NRCS definitions of soils)* YES points = 3 NO points = 0	0
D 1.3 Characteristics of persistent vegetation (emergent, shrub, and/or forest Cowardin class) Wetland has persistent, ungrazed, vegetation for > 2/3 of area points = 5 Wetland has persistent, ungrazed, vegetation from 1/3 to 2/3 of area points = 3 Wetland has persistent, ungrazed vegetation from 1/10 to < 1/3 of area points = 1 Wetland has persistent, ungrazed vegetation <1/10 of area points = 0	5
D 1.4 Characteristics of seasonal ponding or inundation.) *This is the area of ponding that fluctuates every year. Do not count the area that is permanently ponded.* Area seasonally ponded is > ½ total area of wetland points = 3 Area seasonally ponded is ¼ - ½ total area of wetland points = 1 Area seasonally ponded is < ¼ total area of wetland points = 0	0
Total for D 1 Add the points in the boxes above	10

Rating of Site Potential If score is: 12 – 16 = H 6 – 11 = (M) 0 – 5 = L
Record the rating on the first page

D 2.0 Does the landscape have the potential to support the water quality function at the site?	
D2.1 Does the Wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2 Is > 10% of the buffer within 150 ft of wetland unit in land uses that generate pollutants Yes = 1 No = 0	1
D2.3 Are there are septic systems within 250 ft of the wetland unit? Yes = 1 No = 0	?
D2.4 Are there are other sources of pollutants coming into the wetland that are not listed in questions D2.1 – D2.3? Source groundwater Cadmium etc Yes = 1 No = 0	1
Total for D 2 Add the points in the boxes above	

Rating of Landscape Potential If score is: 3 or 4 = (H) 1 or 2 = M 0 = L
Record the rating on the first page

D 3.0 Is the water quality improvement provided by the site valuable to society?	
D3.1 Does the unit discharge directly (within 1 mile) to a stream, river, or lake that is on the 303dlist? Yes = 1 No = 0	0
D 3.2 Is the unit in a basin or sub-basin where water quality is an issue in some aquatic resource (303d list, eutrophic lakes, problems with nuisance and toxic algae)? groundwater contamination Yes = (1) No = 0	1
D 3.3 Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage or basin in which unit is found*) Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	1

Rating of Value If score is: 2-4 = H 1 = (M) 0 = L
Record the rating on the first page

Wetland name or number_____

DEPRESSIONAL WETLANDS **Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion.	Points (only 1 score per box)
D 4. 0 Does the wetland unit have the potential to reduce flooding and erosion?	
D 4.1 Characteristics of surface water flows out of the wetland unit: Wetland has no surface water outlet points = 8 Wetland has an intermittently flowing outlet points = 4 Wetland has a highly constricted permanently flowing outlet points = 4 Wetland has a permanently flowing surface outlet points = 0 *(If outlet is a ditch and not permanently flowing treat unit as "intermittently flowing")*	8
D 4.2 Depth of storage during wet periods *Estimate the height of ponding above the bottom of the outlet. For units with no outlet measure from the surface of permanent water or deepest part (if dry).* Seasonal ponding: => 3 ft above the lowest point in unit or the surface of permanent ponding points = 8 Seasonal ponding: 2 ft - < 3 ft above the lowest point in unit or the surface of permanent ponding points = 6 The wetland is a "headwater" wetland" points = 4 Seasonal ponding: 1 ft - < 2 ft points = 4 Seasonal ponding: 6 in - < 1 ft points = 2 Seasonal ponding: <6 in orr unit has only saturated soils points = 0	4
Total for D 4 Add the points in the boxes above	19

Rating of Site Potential If score is: **12 - 16 = H** 6 - 11 = M 0 - 5 = L

Record the rating on the first page

D 5.0 Does the landscape have the potential to support hydrologic functions at the site?	
D5.1 Does the unit receive any stormwater discharges? Yes = 1 No = 0	1
D5. Is >10% of the land use within 150 ft of the wetland in a land uses that generates runoff? Yes = 1 No = 0	1
D 5.3 Is more than 25% of the contributing basin of the wetland unit covered with intensive human land uses? Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above	3

Rating of Landscape Potential If score is: **3 = H** 1,2 = M 0 = L

Record the rating on the first page

D 6.0 Are the hydrologic functions provided by the site valuable to society?	
D 6.1 Is the unit is in a landscape that has flooding problems? Choose the description that best matches conditions around the wetland unit being rated. *Do not add points. Choose the highest score if more than one condition is met.* ☐ The wetland captures surface water that would otherwise flow downgradient into areas where flooding has damaged human or natural resources (e.g. salmon redds), AND o Damage occurs in sub-basin that is immediately downgradient of unit points=2 o Damage occurs in a sub-basin further down-gradient points = 1 ☒ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. *Explain why* really small wetland stormwater system within city points = 0 ☐ There are no problems with flooding downstream of the unit. points = 0	6
D 6.2 Has the site has been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	

Rating of Value If score is: **2 -4 = H** 1 = M **0 = L**

Record the rating on the first page

Wetland name or number_____

These questions apply to wetlands of all HGM classes. (only 1 score per box)

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1. Does the wetland unit have the potential to provide habitat for many species?

H 1.1 Categories of vegetation structure

Check the Cowardin vegetation classes present and categories of emergent plants. Size threshold for each category is >= ¼ acre or >= 10% of the unit if unit is < 2.5 acres

___Emergent plants 0-12 in. (0 – 30 cm) high are the highest layer and have > 30% cover
X Emergent plants >12 – 40 in.(>30 – 100cm) high are the highest layer with >30% cover rcg
X Emergent plants > 40 in.(> 100cm) high are the highest layer with >30% cover ~~cx~~ rushes
___Scrub/shrub (areas where shrubs have >30% cover) 4-6 checks points = 3
___Forested (areas where trees have >30% cover) 3 checks points = 2
2 checks points = 1
1 check points = 0

1

H 1.2. Is one of the vegetation types "aquatic bed?" YES = 1 point (NO) = 0 points

0

H 1.3. Surface Water

H 1.3.1 Does the unit have areas of "open" water (without herbaceous or shrub plants) over at least ¼ acre **OR** 10% of its area during the March to early June **OR** in August to the end of September?

Note: answer YES for Lake-fringe wetlands

YES = 3 points & **go to H 1.4** (NO) = go to H 1.3.2

H 1.3.2 Does the unit have an intermittent or permanent, and unvegetate,d stream within its boundaries, or along one side, over at least ¼ acre or 10% of its area, (*answer yes only if H 1.3.1 is NO*)?

YES = 3 points (NO) = 0 points

0

H 1.4. Richness of Plant Species

Count the number of plant species in the wetland that cover at least 10 ft^2. (*different patches of the same species can be combined to meet the size threshold) You do not have to name the species.*

Do not include Eurasean Milfoil, reed canarygrass, purple loosestrife, Russian Olive, Phragmites, Canadian Thistle, Yellow-flag Iris, and Salt Cedar (Tamarisk)

# of species ____ Scoring: > 9 species = 2 points 4-9 species = 1 point < 4 species = 0 points

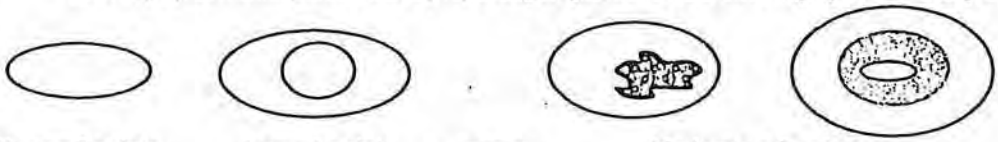
1

H 1.5. Interspersion of habitats

Figure__

Decide from the diagrams below whether interspersion between types of plant structures (described in H 1.1), and unvegetated areas (open water or mudflats) is high, medium, low, or none.

Use map of Cowardin plant classes prepared for questions H1.1 and map of open water from H1.3



None = 0 points **Low** = 1 point **Moderate** = 2 points

High = 3 points **High** = 3 points riparian braided channels with 2 classes = High

NOTE: If you have four or more classes or three plants classes and open water the rating is always "high".

1

Wetland name or number_____

H 1.6. Special Habitat Features: *Check the habitat features that are present in the wetland unit. The number of checks is the score.* ____Loose rocks larger than 4" or large, downed, woody debris (>4in. diameter) within the area of surface ponding or in stream. __X__Cattails or bulrushes are present within the unit. ____Standing snags (diameter at the bottom > 4 inches) in the wetland unit or within 30 m (100ft) of the edge. ____Emergent or shrub vegetation in areas that are permanently inundated/ponded. ____Stable steep banks of fine material that might be used by beaver or muskrat for denning (>45 degree slope) OR signs of recent beaver activity __X__Invasive species cover less than 20% in each stratum of vegetation *(canopy, sub-canopy, shrubs, herbaceous, moss/ground cover)* *Maximum score possible = 6*	2
H 1. TOTAL Score - Add the check marks in the box above	5

Rating of Site Potential **If score is:** **12 – 16 = H** **6 - 11 = M** **0 - 5 = L**
Record the rating on the first page

H 2.0 . Does the landscape have the potential to support habitat at the site?	
H 2.1 Accessible habitat (only area of habitat abutting wetland unit). *Calculate:* % undisturbed habitat 7 + [(% moderate and low intensity land uses)/2] 25/2 = 20.5% If total accessible habitat is: > 1/3 (33.3%) of 1km circle (~100 hectares) points = 3 20 - 33% of 1km circle points = 2 10- 19% of 1km circle points = 1 <10% of 1km circle points = 0	2
H2.2 Undisturbed habitat in 1km circle around unit. If: Undisturbed habitat > 50% of circle points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of circle points = 0	0
H2.3 Land use intensity in 1 km circle. If: > 50% of circle is high intensity land use points = (- 2) Does not meet criterion above points = 0	-2
H 2.4 ☐ The wetland unit is in an area where annual rainfall is less than 12 inches, and its water regime is not influenced by irrigation practices, dams, or water control structures. *(Generally, this means outside boundaries of reclamation areas, irrigation district, or reservoirs)* points = 3	0
Total for H 2 Add the points in the boxes above	0

Rating of Landscape Potential **If score is:** **4- 6 = H** **1-3 = M** **< 1 = L**
Record the rating on the first page

H 3.0 Is the Habitat provided by the site valuable to society?	
H3.1Does the site provides habitat for species valued in laws, regulations or policies? *(choose the highest score)* Site meets ANY of the following criteria: points = 2 __It provides habitat for Threatened or Endangered species (any plant or animal on state or federal lists) __It is a "priority area" for an individual WDFW species __It is a Wetland With a High Conservation Value as determined by the Department of Natural Resources __It has 3 or more priority habitats within 100m (see Appendix B) __It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats within 100m (see Appendix B) points = 1 Site does not meet any of the criteria above points = 0	0

Rating of Value **If score is:** **2 = H** **1 = M** **0 = L**
Record the rating on the first page

Wetland name or number_____

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Please determine if the wetland unit meets the attributes described below and circle the appropriate Category. NOTE: A wetland may meet the criteria for more than one set of special characteristics. Record all those that apply. NOTE: All units should also be characterized based on their functions.

Wetland Type *Check off any criteria that apply to the wetland. Circle the Category when the appropriate criteria are met.*	Category
SC 1.0 Vernal pools Is the wetland unit **less than 4000 ft^2**, and does it meet at least **two** of the following criteria? — Its only source of water is rainfall or snowmelt from a small contributing basin and has no groundwater input — Wetland plants are typically present only in the spring; the summer vegetation is typically upland annuals. *NOTE: If you find perennial, "obligate", wetland plants the wetland is probably NOT a vernal pool* — The soil in the wetland are shallow (<1ft deep (30 cm)) and is underlain by an impermeable layer such as basalt or clay. — Surface water is present for less than 120 days during the "wet" season. YES = Go to SC 1.1 NO - *not a vernal pool* SC 1.1 Is the vernal pool relatively undisturbed in February and March? YES = Go to SC 1.2 NO – *not a vernal pool with special characteristics*	
SC 1.2 Is the vernal pool in an area where there are at least 3 separate aquatic resources within 0.5 miles (other wetlands, rivers, lakes etc.)? YES = Category II NO = Category III	**Cat. II** **Cat. III**
SC 2.0 Alkali wetlands Does the wetland unit meets **one** of the following two criteria? — The wetland has a conductivity > 3.0 mS/cm. — The wetland has a conductivity between 2.0 - 3.0 mS, and more than 50% of the plant cover in the wetland can be classified as "alkali" species (see Table 4 for list of plants found in alkali systems). — If the wetland is dry at the time of your field visit, the central part of the area is covered with a layer of salt. **OR** does the wetland unit meets two of the following three sub-criteria? — Salt encrustations around more than 80% of the edge of the wetland — More than ¾ of the plant cover consists of species listed on Table 4 — A pH above 9.0. All alkali wetlands have a high pH, but please note that some freshwater wetlands may also have a high pH. Thus, pH alone is not a good indicator of alkali wetlands. **YES = Category I** NO – *not an alkali wetland*	**Cat. I**

Wetland name or number_____

SC 3.0 Wetlands with High Conservation Value (WHCV) SC 2.1 Has the Department of Natural Resources updated their web site to include the list of Wetlands with High Conservation Value? YES - Go to SC 2.2 NO – Go to SC 2.3 SC 2.2 Is the wetland unit you are rating listed on the DNR database as having a High Conservation Value? YES = Category I NO = not a WHCV SC 2.3 Is the wetland unit being rated in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf YES____ – contact WNHP/DNR and go to SC 2.4 NO = not a WHCV SC 2.4 Has DNR identified the wetland within the S/T/R as a wetland with High Conservation value and is listed on their web site? YES = Category I NO ____not an WHCV	**Cat. I**
SC 4.0 Bogs and Calcareous Fens Does the wetland unit (or any part of the wetland unit) meet both the criteria for soils and vegetation in bogs or calcareous fens. *Use the key below to identify if the wetland is a bog or calcareous fen. If you answer yes you will still need to rate the wetland based on its functions.* SC 4.1. Does an area within the wetland unit have organic soil horizons (i.e. layers of organic soil), either peats or mucks, that compose 16 inches or more of the first 32 inches of the soil profile? (See Appendix C for a field key to identify organic soils)? Yes - go to SC 4.3 No - go to SC 4.2 SC 4.2. Does an area within the unit have organic soils, either peats or mucks that are less than 16 inches deep over bedrock or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?? Yes - go to SC 4.3 No - *Is not a bog for rating* SC 4.3. Does an area within the unit have more than 70% cover of mosses at ground level AND at least 30% of the total plant cover consists of species in Table 5? Yes – Category I bog No - go to SC 4.4 *NOTE: If you are uncertain about the extent of mosses in the understory you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16" deep. If the pH is less than 5.0 and the plant species in Table 5 are present, the wetland is a bog.* SC 4.4 Is an area with peats or mucks forested (> 30% cover) with subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Englemann's spruce, or western white pine, AND any of the species (or combination of species) listed in Table 5 provide more than 30% of the cover under the canopy **Yes – Category I bog** NO – go to question SC 4.5 5. Do the species listed in Table 6 comprise at least 20% of the total plant cover within an area of peats and mucks? Yes – Is a Calcareous Fen for purpose of rating No - go to Question 6 6. Do the species listed in Table 6 comprise at least 10% of the total plant cover an area of peats and mucks, AND one of the two following conditions is met: • Marl deposits (calcium carbonate (CaCO3) precipitate) occur on the soil surface or plant stems • The pH of free water ≥ 6.8 AND electrical conductivity ≥ 200 uS/cm at multiple locations within the wetland **Yes – Is a Category I calcareous fen** No - Is not a calcareous fen	**Cat. I** **Cat. I**

Wetland name or number_____

SC 5.0 Forested Wetlands Does the wetland unit have an area of forest rooted within its boundary that meets **at least one** of the following three criteria? (*Continue only if you have identified a forested class is present in question H 1.1*) • The wetland is within the "100 year" floodplain of a river or stream • aspen (*Populus tremuloides*) represents at least 20% of the total cover of woody species — There is at least ¼ acre of trees (even in wetlands smaller than 2.5 acres) that are "mature" or "old-growth" according to the definitions for these priority habitats developed by WDFW *(see definitions in question H3.1)* YES = go to SC 5.1 NO –*not a forested wetland with special characteristics*	
SC 5.1 Does the wetland unit have a forest canopy where more than 50% of the tree species (by cover) are slow growing native trees (*see Table 7*) YES = Category I NO = go to SC 5.2	**Cat. I**
SC 5.2 Does the unit have areas where aspen (*Populus tremuloides*) represents at least 20% of the total cover of woody species. YES = Category I NO = go to SC 5.3	**Cat. I**
SC 5.3 Does the wetland unit have areas with a forest canopy where more than 50% of the tree species (by cover) are fast growing species. (*see Table 7*) YES = Category II NO = go to SC 5.5	**Cat. II**
SC 5.4 Is the forested component of the wetland within the "100 year floodplain" of a river or stream? YES = Category II	**Cat. II**
Category of wetland based on Special Characteristics *Choose the "highest" rating if wetland falls into several categories.* If you answered NO for all types enter "Not Applicable" on p.1	

Wetland name or number_____

Appendix B: WDFW Priority Habitats in Eastern Washington

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf)

Count how many of the following priority habitats are within 330 ft (100m) of the wetland unit? *NOTE: This question is independent of the land use between the wetland unit and the priority habitat.*

___**Aspen Stands:** Pure or mixed stands of aspen greater than 0.4 ha (1 acre).

___**Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report p. 152*).

___**Old-growth/Mature forests:** Old-growth east of Cascade crest: Stands are highly variable in tree species composition and structural characteristics due to the influence of fire, climate, and soils. In general, stands will be >150 years of age, with 25 trees/ha (10 trees/acre) that are > 53 cm (21 in) dbh, and 2.5-7.5 snags/ha (1 – 3 snags/acre) that are > 30-35 cm (12-14 in) diameter. Downed logs may vary from abundant to absent. Canopies may be single or multi-layered. Evidence of human-caused alterations to the stand will be absent or so slight as to not affect the ecosystem's essential structures and functions. Mature forests: Stands with average diameters exceeding 53 cm (21 in) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80 - 200 years old west and 80 - 160 years old east of the Cascade crest.

___**Oregon white Oak:** Woodlands Stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

___**Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

___**Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

___**Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

___**Cliffs:** Greater than 7.6 m (25 ft) high and occurring below 5000 ft.

___**Talus:** Homogenous areas of rock rubble ranging in average size 0.15 - 2.0 m (0.5 - 6.5 ft), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

___**Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 51 cm (20 in) in western Washington and are > 2 m (6.5 ft) in height. Priority logs are > 30 cm (12 in) in diameter at the largest end, and > 6 m (20 ft) long.

___**Shrub-steppe:** A nonforested vegetation type consisting of one or more layers of perennial bunchgrasses and a conspicuous but discontinuous layer of shrubs (see Eastside Steppe for sites with little or no shrub cover).

___**Eastside Steppe:** Nonforested vegetation type dominated by broadleaf herbaceous flora (i.e., forbs), perennial bunchgrasses, or a combination of both. Bluebunch Wheatgrass (Pseudoroegneria spicata) is often the prevailing cover component along with Idaho Fescue (Festuca idahoensis), Sandberg Bluegrass (Poa secunda), Rough Fescue (F. campestris), or needlegrass (Achnatherum spp.).

___ **Juniper Savannah:** All juniper woodlands.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Agritech / Bay Chemical City/County: Yakima (City) Sampling Date: 8/25/16

Applicant/Owner: State: WA Sampling Point: Hole 1. ditch area

Investigator(s): Catherine Reed Section, Township, Range:

Landform (hillslope, terrace, etc.): ancient floodplain terrace Local relief (concave, convex, none): concave Slope (%):

Subregion (LRR): Lat: Long: Datum:

Soil Map Unit Name: NWI classification:

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No (If no, explain in Remarks.)

Are Vegetation X, Soil X, or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes X No

Are Vegetation, Soil, or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No	Is the Sampled Area within a Wetland? Yes X No
Hydric Soil Present?	Yes X No	
Wetland Hydrology Present?	Yes X No	

Remarks:
Whole area subject to unknown underground drains. Surface Ditches located on this site and to the south/east end of the property - Installation of railroad grade and clean-up berm to west

VEGETATION – Use scientific names of plants.

Prevalence Index = B/A =

Hydrophytic Vegetation Indicators:

- Dominance Test is >50%
- Prevalence Index is ≤3.0[1]
- Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
- Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes No

Remarks:
Willows and Russian olive in adjacent buffer areas. Tree and shrub canopies influence micro-climate of area to cool it down. Also sumac and roses in buffer. No holes dug in pond area, dominated by rushes, cattails. Water surface visible Duckweed in pond, too.

SOIL

Sampling Point: _____

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-8	2.5Y 3/1		10YR 4/6	12	Distinct		Loam	sample taken at this location because pond itself known soil to contain heavy metal contamination

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) **(LRR C)**
- ___ 1 cm Muck (A9) **(LRR D)**
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)

- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- X Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) **(LRR C)**
- ___ 2 cm Muck (A10) **(LRR B)**
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes _____ No _____

Remarks:
Soil in this location could have been fill, but if so, probably more than 40 plus years

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- X Saturation (A3)
- ___ Water Marks (B1) **(Nonriverine)**
- ___ Sediment Deposits (B2) **(Nonriverine)**
- ___ Drift Deposits (B3) **(Nonriverine)**
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- X Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) **(Riverine)**
- ___ Sediment Deposits (B2) **(Riverine)**
- ___ Drift Deposits (B3) **(Riverine)**
- X Drainage Patterns (B10) man-made ditches
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No X Depth (inches): _____ visible in adjacent pond

Water Table Present? Yes X No ___ Depth (inches): ~~_____~~

Saturation Present? (includes capillary fringe) Yes X No ___ Depth (inches): to surface

Wetland Hydrology Present? Yes _____ No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:
Saturated to surface Obvious redox in spite of altered situation

NOTES:

− denotes sample not analyzed.

< denotes analyte not detected at or exceeding the laboratory reporting limit listed.

B denotes blank contamination.

L denotes a negative instrument reading with an absolute value exceeding the reporting limit.

J denotes the associated value is an estimated quantity.

<J denotes the material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

[1]Data transcribed from the following sources:

Bay_Chem_RI = Table 6, *Bay Chemical Site RI Soil Data Used for Analysis* , provided in the *Former Bay Chemical Site Remedial Investigation Report*, *Volume 1* dated March 1997, prepared by ERC/Pacific Groundwater Group.

ECY_EPI_Sampling = Results of soil sampling conducted by the Washington State Department of Ecology and Environmental Partners Inc of Issaquah, Washington in 2007.

Farallon_Sup_RI = Results of soil sampling conducted by Farallon in 2011.

BC_Soil_Data_EIM = Sampling results provided in *Completion and Compliance Monitoring Report, Bay Chemical Site, Yakima, Washington* dated November 17, 2009, prepared by Farallon.

YSF_Soil_Data_EIM = Sampling results provided in *Completion and Compliance Monitoring Report, Bay Chemical Site, Yakima, Washington* dated November 17, 2009, prepared by Farallon.

[2]Depth in feet below ground surface (bgs).

[3]Analyzed by U.S. Environmental Protection Agency Methods 6000/6010/7000 Series.

[4]Excluded samples include those located within the remediation footprint collected after September 1, 2007.

[5]Zones are used to group points plotted in ratio analysis shown in Figures 6 and 7.

APPENDIX C
BORINGS AND TEST PIT LOGS

FEASIBILITY STUDY REPORT
Agri-Tech and Yakima Steel Fabricators
6 and 10½ East Washington Avenue
Yakima, Washington

Farallon PN: 765-001

PROJECT: *AGRI-Tech/Yakima Steel Fabricators* GEOPROBE NO. *SP-1*

Elevation reference: *Unknown* Well completed: *N/A*

Ground surface elevation: *Unknown* Casing elevation: *N/A*

AS-BUILT DESIGN

No Well Installed

DEPTH (feet)	SOIL DESCRIPTION	SAMPLE TYPE	SAMPLE NUMBER	BLOW COUNTS	OVM READING	GROUND WATER	TESTING
0	*2" concrete over moist, brown, gravelly, medium SAND with trace silt (sulfur odor noted)*						*EPA 8260, 8080*
			SP1-4		*35*		
	Grades to moist to wet, gray, medium/ coarse SAND and GRAVEL with trace silt						
5			*SP1-6*		*31*	ATD	
	Geoprobe terminated at 6 feet.

RE: **WETLAND EVALUATION TECHNICAL MEMORANDUM**
AGRI-TECH AND YAKIMA STEEL FABRICATORS SITE
YAKIMA, WASHINGTON
AGREED ORDER NO. DE 6091
FARALLON PN: 765-001

Farallon Consulting, L.L.C. (Farallon) has prepared this technical memorandum to provide the Washington State Department of Ecology (Ecology) with a summary of the previous soil and sediment investigations and the results of a sediment cleanup site evaluation performed for the approximately 0.45-acre wetland on the southern portion of 6 and 10½ East Washington Avenue in Yakima, Washington (herein referred to as the Site) (Figure 1). This information is provided to support a determination of whether further evaluation of the wetland is needed as part of the Feasibility Study for the Site. Farallon has prepared this memorandum on behalf of Yakima Steel Fabricators, Inc. (YSF) for the YSF and Agri-Tech, Inc. (Agri-Tech) properties that comprise the Site.

The work described in this technical memorandum was performed to meet the requirements of Agreed Order No. DE 6091 dated October 27, 2008, entered into by Ecology and YSF pursuant to the authority of the Washington State Model Toxics Control Act Cleanup Regulation (MTCA); and the First Amendment to Agreed Order No. DE 6091 dated October 17, 2016. Documents used in the preparation of this technical memorandum are provided in Attachment A.

BACKGROUND

The Site consists of Yakima County Tax Parcel Nos. 19133141009 and 19133141409 (Figure 2). Two structures currently are present at the Site: one single-story building currently used for steel fabrication and business offices on the YSF property (YSF building); and one single-story warehouse building on the Agri-Tech property (Agri-Tech building). Currently, the Agri-Tech building is leased by the operator of YSF for use in its steel fabrication operations. The wetland area is present on the southernmost portion of Yakima County Parcel No. 19133141009.

From 2011 through 2014, Farallon conducted a supplemental remedial investigation (RI) of soil and sediment quality to characterize the source, nature, and extent of the chemicals of potential concern (COPCs), including petroleum hydrocarbons, metals, chlorinated pesticides, carcinogenic polycyclic aromatic hydrocarbons (cPAHs), and volatile organic compounds (VOCs), in soil and groundwater on the southern parcel (Yakima County Parcel No. 19133141009) of the Site. The original work scope for completion of the supplemental RI was approved by Ecology and established in the *Feasibility Study Work Plan, Agri-Tech and Yakima Steel Fabricators, 6 and 10½ East Washington Avenue, Yakima, Washington* dated May 3, 2011, prepared by Farallon (FS Work Plan). This memorandum focuses on the area of the wetland in the southernmost portion of the Site, which can be evaluated as a separate sediment management unit under the Sediment Management Standards (SMS), Chapter 173-204 of the Washington Administrative Code (WAC 173-204).

Pertinent information regarding current and historical uses in this area of the Site and surrounding properties and a summary of previous sampling conducted in the wetlands area is presented below. More detailed descriptions of the Site features, ownership and operation, historical Site use, use of surrounding properties, and previous work conducted at the Site are provided in the FS Work Plan and the *Revised Remedial Investigation Report, Agri-Tech & Yakima Steel Fabricators, 6 and 10½ East Washington Avenue, Yakima, Washington* dated June 10, 2004, prepared by Farallon (RI Report).

SITE USAGE AND AREAS OF INVESTIGATION

Based on the historical Site uses, three areas of investigation have been established (Figure 2):

- Area 1 – Area 1, north of the Site wetland, includes the former Yakima Farmer Supply lime and sulfur processing plant, and the area of the plant's former waste pit.
- Area 2 – Area 2, north of the Site wetland, is present on the central and eastern portions of the YSF property between the YSF building and the east-adjacent automobile recycling facility, and is suspected to have included stockpiles of bulk lime and sulfur.
- Area 3 – Area 3 is southwest of the YSF building where a small release of petroleum hydrocarbons was suspected by Ecology proximate to the YSF building and north of the Site wetland. Ecology also identified Area 3 as a potential area of metals contamination due to historical activities at the west-adjacent Bay Chemical Company property, described

in further detail below. Area 3 also currently includes a former pond and the current wetland area.

The wetland was once part of a larger pond where the northern portions were filled during the early years of YSF's acquisition to accommodate steel storage. Since the 1980s the footprint of the pond has continued to shrink to its current size, resulting in the current estimated 0.45-acre wetland. The shrinking condition appears to be largely due to changes in surrounding land use, which changed from rural farming to commercial/industrial. Because of the change in land use, seasonal irrigation channels are no longer introducing water that formerly sustained the pond. The areal photographs presented in Figure 3 depicted the evolution of the pond area to its current wetland status between 1979 to 2016. No buildings have been located, and no activities other than bulk steel storage have reportedly been conducted on the southern portion of the Site. No prior anthropomorphic uses have been documented within the extent of the existing wetland or former pond area.

Historical uses of the Site, including operation of a steel fabrication facility (1980 to present), operation of a fruit packing supply and equipment company (1982 through 1989), and construction and operation of a lime and sulfur formulating plant (1960 through approximately 1978), occurred in Areas 1 and 2, north of Area 3, and in the filled portion of the wetland.

The west-adjacent property is owned by BNSF Railroad Company and historically leased to Bay Chemical Company (Bay Chemical property). A former sludge settling pond area was present on the Bay Chemical property immediately adjacent to the wetland. The sludge settling pond was used for disposal of waste sludge generated during production of liquid zinc sulfate by reacting steel mill flue dust with sulfuric acid on the northern portion of the Bay Chemical property. The sludge settling pond previously was identified as one of two sources of metals contamination to the Site in the technical memorandum regarding Metals Source Evaluation, Agri-Tech and Yakima Steel Fabricators Site, Yakima Steel Fabricators, Yakima, Washington dated October 4, 2016, from Eric Buer and Jeff Kaspar of Farallon to Chris Wend of Ecology (Metals Source Evaluation). According to the Metals Source Evaluation, sampling station WetSed-1 is closest to the Bay Chemical property sludge settling pond from which flue dust and associated metals were likely transported onto the Site by wind and surface water flow.

The Site wetland is bordered by drainage ditches to the south and east that join near the southeastern corner of the Site. No records are available to identify over what period the ditches received dredging and maintenance or when maintenance ceased. As of 2008, the ditches sloped generally to the east/southeast. Based on review of aerial photographs taken in 1979, 1992, 1996, 2003, 2004, 2009, and 2016, the drainage ditches and areas south and east of the Site wetland have remained vegetated and undeveloped since 1979. Site soil to the west and south of the wetland was excavated as part of an Ecology-approved cleanup action that was performed by BNSF between July 30 and October 5, 2007. The cleanup action did not include the wetland area. The excavation extended to a maximum depth of approximately 6 feet below ground surface (bgs) proximate to the drainage ditch south of the wetland. Following the cleanup action, the area was backfilled to the approximate grade currently observed on the Site.

Because the wetland is topographically distinct (3 to 5 feet below the surrounding Site topography); has unique environmental conditions, including seasonal standing water and saturated surface soil; and is subject to sediment criteria that do not apply to other portions of the Site (see below), Farallon recommends that the Site wetland be evaluated as its own area of the Site, Area 4, under the SMS. Wetland buffer areas would remain part of Area 3 as described above.

WETLAND ASSESSMENT AND SEDIMENT EVALUATION

This section presents a description of the Site wetland based on the letter regarding Yakima Steel Fabricators Wetland Assessment Report dated September 13, 2016, from Chris Wend of Ecology to Jeff Kaspar of Farallon (Ecology assessment) (Attachment B). Results of wetland sediment sampling and analysis and sediment bioassay results are also presented.

WETLAND DESCRIPTION AND ECOLOGY ASSESSMENT

A pond has been present on the Site since at least 1979. The present wetland area originally was part of the larger pond. Since the late 1990s, the pond portion of the wetland has transitioned from perennial open water to intermittent standing water with increased growth of reeds and grasses in soft, saturated soil. The footprint of the wetland, including the intermittent pond, was surveyed as part of the RI Report in 1997 and estimated to be approximately 0.4 acre. A wetland delineation performed by Ecology on August 25, 2016 revised the wetland extent to the south and east, and increased the total area to approximately 0.45 acre.

The wetland delineation performed by Ecology was documented in the Ecology assessment provided in Attachment B. The Ecology assessment determined the extent of the wetland based on visual inspection and excavation of an observation pit proximate to the wetland's eastern boundary to confirm the presence of hydric soil.

The Ecology assessment identified the wetland as the area that is "much lower" than the surrounding ground surface, generally within approximately 3 to 5 vertical feet of the pond surface. Because the pond portion of the wetland is sustained by groundwater, approximately 0.3 acre of the 0.45-acre wetland footprint was classified as "emergent" (Figure 3). Per the Ecology assessment, trees and shrubs growing in the area surrounding the wetland and proximate to the ditch to the east, above the area identified to be within 3 to 5 vertical feet of the pond surface area, are in the wetland buffer.

Based on the wetland's morphology, hydrology, and vegetation assemblage, Ecology assigned the wetland a Category III rating. Category III wetlands are identified as having moderate ecological function with some disturbance from their natural state. Category III wetlands are also more isolated from other natural resources in the surrounding landscape than Category II wetlands.

SOIL AND SEDIMENT SAMPLING

Following initial identification of the Site wetland and survey of the wetland boundary in 1997, Ecology requested that soil samples collected from locations with intermittent standing water or perennially saturated conditions be evaluated against SMS criteria as detailed in the letter regarding Feasibility Work Plan Additional Requirements for Wetlands/Pond Area of the Yakima Steel Site Under Agreed Order DE 6091 dated February 16, 2011, from Norman D. Peck of Ecology to Jeff Kaspar of Farallon. SMS criteria include both sediment cleanup objectives (SCOs) and cleanup screening levels (CSLs). Farallon sampled Site wetland soil and sediment on May 23 and 26, 2011 at six locations (Figure 3). Sediment samples were analyzed for the following analytes:

- Metals by U.S. Environmental Protection Agency (EPA) Methods 6000/6010/7000;
- Total petroleum hydrocarbons as gasoline-, as diesel-, and as oil-range organics by Northwest Methods NWTPH-HCID and NWTPH-Dx;
- VOCs by EPA Method 8260B; and
- Pesticides by EPA Method 8081.

Sediment samples were collected from locations that were either intermittently submerged by standing water or were saturated throughout the year from a depth interval of 0 to 10 centimeters below ground surface. However, in the period between Farallon soil and sediment sampling and when the Ecology wetland delineation was performed, saturated conditions associated with the intermittent pond/emergent wetland have expanded to encompass stations previously identified for soil sampling. Thus, all six samples are evaluated as sediment samples in this section.

Analytical results for the wetland samples are provided in Tables 1 through 4. Concentrations of cadmium, lead, and zinc in sediment were elevated in the central portion of the emergent wetland (stations WetSed-1 through WetSed-3) compared to the concentrations observed at the outlying sampling stations (WetSoil-1 and WetSoil-2 to the south, and WetSoil-3 to the north). Cadmium was detected at concentrations exceeding the CSL of 5.4 milligrams per kilogram (mg/kg) in samples collected from the three central sampling stations. Cadmium was detected at concentrations exceeding the SCO of 2.1 mg/kg in sediment collected from sampling station WetSoil-1, south of the central WetSed station group, at a depth of 0 to 6 inches bgs. Other cadmium results for samples collected from stations WetSoil-1 through WetSoil-3 were less than the SCO.

Concentrations of lead and zinc in sediment reflected a similar spatial distribution to that for cadmium, with higher concentrations at stations WetSed-1 through WetSed-3 and slightly elevated concentrations at station WetSoil-1. However, none of the lead or zinc results for samples collected from the Site exceeded their respective SCOs. Concentrations of arsenic were somewhat elevated in samples collected from stations WetSed-2 and WetSed-3, but were less than SCOs. Concentrations of antimony, copper, and mercury did not appear to follow a spatial pattern and were less than SCOs.

Petroleum hydrocarbons, VOCs, and pesticides were either detected at low concentrations less than their respective SCOs or SCLs, or were reported non-detect at the laboratory practical quantitation limit (Tables 2 through 4).

In summary, cadmium concentrations exceeded the CSL in samples collected from three sampling stations and exceeded the SCO in samples collected from one sampling station; all other analytes were detected at concentrations less than their respective SCOs or were reported non-detect at the laboratory practical quantitation limit. Under the SMS, biological test results override chemistry results when determining whether sediments exhibit toxicity to biological organisms. Therefore, bioassays were conducted using the sediment samples collected from the wetlands that exceeded CSLs to further evaluate their toxicity and compliance with SMS biological criteria.

2011 SEDIMENT BIOASSAYS

Bioassay testing of samples collected from stations WetSed-1 through WetSed-3 was performed on May 23, 2011 by Nautilus Environmental (Nautilus) to evaluate the toxicity of the wetland sediments. The Nautilus sediment bioassays included:

- 10-day survival using the amphipod *Hyalella azteca (H. azteca)* (EPA method 100.1);
- 20-day growth and survival using the midge *Chironomus dilutus (C. dilutus)* (EPA method 100.5); and
- Luminescence readings of the marine bacterium *Vibrio fischeri* after 5 minutes and 15 minutes of exposure to sediment porewater (Microtox testing).

This testing suite meets the current sediment biological testing requirements of WAC 173-204-563(3)(d), requiring two different approved species; three endpoints, including one sublethal endpoint; and one chronic test. Because Microtox testing is no longer an approved method of assessment for freshwater species under the SMS, these results are not discussed further in this memorandum. A summary of bioassay results is provided in Table 5. Bioassay results and discussion are provided in Attachment C.[1]

Reductions in the rate of growth of *C. dilutus* were less than the SCO in sediment collected from all three sampling stations (Table 5). Mortality exceeded the CSL in sediment collected from sampling station WetSed-3 on the south-central portion of the emergent wetland in the 20-day survival bioassay using *C. dilutus*. Mortality also exceeded the SCO in sediment collected from sampling station WetSed-2, north of WetSed-3.

Results for the 10-day survival bioassay using *H. azteca* were spatially dissimilar to results for the 20-day survival bioassay using *C. dilutus*. 10-day survival of *H. azteca* at station WetSed-1 exceeded the CSL and exceeded the SCO at station WetSed-2. The CSL is considered to be exceeded if any one test (i.e., 10-day survival of *H. azteca*, 20-day survival of *C. dilutus*, or 20-

[1] The 2011 Nautilus study currently is only available in draft form.

day growth of *C. dilutus*) at a station exceeds the CSL or any two tests exceed the SCO. Therefore, all three stations exceeded the CSL in 2011, but only by the minimum number of test results.

Some quality control deviations from standard bioassay methodology that may have affected the bioassay results were noted by Nautilus, including decreased dissolved oxygen levels during the 20-day survival bioassay using *C. dilutus* and adding twice the recommended number of test animals but not increasing the food ration during the 10-day survival bioassay using *H. azteca*.

2013 SEDIMENT BIOASSAYS

Metals concentrations, including cadmium (the only analyte detected at concentrations exceeding the CSL), were relatively similar in all three samples that were evaluated in the Nautilus sediment bioassays (Table 1). To determine whether metals were associated with the observed toxicity in sediment samples collected from stations WetSed-1 through WetSed-3, Farallon contracted with Ramboll-Environ Inc. of Port Gamble, Washington (Environ) to perform a detailed evaluation of wetland sediment. The Environ study had three primary objectives:

- Verify the toxicity results of the Nautilus bioassay testing;
- Conduct a toxicity identification evaluation; and
- Determine, if toxicity was confirmed, whether a Site-specific cleanup level could be developed.

Environ collected sediment samples from stations WetSed-1 through WetSed-3 on December 3, 2013. No standing water was observed at the time sediment sampling was conducted, and water was encountered at approximately 6 inches bgs. The samples were analyzed for the parameters identified below:

- Metals by EPA method 6010C;
- Grain size and total organic carbon by Plumb (1981);
- Percent solids by SM2540G;
- Dissolved sulfides and ammonia by SM4500/NH_3F;
- Acid volatile sulfides and simultaneously extracted metals by EPA (1991);
- 10-day survival using the amphipod *H. azteca* (EPA method 100.1);
- 20-day growth and survival using the midge *C. dilutus* (EPA method 100.5); and
- Luminescence readings of the marine bacterium *Vibrio fischeri* after 5-minutes and 15-minutes of exposure to sediment porewater (Microtox testing).

This testing suite meets the current sediment biological testing requirements of WAC 173-204-563(3)(d), requiring two different approved species; three endpoints, including one sublethal endpoint; and one chronic test. Because Microtox testing is no longer an approved freshwater species under the SMS, these results are not discussed further in this memorandum. A summary

of bioassay results is provided in Table 5. Bioassay results and discussion are provided in Attachment D.[2]

Analytical results for metals were similar to those obtained by Farallon in 2011. Cadmium concentrations exceeded the CSL of 5.4 mg/kg in sediment collected from all three sampling stations. Zinc concentrations were similar in samples collected from all three sampling stations to concentrations reported in 2011, with the exception of an elevated concentration of 3,810 mg/kg in a sample collected from station WetSed-3, which exceeded the SCO. Concentrations of manganese and lead were similar to concentrations reported in 2011 and did not exceed applicable screening criteria.

Acute mortality exceeded the CSL in the sediment collected from station WetSed-1, proximate to the Bay Chemical property sludge settling pond, during the 10-day survival bioassay using *H. azteca*. Mortality exceeded the SCO in sediment collected from sampling stations WetSed-2 and Wetsed-3 on the central and south-central portions of the emergent wetland, respectively, during the 20-day survival bioassay using *C. dilutus*. Other bioassay results for 10-day survival of *H. azteca* and 20-day growth of *C. dilutus* were less than their respective SCOs.

In these results, only one station exceeded the CSL for 10-day survival of *H. azteca* and two stations exceeded the SCO for 20-day survival for *C. dilutus*, using the same bioassays as conducted in 2011. This difference may be due to natural recovery over time, sequestration of metals by wetland vegetation, or quality control issues in the 2011 bioassays that adversely affected the results.

Environ identified freely dissolved metals, particularly zinc and potentially manganese, as the primary source of toxicity in sediment. Both metals were present in sediment and dissolved in porewater (Table 15 in Attachment D). Environ concluded that "zinc is likely to be the primary driver in toxicity" in porewater at sampling station WetSed-1. However, a combination of metals likely contributed to toxicity at these stations. Organic analytes were not identified as a source of toxicity in sediments collected from any sampling station, consistent with the chemistry results.

SEDIMENT SITE EVALUATION

Identification of a sediment site under SMS (WAC 173-204-520) requires a cluster of at least three sampling stations where the following conditions are met:

- Concentrations of COPCs in sediments exceed the CSL for bioaccumulative chemicals based on protection of human health, wildlife, birds, or fish;
- Concentrations of COPCs in sediment exceed the CSL chemical criteria identified in Table VI in WAC 173-204-563(2); or
- Toxicity test results exceed biological standards identified in Table VII in WAC 173-204-563(3).

[2] The 2014 Environ study currently is only available in Agency Review Draft form.

No bioaccumulative COPCs have been identified in the wetland area. Cadmium is the only metal that has been detected at concentrations exceeding CSL chemical criteria in samples collected from the sampling stations. Bioassay results for sediment collected from the Site wetlands by Environ identified only a single station, WetSed-1, that exceeded biological CSL criteria.

Under the SMS, the results of biological testing override chemistry results. Therefore, based on WAC 173-204-520, the wetland area of the Site does not qualify for listing as a contaminated sediment site. Although this area has already been identified as part of a listed site, it can be evaluated separately as a sediment management unit to determine whether cleanup is required.

Because this area does not meet the site listing threshold under SMS, and because active cleanup of this area would require disturbance of the wetland, Farallon recommends that this area be formally separated into a sediment management unit and designated as requiring no further action.

SUMMARY AND CONCLUSIONS

A pond of variable size has been present on the Site since at least 1979. Over the past 20 years, the pond has transitioned to include progressively less open standing water and increased growth of reeds and grasses in soft, saturated soil. The City of Yakima first identified the combined open water and saturated soil area as a Type III wetland; this designation was carried forward in the RI Report. The extent of the wetland was surveyed in 1997 and had a total area of approximately 0.4 acre. A subsequent delineation and wetland evaluation was performed by Ecology in 2016. The Ecology assessment revised the wetland's total area to 0.45 acre, including 0.3 acre of emergent wetland. Ecology also assigned the wetland a Category III rating, which indicates some disturbance and isolation from the natural environment and a moderate level of ecological function.

Soil and sediment sampling performed by Farallon in 2011 identified cadmium at concentrations exceeding the CSL of 5.4 mg/kg. A bioassay evaluation was performed by Nautilus at six sampling stations within the wetland on the Site. The Nautilus sediment bioassay results identified minor acute and chronic toxicity in wetland sediment samples, but the results were considered inconclusive due to quality control issues.

Farallon contracted with Environ to perform a detailed evaluation of the Site wetland sediment to confirm sediment toxicity and, if confirmed, identify potential causes of toxicity. The Environ evaluation identified toxicity exceeding both chemical and biological CSLs in sediment collected from sampling station WetSed-1. Environ concluded that the toxicity of tested sediments was primarily associated with zinc in sediment porewater, but was unable to calculate a Site-specific cleanup standard.

Although chemical and biological toxicity results for sampling station WetSed-1 exceed sediment CSLs, the Site wetland does not qualify as a sediment site requiring cleanup under WAC 173-204-520 because there were fewer than three sampling stations that exceeded sediment CSLs.

Therefore, Farallon recommends that the 0.45-acre wetland area be separated as a sediment management unit that does not require further evaluation in the Feasibility Study.

RE: Yakima Steel Fabricators Wetland assessment report

Site Name:	Agri Tech Yakima Steel Fabricators
Site Address:	6 & 10 ½ E Washington, Yakima
Facility/Site ID No.:	479
Cleanup Site ID No.:	3639

Dear Mr. Kasper,

Please find enclosed with this letter a full copy of the wetland evaluation report performed by Ecology at the Yakima Steel Fabricators site on August 25, 2016. We now have a designation of the area as a Category III wetland.

Please feel free to include this report as part of the Wetland Appendix in the feasibility study.

Respectfully,

Chris Wend, PhD, PE
Cleanup Project Manager
Toxics Cleanup Program, CRO

DEPARTMENT OF ECOLOGY

Shorelands and Environmental Assistance Program

DATE: September 6, 2016

TO: Chris Wend

FROM: Catherine Reed, PWS, SEA Program

SUBJECT: Yakima Steel Fabricators site (parcel # 19133141009) wetland reconnaissance project SIC code JJ222

On August 25, 2016, we walked around a low-lying "pond" area on the above-referenced parcel in order to answer several questions. Was a wetland present on the site? If so, what is the extent of the wetland area, and what buffers would be required to protect the functional values of the wetland?

The general extent of the wetland was determined by visual observation of wetland conditions in the pond area and by digging one observation hole in a low-lying ditch remnant to the east of the wetland to confirm hydric soil conditions in that moist area. The water source of the pond and ditch appears to be primarily groundwater, and the wetland type is "emergent" based on the kind of vegetation (rushes and cattails) present.

The pond area/wetland is located at the extreme south of the parcel and is primarily confined to an area that is much lower (3 to 5 vertical feet to the pond surface) than the surrounding land elevation. Trees and shrubs that grow adjacent to the pond and the ditch are growing in the buffer, just outside of the wetland. There are berms around the pond wetland, probably composed of fill material from excavation of the wetland sometime in the past. There was also a narrow wetland ditch remnant on the northeast corner of the pond on the east side of the berm as well.

Based on old aerial photos of the site and its vegetation, there is evidence that the wetland area of today is a portion of a much larger historic wetland area, which was either filled or drained over time to accommodate development. The current pond area was likely excavated into an existing wetland area. Therefore, even though this wetland has been altered over time, it is still a "jurisdictional" wetland. This is an important fact when determining how much wetland mitigation may be required for future activities that could impact the wetland.

Since the amount of any mitigation required is based on the wetland's functional values, I completed a wetland rating form for the wetland using Ecology's "Washington State Wetland Rating System for Eastern Washington (2014) methodology. The wetland was rated as a Category III wetland. Ecology would generally recommend 75 to 80 foot buffers to protect wetland functional values based on the wetland being located in a

high-intensity development area, but because the habitat scores of the wetland are so low, if stormwater inputs into the wetland were controlled, then smaller buffers can be considered to protect the functional values. If this wetland were to be filled and wetland mitigation was done, replacement ratios for re-establishment or creation of the wetland would be 2:1 (for every one acre of wetland lost, 2 acres of replacement wetlands would need to be provided).

I hope this information will assist you in working with your client to resolve some of the issues on the site.

DEPRESSIONAL WETLANDS **Water Quality Functions** - Indicators that the site functions to improve water quality.	Points (only 1 score per box)
D 1.0 Does the wetland unit have the potential to improve water quality?	
D 1.1 Characteristics of surface water flows out of the wetland unit: Wetland has no surface water outlet - points = 5 Wetland has an intermittently flowing outlet points = 3 Wetland has a highly constricted permanently flowing outlet points = 3 Wetland has a permanently flowing surface outlet points = 1	5
D 1.2 The soil 2 inches below the surface (or duff layer) is clay or organic *(use NRCS definitions of soils)* YES points = 3 NO points = 0	0
D 1.3 Characteristics of persistent vegetation (emergent, shrub, and/or forest Cowardin class) Wetland has persistent, ungrazed, vegetation for > 2/3 of area points = 5 Wetland has persistent, ungrazed, vegetation from 1/3 to 2/3 of area points = 3 Wetland has persistent, ungrazed vegetation from 1/10 to < 1/3 of area points = 1 Wetland has persistent, ungrazed vegetation <1/10 of area points = 0	5
D 1.4 Characteristics of seasonal ponding or inundation.) *This is the area of ponding that fluctuates every year. Do not count the area that is permanently ponded.* Area seasonally ponded is > ½ total area of wetland points = 3 Area seasonally ponded is ¼ - ½ total area of wetland points = 1 Area seasonally ponded is < ¼ total area of wetland points = 0	0
Total for D 1 Add the points in the boxes above	10

Rating of Site Potential If score is: 12 – 16 = H 6 – 11 = (M) 0 – 5 = L
Record the rating on the first page

D 2.0 Does the landscape have the potential to support the water quality function at the site?	
D2.1 Does the Wetland unit receive stormwater discharges? Yes = 1 No = 0	1
D 2.2 Is > 10% of the buffer within 150 ft of wetland unit in land uses that generate pollutants Yes = 1 No = 0	1
D2.3 Are there are septic systems within 250 ft of the wetland unit? Yes = 1 No = 0	?
D2.4 Are there are other sources of pollutants coming into the wetland that are not listed in questions D2.1 – D2.3? Source groundwater Cadmium etc Yes = 1 No = 0	1
Total for D 2 Add the points in the boxes above	

Rating of Landscape Potential If score is: 3 or 4 = (H) 1 or 2 = M 0 = L
Record the rating on the first page

D 3.0 Is the water quality improvement provided by the site valuable to society?	
D3.1 Does the unit discharge directly (within 1 mile) to a stream, river, or lake that is on the 303dlist? Yes = 1 No = 0	0
D 3.2 Is the unit in a basin or sub-basin where water quality is an issue in some aquatic resource (303d list, eutrophic lakes, problems with nuisance and toxic algae)? groundwater contamination Yes = (1) No = 0	1
D 3.3 Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage or basin in which unit is found*) Yes = 2 No = 0	0
Total for D 3 Add the points in the boxes above	1

Rating of Value If score is: 2-4 = H 1 = (M) 0 = L
Record the rating on the first page

Wetland name or number_____

DEPRESSIONAL WETLANDS **Hydrologic Functions** - Indicators that the site functions to reduce flooding and stream erosion.	Points (only 1 score per box)
D 4. 0 Does the wetland unit have the potential to reduce flooding and erosion?	
D 4.1 Characteristics of surface water flows out of the wetland unit: Wetland has no surface water outlet points = 8 Wetland has an intermittently flowing outlet points = 4 Wetland has a highly constricted permanently flowing outlet points = 4 Wetland has a permanently flowing surface outlet points = 0 *(If outlet is a ditch and not permanently flowing treat unit as "intermittently flowing")*	8
D 4.2 Depth of storage during wet periods *Estimate the height of ponding above the bottom of the outlet. For units with no outlet measure from the surface of permanent water or deepest part (if dry).* Seasonal ponding: => 3 ft above the lowest point in unit or the surface of permanent ponding points = 8 Seasonal ponding: 2 ft - < 3 ft above the lowest point in unit or the surface of permanent ponding points = 6 The wetland is a "headwater" wetland" points = 4 Seasonal ponding: 1 ft - < 2 ft points = 4 Seasonal ponding: 6 in - < 1 ft points = 2 Seasonal ponding: <6 in orr unit has only saturated soils points = 0	4
Total for D 4 Add the points in the boxes above	12

Rating of Site Potential If score is: **12 - 16 = H** **6 - 11 = M** **0 - 5 = L**

Record the rating on the first page

D 5.0 Does the landscape have the potential to support hydrologic functions at the site?		
D5.1 Does the unit receive any stormwater discharges?	Yes = 1 No = 0	1
D5. Is >10% of the land use within 150 ft of the wetland in a land uses that generates runoff?	Yes = 1 No = 0	1
D 5.3 Is more than 25% of the contributing basin of the wetland unit covered with intensive human land uses?	Yes = 1 No = 0	1
Total for D 5 Add the points in the boxes above		3

Rating of Landscape Potential If score is: **3 = H** **1,2 = M** **0 = L**

Record the rating on the first page

D 6.0 Are the hydrologic functions provided by the site valuable to society?	
D 6.1 Is the unit is in a landscape that has flooding problems? Choose the description that best matches conditions around the wetland unit being rated. *Do not add points. Choose the highest score if more than one condition is met.* ☐ The wetland captures surface water that would otherwise flow downgradient into areas where flooding has damaged human or natural resources (e.g. salmon redds), AND o Damage occurs in sub-basin that is immediately downgradient of unit points=2 o Damage occurs in a sub-basin further down-gradient points = 1 ☒ The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. *Explain why* really small wetland stormwater system within city points = 0 ☐ There are no problems with flooding downstream of the unit. points = 0	6
D 6.2 Has the site has been identified as important for flood storage or flood conveyance in a regional flood control plan? Yes = 2 No = 0	0
Total for D 6 Add the points in the boxes above	

Rating of Value If score is: **2 -4 = H** **1 = M** **0 = L**

Record the rating on the first page

Wetland name or number_____

These questions apply to wetlands of all HGM classes. (only 1 score per box)

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1. Does the wetland unit have the potential to provide habitat for many species?

H 1.1 Categories of vegetation structure

Check the Cowardin vegetation classes present and categories of emergent plants. Size threshold for each category is >= ¼ acre or >= 10% of the unit if unit is < 2.5 acres

____Emergent plants 0-12 in. (0 – 30 cm) high are the highest layer and have > 30% cover
X Emergent plants >12 – 40 in.(>30 – 100cm) high are the highest layer with >30% cover rcg
X Emergent plants > 40 in.(> 100cm) high are the highest layer with >30% cover ~~cx~~ rushes
____Scrub/shrub (areas where shrubs have >30% cover) 4-6 checks points = 3
____Forested (areas where trees have >30% cover) 3 checks points = 2
2 checks points = 1
1 check points = 0

1

H 1.2. Is one of the vegetation types "aquatic bed?" YES = 1 point (NO) = 0 points

0

H 1.3. Surface Water

H 1.3.1 Does the unit have areas of "open" water (without herbaceous or shrub plants) over at least ¼ acre **OR** 10% of its area during the March to early June **OR** in August to the end of September?

Note: answer YES for Lake-fringe wetlands

YES = 3 points & **go to H 1.4** (NO) = go to H 1.3.2

H 1.3.2 Does the unit have an intermittent or permanent, and unvegetate,d stream within its boundaries, or along one side, over at least ¼ acre or 10% of its area, (*answer yes only if H 1.3.1 is NO*)?

YES = 3 points (NO) = 0 points

0

H 1.4. Richness of Plant Species

Count the number of plant species in the wetland that cover at least 10 ft^2. (*different patches of the same species can be combined to meet the size threshold) You do not have to name the species.*

Do not include Eurasean Milfoil, reed canarygrass, purple loosestrife, Russian Olive, Phragmites, Canadian Thistle, Yellow-flag Iris, and Salt Cedar (Tamarisk)

# of species ____ Scoring: > 9 species = 2 points 4-9 species = 1 point < 4 species = 0 points

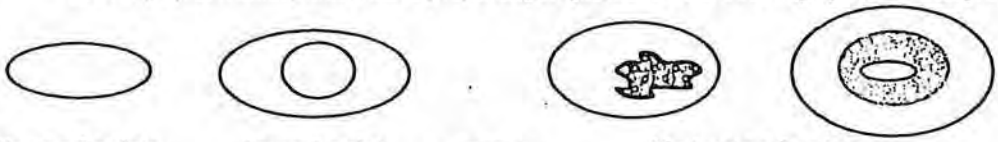
1

H 1.5. Interspersion of habitats

Figure__

Decide from the diagrams below whether interspersion between types of plant structures (described in H 1.1), and unvegetated areas (open water or mudflats) is high, medium, low, or none.

Use map of Cowardin plant classes prepared for questions H1.1 and map of open water from H1.3



None = 0 points **Low** = 1 point **Moderate** = 2 points

High = 3 points **High** = 3 points riparian braided channels with 2 classes = High

NOTE: If you have four or more classes or three plants classes and open water the rating is always "high".

1

Wetland name or number_____

H 1.6. Special Habitat Features: *Check the habitat features that are present in the wetland unit. The number of checks is the score.* ____Loose rocks larger than 4" or large, downed, woody debris (>4in. diameter) within the area of surface ponding or in stream. __X__Cattails or bulrushes are present within the unit. ____Standing snags (diameter at the bottom > 4 inches) in the wetland unit or within 30 m (100ft) of the edge. ____Emergent or shrub vegetation in areas that are permanently inundated/ponded. ____Stable steep banks of fine material that might be used by beaver or muskrat for denning (>45 degree slope) OR signs of recent beaver activity __X__Invasive species cover less than 20% in each stratum of vegetation *(canopy, sub-canopy, shrubs, herbaceous, moss/ground cover)* *Maximum score possible = 6*	2
H 1. TOTAL Score - Add the check marks in the box above	5

Rating of Site Potential **If score is:** **12 – 16 = H** **6 - 11 = M** **0 - 5 = L**
Record the rating on the first page

H 2.0 . Does the landscape have the potential to support habitat at the site?	
H 2.1 Accessible habitat (only area of habitat abutting wetland unit). *Calculate:* % undisturbed habitat 3 + [(% moderate and low intensity land uses)/2] 17/2 = 20.5% If total accessible habitat is: > 1/3 (33.3%) of 1km circle (~100 hectares) points = 3 20 - 33% of 1km circle points = 2 10- 19% of 1km circle points = 1 <10% of 1km circle points = 0	2
H2.2 Undisturbed habitat in 1km circle around unit. If: Undisturbed habitat > 50% of circle points = 3 Undisturbed habitat 10 - 50% and in 1-3 patches points = 2 Undisturbed habitat 10 - 50% and > 3 patches points = 1 Undisturbed habitat < 10% of circle points = 0	0
H2.3 Land use intensity in 1 km circle. If: > 50% of circle is high intensity land use points = (- 2) Does not meet criterion above points = 0	-2
H 2.4 ☐ The wetland unit is in an area where annual rainfall is less than 12 inches, and its water regime is not influenced by irrigation practices, dams, or water control structures. *(Generally, this means outside boundaries of reclamation areas, irrigation district, or reservoirs)* points = 3	0
Total for H 2 Add the points in the boxes above	0

Rating of Landscape Potential **If score is:** **4- 6 = H** **1-3 = M** **< 1 = L**
Record the rating on the first page

H 3.0 Is the Habitat provided by the site valuable to society?	
H3.1Does the site provides habitat for species valued in laws, regulations or policies? *(choose the highest score)* Site meets ANY of the following criteria: points = 2 __It provides habitat for Threatened or Endangered species (any plant or animal on state or federal lists) __It is a "priority area" for an individual WDFW species __It is a Wetland With a High Conservation Value as determined by the Department of Natural Resources __It has 3 or more priority habitats within 100m (see Appendix B) __It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats within 100m (see Appendix B) points = 1 Site does not meet any of the criteria above points = 0	0

Rating of Value **If score is:** **2 = H** **1 = M** **0 = L**
Record the rating on the first page

Wetland name or number_____

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Please determine if the wetland unit meets the attributes described below and circle the appropriate Category. NOTE: A wetland may meet the criteria for more than one set of special characteristics. Record all those that apply. NOTE: All units should also be characterized based on their functions.

Wetland Type *Check off any criteria that apply to the wetland. Circle the Category when the appropriate criteria are met.*	Category
SC 1.0 Vernal pools Is the wetland unit **less than 4000 ft^2**, and does it meet at least **two** of the following criteria? — Its only source of water is rainfall or snowmelt from a small contributing basin and has no groundwater input — Wetland plants are typically present only in the spring; the summer vegetation is typically upland annuals. *NOTE: If you find perennial, "obligate", wetland plants the wetland is probably NOT a vernal pool* — The soil in the wetland are shallow (<1ft deep (30 cm)) and is underlain by an impermeable layer such as basalt or clay. — Surface water is present for less than 120 days during the "wet" season. YES = Go to SC 1.1 NO - *not a vernal pool* SC 1.1 Is the vernal pool relatively undisturbed in February and March? YES = Go to SC 1.2 NO – *not a vernal pool with special characteristics*	
SC 1.2 Is the vernal pool in an area where there are at least 3 separate aquatic resources within 0.5 miles (other wetlands, rivers, lakes etc.)? YES = Category II NO = Category III	**Cat. II** **Cat. III**
SC 2.0 Alkali wetlands Does the wetland unit meets **one** of the following two criteria? — The wetland has a conductivity > 3.0 mS/cm. — The wetland has a conductivity between 2.0 - 3.0 mS, and more than 50% of the plant cover in the wetland can be classified as "alkali" species (see Table 4 for list of plants found in alkali systems). — If the wetland is dry at the time of your field visit, the central part of the area is covered with a layer of salt. **OR** does the wetland unit meets two of the following three sub-criteria? — Salt encrustations around more than 80% of the edge of the wetland — More than ¾ of the plant cover consists of species listed on Table 4 — A pH above 9.0. All alkali wetlands have a high pH, but please note that some freshwater wetlands may also have a high pH. Thus, pH alone is not a good indicator of alkali wetlands. **YES = Category I** NO – *not an alkali wetland*	**Cat. I**

Wetland name or number_____

SC 3.0 Wetlands with High Conservation Value (WHCV) SC 2.1 Has the Department of Natural Resources updated their web site to include the list of Wetlands with High Conservation Value? YES - Go to SC 2.2 NO – Go to SC 2.3 SC 2.2 Is the wetland unit you are rating listed on the DNR database as having a High Conservation Value? YES = Category I NO = not a WHCV SC 2.3 Is the wetland unit being rated in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf YES____ – contact WNHP/DNR and go to SC 2.4 NO = not a WHCV SC 2.4 Has DNR identified the wetland within the S/T/R as a wetland with High Conservation value and is listed on their web site? YES = Category I NO ____not an WHCV	**Cat. I**
SC 4.0 Bogs and Calcareous Fens Does the wetland unit (or any part of the wetland unit) meet both the criteria for soils and vegetation in bogs or calcareous fens. *Use the key below to identify if the wetland is a bog or calcareous fen. If you answer yes you will still need to rate the wetland based on its functions.* SC 4.1. Does an area within the wetland unit have organic soil horizons (i.e. layers of organic soil), either peats or mucks, that compose 16 inches or more of the first 32 inches of the soil profile? (See Appendix C for a field key to identify organic soils)? Yes - go to SC 4.3 No - go to SC 4.2 SC 4.2. Does an area within the unit have organic soils, either peats or mucks that are less than 16 inches deep over bedrock or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?? Yes - go to SC 4.3 No - *Is not a bog for rating* SC 4.3. Does an area within the unit have more than 70% cover of mosses at ground level AND at least 30% of the total plant cover consists of species in Table 5? Yes – Category I bog No - go to SC 4.4 *NOTE: If you are uncertain about the extent of mosses in the understory you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16" deep. If the pH is less than 5.0 and the plant species in Table 5 are present, the wetland is a bog.* SC 4.4 Is an area with peats or mucks forested (> 30% cover) with subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Englemann's spruce, or western white pine, AND any of the species (or combination of species) listed in Table 5 provide more than 30% of the cover under the canopy **Yes – Category I bog** NO – go to question SC 4.5 5. Do the species listed in Table 6 comprise at least 20% of the total plant cover within an area of peats and mucks? Yes – Is a Calcareous Fen for purpose of rating No - go to Question 6 6. Do the species listed in Table 6 comprise at least 10% of the total plant cover an area of peats and mucks, AND one of the two following conditions is met: • Marl deposits (calcium carbonate (CaCO3) precipitate) occur on the soil surface or plant stems • The pH of free water ≥ 6.8 AND electrical conductivity ≥ 200 uS/cm at multiple locations within the wetland **Yes – Is a Category I calcareous fen** No - Is not a calcareous fen	**Cat. I** **Cat. I**

Wetland name or number_____

SC 5.0 Forested Wetlands Does the wetland unit have an area of forest rooted within its boundary that meets **at least one** of the following three criteria? (*Continue only if you have identified a forested class is present in question H 1.1*) • The wetland is within the "100 year" floodplain of a river or stream • aspen (*Populus tremuloides*) represents at least 20% of the total cover of woody species — There is at least ¼ acre of trees (even in wetlands smaller than 2.5 acres) that are "mature" or "old-growth" according to the definitions for these priority habitats developed by WDFW *(see definitions in question H3.1)* YES = go to SC 5.1 NO –*not a forested wetland with special characteristics*	
SC 5.1 Does the wetland unit have a forest canopy where more than 50% of the tree species (by cover) are slow growing native trees (*see Table 7*) YES = Category I NO = go to SC 5.2	**Cat. I**
SC 5.2 Does the unit have areas where aspen (*Populus tremuloides*) represents at least 20% of the total cover of woody species. YES = Category I NO = go to SC 5.3	**Cat. I**
SC 5.3 Does the wetland unit have areas with a forest canopy where more than 50% of the tree species (by cover) are fast growing species. (*see Table 7*) YES = Category II NO = go to SC 5.5	**Cat. II**
SC 5.4 Is the forested component of the wetland within the "100 year floodplain" of a river or stream? YES = Category II	**Cat. II**
Category of wetland based on Special Characteristics *Choose the "highest" rating if wetland falls into several categories.* If you answered NO for all types enter "Not Applicable" on p.1	

Wetland name or number_____

Appendix B: WDFW Priority Habitats in Eastern Washington

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf)

Count how many of the following priority habitats are within 330 ft (100m) of the wetland unit? *NOTE: This question is independent of the land use between the wetland unit and the priority habitat.*

___**Aspen Stands:** Pure or mixed stands of aspen greater than 0.4 ha (1 acre).

___**Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report p. 152*).

___**Old-growth/Mature forests:** Old-growth east of Cascade crest: Stands are highly variable in tree species composition and structural characteristics due to the influence of fire, climate, and soils. In general, stands will be >150 years of age, with 25 trees/ha (10 trees/acre) that are > 53 cm (21 in) dbh, and 2.5-7.5 snags/ha (1 – 3 snags/acre) that are > 30-35 cm (12-14 in) diameter. Downed logs may vary from abundant to absent. Canopies may be single or multi-layered. Evidence of human-caused alterations to the stand will be absent or so slight as to not affect the ecosystem's essential structures and functions. Mature forests: Stands with average diameters exceeding 53 cm (21 in) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80 - 200 years old west and 80 - 160 years old east of the Cascade crest.

___**Oregon white Oak:** Woodlands Stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

___**Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

___**Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

___**Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

___**Cliffs:** Greater than 7.6 m (25 ft) high and occurring below 5000 ft.

___**Talus:** Homogenous areas of rock rubble ranging in average size 0.15 - 2.0 m (0.5 - 6.5 ft), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

___**Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 51 cm (20 in) in western Washington and are > 2 m (6.5 ft) in height. Priority logs are > 30 cm (12 in) in diameter at the largest end, and > 6 m (20 ft) long.

___**Shrub-steppe:** A nonforested vegetation type consisting of one or more layers of perennial bunchgrasses and a conspicuous but discontinuous layer of shrubs (see Eastside Steppe for sites with little or no shrub cover).

___**Eastside Steppe:** Nonforested vegetation type dominated by broadleaf herbaceous flora (i.e., forbs), perennial bunchgrasses, or a combination of both. Bluebunch Wheatgrass (Pseudoroegneria spicata) is often the prevailing cover component along with Idaho Fescue (Festuca idahoensis), Sandberg Bluegrass (Poa secunda), Rough Fescue (F. campestris), or needlegrass (Achnatherum spp.).

___ **Juniper Savannah:** All juniper woodlands.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Agritech / Bay Chemical City/County: Yakima (City) Sampling Date: 8/25/16

Applicant/Owner: State: WA Sampling Point: Hole 1. ditch area

Investigator(s): Catherine Reed Section, Township, Range:

Landform (hillslope, terrace, etc.): ancient floodplain terrace Local relief (concave, convex, none): concave Slope (%):

Subregion (LRR): Lat: Long: Datum:

Soil Map Unit Name: NWI classification:

Are climatic / hydrologic conditions on the site typical for this time of year? Yes X No (If no, explain in Remarks.)

Are Vegetation X, Soil X, or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes X No

Are Vegetation, Soil, or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No	Is the Sampled Area within a Wetland? Yes X No
Hydric Soil Present?	Yes X No	
Wetland Hydrology Present?	Yes X No	

Remarks:
Whole area subject to unknown underground drains. Surface Ditches located on this site and to the south/east end of the property - Installation of railroad grade and clean-up berm to west

VEGETATION – Use scientific names of plants.

This report has been prepared based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party.

1.0 INTRODUCTION

On May 23rd, 2011 Test America collected freshwater sediments for biological testing. Test America contracted with Nautilus Environmental to provide toxicity-testing services for the project. The three sediment samples selected for testing included samples E-WetSed-1-052311 (WETSED-1), E-WetSed-2-052311 (WETSED-2), and E-WetSed-3-052311 (WETSED-3). No reference sample was collected in conjunction with this project. The freshwater sediment samples were tested for toxicity using the *Chironomus dilutus* (aka *tentans*) 20-day survival and growth bioassay (USEPA 2000 and ASTM 2000), the *Hyalella azteca* 10-day survival bioassay (USEPA 2000 and ASTM 2000), and the 15-minute 100 percent porewater Microtox® bacteria bioluminescence test. All tests met negative and positive control criteria.

Results were evaluated by comparing test data to the criteria in the Sediment Evaluation Framework for the Pacific Northwest (RSET 2009) guidance document. *C. dilutus*, *H. azteca*, and Microtox results were compared to control results, and examined for statistically significant effects ($\alpha = 0.05$). Acceptability criteria from the literature are summarized in Table 1.

Table 1 Acceptability criteria for bioassays

Test Type	***C. dilutus* 20-Day**	***H. azteca* 10-Day**	**Microtox**
Endpoint	Survival and Growth	Survival	Luminescence
Source	RSET 2009	RSET 2009	RSET 2009
Test Criteria	One-hit failure is mortality > control mortality + 25% and/or biomass <60% of control biomass and significant difference Two-hit failure is mortality > control mortality + 15% and/or biomass <75% of control biomass and significant difference	One-hit failure is mortality > control mortality + 25% and significant difference Two-hit failure is mortality > control mortality + 10% and significant difference	One-hit failure is Luminescence <75% of control luminescence and significant difference Two-hit failure is Luminescence <85% of control luminescence and significant difference
Control Criteria	Negative control ≤32% mortality and growth ≥0.48 mg/ind. ash-free dry weight	Negative control ≤20% mortality	Negative control final light output > 72% of initial output

2.0 SAMPLES

Upon receipt of samples from Test America, samples were matched with the chain-of-custody form and inspected. Samples were stored at 4 ± 2°C in the dark prior to test initiation. Toxicity tests were initiated within 2 weeks of collection (Table 2). Total ammonia levels in the porewater ranged from <1.0 to 2.7 milligrams per liter (mg/L). Both overlying ammonia and sulfides were also measured during testing, and the results are reported in the QA/QC sections for each test.

Table 2 Summary of sample collection and test initiation dates

Sample ID	Collection Date	Microtox Test Initiation Date	*H. azteca* Test Initiation Date	*C. dilutus* Test Initiation Date
E-WetSed-1-052311	May 23, 2011	June 6, 2011	June 7, 2011	June 9, 2011
E-WetSed-2-052311				
E-WetSed-3-052311				

3.0 *CHIRONOMUS DILUTUS* TEST

3.1 Methods

C. dilutus were exposed to test sediments for 20 days to determine the effects of site sediment on survival and growth. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 3.

C. dilutus egg cases were obtained from Aquatic BioSystems (Fort Collins, Colorado) and arrived at the laboratory on June 8, 2011. The egg cases were transported in insulated containers in oxygen-saturated water contained in 500-mL plastic bottles. Upon arrival at the laboratory, water quality parameters were measured and observations of organism condition were made. The egg cases were 20°C at receipt, and were cultured at 23°C. The organisms emerged from the egg cases on June 9th and tests were initiated the same day.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml of sediment was distributed to each of eight labeled test chambers for each of the samples, and

175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Twelve organisms were directly added to each test chamber, in random order.

Each test chamber was provided 1.5 mL of food daily (after the second renewal) starting on Day -1. The food consisted of a mixture of 4 g ground Tetrafin® flakes mixed with 1 L diluted mineral water. The feeding regime was reduced if the presence of excess food was observed on the sediment surface in several test chambers, which occurred on Day 8 only. Abnormal conditions or unusual animal behavior, if observed, were noted daily.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while alkalinity, hardness, ammonia and sulfides were measured on Days 5, 10, and 15. Water was renewed twice daily.

At test termination, subsamples of overlying water were collected from each water quality replicate for ammonia, hardness, alkalinity, and sulfide analyses. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. Animals were removed from the screen and the number of survivors counted and recorded. Presence of pupae, flies, or exuviae (molts) were noted. The larvae were rinsed with deionized water and placed into pre-ashed, pre-weighed weigh boats. The weigh boats were placed in an oven at 60°C for at least 24-hours, then placed in a dessicator until dry weight could be measured. The weigh boats were then placed in a muffle furnace at 550°C for two hours, placed in a dessicator to cool, then weighed again to determine the ash weight. The ash weight was subtracted from the dry weight to determine the ash-free dry weight (AFDW). The number and AFDW of surviving chironomids were evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitney U-test, as appropriate, to determine whether the samples exhibited a significant

decrease in survival or growth relative to the control ($p<0.05$). Survival data were arcsine transformed, while growth data was either square root or log transformed as needed to stabilize the variances and improve normality of the data prior to performing the t-test. Data that failed to meet parametric assumptions even after transformations were analyzed with the non-parametric Mann-Whitney U-test. Site performance was evaluated against the sediment acceptability criteria outlined in RSET 2009 (Table 1). The criteria for acceptable test performance were an average of ≤32 percent mortality of control organisms, and an average of at least 0.48 mg/individual AFDW per surviving control organism.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the tests on the sediments to determine whether the sensitivity of the test organisms was appropriate. This test was run with four replicates, ten animals per replicate, in diluted mineral water at 23°C, with a small amount of clean control sand as a substrate. Tetrafin® slurry (1.25 mL of 4 g/L Tetrafin) was added to each chamber on days 0 and 2.

Table 3 Summary of methods for the 20-day test with *Chironomus dilutus*

Test initiation date	June 9, 2011
Test termination date	June 29, 2011
Test organism source	Aquatic BioSystems; Fort Collins, Colorado
Organism age at test initiation	< 4 hours post-emergence from egg case
Feeding	1.5 mL of 4.0 g/L Tetrafin mixture every day; frequency reduced if excess food observed
Test chamber	475-mL glass beaker
Test sediment volume	100 mL
Dilution water type & volume	175 mL diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	12
Number of replicates/sample	8 plus water quality surrogates
Test temperature	23± 1°C
Illumination	16 hours light : 8 hours dark
Aeration	Started on Day 13
Reference toxicant	Copper chloride
Acceptability Criteria	≤32% mortality, 0.48 mg/individual AFDW

3.2 Results

The results of toxicity tests conducted using *C. dilutus* are provided in Table 4. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 4 Results of *Chironomus dilutus* tests. Samples with statistically reduced survival or growth are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference From	Ash-Free Dry Weight per Org (mg)	Ash-Free Dry Weight Percent of Control
Control	6.3 ± 7.4	--	0.91 ± 0.11	--
WETSED-1	20.8 ± 21.4	14.6	1.11 ± 0.46	123
WETSED-2	24.0 ± 12.9	17.7	0.87 ± 0.22	96
WETSED-3	**63.5 ± 31.2**	**57.3**	0.60 ± 0.57	66

[1]Criteria for one-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 15% of control (RSET 2009)

3.3 QA/QC

The *C. dilutus* were received in good condition for the June 9, 2011 test. All water quality parameters remained within acceptable ranges throughout the tests. A summary of the water quality parameters is presented in Table 5. Dissolved oxygen levels were decreased to a level on concern on day 13, and all replicates were aerated from that point forward. There were no deviations from the protocols. The toxicity test for mortality with this species met the control acceptability criterion (<32 percent mortality; >0.48 mg/ind AFDW).

Table 5 Summary of water quality parameters for *C. dilutus* tests (means and ranges). Required values are shown in brackets.

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
	Mean (Min-Max)			
Temp. (°C) [23 ± 1°C]	22.0 (21.7-22.2)	22.0 (21.8-22.2)	21.9 (21.7-22.1)	21.9 (21.7-22.1)
DO (mg/L) [>2.5 mg/L]	6.7 (3.3-9.0)	6.7 (3.5-9.0)	7.1 (5.2-9.1)	7.0 (5.2-9.0)
pH [6-9]	7.34 (6.58-7.99)	7.18 (6.43-7.89)	7.13 (6.46-7.80)	7.35 (6.80-7.99)
Cond. (µS/cm) [NA]	208 (127-296)	180 (149-227)	249 (158-413)	251 (192-382)
Alkalinity (mg/L $CaCO_3$) [<50% variable]	58 (48-72)	65 (60-68)	69 (64-72)	85 (80-88)
Hardness (mg/L $CaCO_3$) [<50% variable]	83 (80-88)	98 (80-108)	195 (84-228)	122 (100-140)
Total Overlying NH3 (mg/L) [<50% variable]	1.6 (1.1-1.7)	1.2[a] (<1.0-1.3)	1.3[a] (<1.0-1.3)	<1.0 (<1.0-<1.0)
Total Overlying Sulfides (mg/L) [NA]	0.035[a] (<0.010-0.058)	0.028[a] (<0.010-0.054)	0.044[a] (<0.010-0.044)	0.020[a] (<0.010-0.021)

[a] estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 6. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 6 *C. dilutus* reference toxicant test results.

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Chironomus dilutus	June 23, 2011	Cu	571 µg/L	401 – 1070 µg/L	22.7

3.4 Discussion

Mortality in the samples ranged from 20.8 to 63.5 percent, compared with 6.3 percent in the control. Sediment samples WETSED-2 and WETSED-3 were significantly different from control and were more than 15 percent higher than the control, failing the two-hit criterion for survival. WETSED-3 was also more than 25 percent higher than the control, failing the one-hit criterion for survival. Survival in WETSED-1 was not significantly different from the control, due to high

variability in the sample. Growth in the samples ranged from 0.60 to 1.11 mg/individual AFDW, compared with 0.91 mg/individual AFDW in the control. Growth in sample WETSED-1 was greater than the control. Growth in WETSED-2 and WETSED-3 was not significantly different from the control. Therefore none of the sites fail either the one- or two-hit failure requirements.

The total ammonia level reached 1.3 mg/L in the test sediments, which was well below the reported 4-day lethal concentration for 50% of test organisms (LC_{50}) range for *C. dilutus* of 82 to 370 mg/L (USEPA 2000). While sulfide toxicity thresholds are not available for this species, they were measured as part of the Ecology reference site study (Nautilus 2008), and samples with porewater sulfide values similar (0.226 to >0.600 mg/L) to the values found in the current study (0.010 to 0.054 mg/L) did not result in measurable effects. Therefore, it is unlikely that ammonia or sulfide levels caused the observed increases in mortality in the test sediments.

4.0 *HYALELLA AZTECA* TEST

4.1 Methods

H. azteca were exposed to test sediments for 10 days to determine the effects of site sediments on survival. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 7.

H. azteca were obtained from Aquatic Indicators (St. Augustine, Florida) and arrived at the laboratory on June 2, 2011. The organisms were transported in insulated boxes in oxygen-saturated water contained in plastic bags with fine screens as a substrate. Upon arrival at the laboratory, water quality parameters were measured and observations of animal condition were made. The organisms were acclimated to test conditions prior to test initiation over a 96-hour time period. During the acclimation period, the animals were observed for any indication of stress or significant mortality and any observations were recorded.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml sediment was distributed to each of eight labeled test chambers for each of the samples, and 175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed

overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Organisms were carefully separated into groups of 10 amphipods in 30 mL cups containing diluted mineral water. The number of organisms was then recounted and any animals exhibiting signs of stress were replaced. The organisms were then gently added to the test chambers, two cups for each test chamber for a total of 20 organisms per chamber.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while overlying ammonia, sulfide, hardness, and alkalinity were monitored on Day 5. Water was renewed twice daily in all chambers. Abnormal conditions or unusual animal behavior, if observed, were also noted daily. Each test chamber was fed 1 ml of Yeast Trout Chow (YTC) daily after the second renewal.

At test termination, subsamples of overlying water were collected for ammonia, hardness, alkalinity, and sulfides analyses, from each water quality replicate. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. The screen was then placed in diluted mineral water and the number of survivors counted and recorded. The number of surviving amphipods was evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitey U-test, as appropriate, to determine whether the samples exhibited a significant decrease in survival relative to the control ($p<0.05$). Survival data was arcsin transformed as needed to stabilize the variances and improve normality of the data. Site performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the sediment tests to determine whether the sensitivity of the test organisms was within the range typically observed. The test was run with four replicates, ten animals per replicate, in diluted mineral water with a square of nitex screen as a substrate.

Table 7 Summary of methods for the 10-day test with *Hyalella azteca*.

Test initiation date	June 7, 2011
Test termination date	June 17, 2011
Test organism source	Aquatic Indicators, St. Augustine, Florida
Organism age at test initiation	8 days
Feeding	1 ml of YTC daily
Test chamber	475-ml glass beaker
Test sediment volume	100 ml
Dilution water type & volume	175 ml diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	10
Number of replicates/sample	8 plus water quality surrogate
Test temperature	23 ± 1°C
Illumination	16 hours light: 8 hours dark
Aeration	None
Reference toxicant	Copper chloride
Acceptability criterion for control	≥80% survival

4.2 Results

The results of toxicity tests conducted using *H. azteca* are provided in Table 8. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 8 Results of *Hyalella azteca* tests. Samples with statistically reduced survival or are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference from Control
Control	1.3 ± 2.3	--
WETSED-1	**100 ± 0.0**	98.7
WETSED-2	13.8 ± 11.6	12.5
WETSED-3	3.8 ± 4.4	2.5

[1]Criteria for one-hit failure is significant decrease in mortality (p<0.05), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality (p<0.05), **and** mortality greater than 10% of control (RSET 2009)

4.3 QA/QC

The *H. azteca* were received in good condition and the toxicity tests with this species met the control acceptability criterion (<20 percent mortality). A summary of the water quality parameters is provided in Table 10. All water quality parameters remained within acceptable ranges throughout the tests. Instead of the 10 animals per replicate required by the protocol, 20 animals were added to each replicate. As the controls still met acceptability criteria and water quality stayed within ranges for the test, this deviation is not expected to have affected the results. There were no other deviations from the protocol.

Table 9 Summary of water quality parameters for *H. azteca* analyses (means and ranges). Required values are shown in brackets.

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
		Mean (Min-Max)		
Temp. (°C)	22.3	22.2	22.2	22.2
[23 ± 1°C]	(21.9-23.4)	(21.9-23.3)	(21.9-23.3)	(21.8-23.2)
DO (mg/L)	7.0	6.3	6.4	6.5
[>2.5 mg/L]	(5.8-8.4)	(5.4-7.3)	(5.4-7.2)	(5.6-7.3)

(mg/L) [<50% variable]	(<0.010-0.125)	(0.014-0.293)	(0.012-0.126)	(<0.010-0.107)

[a]estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 10. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 10 H. Azteca reference toxicant test results.

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Hyalella azteca	June 2, 2011	Cu	188 µg/L	0 – 1360 µg/L	74.6

4.4 Discussion

Mortality in the samples ranged from 3.8 to 100 percent, compared with 1.3 percent in the control. Sediment samples WETSED-1 and WETSED-2 were significantly different from control and were more than 10 percent higher than the control, failing the two-hit criterion for survival. WETSED-1 was more than 25 percent higher than the control, failing the one-hit criterion for survival.

5.0 MICROTOX® TEST

5.1 Methods

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox test. The bacteria were exposed to porewater extracted from sediment samples and light readings were measured after 5 and 15 minutes of exposure. Test equipment included the Microtox Model 500 Analyzer, which measures light output and is equipped with a 15°C chamber to maintain test temperature in the samples and a 4°C chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot #s 10K1032, expiration date 10/2012) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Ecology (2008) test protocol; these methods are summarized in Table 11. Approximately 50 ml of porewater was extracted from each sample by centrifuging for 30 minutes at 4500 G. Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea Marine Mix artificial seasalt. The DO ranged from 7.2 to 8.2 mg/L in the adjusted samples. Since the DO in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L), the samples did not require aeration. The pH was adjusted to 7.8 to 8.2 using NaOH or HCl. None of the porewater samples were diluted below 90 percent. The control was deionized water adjusted to 20 ppt with artificial seasalt. Each porewater was tested within 3 hours of extraction.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox test wells and 1 ml of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 µl was added to each test cuvette, with mixing after each addition. After an initial incubation period of 5 minutes, the control cuvette was placed in the read chamber of the Microtox Analyzer to set the instrument. Initial light readings (I_0) were then taken by placing each cuvette in the read chamber of the Microtox Analyzer and measurements were recorded on a data sheet. Light output was measured at 5 minutes (I_5) and 15 minutes (I_{15}) of exposure after the initial light reading (I_0).

Test acceptability criteria were final mean control light output greater than or equal to 72 percent of initial control mean output, and test mean output not greater than 110 percent of control mean output. The data were evaluated statistically by conducting one-tailed t-tests or Mann-Whitney U-tests on the change in output over time for test sediment porewaters compared to the control porewater (where light output was lower than the control). Sediment performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A reference toxicant test using phenol was conducted in conjunction with the sediment tests to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 11 Summary of methods for the Microtox test.

Test dates	June 6, 2011
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#10K1032, Expiration 10/2012
Control	Saltwater (20 ppt) prepared with Crystal Sea artificial seasalt
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea salt; pH adjustment to 7.8-8.2 ppt; DO 5.0 to 10.2 mg/L
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Phenol
Acceptability criteria	Final control light output ≥72% initial; test output ≤110% control

5.2 Results

The results of toxicity tests conducted using Microtox are provided in Table 12. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 12 Results of Microtox tests. Samples with statistically reduced luminescence are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	5 minute reading		15 minute reading	
	Mean % of initial light output	Significantly different relative to the control	Mean % of initial light output	Significantly different relative to the control
Control	96 ± 3	--	84 ± 3	--
WETSED-1	**68 ± 4**	Yes	**17 ± 1**	Yes
WETSED-2	**72 ± 1**	Yes	**25 ± 1**	Yes
WETSED-3	81 ± 1	Yes	**35 ± 2**	Yes

[1]Criteria for one-hit failure is luminescence less than 75% of control luminescence **and** significant difference (RSET 2009); [2]Criteria for two-hit failure is luminescence less than 85% of control luminescence **and** significant difference (RSET 2009)

5.3 QA/QC

A summary of the water quality parameters for the Microtox tests is provided in Table 13. The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Table 13 Summary of sites water quality parameters for Microtox analyses

Analyte	Mean (st.dev)	Minimum	Maximum	Number of Readings	Met Requirements
Initial Salinity (ppt)	1.1 (0.3)	0.8	1.3	3	N/A
Final Salinity (ppt)	19.9 (0.4)	19.5	20.2	3	Y
Initial DO (mg/L)	7.3 (0.2)	7.2	7.5	3	N/A
Final DO (mg/L)	7.3 (0.2)	7.2	7.5	3	Y

Total NH3 (mg/L)	2.0 (1.0)[1]	<1.0	2.7	3	N/A

[1]estimated value

Results of the reference toxicant test conducted in conjunction with this testing program are provided in Table 14. Bench sheets and control charts are provided in Appendix E. The test was run with the same batch of organisms used in the testing program. The results of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 14 Microtox reference toxicant test results.

Species	Test date	Toxicant	EC50	Acceptable Range (mean ± 2 S.D.)	CV (%)
Microtox	June 6, 2011	Phenol	5 min: 19.6 mg/L 15 min: 40.9 mg/L	5 min: 24.2 – 55.1 15 min: 31.0 – 92.2	19.5 24.8

5.4 Discussion

Change in light output in the samples at 15 minutes ranged from 17 to 35 percent, compared with 84 percent in the controls. Samples WETSED1, WETSED2, and WETSED3 were all significantly different from the controls and had luminescence less than 75% of controls, failing the one-hit criteria for luminescence.

6.0 CONCLUSIONS

WETSED-1 failed the one-hit criterion for *H. azteca* survival and the one-hit criterion for Microtox luminescence, but did not have a hit in the *C. dilutus* survival or growth criterion (RSET 2009). WETSED-2 failed the two-hit criterion for *C. dilutus* and *H. azteca* survival, and failed the one-hit criterion for Microtox luminescence (RSET 2009). WETSED-3 failed the one-hit criterion for *C. dilutus* survival and Microtox luminescence (RSET 2009).

10 Day Toxicity Test Data Sheet - Nautilus Environmental

Freshwater Sediment 10 day Observations

Client: Test America
Test #: 1106-TD13, TD14, TD15

Start Date & Time: 6/7/11 1445
End Date & Time: 6/17/11 1545
Test Organism: *H. azteca*

N = normal
R= no burrows
M= dead on surface
A= avoidance
L = anoxic surface
F= fungal patches
O= no air flow (DO?)
O= excess food

Glossary of Terms

Acute toxicity: Toxicity due to a short-term exposure. The measured effect may be lethal or sub-lethal.

AFDW: Ashed-free dry weight

Amphipod: *Hyalella azteca:* For this program, the amphipod, *Hyalella azteca* was used to evaluate toxicity.

Benthic Test: A whole-sediment test, conducted with animals exposed to test sediments

C: Control

Chironomus: The genus for the midge test species, *Chironomus dilutus*. For this report, *Chironomus* is sometimes used to refer to *Chironomus dilutus*.

Chronic toxicity: Toxicity due to a longer duration exposure. The measured effect may be lethal or sub-lethal (e.g. growth).

COPC: Chemicals of Potential Concern

CSL: Cleanup screening level; levels which may require action

EC50: Median effective concentration. That concentration that elicits an effect on 50% of the test population.

Ecology: Washington Department of Ecology

Hyalella: The genus for the amphipod test species, *Hyalella azteca*. For the purposes of this report, *Hyalella* is sometimes used to refer to *Hyalella azteca*.

LC50: Median lethal concentration. That concentration that is lethal to 50% of the test population.

M: Mortality

Midge: *Chironomus dilutus* – for this program, the midge *Chironomus dilutus* was used to evaluate toxicity.

MIG: Mean individual growth

Porewater Test: Toxicity test with test organisms exposed to porewater extracted from test sediments

RSET: Regional Sediment Evaluation Team

SCO: Sediment cleanup objective; long-term sediment quality goals for cleanup actions

SMS: Sediment management standards

TNWR: Toppenish National Wildlife Refuge

YSF: Yakima Steel Fabricators

1. Introduction

Farallon Consulting LLC (Farallon) is conducting a remedial investigation of a light industrial site in Yakima, Washington. The Agri-Tech/Yakima Steel Fabricator (YSF) property includes a small Type 3 wetland. Previous studies with sediment collected from three wetland stations found cadmium levels above the State screening levels; sediment toxicity testing showed the potential for adverse biological effects. However, the results of previous tests were equivocal. ENVIRON (formerly NewFields) were requested to conduct an evaluation of toxicity and the potential causes of toxicity in sediments from the wetland. The purpose of this supplemental remedial investigation was to inform the feasible remedial analysis and cleanup action plan as it relates to the wetland area by:

- Reevaluating the potential for toxicity in site wetland sediments; and,
- If toxicity is observed, determine whether cadmium or other metals of potential concern are the likely cause.
- Generate data that can lead to a cleanup level for the site.

1.1 Background and 2011 Investigation

Prior studies evaluated wetland soils and sediments at the south end of the Agri-Tech/YSF property (Figure 1) for contaminants of potential concern (COPC) and sediments were evaluated for toxicity (Farallon 2011). Based on the soil and sediment chemistry, cadmium was the only analyte observed at concentrations exceeding the preliminary soil screening levels (Table 1). For the sediment samples, cadmium was the only COPC that exceeded the State of Washington's recently promulgated freshwater sediment cleanup screening level (CSL) and sediment cleanup objective (SCO) criterion. The CSL values represent levels which may require action; whereas the SCO values represent long-term sediment quality goals for cleanup. The CSL chemical criteria are higher than the SCO criteria; likewise, the toxicity thresholds for CSL are higher than those of the SCO. The Freshwater CSL and SCO values are based on a regional dataset with concomitant sediment chemistry and bioassay data. However, this dataset did not include small wetlands and as such they may not necessarily represent the bioavailability and toxicity of chemicals in the largely static sediment reducing environments found in small wetlands.

As required by the Sediment Management Standards (SMS), toxicity tests were conducted on the wetland sediments in 2011. Tests included the 10-day amphipod survival test with the amphipod, *Hyalella azteca*, the 20-day midge growth and survival test with the midge, *Chironomus dilutus*, and the Microtox® test. The bioassay report (Nautilus 2011; Appendix A) compared the test results to control samples based on criteria as defined in the Regional Sediment Evaluation Team (RSET) sediment evaluation framework for dredged material (USACE/EPA 2009). Since that time, the Washington Department of Ecology (Ecology) promulgated biological criteria for the freshwater sediment tests with *Hyalella* and *Chironomus*. The results of the wetland sediment toxicity tests are compared to the Ecology criteria in Table 2. For the Microtox® test, RSET criteria were used as the SMS revisions do not include Microtox® criteria. It should be noted that the RSET criteria are based on a "one-hit/two-hit" evaluation. Toxicity observed at the two-hit level represents a lower level of toxicity and indicates that two toxicity tests would need to exceed the two-hit criteria to fail a sediment treatment. The one-hit

criteria represents a higher level of toxicity and indicates that one toxicity test exceeding the one-hit criteria would fail a sediment treatment.

Toxicity exceeding the CSL criteria was observed in WETSED-1 for the *Hyalella* test, whereas no toxicity was observed in the *Chironomus* test for both survival and growth. WETSED-2 passed the CSL and SCO criteria for *Hyalella* survival and *Chironomus* growth, with *Chironomus* mortality slightly above the SCO criteria. In contrast, the WETSED-3 sediment passed the SCO criteria for the *Hyalella* test, but failed the CSL criteria for *Chironomus* mortality. Survival among the replicates for the *Chironomus* test was highly variable, ranging from 0 to 9 individuals per replicate. Marginal toxicity exceeding the CSL and SCO criteria were observed for each of the test treatments in the Microtox® test.

Overall the QA/QC was acceptable for the toxicity tests (summary in Table 3; full report in Appendix A). Survival and growth in the negative control sediment (clean silica sand routinely used in freshwater sediment tests or laboratory seawater for the Microtox® test) were within acceptable limits. The positive control (reference-toxicant tests) with the exception of the Microtox® LC_{50} for the 5 minute reading, which was slightly below the acceptable range. Water quality parameters, including ammonia and sulfide values were within the tolerance limits for the test organisms. The amphipod test was initiated with 20 test organisms rather than 10; however, the food ration was not altered for the increased loading rate. While this may have affected test organism fitness and growth, it is unlikely that this would result in the high mortality observed in WETSED-1. For the *Chironomus* test, there was high inter-replicate variability with coefficients of variation ranging from 49% to 102%. This test can be subject to error at test initiation if proper care is not taken placing the extremely small larval *Chironomus* into the test chambers. Nematodes were observed in some test replicates, which could result in predation and loss of early Chironomid larvae which are very small (about the size of an eyelash). Additionally, the duration of this test is very near the hatch stage and it is possible to have a loss of test organisms when they have developed into flies. While it is not possible to determine if these were sources of the variability from the available data, high variability is an indication that non-contaminant interactions may have affected the test results.

Table 3. Negative and Positive Control Performance, 2011 Toxicity Tests.

Test	Negative Control Performance	Acceptable Limit	Positive Control Performance	Acceptable Range
Hyalella	1.3% mortality	<20%	188 µg/L Cu	0 – 1,360 µg/L Cu
Chironomus	6.3% mortality 0.91 mg AFDW/ind	<32% >0.48 mg AFDW/ind	571 µg/L Cu	401 – 1,070 µg/L Cu
Microtox	5 min: 96% 5 min: 84%	72% - 110%	19.6 mg/L phenol 40.9 mg/L phenol	24.2 – 55.1 mg/L 31.0 – 92.2 mg/L

Although cadmium concentrations were generally similar for the three wetland sediments (6.8 to 9.2 mg/kg), the observed toxicity was highly variable across the site. Sample WETSED-1 had 100% mortality in the *Hyalella* test, but did not show toxicity in the *Chironomus* test; sample WETSED-3 had 57% mortality in the *Chironomus* test, but high survival in the *Hyalella* test. With the exception of the Microtox® test, WETSED-2 showed little toxicity. While it would not be unexpected to have different cadmium sensitivities among test species, the pattern of responses for each test would be expected to be somewhat consistent across the test treatments if cadmium was the primary cause of toxicity as the sediment chemistry might suggest.

There was consistency in response for all sediment treatments for the Microtox® test results. However, Microtox® tests have been shown to be highly sensitive to non-contaminant factors such as turbidity, ammonia, sulfides, organics, and holding times (Brouwer and Murphy 1994; Benton et al. 1995; Pardos et al 1999; Bennet and Cubbage 1992). In Microtox® tests with marine samples, holding times have been associated with toxicity (NewFields 2009). In a holding-time study, no toxicity was observed for samples tested within 2 to 4 days of collection; however, nearly half of the samples were found to exceed SMS criteria for samples tested 20 days after collection. All samples tested 37 days after collection failed in the Microtox®. In the Microtox® tests conducted with the Agri-Tech/YSF wetland sediments holding times were 15 days and likely affected the test results.

Site-specific factors (e.g. pH, redox potential, sediment grain size, and organic carbon) can affect metals availability and toxicity, as well as the ability of chemical criteria to predict a relationship between COPCs and toxicity. In many cases, the pH in wetland sediments may be lower than for larger, more dynamic water bodies. Lower pH tends to favor adsorption of metals onto finer sediment particles (John and Leventhal 1994). Furthermore, wetland sediments typically have elevated total organic carbon content due to the dense vegetation, which is not exported, from the system. Binding with organic carbon also reduces availability. Organically enriched sediments can form a strongly reducing (anoxic) environment which promotes sulfate reduction and sulfide mineral deposition. In such environments, free cadmium (the more toxic fraction) can form less toxic insoluble sulfide complexes. As such, the measured cadmium concentrations may not be similarly available or toxic as in riverine or lake systems. National chemical criteria or guidance values (e.g. Threshold and Probable Effects Levels), are based on datasets developed in water bodies that are quite different than the small wetland on the Agri-Tech/YSF

site. The dataset used in developing the recently promulgated SMS criteria includes large water bodies such as Portland Harbor, the Columbia River, Lake Roosevelt and the Spokane River.

The potential differences in availability and toxicity in wetland sediments versus sediments from larger water bodies are a significant source of uncertainty in developing a cause-effect relationship between screening level exceedances of chemicals of potential concern and toxicity. This is reinforced by a lack of consistency between the observed concentrations of cadmium and other metals in the sediment samples and toxicity among the three sediment samples. Confirming the cause of toxicity is an important step to determining appropriate subsequent actions for the wetland site, for completing the Feasibility Study, developing the conceptual site model, and for developing the cleanup action plan (CAP). Since Ecology has indicated that the success of the cleanup action will be based on the absence of toxicity, it is critical that appropriate criteria define any cleanup action for the wetland and be used to determine when the cleanup action is complete.

1.2 Approach for 2013 Supplemental Investigation

In order to determine whether site-related metals were associated with the observed toxicity, ENVIRON conducted a targeted study to accomplish the following objectives:

- Verify toxicity in the WETSED samples from each of the three stations;
- If toxicity is confirmed, determine whether cadmium or other metals present in the wetland site are the likely cause;
- If toxicity is confirmed and related to metals, determine whether a site-specific clean-up level would be appropriate.

The approach to address these study objectives was to conduct a sampling and analysis program that included resampling the three wetland stations previously tested, conducting confirmatory toxicity tests and targeted analytical chemistry, and performing a suite of forensic toxicity tests called toxicity identification evaluations (TIEs). The TIEs are a series of sample manipulations intended to alter the availability of certain classes of compounds (such as cationic metals) which are followed by toxicity tests with the manipulated sample. If sample toxicity changes in a manner predicted by the TIE manipulation, it provides a line of evidence that that class of compounds is associated with the observed toxicity. A suite of manipulations are included in this program to provide multiple lines of evidence. It should be noted that the TIE may not necessarily identify synergistic or additive effects, however, it may identify key factors that are driving factors in any observed toxicity. The results of the toxicity tests and TIE studies will then be evaluated in combination with the analytical chemistry to better understand the availability of site-related metals and the potential sources of observed toxicity.

2 Methods

2.1 Sediment Collection and Handling

Surface sediment collection was conducted on December 3, 2013. Surface samples were collected from the three previously sampled WETSED stations at the Agri-Tech/YSF site (Site; Figure 1) as well as from one location at the Toppenish National Wildlife Refuge (TNWR) for use in dilution series testing. The WETSED stations were located within the wetland and were immediately east of, and distinctly separate from the previous backfill area associated with Bay Chemical sediment removal. Stations were located using a WAAS enabled GPS and visual landmarks. Final station coordinates were recorded in the field and are presented in Table 4.

Surface sediment to a depth of 6" was collected from each of the WETSED stations. This sampling depth targeted the depth of sediment considered to be biologically active and most relevant to evaluating risk at the site. The site was dominated by cattails (*Typha* sp.) which had a root system that extended to approximately 6". Additionally, many of the wetland invertebrates (e.g. amphipods, Chironomids) occupy the upper most sediment surface (1"-2"). The wetland at the Site was dry at the time of sampling and sediment was collected by hand to a depth of 6 inches using stainless steel scoops. Collection tools were washed with warm soapy water, rinsed with deionized water, and then rinsed with acetone. Stainless steel spoons and scoops were cleaned at the Port Gamble laboratory and wrapped in foil.

Prior to sampling, above-ground vegetation was cleared from the sampling area. Care was taken during sampling to avoid roots and other large organic debris. Sediment from the TNWR was collected using a small stainless steel van Veen sampler from Toppenish Creek. Sediment was collected from an area closed to hunting, approximately 25 to 30 ft. upstream of a small bridge. Approximately five gallons of sediment was collected from each location to provide sufficient sample volume to support the analyses and TIE manipulations. Sediment from each station was placed into clean, food-grade plastic bags, labeled with station number, and then placed into a cooler. Sediment for AVS/SEM analysis was placed directly into certified clean glass sample jars with no head space. The samples remained on ice and in the dark until they were delivered to the ENVIRON laboratory for processing.

At the laboratory, sediment from each station was homogenized and then subsampled for chemical analysis. Samples were sent to the analytical laboratory (Analytical Resources Incorporated). Target analytes for project sediments included sediment grain size, total organic carbon, AVS/SEM, and total Cd, Mn, Pb, and Zn.

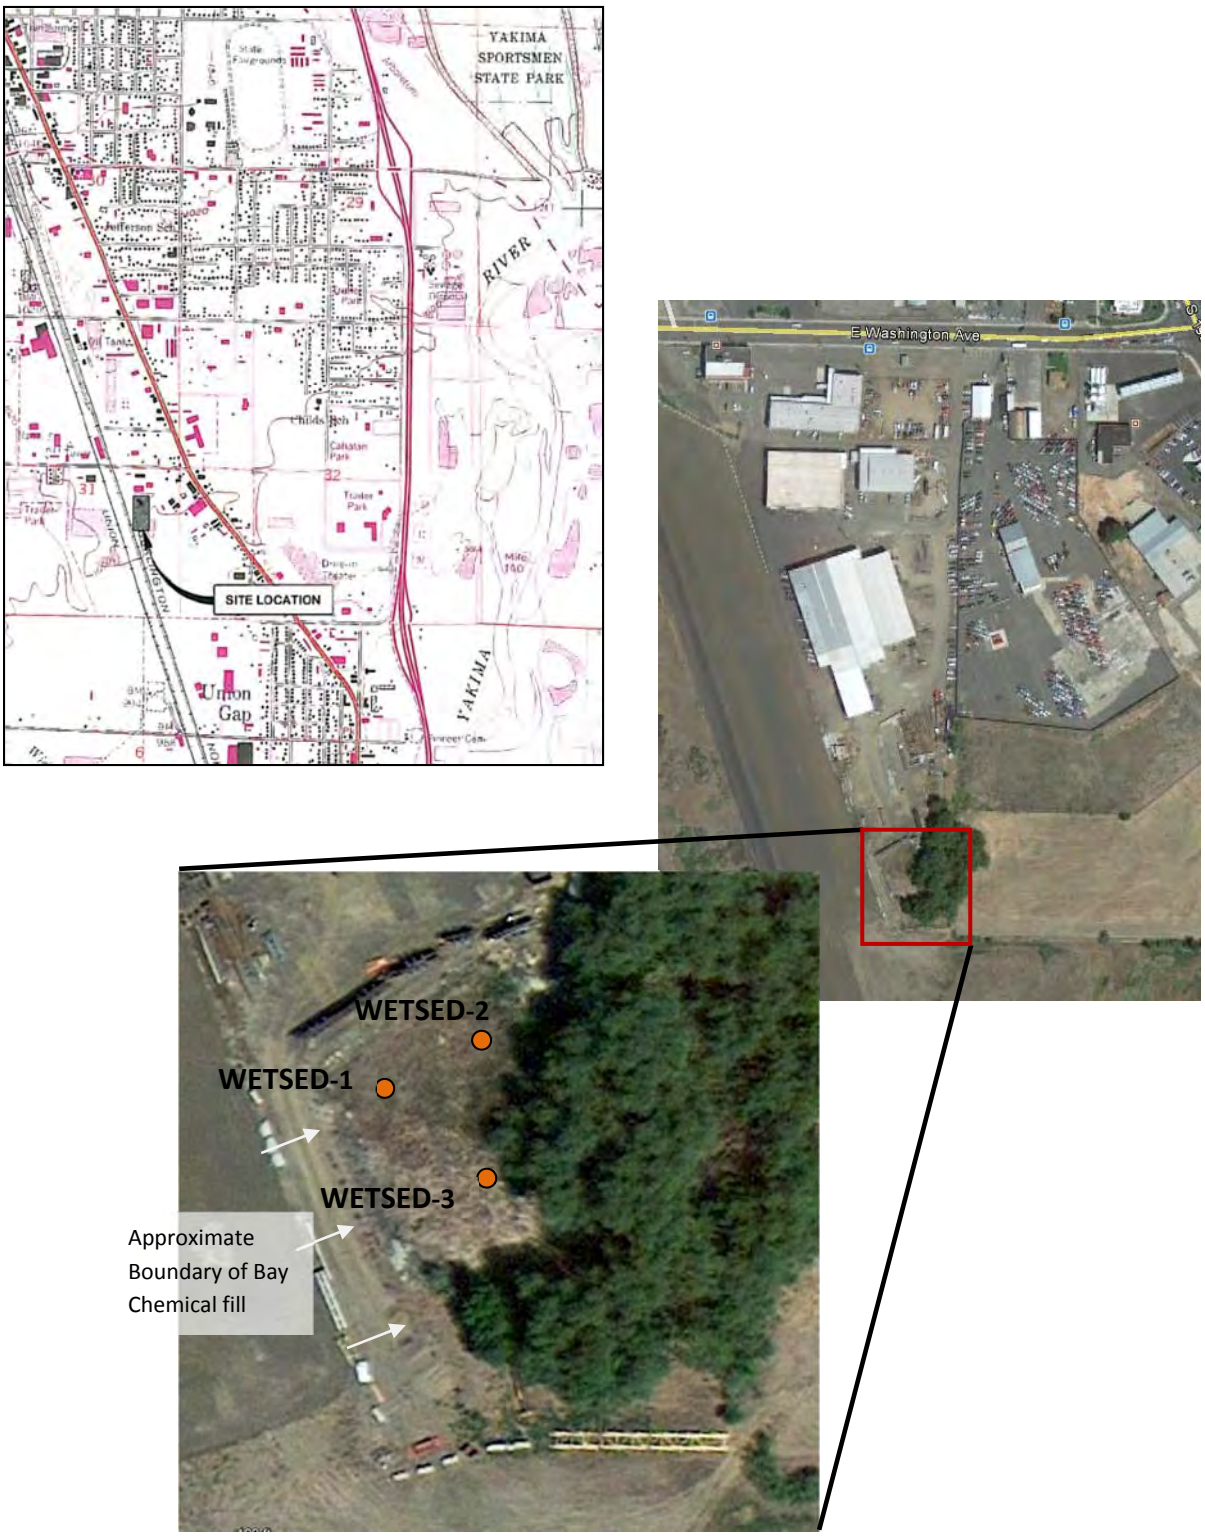

Figure 1. Agri-Tech/Yakima Steel Wetland study area.

Table 4. Station locations, Agri-Tech/YSF 2013.

Station	Latitude	Longitude	Time	Comments
WETSED-1-13	46° 34.034	120° 20.416	12:31	Dry silt/clay overlying wet cobble; heavy vegetation
WETSED-2-13	46° 34.036	120° 29.406	13:06	Dry silt/clay; heavy vegetation
WETSED-3-13	46° 34.028	120° 29.406	13:36	Dry silt/clay with sand overlying moist silt/sand; heavy vegetation
TNWR	46° 18.508	120° 20.786	10:01	Silty sand

2.2 Chemical Analysis

The three WETSED test sediments and dilution series sediments were analyzed for grain size, total organic carbon (TOC), porewater ammonia and sulfides, the metals cadmium (Cd), lead (Pb), manganese (Mn), and zinc (Zn), and AVS/SEM (Table 5). Note that the 0% dilution (TNWR only) was not submitted for chemical analysis. With the exception of ammonia and sulfides, laboratory analyses were conducted by Analytical Resources Inc. of Tukwila, Washington. Porewater ammonia and sulfides were measured at the ENVIRON laboratory.

Sediment grain size was analyzed to determine the general size classes that make up the sediment (e.g., gravel, sand, silt, and clay). Grain size was conducted using the gravimetric procedure described in PSEP (1986) and Plumb (1981). The TOC, made up of volatile and nonvolatile organic compounds, was determined following Plumb (1981). This procedure involved dissolving inorganic carbon (carbonates and bicarbonates) with hydrochloric acid or sulfuric acid prior to TOC analysis. Total solids were also measured to convert concentrations of the chemical parameters from a wet-weight to a dry-weight basis. Percent solids were determined by Standard Method SM2540G (APHA 2002).

The analysis for the project specific metals was conducted using an inductively coupled plasma emissions spectrometer equipped with a mass detector (ICP-MS), in accordance with USEPA 6010C Rev.3 (EPA 2007). Porewater samples were collected by ENVIRON and were analyzed for ammonia and dissolved sulfides. Total ammonia as nitrogen was measured using an Orion meter fitted with an ammonia ion-specific probe. Total sulfides as S^{-2} were measured using a HACH DR/2800V Spectrophotometer.

The methods for acid volatile sulfides followed EPA (1991). In this colorimetric method, sulfide in the sample was converted to hydrogen sulfide by the addition of hydrochloric acid at room temperature. The hydrogen sulfide (H_2S) was purged from the sample by an inert gas and trapped in a sodium hydroxide (NaOH) solution. With the addition of a mixed-diamine reagent (MDR), the sulfide was

Table 5. Chemical and Physical Parameters, Analytical Methods, and Target Detection Limits, Agri-Tech/ YSF 2013.

Parameter	Method	Procedure	Sediment Target Reporting Limit (dry weight)
Conventionals			
Grain Size	PSEP; Plumb (1981)	Sieve/Pipette	1.0%
TOC	Plumb (1981)	Combustion IR	0.1%
Percent Solids	SM2540G	Gravimetric	0.1%
Dissolved Sulfides	SM4500	Colorimetric	0.001 mg/L
Ammonia	SM 4500N H3F	Probe	0.001 mg/L
Metals			
Cadmium (Cd)	USEPA 6010c	ICP-MS	0.2 mg/kg
Lead (Pb)	USEPA 6010c	ICP-MS	2 mg/kg
Manganese (Mn)	USEPA 6010c	ICP-MS	0.1 mg/kg
Zinc (Zn)	USEPA 6010c	ICP-MS	1 mg/kg
AVS	EPA 1991	Colorimetric	0.05
SEM	EPA 1991	ICP-MS	As above
Bioassays			
Acute Toxicity	USEPA 100.1	Amphipod	NA
Acute Toxicity	SAPA 2008	Microtox®	NA
Chronic Toxicity	USEPA 100.5	Larval Midge	NA

converted to methylene blue and measured on a UV-VIS spectrometer. The acid-sediment slurry was centrifuged to settle the sediment. The supernatant was poured into an acid cleaned Teflon bottle and then analyzed by Inductively Coupled Plasma Mass Spectrometry (ICP-MS) for cadmium, lead, manganese, and zinc following a modification of EPA Method 1638. The amount of each metal that is soluble in the porewater is dependent upon the amount of sulfides to bind with and the relative affinity of the metal to bind with sulfides. For these four metals, lead can replace the other three metals bound to sulfides, followed by cadmium replacing zinc and manganese (EPA 2005). Zinc and manganese will then bind to what sulfides are available.

2.3 Test Treatment Preparation

2.3.1 Test Sediments for Baseline and Dilution Series Toxicity Testing

The potential for benthic toxicity in sediment from the three stations was evaluated using three benthic toxicity tests: the 10-day acute toxicity test with the amphipod *Hyalella azteca*, the 20-day chronic test with the midge *Chironomus dilutus*, and the Microtox® test using bioluminescent bacteria. The purpose of the baseline toxicity tests was to establish a baseline for subsequent TIE and to confirm or refine earlier estimates of toxicity from the 2011 toxicity tests. A dilution series test was also conducted using decreasing concentrations of WETSED-3 test sediment mixed with sediment collected from TNWR. The dilution series test was included to determine whether there was a dose-response to the test sediment

to assist in determining a site-specific clean up criteria if required. As indicated in the results section, there was no response in the WETSED-3 sediment dilution test.

The baseline tests were conducted with homogenized sediment from the three on-site stations (WETSED 1, WETSED-2, and WETSED-3), a series of dilutions of WETSED-3, and a laboratory control sediment. The laboratory control sediment was tested with two benthic tests to validate test results and verify that test conditions were suitable for test organism health. The laboratory control sediment was silica sand that was thoroughly rinsed with diluted mineral water (DMW).

The dilution series test was conducted with a series of sediment dilutions prepared using sediment from WETSED-3 and gradually increasing volumes of TNWR sediment. Sediment dilutions tested were 100%, 67%, 33%, and 11% test sediment in reference sediment and targeted whole sediment cadmium concentrations of 9, 6, 3, 1 mg/kg Cd. Sediment dilutions were prepared volumetrically based on the whole sediment concentration of 9 mg/kg Cd in WETSED-3 sediment. An appropriate mass of test and dilution sediment was combined in 1-gal glass jars. The sediment was homogenized using a clean, stainless-steel spoon and then fitted with Teflon-line lids. Jars were then placed onto a roller table and mixed continuously for 24 hours to evenly distribute the test and dilution sediment. After the mixing period, the test jars were placed in the cold-room (4°C) to allow for equilibration. A subsample of each dilution was submitted to the analytical laboratory to confirm the test cadmium concentration.

2.4 TIE Manipulations

Based on the results of the baseline testing, TIE tests were conducted with both sediment and porewater from the WETSED-1 sample. TIE procedures followed methods outlined in EPA (2007) and WERF (2007). Porewater was collected by double centrifugation. After the sediment was centrifuged once, the supernatant was decanted into another clean Teflon jar and centrifuged again. The supernatant in this jar was decanted into a glass container. This was the unmanipulated WETSED-1 sample for the porewater TIE. A TIE treatment control was tested concurrent to each of the sediment and porewater TIE manipulations. For sediment tests, the TIE control was comprised of silica sand (control sediment) plus the respective treatment. For the porewater TIE manipulations, the negative controls were diluted mineral water (control water) plus the respective treatment. The TIE manipulations included in this evaluation are summarized in Table 6 and the methods are summarized in the following sections.

Table 6. Toxicity Tests and TIE Manipulations Included in Agri-Tech/YSF 2013.

Matrix	TIE Method	Target Chemical Class	Test	Control
Sediment	SIR-300	Cationic Metals	10-d Amphipod	Silica sand + SIR-300
Sediment	Powdered Coconut Charcoal	Organics	10-d Amphipod	Silica sand + PCC
Porewater	EDTA (4 and 2 mg/L)	Metals	10-d Amphipod	Control water + EDTA (4 and 2 mg/L)
Porewater	SIR-300	Cationic Metals	10-d Amphipod Microtox	Control water filtered through SIR-300
Porewater	C18 Column	Organics	10-d Amphipod	Control water filtered through C18 column
Porewater	Filtration	Particulate bound contaminants	10-d Amphipod	Filtered control water

2.4.1 Whole Sediment TIE Manipulations

Two whole sediment manipulations were included in the TIE evaluations to evaluate the role of metals and organic contaminants of potential concern. Whole sediment TIE tests were conducted with *Hyalella azteca*. The following section describes the methods for the whole sediment TIE manipulations.

2.4.1.1 Cation-exchange Resin Beads in Sediment

SIR-300 is a macroporous, weak-acid cation exchange resin which has chelating properties for heavy metal ions. SIR-300 beads can be mixed directly into sediments to reduce cationic metal bioavailability (Burgess et al. 2000).

To prepare the resin beads, approximately 50 g of beads (Resin Tech Inc. West Berlin NJ), were placed in a polycarbonate tube fitted with a nytex screen and rinsed with tapwater and then deionized (DI) water. A 10% mixture of SIR-300 resin in test sediment by wet weight was prepared by manually mixing 25 g of resin beads into 225g sediment for a total mass of 250 g. Once visually homogenous, the mixture was placed on a rolling table for 24 hours, and then placed in test chambers and tested following the standard procedure for the 10-day test.

A SIR-300 blank was also tested concurrently by creating a 10% mixture of the resin beads in control sediment following the procedure described above.

2.4.1.2 Powdered Coconut Charcoal (PCC) in Sediment

Powdered coconut charcoal is pyrolized activated coconut husk that has been ground to <45 µm. PCC can be added to whole sediment to reduce bioavailability of a broad spectrum of organic contaminants (Ho et al. 2004). This treatment was added to determine whether site-related organics were related to observed toxicity. Previous studies have shown a toxic threshold for PCC at 15% (WERF 2007), therefore a 5% mixture was used.

PCC was prepared by hydrating the charcoal with deionized water in a 2000 mL Erlenmeyer flask. Excess moisture was then removed after hydration using a vacuum filter. Once the free moisture was removed from the PCC, a 5% mixture by wet weight was prepared by homogenizing 40 g of PCC in 800 g of WETSED-1 test sediment. Once uniform in appearance, the test sediment was placed on rolling table for 24 hours, and then placed in test chambers following the standard procedure.

A PCC blank was also tested concurrently by creating a mixture of PCC in control sediment (45 g PCC in 900 g control sediment) following the procedure described above.

2.4.2 Porewater TIE Manipulations

Porewater from WETSED-1 was extracted from the whole sediment and treated with several targeted TIE manipulations. Porewater toxicity tests were conducted with amphipods and Microtox®; larval midge (*C. dilutus*) do not survive well in water-only exposures and are not typically included in porewater evaluations.

2.4.2.1 Baseline Toxicity

The baseline toxicity test was conducted on unmanipulated porewater samples. For the purposes of this study, undiluted porewater was tested without a dilution series. Porewater was collected from the whole sediment by double centrifugation as described above. The supernatant was then collected into a clean, glass jar taking care to avoid collection of the fine particulates from the sediment-water interface. Porewater was then held at 4°C until it was used in toxicity tests or treated following the TIE procedures described below.

2.4.2.2 Cation-Exchange Column

Sediment interstitial water was pumped through a cation exchange column to extract cationic metals. When combined with chemical analysis of the rinsate, a removal of toxicity in the rinsate can be used to identify the cause of toxicity (USEPA 1996; Burgess et al. 1997).

The cation exchange column was prepared by packing SIR-300 resin beads in a Supelco LC-WCX column. A peristaltic pump fitted with solastic tubing was attached to the input fitting of the extraction column and the flow adjusted to 2.5 mL per minute. In order to prepare the resin beads, 2 mL of methanol was pumped through the column followed by 6 mL of deionized water. Care was taken to keep the resin column moist between each step.

Control water was passed through the cation-exchange column at a flow rate of 2.5 mL per minute and collected in a clean glass beaker. The column was re-prepared using methanol followed by deionized water prior to filtering the WETSED-1 porewater. Sufficient porewater was passed through the resin column to allow for testing and chemical analysis. The SIR-300 control and the treated porewater were then placed in the temperature-controlled room to equilibrate to test temperature prior to testing.

2.4.2.3 C-18 Column

Sediment interstitial water was pumped through an organic compound solid-phase extraction column, or C-18 exchange column, to remove non-ionic organic toxicants from interstitial water. Reduction of toxicity in the column rinsate provides evidence to characterize toxicity caused by organic compounds (USEPA 1991).

An Oasis HLB organic solid-phase extraction column was fitted with solastic tubing. A peristaltic pump was used with the flow adjusted to 1 mL per minute. In order to prepare the column, 3 mL of methanol was pumped through the column followed by 5 mL of DI water. Care was taken to keep the column moist between each step.

Control water was passed through the C18 column at a flow rate of 2 mL per minute and collected in a clean glass beaker. The column was re-prepared using methanol followed by DI water prior to filtering the WETSED-1 porewater. Sufficient porewater was passed through the column to allow for testing and chemical analysis. The C18 control and the treated porewater were then placed in the temperature-controlled room to equilibrate to test temperature.

2.4.2.4 EDTA

Disodium ethylenediaminetetraacetic acid (EDTA) is an organic chelating molecule that preferentially binds divalent metals. When added directly to interstitial water samples, EDTA can reduce the bioavailability and toxicity of metals such as cadmium and zinc. EDTA can also exhibit toxicity to aquatic invertebrates, so care must be taken not to use concentrations that approach the effects thresholds for *Hyalella*.

An EDTA stock solution was prepared by adding 2.78 g disodium EDTA in 100-mL of DI water and mixed with a stir bar. While some guidance recommends EDTA concentrations as high as 60 mg/L, we have previously observed *Hyalella* toxicity at 8 mg/L (Weston 2007). The target EDTA concentrations for this study were 4 mg/L and 2 mg/L in order to minimize EDTA toxicity in the treated porewater preparations. WETSED-1 porewater was treated with 0.16 µL and 0.08 µL of stock solution for each mL of test water. The EDTA was mixed with the control and test porewater for 3 hours. The resulting pH of the treated porewater sample was low (pH = 2) and was adjusted to within the test range by adding NaOH. A high and low EDTA control was prepared in a similar manner with 0.16 µL and 0.08 µL of stock solution per mL dilution water.

2.4.2.5 Filtration Tests

Filtration tests were performed to determine whether the chemicals causing toxicity were bound to particulate matter in the porewater. A reduction in toxicity following filtration indicates that chemicals are particulate bound; the filtration step is also used as a control for the SIR-300 and C18 methods that filter samples during treatment. The WETSED-1 porewater was prepared by filtering the sample (50 mL) through a 1 µm glass fiber filter with a vacuum pump. A filtration-control was prepared by filtering dilution water (control water) in a similar manner.

2.5 Toxicity Test Methods

2.5.1 10-d Acute Amphipod Sediment Test with *Hyalella azteca*

Testing methods for the amphipod bioassay followed procedures outlined in the test method 100.1 of the Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates (USEPA 2000). The 10-day endpoint measured the impact of the site sediments on the survival of *H. azteca*.

Test organisms were exposed to the test sediments and the laboratory control sediment in 300-mL glass jars fitted with screened ports to allow for water renewals. Approximately 100 mL of test and control sediment (to a depth of 1 cm) was placed in each of eight replicate test chambers with 175 mL of moderately hard diluted mineral water (DMW; 80 – 100 mg/L $CaCO_3$). Two surrogate chambers were set up for each treatment to allow for pore water ammonia measurement at test initiation and termination. An additional surrogate was set up for water quality measurements on days 0 - 10 to limit the impact of disturbance to the test organisms. Test chambers were placed in predetermined random positions and allowed to equilibrate to test conditions overnight. The amphipod test was run under a 16-hour light: 8-hour dark photoperiod at a temperature of 23 $\pm$ 1°C.

Prior to test initiation, an initial set of water quality parameters was measured in the overlying water of the water quality surrogate. The water quality parameters included temperature, dissolved oxygen, pH, and conductivity. Hardness, alkalinity, and ammonia were measured in the overlying water of a composite from replicates within each treatment. In addition, one surrogate replicate from each test treatment was used to extract pore water via centrifugation for subsequent analysis of ammonia. The water quality instruments were calibrated daily or on their recommended schedule. Records of instrument calibration were retained in the laboratory logs.

Amphipods (*H. azteca*) were supplied by Aquatic Biosystems of Fort Collins, Colorado. To initiate the test, 10 amphipods were randomly selected and placed into each test chamber. Amphipods remaining in the water column and exhibiting abnormal behavior after one hour were replaced. Each test chamber was outfitted with a Zumwalt style water delivery system to facilitate twice daily water renewals. Each test chamber was fed daily with 1 mL of stock YCT/Tetrafin™ solution. The number of dead and surfaced animals was noted for each replicate daily. On Day 10, the sediments from each chambers was sieved through a 0.5-mm screen and the number of survivors was recorded. Test acceptability criterion was greater than 80 percent mean control survival.

To evaluate the relative sensitivity of the organisms, a 4-day water-only reference toxicant test was conducted using ammonium chloride with nominal concentrations of 0, 5, 10, 20, 40, and 80 mg/L total ammonia to establish the sensitivity of test organisms used in the evaluation of the project sediments. The reference-toxicant LC_{50} for the population of test organisms used in the project tests were compared to laboratory control charts to determine their sensitivity relative to populations previously tested at the ENVIRON laboratory.

2.5.2 20-d Chronic Midge Sediment Test with *Chironomus dilutus*

Testing methods for the midge larvae bioassay followed procedures outlined in the test method 100.5 of the Methods for Measuring the Toxicity and Bioaccumulation of Sediment-associated Contaminants with Freshwater Invertebrates (EPA 2000). The 20-day endpoint measured the impact of the site sediments on the survival and growth of *C. dilutus*.

Test organisms were exposed to the test sediments and the laboratory control sediment in 300-mL glass jars fitted with screened ports to allow for water renewals. Approximately 100 mL of test and control sediment (to a depth of 1 cm) was placed in each of eight replicate test chambers with 175 mL of moderately hard diluted mineral water (DMW; 80 – 100 mg/L $CaCO_3$). Two surrogate chambers were set up for each treatment to allow for pore water ammonia measurement at test initiation and termination. An additional surrogate was set up for water quality measurements on days 0 - 10 to limit the impact of disturbance to the test organisms. Test chambers were placed in predetermined random positions and allowed to equilibrate to test conditions overnight. The larval midge test was run under a 16-hour light: 8-hour dark photoperiod at a temperature of 22 $\pm$ 1°C.

Prior to test initiation, an initial set of water quality parameters was measured in the overlying water of the water quality surrogate. The water quality parameters included temperature, dissolved oxygen, pH, and conductivity. Hardness, alkalinity, and ammonia were measured in the overlying water of a composite from replicates within each treatment. In addition, one surrogate replicate from each test treatment was used to extract pore water via centrifugation for subsequent analysis of ammonia. Water quality instruments were calibrated daily or on their recommended schedule. Records of instrument calibration were retained in the laboratory logs.

Chironomus dilutus egg cases were obtained from Aquatic BioSystems of Fort Collins, Colorado and cultured to obtain larvae <2-hours in age for the test. Egg cases were held in diluted mineral water at 23°C until test initiation. Larvae began hatching after approximately 2 – 4 days. To select organisms for the test, egg cases were transferred to petri dishes with culture water and observed under a dissecting microscope. Healthy organisms were considered those actively moving and less than two hours separated from their egg cases. Twelve (12) larvae were transferred directly to each test chamber using a fine-tip Pasteur pipette. A squirt bottle with diluted mineral water was used to spray the surface to ensure no animals were caught in the surface tension and to allow animals to successfully bury into the sediment. The chambers were outfitted with a Zumwalt style water delivery system to facilitate twice daily water renewals. Water quality parameters were measured in the water quality surrogate. The number of dead and surfaced animals was noted for each replicate daily. Organisms were fed 6 mg of ground Tetramin™ per test chamber daily.

On Day 20, the sediments from the chambers were sieved through a 0.5-mm screen and the number of survivors was recorded. Survivorship was measured as the number of *C. dilutus* larvae, pupae, and flies remaining at test termination; however, only the larvae were utilized for determining the growth endpoint. Surviving larvae from each replicate were placed in pre-ashed and pre-weighed aluminum

boats and dried at 60°C for 24 hours to determine dry weights. The weigh boats were subsequently ashed at 550°C for 2 hours and reweighed in order to calculate the ash-free dry weight (AFDW) of the surviving larvae. Mean AFDW per surviving individual (growth) and per original number (biomass) was calculated. Test acceptability criteria were >68% mean control survival (≤32% mean mortality) and a mean growth per survivor (MIG) of greater than 0.60 mg AFDW. The formula for growth was as follows:

$$\text{Growth} = (\text{Dry Weight} - \text{Ashed Weight})/N_t$$

$$\text{Biomass} = (\text{Dry Weight} - \text{Ashed Weight})/N_i$$

$$\text{MIG} = [(\text{Dry Weight} - \text{Ashed Weight})/N_t]/20$$

where:

N_t = total number of animals recovered at test termination
N_i = number of animals added at test initiation.

A reference toxicant test was conducted using copper sulfate with concentrations of 0, 250, 500, 1000, 2000, and 4000 µg/L Cu^{2+} to establish the sensitivity of test organisms used in the evaluation of the project sediments. The reference-toxicant LC_{50} for the population of test organisms used in the project tests were compared to laboratory control charts to determine their sensitivity relative to populations previously tested at the ENVIRON laboratory.

2.5.3 Microtox® Test

The Microtox® test was performed by Rainier Environmental LLC. The Microtox test exposed the luminescent marine bacterium *Vibrio fischeri* to porewater extracted from test sediments, as well as for the SIR-300 treated porewater and SIR-300 control. Bacterial light output was measured using the Microtox® Model 500 Analyzer at 5 and 15 minutes of exposure. Light output from the test porewater was compared to that of the reference treatments at both time intervals. A complete description of the Microtox® test methods is presented in Appendix B.

2.5.4 Porewater Toxicity Tests

Porewater toxicity tests were conducted during the toxicity identification evaluations with the amphipod *Hyalella azteca*. Tests were conducted as static, acute exposures with 15 mL of whole and treated porewater, treatment controls, and a laboratory control in 20 mL glass vials. Porewater was collected from the whole sediment by double centrifugation. Test sediment was placed in 1-L Teflon jars and centrifuged for 30 minutes at 3200 g. After the sediment was centrifuged once, the supernatant was decanted into another clean Teflon jar and centrifuged again. The supernatant was then collected into a clean, glass jar taking care to avoid collection of the fine particulates from the sediment-water interface. Prior to testing, porewater and control samples were placed in a temperature-controlled room and allowed to equilibrate. Porewater samples were provided trickle flow aeration prior to testing to ensure that dissolved oxygen would remain within acceptable ranges throughout the test.

The porewater tests were conducted with four amphipods in each of five test chambers for a total test population of 20 organisms. Test chambers were placed in predetermined random positions and allowed to equilibrate to test conditions. The amphipod test was run under a 16-hour light: 8-hour dark photoperiod at a temperature of 23 $\pm$ 1°C.

Prior to test initiation, an initial set of water quality parameters was measured. Amphipods (*H. azteca*) were supplied by Aquatic Biosystems and were 6 to 8 days old at test initiation. To initiate the test, four amphipods were randomly selected and placed into each test chamber. Each test chamber was fed with 1 mL of stock YCT/Tetrafin™ solution on test day 5. The number of dead animals was noted for each replicate on test days 4 and 10. Test acceptability criterion was greater than 80 percent mean control survival.

2.5.5 Water for Bioassay Testing

The laboratory water used in this study was diluted mineral water (DMW). This water was prepared by diluting Perrier® mineral water with laboratory de-ionized water to the appropriate hardness. This water source has been used successfully on numerous similar bioassay testing programs conducted at the Port Gamble Laboratory. Extensive testing with a variety of species has shown that this water source provide good survival in laboratory controls.

2.5.6 Water Quality

Water quality was monitored daily and readings were recorded on data sheets. Dissolved oxygen and temperature were measured using a Hach™ HQ40d multimeter with a Luminescent Dissolved Oxygen (LDO) probe. Conductivity was measured using an Orion™ 5-Star multimeter with a conductivity probe; pH was measured using a YSI™ pH100 meter with a pH probe. Ammonia was analyzed using an Orion™ 5-Star multimeter with an ammonia ion-selective electrode calibrated with a three-point calibration curve (1, 10, and 100 mg/L). Hardness and alkalinity were measured utilizing Hach™ titration kits.

2.6 Data Analysis and QA/QC

Water quality and endpoint data were entered into Excel spreadsheets. Water quality parameters were summarized by calculating the mean, minimum, and maximum values for each test treatment. Endpoint data were calculated for each replicate and the mean values and standard deviations were determined for each test treatment.

Hand-entered data was reviewed for data entry errors, which were corrected prior to summary calculations. A minimum of 10% of the calculations and data sorting were reviewed for errors. Review counts were conducted on apparent outliers.

Statistical comparisons were made using a t-test following guidance in USEPA (2000). Data reported as percent survival were transformed using an arcsine square root transformation prior to statistical analysis. Data were tested for normality using the Wilk-Shapiro test and equality of variance using Levene's test. Determinations of statistical significance were based on one-tailed Student's t-tests with an alpha of 0.05. For samples failing to meet assumptions of normality, a Mann-Whitney test was

conducted to determine significance. For those samples failing to meet the assumptions of normality and equality of variance, a t-test on rankits was used.

For AVS/SEM evaluations, total SEM was calculated as the sum of the four metals analyzed during SEM and AVS measurements. Total excess SEM (free metal ions) was calculated as the molar AVS concentration subtracted from the molar total SEM concentration. This value was divided by the fraction of TOC in the sediment sample for comparison to the equilibrium sediment benchmarks as described by the EPA (EPA 2005). The result is the TOC normalized-total SEM in excess of the sediment binding capacity (µmol SEM/g_{TOC}).

3. Results

Each of the three WETSED stations was reoccupied and sediment was collected to a depth of 6". There was no standing water at the time of sampling, with the water-level at approximately 6" below ground surface (Figures 2 and 3). Sediment was moist at the surface to wet at the bottom of the 6" sampling horizon. At each of the stations, the sediment surface was covered with a heavy layer of large organic debris, primarily dead and decaying cattails. Care was taken to remove heavy organic debris and large root matter.

Sediment from WETSED-1 was dominated by sand (68%), with moderate amounts of silt (28.3%) and clay (13.4%; Table 7). Total organic carbon was 5.15%. Sediment from Stations WETSED-2 and WETSED-3 were dominated by clayey silt, with 76.7% and 88.3% silt and clay, respectively. TOC for sediment from WETSED-2 and WETSED-3 was 3.79% and 4.37%, respectively. While large plant material was removed from samples prior to chemical analysis, it is likely that this material contributed to the organic carbon. Porewater ammonia concentrations were generally low, below 1 mg/kg in each of the sediment treatments. Similarly, porewater sulfide concentrations were generally low, ranging from 0.036 to 0.055 mg/L. Porewater pH ranged from 7.14 to 7.28.

Underline: Fails SCO and CSL

Concentrations of metals were generally similar to those observed during the initial site investigation (Farallon 2011). Cadmium concentrations in the 2013 sediment samples ranged from 6.5 to 9.4 mg/kg; cadmium concentrations in 2011 ranged from 6.8 to 9.2 mg/kg. Concentrations of lead, manganese, and zinc in 2013 were generally similar across the site and were also similar to values observed in 2011. Zinc concentrations were 2240 to 3810 mg/kg in the 2013 samples.

3.1 Baseline and Dilution Series Whole-Sediment Tests

3.1.1 10-Day Benthic Amphipod Test

The 10-d amphipod test with *Hyalella azteca* was initiated on December 13, 2013. A summary of test conditions, test results and water quality observations for the test are presented in Tables 8 to 10. All data sheets are presented in Appendix C. With the exception of temperature and pH, water quality parameters remained within the recommended ranges throughout the duration of the test. Temperature was within range from Day 0 to 9; test temperature on Day 10 was 20.0° to 20.5°C. This temperature is within the tolerance range for *Hyalella azteca* and was observed only at test termination, and therefore was unlikely to have affected test performance. Porewater ammonia in the three test treatments was 0.3 to 1.1 mg/L total ammonia in the treatments. This was below the project-specific LC_{50} of for ammonia of 1.46 mg/L total ammonia. The test was validated by 91% survival in the controls. The LC_{50} for the ammonia reference-toxicant test was 1.46 mg/L total ammonia, within the control chart limits (1.2 – 26 mg/L), indicating that the test animals were similar in sensitivity to previous populations used at the Port Gamble laboratory.

Mean percentage mortality in the test treatments WETSED-2 and WETSED-3 was 5% and was not significantly different than that of the control. Mean mortality in the two treatments was lower than that of the control, passing the SMS criteria. Mean mortality in the WETSED-1 sediment was 100% and was significantly different from the control. Mean mortality in the WETSED-1 treatment was 91.8% greater than that of the control and failing the CSL for the amphipod test (M_T-M_C>25%).The dilution series test was conducted concurrent with the baseline tests to evaluate the relationship between the cadmium concentration and toxicity. Based on an initial screen of metals concentrations, WETSED-3 was selected for use in the dilution series test,with test concentrations targeting cadmium concentrations of 9, 6, 3, and 1 mg/kg. Concentrations observed in the 100%, 67%, 33%, and 11% treatments were 7.1, 5.1, 2.9, 1.1 mg/kg Cd, respectively (Table 7). The dilution series showed no relationship between the total cadmium concentration and survival, with no significant changes in mean percentage survival, relative to the control, across the dilution series. This was true for total lead, manganese, and zinc as well. Survival ranged from 88.8% to 97.5% for the different test treatments.

Test Protocol Deviations	Temperature	

3.1.2 Benthic toxicity tests with *Chironomus dilutus*

The 20-d chronic test with larval midge (*C. dilutus*) was initiated on December 13, 2013. A summary of test conditions, test results and water quality observations for the test are presented in Tables 11 through 13. Test results and water quality observations for each of the test replicates and supporting information of the *Chironomus* test is presented in Appendix C. Mean percentage survival in the control sediment was 90.6%, meeting the performance criteria of >68% survival for the controls. Mean growth in the controls was 1.82 mg AFDW/ind, meeting the performance criteria of ≥0.60 mg/ind.

Water quality measurements were within target limits with the exception of dissolved oxygen and temperature. Dissolved oxygen dropped to below target parameters on Day 19 and trickle-flow aeration was added to all chambers for the duration of the test period. Because the decrease in DO was observed at the end of the test period and renewals were performed twice daily limiting the duration of the deviation, it is unlikely that survival or growth endpoints were affected. While the published range for temperature is 23° ±1°C, the test conducted for this study targeted a range of 21° to 23°C to prevent larvae from prematurely pupating. Temperatures were slightly above this range at test initiation; however, at the time animals were placed in the test chambers, test temperatures were within range. On test day 10, test temperature was below 21°C, but was within 1°C in all chambers. Ammonia values

were below NOEC values for *C. dilutus*. The LC_{50} values for the copper sulfate reference-toxicant tests were 1.18 mg/L, within the control chart limits of 0.30 – 2.12 mg/L. This indicates that the test organisms were of similar sensitivity to those previously tested at the Port Gamble Laboratory.

Mean mortality in the test treatments ranged from 22.9% to 29.2%. There was no statistically significant increase in mortality in WETSED-1, relative to the control. Mean percent mortality in WETSED-2 and WETSED-3 were statistically different from the control; however, the difference between mean mortality observed in each of the WETSED test treatments and the control was 13.5% to 19.8%, which was within the CSL criterion for *Chironomus* survival (M_T-M_C >25%). Mean mortality in WETSED-2 and WETSED-3 was slightly above the SCO for mortality (M_T-M_C >15%). *Chironomus* survival in both the WETSED-2 and WETSED-3 test treatments exceeded the control performance criteria.

No statistical decreases in growth were observed in the test treatments, relative to the control. With the exception of WETSED-1, growth in the test treatments exceeded that of the control. Mean individual growth in WETSED-1 was 1.61 mg/ind AFDW, which was 11.5% of the control treatment. This difference was within both the SCO and CSL for freshwater sediments.

The dilution series showed no relationship between the total metals concentrations and survival, with no significant changes in mean percentage survival, relative to the control, across the dilution series. Mean mortality for the different test treatments ranged from 22.3% to 37.5%, with the TNWR (0% WETSED-3) showing the highest mortality for each of the dilution series treatments. *Chironomus* growth in each of the dilution series treatments was greater than that of the control. The highest growth was observed in the 10% and 0% treatments, however, there were no significant differences across the treatments.

Table 11. Survival Summary for the 20-day Benthic Test with *Chironomus dilutus*, Agri-Tech/YSF 2013.

3.1.3 Benthic toxicity tests with Microtox®

The Microtox® tests were performed by Rainier Environmental using the luminescent marine bacterium *Vibrio fischeri* in combination with the Microtox® Model 500 Analyzer. Light output of the bacterium reacting with the test sample was measured at 5 and 15 minutes of exposure. The test compared sample porewater extracts to the controls and the data was evaluated statistically on the change in output over time. Full test results with benchsheets are presented in Appendix B.

Water quality parameters were within target ranges with dissolved oxygen ranging from 6.2 to 7.5 mg/L and pH ranging from 7.14 to 8.15. The final mean light output in the control treatment was 80% of initial output, exceeding the control performance criteria of 72% (Table 14). The estimated LC_{50} for the reference toxicant test was 1209 µg/L and 438 µg/L Cu for the 5 and 15 minute exposures, respectively. These values were within the laboratory historical limits (5 min: 929 – 1666 µg/L; 15 min: 425-613 µg/L Cu), indicating that the test organisms were similar to those tested previously at the Rainier Environmental laboratory.

Table 14. Summary of Test Results for the Microtox® Test, Agri-Tech/YSF 2013.

Treatment[2]	5-Minute Reading		15-Minute Reading	
	Mean Percentage Change in Light Output	T/C[3,4]	Mean Percentage Change in Light Output	T/C[3,4]
Control	91 ±4	--	80 ±4	--
WETSED-1	59 ±3	**0.65 S[1]**	11 ±1	**0.14 S**
WETSED-2	94 ±3	1.03	78 ±4	0.98
WETSED-3	97 ±2	1.07	80 ±2	1.00
Control	91 ±3	--	79 ±4	--
100% WETSED-3	95 ±5	1.04	77 ±4	0.97
67% WETSED-3	94 ±3	1.03	80 ±7	1.01
33% WETSED-3	98 ±3	1.08	84 ±5	1.06
11% WETSED-3	98 ±2	1.08	85 ±2	1.08
TNWR	97 ±1	1.07	86 ±2	1.09

[1] **S**: Mean value is statistically different than the mean value in the control treatment
[2]Dilution series treatments listed as nominal concentrations
[3]RSET low (two hit): T/C <0.85
[4]RSET high (one-hit): T/C <0.75
Bold: Fails SCO; Underline: Fails SCO and CSL

With the exception of WETSED-1, no significant differences in mean percentage light output were observed in the WETSED or dilution test samples. Light output was >90% of the initial reading at 5 minutes, and >77% at 15 minutes; ≥97% of the control. Light output in the WETSED-1 treatment was 35% that of the control at 5 minutes and was 14% of the control at 15 minutes (a reduction in light output of 86%). The WETSED-1 light output failed the RSET Microtox® criteria for both time intervals.

3.2 Toxicity Identification Tests

Porewater was extracted from the whole sediment collected from Station WETSED-1 using centrifugation. Porewater samples and whole sediment were then treated following the methods outlined in Section 2.4. The toxicity identification evaluation of the WETSED-1 sediment included the following targeted chemical classes and associated methods:

- Cationic metals – cation exchange resin beads in sediment and in porewater filtered through SIR-300 to address the role of cationic metals;
- Metals – EDTA in porewater to address the role of metals in general;
- Organics – Powdered coconut charcoal (PCC) in sediment and sediment filtered through a solid-phase extraction column (C-18 cartridge) to address the potential role of non-ionic organics;
- Ammonia/sulfides – compare porewater concentration with species sensitivity data; and,
- Particulates – filtered sample to address the potential role of particulates.

3.2.1 Porewater Chemistry

Treated and untreated porewater samples were analyzed for metals (Table 15). Cadmium and lead were undetected in the WETSED-1 porewater, with detection limits of 0.002 mg/L and 0.02 mg/L, respectively. Zinc was observed at a concentration of 28.3 mg/kg in the WETSED-1 porewater, with a manganese concentration of 4.49 mg/kg. Ammonia in the WETSED-1 porewater was 0.46 mg/L.

With the exception of the SIR-300 treatment, porewater concentrations of metals were unchanged by the TIE manipulations. Two concentrations of EDTA were added to the porewater; however, neither treatment decreased the concentration of manganese or zinc in the porewater. The target concentrations of EDTA were 0.25 and 0.5 times the EDTA LC_{50} and were considered an upper concentration for testing with *Hyalella azteca*. Filtration of the porewater also did not decrease the concentration of manganese or zinc, indicating that these metals were not associated with particulates but were present in a dissolved phase. As expected, treatment of the WETSED-1 porewater with the C18 column did not alter the concentrations of metals in the porewater.

Treatment of the WETSED-1 porewater with the SIR-300 cation-exchange resin effectively decreased the concentrations of both manganese and zinc. The concentration of manganese was decreased from 4.49 mg/L to 0.053 mg/L Mn; zinc was decreased from 28.3 to 0.13 mg/L Zn.

Table 15. Metals in Untreated and Treated WETSED-1 Porewater, Agri-Tech/YSF 2013.

Treatment	Metal (mg/L)				Ammonia (mg/L Total)
	Cadmium	Lead	Manganese	Zinc	
WETSED-1	0.002 U	0.02 U	4.49	28.3	0.46

WS-1 Filtered	0.002 U	0.02 U	4.37	25.8	--

U: Undetected. Actual concentration below reported concentration

3.2.2 Porewater Toxicity Tests with *Hyalella azteca*

Water-only toxicity tests were conducted with the amphipod *Hyalella azteca*. The porewater test was conducted as a 10-day test, with both a 96-h and 10-d endpoint. The porewater test was initiated on January December 13, 2013. A summary of test conditions, test results, and water quality observations for the test are presented in Tables 16 to 18. Data for all replicates, as well as testing bench sheets are presented in Appendix D. Water quality parameters remained within the recommended ranges throughout the duration of the test. The test was validated by 90% survival in the controls. The LC_{50} for the ammonia reference-toxicant test was 6.79 mg/L total ammonia, within the control chart limits (0.0 – 26.5 mg/L), indicating that the test animals were similar in sensitivity to previous populations used at the Port Gamble laboratory.

Mean percentage survival in the unfiltered WETSED-1 porewater was 0.0%, with complete effects observed at the 96-h endpoint. Mean percentage survival in the two EDTA treatments, the C18 treated and filtered porewater was also 0%, indicating that these treatments did not decrease toxicity. Survival in the EDTA and C18 controls (clean DI treated in a similar manner) ranged from 75% to 95%, indicating that the observed toxicity was not associated with the EDTA or C18 treatments.

Mean percentage survival in the SIR-300 treated porewater was 50% at 96-hours, showing a significant increase in survival relative to the WETSED-1 porewater. This provided a strong indication cationic metals were likely to have had a role in the toxicity observed in the WETSED-1 porewater. This observation was further strengthened by the low ammonia concentrations observed in the porewater samples (<1 mg/L total ammonia). Ammonia concentrations can sometimes be increased by SIR-300 treatment, potentially contributing to toxicity. No significant toxicity was observed in the SIR-300 control, indicating that the cation exchange resin did not affect amphipod survival.

While there was some additional mortality at 10-days of exposure, this was due to one to two additional mortalities in both the SIR-300 treatment and control. Because the effects in the WETSED-1 treatment were observed at 96-hours and little change was observed across the test between 96-hour and 10-day, the 96-hour endpoint was used for evaluating toxicity.

Table 16. Summary of Results for the 4-day and 10-day Porewater TIE Test with *Hyalella azteca*, Agri-Tech/YSF 2013.

3.2.3 Porewater Toxicity Tests with *Microtox*®

Based on the results of the amphipod TIE tests, the Microtox® TIE included the WETSED-1 porewater and SIR-300 treated porewater. A summary of the test results are presented in Table 19. Data for all replicates, as well as testing bench sheets are presented in Appendix D. The final mean light output in the control treatment was 77% of initial output, meeting the control performance criteria of >72%.

The WETSED-1 porewater sample showed significantly decreased light output, relative to the control, at both the 5 minute and 15 minute time interval. Light output in the untreated WETSED-1 porewater was 88% and 67% that of the control for the 5 and 15 minute interval, respectively. While this is decreased relative to the control, the effects were less than those observed from the whole sediment samples. This may have been due to the loss of fines during the centrifugation process.

Treatment with SIR-300 completely removed toxicity, with no significant effects observed in the SIR-300 treated porewater. Light output in this treatment exceeded the control water both at the 5 and 15 minute interval (104% of the control). No effects were observed in the SIR-300 control.

Table 19. Summary of Test Results for the Porewater Microtox® Test, Agri-Tech/YSF 2013.

3.2.4 10-Day Benthic (Whole Sediment) Amphipod TIE Test

The 10-d benthic TIE test with *Hyalella azteca* was initiated on January 31, 2014. A summary of test conditions, test results and water quality observations for the test are presented in Tables 20 to 22 and Appendix E. With the exception of temperature, water quality parameters remained within the recommended ranges throughout the duration of the test. Temperature generally ranged between 21.0 to 23.0°C, which is within the tolerance range for this species and was unlikely to have affected test performance. The test was validated by 87.5% survival in the controls, which met the control performance standard of ≥80% survival. The LC_{50} for the ammonia reference-toxicant test was 6.79 mg/L total ammonia, within the control chart limits (0.0 – 26.5 mg/L), indicating that the test animals were similar in sensitivity to previous populations used at the Port Gamble laboratory.

Mean percentage mortality in the WETSED-1 sediment was similar to that of the first round of tests, with 100% mortality. Treatment with SIR-300 decreased toxicity, with mean percentage mortality of 32.5%. Survival in the SIR-300 treated sediment was not statistically different from the control and the difference between the SIR-300 treated sediment and the control was 20%, within the CSL criteria of ≤25%.

Treatment with powdered coconut charcoal did not alter toxicity, with 0% survival in the PCC amended WETSED-1 sediment. However, survival in the PCC control was 5%, indicating that the PCC amendment likely contributed to toxicity in the PCC treatments.

4. Discussion

As part of the remedial investigation of the Agri-Tech/YSF property, sediment evaluations were conducted to refine estimates of toxicity in wetland sediments and to better understand the potential relationship between site-related chemicals and observed affects. The results of this investigation are intended to inform the cleanup action plan as it pertains to the wetland.

4.1 Summary of Whole-Sediment Baseline Tests

Concentrations of cadmium exceeded the CSL of 5.4 mg/kg in each of the sediment treatments. With the exception of zinc in sediment from WETSED-3, concentrations of lead, manganese, and zinc were below screening levels. Zinc in sediment from WETSED-3 was 3810 mg/kg, slightly above the SCO of 3200 mg/kg.

In the baseline toxicity tests, WETSED-1 failed the CSL criteria for both the 10-day acute amphipod test and the Microtox® test (Table 23). No significant toxicity was observed in WETSED-1 sediment for either mortality or growth in the 20-day chronic test with *Chironomus dilutus*. Sediment from WETSED-2 and WETSED-3 met the CSL criteria for all three sediment tests. Mortality in the chronic toxicity test with *Chironomus dilutus* exceeded the SCO for both of these treatments, however, control-normalized mortality was within 2% and 5% of the criterion for WETSED-2 and 3, respectively.

Table 23. Summary of Wetland Soil and Sediment Chemistry, Agri-Tech/YSF 2013.

Toxicity Endpoint	SCO	CSL	WETSED-1	WETSED-2	WETSED-3

4.2 Comparison to the Previous Investigation

In general, the conventional sediment characteristics and metals concentrations were similar between the current samples (2013) and those samples during the previous wetland investigation (2011). Sediment from Station WETSED-1 was characterized as a mixture of sand and silt/clay, with 5% TOC (Table 24). Both WETSED-2 and WETSED-3 were dominated by fine-grained sediment, with slightly lower TOC (3.6% to 4.7% TOC).

Concentrations of cadmium were similar across the two studies, with concentrations ranging from 6.6 to 9.9 mg/kg, with all measured concentrations exceeding the CSL for cadmium. As in the initial investigation, concentrations of lead and zinc were below CSL levels.

The results of the 2013 amphipod tests confirmed the findings of the 2011 study. Acute toxicity was observed for sediment from WETSED-1, with 100% mortality. While mortality was higher in 2011 for WETSED-2 (14%), this treatment met SMS criteria in both studies. No significant mortality was observed in sediment from WETSED-3 in either 2011 or 2013.

For the chronic sediment test with *Chironomus dilutus*, earlier results for WETSED-1 and WETSED-2 sediments were confirmed with no significant mortality or decreased growth observed in sediment from WETSED-1; marginal mortality was observed in WETSED-2, passing CSL criteria. Mortality and growth in WETSED-3 passed CSL criteria, which failed CSL criteria during the 2011 tests.

Microtox® tests showed marked improvement during the current study. Tests were conducted within two days of collection to minimize effects associated with holding times. No toxicity was observed for either the WETSED-2 or WETSED-3 treatments for either the 5 minute or 15 minute endpoint. Both sediment treatments failed CSL criteria in 2011. The CSL failures observed in the WETSED-1 treatment in 2011 was confirmed, with similar responses to those of 2011.

4.3 Dilution Series Test

Each of the toxicity tests (*Hyalella*, *Chironomus*, and Microtox) were conducted with a series of sediment dilutions prepared with test sediment WETSED-3 diluted with reference sediment from the Toppenish National Wildlife Refuge. The dilution series test was conducted concurrent to the baseline tests. WETSED-3 was selected based on the concentration of cadmium, which was highest among the three test treatments. Measured concentrations of cadmium, lead, and zinc showed a decrease with test sediment dilutions, with cadmium concentrations generally achieving the target concentration (Table 7). Manganese concentrations in the test sediments increased with dilution, with the highest concentration of manganese found in the 1% WETSED-3 treatment.

In general, there was little difference in response across the dilution series for each of the tests. *Chironomus* growth was higher in the 0% and 11% WETSED-3 treatments (Table 25); however, the variability for this endpoint was quite high and differences were not significant. In all treatments, *Chironomus* growth was greater than in the control sediment. Based on the dilution series test, the total metals concentrations in the WETSED-3 treatment did not appear to be predictive of effects.

Table 25. Summary of Dilution Series Test Results, Agri-Tech/YSF, 2013.

Underline: Fails SCO and CSL

4.4 Toxicity Identification Evaluation

Based on the results of the baseline toxicity tests, WETSED-1 was selected for further evaluations of the source of toxicity. Toxicity identification evaluations with both sediment and porewater samples provided multiple lines of evidence to relate the observed toxicity in WETSED-1 with contaminants of potential concern. The following section provides a summary of the TIE findings which are then used in a weight of evidence approach to draw conclusions regarding the source(s) of toxicity with the sediments represented by WETSED-1.

4.4.1 AVS/SEM

Total metals concentrations in sediment can be unreliable predictors of toxicity because the availability of metals to aquatic organisms depends upon a number of site-specific factors. .. The primary route of exposure for benthic organisms is uptake via the interstitial pore water that occurs between the grains of sediment. Metals in this aqueous phase tend to be more bioavailable than those bound to sediment (DiToro et al. 1991). Metals bound to sediment solids in various forms are largely unavailable to aquatic organisms and are considered to be far less toxic than dissolved metals in the pore water. The precipitation of metal sulfides (AVS) and the adsorption of metals to organic carbon in sediment are two processes that serve to control the equilibrium between metals on the sediment and dissolved metals in the pore water. The AVS:SEM ratio based on measured acid volatile sulfides (AVS) and simultaneously extracted metals (SEM) allow for a site-specific prediction of the bioavailability of certain metals. The AVS:SEM analysis addresses the question of whether certain metals are present at concentrations that exceed the binding capacity of the sediment matrix. If those metals are not bound, they may be more readily available and more biologically active.

AVS is an operationally defined measurement of metal sulfides that naturally occur in sediments. AVS represents the iron and manganese sulfide minerals in the sediments that react with certain metals. Cationic metals, such as cadmium, form sulfide minerals less soluble than natural AVS. As a result, these toxic metals displace iron or manganese from AVS and are themselves sequestered in a very insoluble and biologically unavailable form. (U.S. EPA 1994; DiToro et al. 1996). The precipitation of metals by AVS is assumed to eliminate the mobility and toxicity of that metal, so it is important to account for this removal when computing the porewater concentration of metal from the concentration on the solids. The amount of AVS can vary in different sediments, resulting in differing binding capacities. Once the binding capacity of the AVS is met, the metals are available for uptake or for other binding mechanisms. Thus, the ratio of simultaneously extracted metals (SEM) to AVS can be used to predict whether metals toxicity should not occur; when SEM:AVS is less than 1. It should be noted that the SEM/AVS model does not necessarily predict toxicity when the SEM:AVS is greater than 1, due to other factors that may control toxicity.

The binding capacity of AVS is competitive between metals with the sulfide form of each metal having its own solubility. The least soluble sulfide-metal will precipitate completely before the other metals are bound by the available AVS. The complete order of sulfide solubilities is: Cu < Pb < Cd < Zn < Ni. This means that for a given amount of AVS, CuS will always precipitate before any others. If the total Hg is greater than the AVS, then all the AVS will be CuS and the remaining metals would not for insoluble precipitates. Mercury will also bind with AVS, however, concentrations observed in previous wetland soil samples were between 0.04 and 0.14 mg/kg (Table 1) and would not result in significant binding of the observed AVS. .

The SEM and AVS measured in the WETSED-1 treatment and the SEM-AVS ratio is presented in Table 26. The SEM for cadmium, lead, and manganese were similar to those of the whole sediment, whereas the SEM_{Zn} was 4,790 mg/kg, which is higher than the total zinc measured in the initial analysis of the WETSED-1 sediment. The total SEM, based on a suite of five metals was 5,096 mg/kg (Table 25, Column 3) or 76.3 µmol/g (Table 25, Column 4). The AVS in the WETSED-1 was 48.9 µmol/g (Table 25, Column 6) and the SEM:AVS ratio was greater than 1 indicating the potential for metals toxicity. Based on the preferential binding capacity of AVS (Table 25, Column 8), all of the copper, cadmium, and lead were predicted to be entirely bound by AVS and in the particulate form. Approximately 60% of the zinc SEM was predicted to be bound to sulfides, with approximately 40% of the zinc and all the remaining manganese predicted to be unbound by sulfides.

Table 26. Results of AVS and SEM Analysis for Sediment from WETSED-1, Agri-Tech/YSF 2013.

Total		5096.5	76.3	1570	48.9	0.052	+26.7	518

[1] MW= molecular weight;
[2] Mass of AVS divided by molecular weight of sulfur (32.087) to obtain AVS molar mass
[3]Copper concentration based on total copper measurement (Table 1).

As indicated above, simply knowing that metals are available does not predict effects. Previous studies have compared the available metals (SEM-AVS) to the fraction of total organic carbon (TOC) in the sediments and ranked the likelihood of toxicity (Besser et al. 2013; DiToro et al. 1991; 1992). The TOC normalized SEM/AVS (SEM-AVS divided by the fraction of TOC) can be ranked into one of three categories: metals unlikely to cause toxicity (<130 µmol/g_{OC}), potential metals toxicity (130-3000 µmol/g_{OC}) and metals toxicity expected (>3000 µmol/ g_{OC}). The TOC-normalized SEM-AVS for the WETSED-1 sediment was 518 µmol/g_{OC}, falling in the category of metals potentially being the cause of observed toxic effects (Table 26).

4.4.2 Whole Sediment TIE Toxicity Testing

To confirm the role of metals in the toxicity predicted by the SEM/AVS model, amphipod toxicity tests were conducted with WETSED-1 sediment treated with SIR-300 cation-resin beads. The SIR-300 resin preferentially binds cationic metals, reducing their bioavailability and resulting toxicity. Mean percentage survival in the treated sediment was then compared to the untreated sample.

A significant decrease in toxicity was observed in the SIR-300 treated sediment, with 32% mortality in the SIR-300 treatment compared to 100% mortality in the untreated WETSED-1 sediment (Figure 4). Furthermore, amphipod survival in the SIR-300 treated sample met the CSL criteria for the amphipod test.

The WETSED-1 sediment was also treated with powdered coconut charcoal to confirm that site-related organics are not associated with toxicity in the WETSED-1 sediment. PCC binds non-ionic organic contaminants. Toxicity was not altered in the PCC treatment with 100% mortality, indicating that toxicity was not associated with organics (removal of organics present did not alter toxicity). However, the PCC control (PCC in control sediment) also showed toxicity, with 95% mortality. PCC has been shown to elicit a toxic response in some invertebrates, with the fine powder adhering to the gills and other external surfaces. While PCC was added at concentrations below toxicity thresholds, effects were clearly present, making it difficult to distinguish between toxicity associated with PCC and that of the original sample.

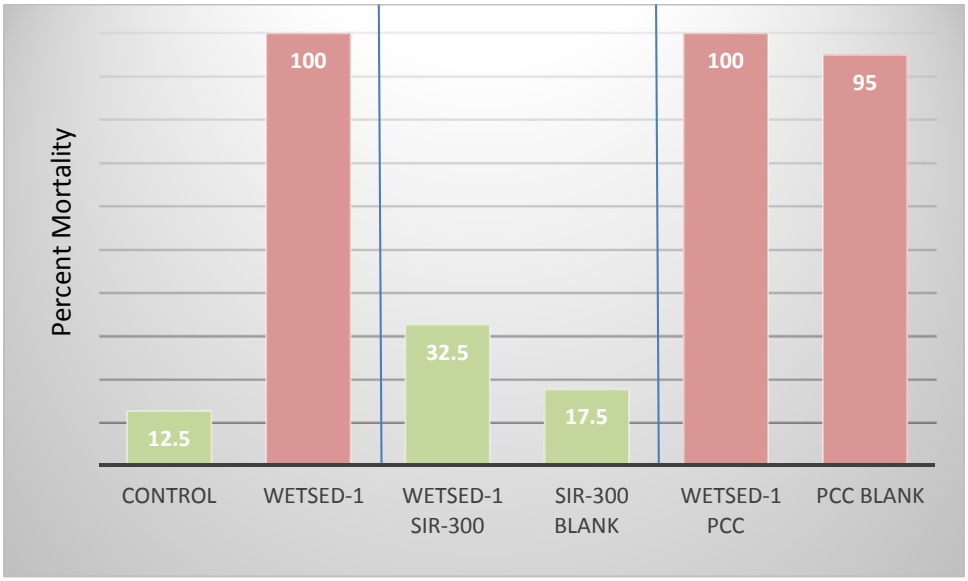

Figure 4. TIE Test Results for the Whole Sediment Test with *Hyalella azteca*.

4.4.3 Porewater TIE Toxicity Testing

In order to further assess the role of metals in toxicity observed in the WETSED-1 sediment, TIE tests were conducted with porewater extracted from the whole sediment. Porewater tests have the advantage of focusing toxicity estimates on the more bioavailable form of contaminants of potential concern. Toxicity evaluations were conducted with the two species that showed toxicity in the baseline tests, *Hyalella azteca* (96-h endpoint) and Microtox®. Analytical chemistry was conducted on untreated and treated porewater to directly measure changes in metals concentrations before and after treatment.

4.4.3.1 Porewater TIEs

The porewater TIE study included six treatments (Table 27), including the following:

- untreated WETSED-1 porewater;
- treatments to reduce metals availability (cation-exchange resin, EDTA Low and High);
- a treatment to reduce organics availability (solid-phase extraction (SPE) C18 column); and,
- a treatment to reduce particulate-bound metals (filtration).

Toxicity was observed in the untreated porewater in both the amphipod and Microtox® tests. Amphipod mortality was 100% and Microtox® showed a 66% reduction in light output, relative to the control.

Treatment of the WETSED-1 porewater with the cation-exchange resin resulted in a significant decrease in toxicity for both the amphipod and Microtox® tests. Control normalized mortality in the amphipod test was reduced to 44%. While there was a significant reduction in amphipod toxicity, some toxicity remained in the SIR-300 treated porewater. Toxicity removal was complete in the Microtox® test with light output exceeding that of the control for both the 5-minute and 15-minute time interval.

No significant differences were observed for the amphipod test in the C18, filtered porewater, and EDTA treatments, with 100% mortality in each treatment. The C18 solid-phase extraction test did not improve survival, a sign that organic contaminants were not a significant contributor to toxicity. Similarly, filtration had no effect, indicating the cause of toxicity was not bound to particles, i.e. free metal ions. The two concentrations of EDTA used did not reduce toxicity. However, the EDTA preparations did not appear to fully dissolve making it difficult to evaluate the binding potential of these treatments.

4.4.3.2 Porewater Chemistry

Cadmium and lead were not detected in the untreated porewater, indicating that while cadmium was observed in whole sediment at concentrations above the CSL, it was not present in the more readily available form. Both manganese and zinc were observed in the untreated WETSED-1 porewater at concentrations of 4.5 mg/L and 28.3 mg/L, respectively. These results are consistent with the AVS binding affinity of the different metals (SEM_{Pb}>SEM_{Cd}>SEM_{Zn}), and suggest that the AVS is sufficient to bind both lead and cadmium, but are not sufficient to completely bind zinc.

Treatment with the SIR-300 cation resin reduced manganese and zinc concentrations by two orders of magnitude, with resulting concentrations of 0.05 mg/L Mn and 0.13 mg/L Zn. EDTA treatments did not

alter the concentrations of manganese and zinc. This may be due to insufficient dissolved EDTA in an effort to avoid EDTA toxicity. There were no changes in metals concentrations with filtration, indicating that the manganese and zinc in the WETSED-1 porewater were not associated with particulates.

Table 27. Results of Porewater Chemistry and Porewater Toxicity Tests, Agri-Tech/YSF 2013.

Treatment	Cadmium (mg/L)	Lead (mg/L)	Manganese (mg/L)	Zinc (mg/L)	*Hyalella* 96-Hour Survival (%)	Microtox light output

<u>Underline</u>: Fails SCO and CSL

4.4.4 The Role of Metals in Toxicity

As indicated above, cadmium and lead were not observed in porewater at concentrations above the limits of detection (Cd: 2 ppb; Pb: 20 ppb). This is well below effects levels for *Hyalella azteca*, as well as for *Chironomus dilutus*. Furthermore, the preferential binding of AVS predicted that cadmium and lead would be present as metal-sulfide precipitates and would not be in the more readily available dissolved form. The potential for toxicity associated with particulate cadmium and lead was ruled out in the tests with filtered porewater samples, with no change in toxicity with the removal of particulates.

Zinc and manganese were predicted to be available in the freely dissolved phase and were present in the porewater samples that were associated with toxicity. A toxic-unit approach was used to further evaluate the role of zinc and manganese in porewater toxicity and to better understand the toxicity remaining following SIR-300 treatment. The toxic unit (TU) approach compares the chemical concentration in a sample to a standard measure of toxicity. Typically the toxic unit is defined as the median-lethal concentration, or LC_{50}. For the purpose of this study, the zinc and manganese toxic units were defined as the respective LC_{50} values based toxicity data for *Hyalella azteca* available in the literature.

For zinc, previous laboratory studies with *Hyalella azteca* have found the zinc LC_{50} to be between 0.049 mg/L and 0.245mg/L Zn (Phipps et al 1995, Borgmann et al 2005). These studies were performed using differing water characteristics (e.g. hardness) as well as varying exposure durations (7-10 days), providing a good approximation for the sensitivity of *H. azteca* to zinc. The average LC_{50} was 0.147mg/L and was used as the TU_{Zn} for this analysis.

The untreated porewater had a zinc concentration equivalent to 192 toxic units. This indicated that the untreated porewater had concentrations of zinc that were nearly 200 times higher than the LC_{50} and would be expected to cause the observed amphipod toxicity. The SIR-300 treated porewater had a zinc concentration equivalent to 0.9 toxic units, or a concentration of zinc that was very near to the median lethal concentration. Indeed, the 96-hour control-normalized mean percent mortality in the treated porewater was 44%. This analysis indicated that the concentrations of zinc in the WETSED-1 porewater effectively predicted the level of toxicity observed for both the untreated and treated porewater, indicating that zinc was a driver of toxicity in the WETSED-1 porewater.For manganese, previous laboratory studies with *Hyalella azteca* reported a mean LC_{50} of 2.77 mg/L Mn (Borgmann et al 2005) which was used as the TU_{Mn} for this analysis. The untreated porewater had a manganese concentration equivalent to 1.6 toxic units. This indicated that the untreated porewater had concentrations of manganese that were similar to the LC_{50}. While manganese cannot be ruled out as a contributor to toxicity, it would not be expected to cause the level of amphipod toxicity observed in the untreated sample. The SIR-300 treated porewater had a manganese concentration equivalent to 0.02 toxic units, or a concentration of zinc that was two one-hundredths of the LC_{50}. This analysis indicated that the concentrations of manganese in the WETSED-1 porewater were not sufficient to predict toxicity in either the untreated and treated porewater.

As discussed in this section, sediment processes act to sequester cationic metal either through precipitation as metal sulfide phases or through adsorption onto organic carbon, greatly reducing their bioavailability and toxicity (Gambrell 1994). However, the extent to which cationic metal elements are bound and made unavailable are affected by environmental conditions.

AVS concentrations vary seasonally, but are generally considered to decrease in the cold winter months, presumably due to a decrease in the generation of sulfide by sulfide-reducing bacteria at cooler temperatures (Ankley et al. 1996). Conversely higher AVS and an increased binding capacity may occur during warmer months due to increased production of organic matter and increased activity of sulfate-reducing bacterial (Herlihy and Mills 1985). Decreases in AVS would predict an increase freely dissolved cationic metals. Based on the preferential binding of sulfides, zinc would continue to be the driver in toxicity prior to cadmium and lead.

Hydrogen ion activity (pH) is also an important factor in determining metals availability. As surface sediments become oxidized in the spring and summer months, pH decreases resulting in the release of adsorbed metal ions into the dissolved phase (John and Leventhal 1995). This release of metal ions can occur for Zn at moderately low pHs and may result in an increase in toxicity. These two seasonal influences did not appear to alter the presence of toxicity in WETSED-1 or the relatively low toxicity in sediment from WETSED-2, with similar results being observed in 2011 and 2013 for the benthic tests with *Hyalella* and *Chironomus*. The Microtox® test results in 2011 appear to have been influenced by extended holding times. Differences in Chironomus toxicity tests for WETSED-3 in 2011 and 2013 may be due to refinements in test methods or seasonal influences.

5. Summary of Findings

As part of the remedial investigation of the Agri-Tech/Yakima Steel Fabricators site in Yakima, Washington, ENVIRON conducted a supplemental investigation of sediments from a small wetland located at the south end of the site. The purpose of this investigation were as follows:

- Verify toxicity in the WETSED samples from each of the three stations;
- If toxicity is confirmed, determine whether cadmium or other metals present in the wetland site are the likely cause;
- If toxicity is confirmed and related to metals, determine whether a site-specific clean-up level would be appropriate.

Physical and Chemical Characteristics of Wetland Sediments:

The physical characteristics of the sediments collected in 2013 were similar to those collected in 2011. Sediment at two stations, WETSED-2 and WETSED-3 was predominantly fine-grained, with approximately 4% TOC. Sediment from Station WETSED-1 was sandier in nature, with approximately 50% fines and 5% TOC. The area sampled was a cattail marsh, with a high amount of fine and coarse plant material present in the sediments. Organic carbon was likely influenced by the presence of the plant material, creating elevated levels relative to grain size.

Sediment pH based on porewater samples collected from homogenized sediment samples ranged from 7.14 to 7.28. However, after sediments had been held in anaerobic conditions, pH in the WETSED -1, 2, and 3 treatments dropped to pH 5.6, 7.0, and 6.8, respectively. This may provide an indication that the organically enriched sediments at WETSED-1 may alter pH and thereby affect availability of metals in this portion of the wetland.

Concentrations of total metals were similar in sediment from the three stations and were similar to values observed during previous investigation. Concentrations of cadmium ranged from 6.6 to 9.9 mg/kg, exceeding the CSL of 5.4 mg/kg for cadmium. As in the initial investigation, concentrations of lead and zinc were below CSL levels. The concentration of zinc at WETSED-3 (3,810 mg/kg Zn) was above the SCO (3,200 mg/kg Zn).

Whole-Sediment Toxicity:

WETSED-1 was the only test treatment that exceeded the CSL thresholds for benthic toxicity, based on the responses in the *Hyalella azteca* and Microtox® tests conducted in 2013. Both WETSED-2 and WETSED-3 exceeded the SCO threshold for mortality in the *Chironomus* test. However, the level of response observed in WETSED-2 and WETSED-3 was near the SCO threshold,was similar to that of the reference sediment, and was within the control performance criteria for this test. The findings from the whole-sediment toxicity tests were as follows:

- For the amphipod test with *Hyalella azteca*, acute toxicity was observed in sediment from Station WETSED-1, with 100% mortality; no toxicity was observed in the WETSED-2 or 3 test treatments. These results were similar to those observed during the 2011 investigation.

- For the *Chironomus* test, all test sediment met the CSL criteria for mortality and growth; all test treatments also met the SCO criteria for the more sensitive growth endpoint. The SCO criteria for *Chironomus* mortality was exceeded by 2% and 5% in sediment from WETSED-2 and WETSED-3, respectively. The mortality observed in both treatments was similar to or less than the mortality observed in the reference sediment used in the dilution series test and was within the control performance criteria for mortality (>68% survival). With the exception of WETSED-3, the responses observed in the *Chironomus* test in 2013 were generally similar to those of 2011. Mortality and growth responses were greater in the 2011 tests for WETSED-3. This may be due to the control of sources of test variability or seasonal differences in sediment characteristics.
- For the Microtox® test, no toxicity was observed in the WETSED-2 and WETSED-3 test treatments. Toxicity exceeding the CSL screening level was observed for the WETSED-1 treatment. Tests conducted in 2011 showed toxicity in all Microtox® tests; however, this was likely due to longer holding times prior to analysis, which have been shown to correlate with increased false-positive results (NewFields 2009). Tests conducted in 2013 were initiated less than two days from sample collection in order to avoid this source of variability.
- Total metals concentrations were not predictive to toxicity responses observed in 2013. The responses did not correspond to whole sediment total metals concentrations in the three WETSED treatments or in the dilution series test.

Sources of Toxicity:

Toxicity identification evaluations conducted with treatment WETSED-1 indicated that metals, specifically freely dissolved cationic metals, were associated with the observed toxicity. The primary findings of the TIE evaluations were as follows:

- The AVS:SEM and organic carbon normalized SEM-AVS indicated that simultaneously extractable metals were present at concentrations exceeding the AVS binding capacity of the sediment and predicted that freely-dissolved cationic metals in the sample were a potential cause of toxicity.
- WETSED-1 sediment treated with the cation exchange resin SIR-300, showed a significant decrease in amphipod mortality and Microtox® response, suggesting that cationic metals were associated with the observed toxicity. Relative to the control, the SIR-300-treated sediment passed CSL criteria. Sediment treated with PCC did not show a change in toxicity, suggesting that organic COPCs were not associated with toxicity.
- Porewater from WETSED-1 sediment treated with the cation exchange resin SIR-300, showed a significant decrease in amphipod mortality and Microtox® response, further suggesting that dissolved cationic metals were associated with the observed toxicity.
- Porewater from WETSED-1 sediment treated with filtration and with C-18 solid-phase extraction showed no change in amphipod mortality, indicating that particulates and organic COPCs, respectively were not related to toxicity. EDTA-treated porewater also showed no change in amphipod mortality. However, the analytical chemistry demonstrated that metals concentrations were unaffected by the EDTA treatment; therefore, this TIE manipulation could not be used to formulate conclusions regarding porewater toxicity.

The Role of Metals in Observed Toxicity

Toxicity observed during the 2013 tests was primarily due to zinc and potentially manganese. Cadmium and lead did not appear to be related to the observed toxicity. The primary findings related to the role of metals in the observed toxicity were as follows:

- TIE results indicated that freely dissolved metals were mostly likely associated with toxicity (as stated above).
- The AVS:SEM preferential binding affinities of the cationic metals predicted that cadmium and lead would be entirely bound to AVS and would not be present in the more toxic dissolved form. Both zinc and manganese were predicted to be present in the more bioavailable, dissolved phase.
- Cadmium and lead were not detected in the porewater samples; zinc and manganese were detected in porewater samples.
- Treatment of the porewater with the cation resin SIR-300 effectively removed both zinc and manganese, decreasing the concentrations by two orders of magnitude. Toxicity was also reduced in the SIR-300 treated porewater as a direct result of the SIR-300.
- The concentration of zinc in the SIR-300 treated porewater predicted the magnitude of toxicity observed in the treated porewater (0.9 TU). Zinc is likely to be a primary driver in toxicity.
- Manganese concentrations were also decreased with SIR-300 treatment, but remaining Mn concentrations were well below those that would predict biological effects (0.02 TU). Manganese was not likely to have been primary driver in toxicity.
- Seasonal site conditions may alter the concentrations of dissolved cationic metals. However, zinc is the most likely driver of toxicity based on the corresponding binding affinities and the SEM concentrations of zinc.

Based on the findings of the investigation work herein, no CSL exceedances for biological criteria were observed at Stations WETSED-2 and WETSED-3. Acute toxicity exceeding the CSL criteria was observed in sediment from Station WETSED-1. TIE evaluations of both sediment and porewater indicate that metals, specifically cationic metals were associated with the observed responses. Concentrations of metals observed in the WETSED-1 porewater and correlation analysis using a toxic unit approach indicate that zinc is the likely contributor to toxicity. The adjacent Bay Chemical Site is a known source of zinc in soil and groundwater resulting from former operations at that site. A source of a release of zinc has not been identified on the Agri-Tech/Yakima Steel Fabricators site.

1.0 INTRODUCTION

On May 23rd, 2011 Test America collected freshwater sediments for biological testing. Test America contracted with Nautilus Environmental to provide toxicity-testing services for the project. The three sediment samples selected for testing included samples E-WetSed-1-052311 (WETSED-1), E-WetSed-2-052311 (WETSED-2), and E-WetSed-3-052311 (WETSED-3). No reference sample was collected in conjunction with this project. The freshwater sediment samples were tested for toxicity using the *Chironomus dilutus* (aka *tentans*) 20-day survival and growth bioassay (USEPA 2000 and ASTM 2000), the *Hyalella azteca* 10-day survival bioassay (USEPA 2000 and ASTM 2000), and the 15-minute 100 percent porewater Microtox® bacteria bioluminescence test. All tests met negative and positive control criteria.

Results were evaluated by comparing test data to the criteria in the Sediment Evaluation Framework for the Pacific Northwest (RSET 2009) guidance document. *C. dilutus*, *H. azteca*, and Microtox results were compared to control results, and examined for statistically significant effects ($\alpha = 0.05$). Acceptability criteria from the literature are summarized in Table 1.

Table 1 Acceptability criteria for bioassays

Test Type	***C. dilutus* 20-Day**	***H. azteca* 10-Day**	**Microtox**
Endpoint	Survival and Growth	Survival	Luminescence
Source	RSET 2009	RSET 2009	RSET 2009
Test Criteria	One-hit failure is mortality > control mortality + 25% and/or biomass <60% of control biomass and significant difference Two-hit failure is mortality > control mortality + 15% and/or biomass <75% of control biomass and significant difference	One-hit failure is mortality > control mortality + 25% and significant difference Two-hit failure is mortality > control mortality + 10% and significant difference	One-hit failure is Luminescence <75% of control luminescence and significant difference Two-hit failure is Luminescence <85% of control luminescence and significant difference
Control Criteria	Negative control ≤32% mortality and growth ≥0.48 mg/ind. ash-free dry weight	Negative control ≤20% mortality	Negative control final light output > 72% of initial output

2.0 SAMPLES

Upon receipt of samples from Test America, samples were matched with the chain-of-custody form and inspected. Samples were stored at 4 ± 2°C in the dark prior to test initiation. Toxicity tests were initiated within 2 weeks of collection (Table 2). Total ammonia levels in the porewater ranged from <1.0 to 2.7 milligrams per liter (mg/L). Both overlying ammonia and sulfides were also measured during testing, and the results are reported in the QA/QC sections for each test.

Table 2 Summary of sample collection and test initiation dates

Sample ID	Collection Date	Microtox Test Initiation Date	*H. azteca* Test Initiation Date	*C. dilutus* Test Initiation Date
E-WetSed-1-052311	May 23, 2011	June 6, 2011	June 7, 2011	June 9, 2011
E-WetSed-2-052311				
E-WetSed-3-052311				

3.0 *CHIRONOMUS DILUTUS* TEST

3.1 Methods

C. dilutus were exposed to test sediments for 20 days to determine the effects of site sediment on survival and growth. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 3.

C. dilutus egg cases were obtained from Aquatic BioSystems (Fort Collins, Colorado) and arrived at the laboratory on June 8, 2011. The egg cases were transported in insulated containers in oxygen-saturated water contained in 500-mL plastic bottles. Upon arrival at the laboratory, water quality parameters were measured and observations of organism condition were made. The egg cases were 20°C at receipt, and were cultured at 23°C. The organisms emerged from the egg cases on June 9th and tests were initiated the same day.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml of sediment was distributed to each of eight labeled test chambers for each of the samples, and

175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Twelve organisms were directly added to each test chamber, in random order.

Each test chamber was provided 1.5 mL of food daily (after the second renewal) starting on Day -1. The food consisted of a mixture of 4 g ground Tetrafin® flakes mixed with 1 L diluted mineral water. The feeding regime was reduced if the presence of excess food was observed on the sediment surface in several test chambers, which occurred on Day 8 only. Abnormal conditions or unusual animal behavior, if observed, were noted daily.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while alkalinity, hardness, ammonia and sulfides were measured on Days 5, 10, and 15. Water was renewed twice daily.

At test termination, subsamples of overlying water were collected from each water quality replicate for ammonia, hardness, alkalinity, and sulfide analyses. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. Animals were removed from the screen and the number of survivors counted and recorded. Presence of pupae, flies, or exuviae (molts) were noted. The larvae were rinsed with deionized water and placed into pre-ashed, pre-weighed weigh boats. The weigh boats were placed in an oven at 60°C for at least 24-hours, then placed in a dessicator until dry weight could be measured. The weigh boats were then placed in a muffle furnace at 550°C for two hours, placed in a dessicator to cool, then weighed again to determine the ash weight. The ash weight was subtracted from the dry weight to determine the ash-free dry weight (AFDW). The number and AFDW of surviving chironomids were evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitney U-test, as appropriate, to determine whether the samples exhibited a significant

decrease in survival or growth relative to the control ($p<0.05$). Survival data were arcsine transformed, while growth data was either square root or log transformed as needed to stabilize the variances and improve normality of the data prior to performing the t-test. Data that failed to meet parametric assumptions even after transformations were analyzed with the non-parametric Mann-Whitney U-test. Site performance was evaluated against the sediment acceptability criteria outlined in RSET 2009 (Table 1). The criteria for acceptable test performance were an average of ≤32 percent mortality of control organisms, and an average of at least 0.48 mg/individual AFDW per surviving control organism.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the tests on the sediments to determine whether the sensitivity of the test organisms was appropriate. This test was run with four replicates, ten animals per replicate, in diluted mineral water at 23°C, with a small amount of clean control sand as a substrate. Tetrafin® slurry (1.25 mL of 4 g/L Tetrafin) was added to each chamber on days 0 and 2.

Table 3 Summary of methods for the 20-day test with *Chironomus dilutus*

Test initiation date	June 9, 2011
Test termination date	June 29, 2011
Test organism source	Aquatic BioSystems; Fort Collins, Colorado
Organism age at test initiation	< 4 hours post-emergence from egg case
Feeding	1.5 mL of 4.0 g/L Tetrafin mixture every day; frequency reduced if excess food observed
Test chamber	475-mL glass beaker
Test sediment volume	100 mL
Dilution water type & volume	175 mL diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	12
Number of replicates/sample	8 plus water quality surrogates
Test temperature	23± 1°C
Illumination	16 hours light : 8 hours dark
Aeration	Started on Day 13
Reference toxicant	Copper chloride
Acceptability Criteria	≤32% mortality, 0.48 mg/individual AFDW

3.2 Results

The results of toxicity tests conducted using *C. dilutus* are provided in Table 4. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 4 Results of *Chironomus dilutus* tests. Samples with statistically reduced survival or growth are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference From	Ash-Free Dry Weight per Org (mg)	Ash-Free Dry Weight Percent of Control
Control	6.3 ± 7.4	--	0.91 ± 0.11	--
WETSED-1	20.8 ± 21.4	14.6	1.11 ± 0.46	123
WETSED-2	24.0 ± 12.9	17.7	0.87 ± 0.22	96
WETSED-3	**63.5 ± 31.2**	**57.3**	0.60 ± 0.57	66

[1]Criteria for one-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 15% of control (RSET 2009)

3.3 QA/QC

The *C. dilutus* were received in good condition for the June 9, 2011 test. All water quality parameters remained within acceptable ranges throughout the tests. A summary of the water quality parameters is presented in Table 5. Dissolved oxygen levels were decreased to a level on concern on day 13, and all replicates were aerated from that point forward. There were no deviations from the protocols. The toxicity test for mortality with this species met the control acceptability criterion (<32 percent mortality; >0.48 mg/ind AFDW).

Table 5 Summary of water quality parameters for *C. dilutus* tests (means and ranges). Required values are shown in brackets.

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
	Mean (Min-Max)			
Temp. (°C) [23 ± 1°C]	22.0 (21.7-22.2)	22.0 (21.8-22.2)	21.9 (21.7-22.1)	21.9 (21.7-22.1)
DO (mg/L) [>2.5 mg/L]	6.7 (3.3-9.0)	6.7 (3.5-9.0)	7.1 (5.2-9.1)	7.0 (5.2-9.0)
pH [6-9]	7.34 (6.58-7.99)	7.18 (6.43-7.89)	7.13 (6.46-7.80)	7.35 (6.80-7.99)
Cond. (µS/cm) [NA]	208 (127-296)	180 (149-227)	249 (158-413)	251 (192-382)
Alkalinity (mg/L $CaCO_3$) [<50% variable]	58 (48-72)	65 (60-68)	69 (64-72)	85 (80-88)
Hardness (mg/L $CaCO_3$) [<50% variable]	83 (80-88)	98 (80-108)	195 (84-228)	122 (100-140)
Total Overlying NH3 (mg/L) [<50% variable]	1.6 (1.1-1.7)	1.2[a] (<1.0-1.3)	1.3[a] (<1.0-1.3)	<1.0 (<1.0-<1.0)
Total Overlying Sulfides (mg/L) [NA]	0.035[a] (<0.010-0.058)	0.028[a] (<0.010-0.054)	0.044[a] (<0.010-0.044)	0.020[a] (<0.010-0.021)

[a] estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 6. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 6 *C. dilutus* reference toxicant test results.

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Chironomus dilutus	June 23, 2011	Cu	571 µg/L	401 – 1070 µg/L	22.7

3.4 Discussion

Mortality in the samples ranged from 20.8 to 63.5 percent, compared with 6.3 percent in the control. Sediment samples WETSED-2 and WETSED-3 were significantly different from control and were more than 15 percent higher than the control, failing the two-hit criterion for survival. WETSED-3 was also more than 25 percent higher than the control, failing the one-hit criterion for survival. Survival in WETSED-1 was not significantly different from the control, due to high

variability in the sample. Growth in the samples ranged from 0.60 to 1.11 mg/individual AFDW, compared with 0.91 mg/individual AFDW in the control. Growth in sample WETSED-1 was greater than the control. Growth in WETSED-2 and WETSED-3 was not significantly different from the control. Therefore none of the sites fail either the one- or two-hit failure requirements.

The total ammonia level reached 1.3 mg/L in the test sediments, which was well below the reported 4-day lethal concentration for 50% of test organisms (LC_{50}) range for *C. dilutus* of 82 to 370 mg/L (USEPA 2000). While sulfide toxicity thresholds are not available for this species, they were measured as part of the Ecology reference site study (Nautilus 2008), and samples with porewater sulfide values similar (0.226 to >0.600 mg/L) to the values found in the current study (0.010 to 0.054 mg/L) did not result in measurable effects. Therefore, it is unlikely that ammonia or sulfide levels caused the observed increases in mortality in the test sediments.

4.0 *HYALELLA AZTECA* TEST

4.1 Methods

H. azteca were exposed to test sediments for 10 days to determine the effects of site sediments on survival. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 7.

H. azteca were obtained from Aquatic Indicators (St. Augustine, Florida) and arrived at the laboratory on June 2, 2011. The organisms were transported in insulated boxes in oxygen-saturated water contained in plastic bags with fine screens as a substrate. Upon arrival at the laboratory, water quality parameters were measured and observations of animal condition were made. The organisms were acclimated to test conditions prior to test initiation over a 96-hour time period. During the acclimation period, the animals were observed for any indication of stress or significant mortality and any observations were recorded.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml sediment was distributed to each of eight labeled test chambers for each of the samples, and 175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed

overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Organisms were carefully separated into groups of 10 amphipods in 30 mL cups containing diluted mineral water. The number of organisms was then recounted and any animals exhibiting signs of stress were replaced. The organisms were then gently added to the test chambers, two cups for each test chamber for a total of 20 organisms per chamber.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while overlying ammonia, sulfide, hardness, and alkalinity were monitored on Day 5. Water was renewed twice daily in all chambers. Abnormal conditions or unusual animal behavior, if observed, were also noted daily. Each test chamber was fed 1 ml of Yeast Trout Chow (YTC) daily after the second renewal.

At test termination, subsamples of overlying water were collected for ammonia, hardness, alkalinity, and sulfides analyses, from each water quality replicate. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. The screen was then placed in diluted mineral water and the number of survivors counted and recorded. The number of surviving amphipods was evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitey U-test, as appropriate, to determine whether the samples exhibited a significant decrease in survival relative to the control ($p<0.05$). Survival data was arcsin transformed as needed to stabilize the variances and improve normality of the data. Site performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the sediment tests to determine whether the sensitivity of the test organisms was within the range typically observed. The test was run with four replicates, ten animals per replicate, in diluted mineral water with a square of nitex screen as a substrate.

Table 7 Summary of methods for the 10-day test with *Hyalella azteca*.

Test initiation date	June 7, 2011
Test termination date	June 17, 2011
Test organism source	Aquatic Indicators, St. Augustine, Florida
Organism age at test initiation	8 days
Feeding	1 ml of YTC daily
Test chamber	475-ml glass beaker
Test sediment volume	100 ml
Dilution water type & volume	175 ml diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	10
Number of replicates/sample	8 plus water quality surrogate
Test temperature	23 ± 1°C
Illumination	16 hours light: 8 hours dark
Aeration	None
Reference toxicant	Copper chloride
Acceptability criterion for control	≥80% survival

4.2 Results

The results of toxicity tests conducted using *H. azteca* are provided in Table 8. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 8 Results of *Hyalella azteca* tests. Samples with statistically reduced survival or are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference from Control
Control	1.3 ± 2.3	--
WETSED-1	**100 ± 0.0**	98.7
WETSED-2	13.8 ± 11.6	12.5
WETSED-3	3.8 ± 4.4	2.5

[1]Criteria for one-hit failure is significant decrease in mortality (p<0.05), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality (p<0.05), **and** mortality greater than 10% of control (RSET 2009)

4.3 QA/QC

The *H. azteca* were received in good condition and the toxicity tests with this species met the control acceptability criterion (<20 percent mortality). A summary of the water quality parameters is provided in Table 10. All water quality parameters remained within acceptable ranges throughout the tests. Instead of the 10 animals per replicate required by the protocol, 20 animals were added to each replicate. As the controls still met acceptability criteria and water quality stayed within ranges for the test, this deviation is not expected to have affected the results. There were no other deviations from the protocol.

Table 9 Summary of water quality parameters for *H. azteca* analyses (means and ranges). Required values are shown in brackets.

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
		Mean (Min-Max)

(mg/L) [<50% variable]	(<0.010-0.125)	(0.014-0.293)	(0.012-0.126)	(<0.010-0.107)

[a]estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 10. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 10 H. Azteca reference toxicant test results.

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Hyalella azteca	June 2, 2011	Cu	188 µg/L	0 – 1360 µg/L	74.6

4.4 Discussion

Mortality in the samples ranged from 3.8 to 100 percent, compared with 1.3 percent in the control. Sediment samples WETSED-1 and WETSED-2 were significantly different from control and were more than 10 percent higher than the control, failing the two-hit criterion for survival. WETSED-1 was more than 25 percent higher than the control, failing the one-hit criterion for survival.

5.0 MICROTOX® TEST

5.1 Methods

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox test. The bacteria were exposed to porewater extracted from sediment samples and light readings were measured after 5 and 15 minutes of exposure. Test equipment included the Microtox Model 500 Analyzer, which measures light output and is equipped with a 15°C chamber to maintain test temperature in the samples and a 4°C chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot #s 10K1032, expiration date 10/2012) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Ecology (2008) test protocol; these methods are summarized in Table 11. Approximately 50 ml of porewater was extracted from each sample by centrifuging for 30 minutes at 4500 G. Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea Marine Mix artificial seasalt. The DO ranged from 7.2 to 8.2 mg/L in the adjusted samples. Since the DO in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L), the samples did not require aeration. The pH was adjusted to 7.8 to 8.2 using NaOH or HCl. None of the porewater samples were diluted below 90 percent. The control was deionized water adjusted to 20 ppt with artificial seasalt. Each porewater was tested within 3 hours of extraction.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox test wells and 1 ml of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 µl was added to each test cuvette, with mixing after each addition. After an initial incubation period of 5 minutes, the control cuvette was placed in the read chamber of the Microtox Analyzer to set the instrument. Initial light readings (I_0) were then taken by placing each cuvette in the read chamber of the Microtox Analyzer and measurements were recorded on a data sheet. Light output was measured at 5 minutes (I_5) and 15 minutes (I_{15}) of exposure after the initial light reading (I_0).

Test acceptability criteria were final mean control light output greater than or equal to 72 percent of initial control mean output, and test mean output not greater than 110 percent of control mean output. The data were evaluated statistically by conducting one-tailed t-tests or Mann-Whitney U-tests on the change in output over time for test sediment porewaters compared to the control porewater (where light output was lower than the control). Sediment performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A reference toxicant test using phenol was conducted in conjunction with the sediment tests to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 11 Summary of methods for the Microtox test.

Test dates	June 6, 2011
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#10K1032, Expiration 10/2012
Control	Saltwater (20 ppt) prepared with Crystal Sea artificial seasalt
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea salt; pH adjustment to 7.8-8.2 ppt; DO 5.0 to 10.2 mg/L
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Phenol
Acceptability criteria	Final control light output ≥72% initial; test output ≤110% control

5.2 Results

The results of toxicity tests conducted using Microtox are provided in Table 12. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 12 Results of Microtox tests. Samples with statistically reduced luminescence are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	5 minute reading		15 minute reading	
	Mean % of initial light output	Significantly different relative to the control	Mean % of initial light output	Significantly different relative to the control
Control	96 ± 3	--	84 ± 3	--
WETSED-1	**68 ± 4**	Yes	**17 ± 1**	Yes
WETSED-2	**72 ± 1**	Yes	**25 ± 1**	Yes
WETSED-3	81 ± 1	Yes	**35 ± 2**	Yes

[1]Criteria for one-hit failure is luminescence less than 75% of control luminescence **and** significant difference (RSET 2009); [2]Criteria for two-hit failure is luminescence less than 85% of control luminescence **and** significant difference (RSET 2009)

5.3 QA/QC

A summary of the water quality parameters for the Microtox tests is provided in Table 13. The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Table 13 Summary of sites water quality parameters for Microtox analyses

Analyte	Mean (st.dev)	Minimum	Maximum	Number of Readings	Met Requirements
Initial Salinity (ppt)	1.1 (0.3)	0.8	1.3	3	N/A
Final Salinity (ppt)	19.9 (0.4)	19.5	20.2	3	Y
Initial DO (mg/L)	7.3 (0.2)	7.2	7.5	3	N/A
Final DO (mg/L)	7.3 (0.2)	7.2	7.5	3	Y
Initial pH	7.5 (0.4)	7.2	7.9	3	N/A
Final pH	7.9 (0.02)	7.9	7.9	3	Y
Final Concentration (%)	99.9 (0.0)	99.0	100	3	Y
Total NH3 (mg/L)	2.0 (1.0)[1]	<1.0	2.7	3	N/A

[1]estimated value

Results of the reference toxicant test conducted in conjunction with this testing program are provided in Table 14. Bench sheets and control charts are provided in Appendix E. The test was run with the same batch of organisms used in the testing program. The results of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 14 Microtox reference toxicant test results.

Species	Test date	Toxicant	EC50	Acceptable Range (mean ± 2 S.D.)	CV (%)
Microtox	June 6, 2011	Phenol	5 min: 19.6 mg/L 15 min: 40.9 mg/L	5 min: 24.2 – 55.1 15 min: 31.0 – 92.2	19.5 24.8

5.4 Discussion

Change in light output in the samples at 15 minutes ranged from 17 to 35 percent, compared with 84 percent in the controls. Samples WETSED1, WETSED2, and WETSED3 were all significantly different from the controls and had luminescence less than 75% of controls, failing the one-hit criteria for luminescence.

6.0 CONCLUSIONS

WETSED-1 failed the one-hit criterion for *H. azteca* survival and the one-hit criterion for Microtox luminescence, but did not have a hit in the *C. dilutus* survival or growth criterion (RSET 2009). WETSED-2 failed the two-hit criterion for *C. dilutus* and *H. azteca* survival, and failed the one-hit criterion for Microtox luminescence (RSET 2009). WETSED-3 failed the one-hit criterion for *C. dilutus* survival and Microtox luminescence (RSET 2009).

Table 15 One-hit/Two-hit criteria summary results table

Site	*C. dilutus* Survival	*C. dilutus* Growth	*H. azteca* Survival	Microtox Luminescence
WETSED-1	None	None	One-hit	One-hit
WETSED-2	Two-hit	None	Two-hit	One-hit
WETSED-3	One-hit	None	None	One-hit

This report has been prepared based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party.

1.0 INTRODUCTION

Freshwater sediment samples were collected and evaluated for toxicity as part of a project being conducted by NewFields Northwest. Freshwater sediment samples were tested for toxicity using Microtox® tests.

2.0 METHODS

2.1 Sample Collection and Transportation

NewFields personnel collected three freshwater sediment porewater subsamples on March 18, 2014. Samples were shipped by Fed Ex and received by Rainier Environmental on March 19, 2014. Sample containers were inspected upon receipt and the contents verified against information on the chain-of-custody form. The samples were stored at 4°C in the dark until used for testing.

2.2 Test Procedures

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox® tests. The bacteria were exposed to porewater extracted from the sediment samples and light readings were measured after a 5 minute incubation period and then after an additional 5 minutes and 10 minutes of exposure. Testing was performed using the Microtox® Model 500 Analyzer which measures light output and is equipped with a 15°C chamber to maintain test temperature in the samples and a 4°C chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot # 12B4010, Expiration date 2/15) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox® Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Washington Department of Ecology (WDOE, 2008) test protocol, which are summarized in Table 1. Approximately 25 milliliters (mL) of porewater was extracted from each sample by centrifugation for 30 minutes at 4500 G (Porewater extracted at Newfields). Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea artificial sea salt. The dissolved oxygen (DO) in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L) and did not require aeration. The pH was adjusted to 7.9 to 8.2, as necessary, using NaOH or HCl. The laboratory control consisted of deionized water adjusted to 20 ppt with artificial seasalt.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox® test wells and 1 mL of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 microliters (µL) were added to each test cuvette. After an initial incubation period of 5 minutes, the first control cuvette was placed in the read chamber of the Microtox® Analyzer to set the instrument. Initial light readings (I_o) were then taken by placing each cuvette in the read chamber of the Microtox® Analyzer and measurements were recorded on a data sheet. Light output was measured in each cuvette after an additional 5 minutes (I_5) and 10 minutes (I_{15}) of exposure. Test acceptability criteria is a mean control final light output greater than 72 percent of initial output and a test mean output not greater than 110 percent of the control mean output.

The data were evaluated statistically by conducting one-tailed t-tests on the change in light output over time for the test sediment porewaters compared to the control

A reference toxicant test using copper chloride was conducted in conjunction with the sediment porewater test to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 1. Summary of methods for the Microtox test.

Test date	March 19, 2014
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#12B4010, Expiry 2/15
Control	Saltwater (20 ppt) prepared with Crystal Sea Marine Mix
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea Marine Mix; pH adjustment to 7.9-8.2
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Copper Chloride

3.0 RESULTS

The results of toxicity tests conducted using Microtox® are provided in Tables 2 and 3. Sample WETSED 1 had a test mean output of less than 75 percent of the control mean output, at 15 minutes, indicating a Washington State Department of Ecology Sediment Quality Standard (SQS) failure and a Cleanup Screening Level (CSL) failure for freshwater Sediments. The other samples did not exceed sediment quality standards for the State of Washington (WDOE 2008).

Table 2. Results of Microtox® tests.

Sample ID	Change in light output as a % of Control (5 minutes)	Change in light output as a % of Control (15 minutes)
WETSED-1	88	63
SIR-300	104	104
SIR-300 Control	109	111

Table 3. Statistical analyses of Microtox results.

Sample ID	5-minute reading		15 minute reading	
	Mean % change in light output	Significantly different relative to the control	Mean % change in light output	Significantly different relative to the control
Control	85 ± 2	---	77 ± 3	---
WETSED-1	75 ± 2	No	49 ± 3	Yes
SIR-300	89 ± 3	No	81 ± 3	No
SIR-300 Control	93± 4	No	86 ± 3	No

4.0 QA/QC

The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Results of reference toxicant test used to monitor laboratory performance and test organism sensitivity are provided in Table 4. The results for the reference toxicant test fell within the range of mean ± two standard deviations of historical results, indicating that test organisms were of an appropriate degree of sensitivity.

Table 4. Reference toxicant test results.

Exposure Duration	Test date	Toxicant	EC50	Acceptable Range	CV (%)
5 Minutes	March 19, 2014	Copper	1352µg/L	978-1614	12.3
15 Minutes			414 µg /L	375-615	12.1

$I_{(0)}$ is the light reading after the initial five minute incubation period

$I_{(5)}$ is the light reading five minutes after $I_{(0)}$

$I_{(15)}$ is the light reading fifteen minutes after $I_{(0)}$

$C_{(t)}$, $R_{(t)}$, and $T_{(t)}$ are the changes in light readings from the intial reading in each sample container for the control, reference sediment

Quality Control Steps:

1. Is control final mean output greater than or equal to 72% control initial mean output?

$I_{(5)}$:$F_{c(mean)}/I_{c(mean)}$: **85%** **YES**

$I_{(15)}$:$F_{c(mean)}/I_{c(mean)}$: **77%** **YES**

YES: Control results are acceptable and can be used for statistical analyses.
NO: Control results are unacceptable (use reference sediment for statistical analysis if available).

2. Are test initial mean values greater than or equal to 80% of control initial mean values?

S1 $I_{T(mean)}/I_{C(mean)}$: **78%** **NO**

S2 $I_{T(mean)}/I_{C(mean)}$: **91%** **YES**

S3 $I_{T(mean)}/I_{C(mean)}$: **96%** **YES**

S4 $I_{T(mean)}/I_{C(mean)}$: **#DIV/0!** **#DIV/0!**

S5 $I_{T(mean)}/I_{C(mean)}$: **#DIV/0!** **#DIV/0!**

INVALD: If the test sediment is greater than 110%, the results in uninterpretable
YES: If test sediment is reference, reference is acceptable

This report has been prepared based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party.

1.0 INTRODUCTION

Freshwater sediment samples were collected and evaluated for toxicity as part of a project being conducted by NewFields Northwest. Freshwater sediment samples were tested for toxicity using Microtox® tests.

2.0 METHODS

2.1 Sample Collection and Transportation

NewFields personnel collected three freshwater sediment subsamples on December 4, 2013. Samples were shipped by Fed Ex and received by Rainier Environmental on December 5, 2013. Sample containers were inspected upon receipt and the contents verified against information on the chain-of-custody form. The samples were stored at 4°C in the dark until used for testing.

2.2 Test Procedures

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox® tests. The bacteria were exposed to porewater extracted from the sediment samples and light readings were measured after a 5 minute incubation period and then after an additional 5 minutes and 10 minutes of exposure. Testing was performed using the Microtox® Model 500 Analyzer which measures light output and is equipped with a 15°C chamber to maintain test temperature in the samples and a 4°C chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot # 12B4010, Expiration date 2/15) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox® Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Washington Department of Ecology (WDOE, 2008) test protocol, which are summarized in Table 1. Approximately 25 milliliters (mL) of porewater was extracted from each sample by centrifugation for 30 minutes at 4500 G. Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea artificial sea salt. The dissolved oxygen (DO) in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L) and did not require aeration. The pH was adjusted to 7.9 to 8.2, as necessary, using NaOH or HCl. The laboratory control consisted of deionized water adjusted to 20 ppt with artificial seasalt. Each porewater was tested within 3 hours of extraction.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox® test wells and 1 mL of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 microliters (µL) were added to each test cuvette. After an initial incubation period of 5 minutes, the first control cuvette was placed in the read chamber of the Microtox® Analyzer to set the instrument. Initial light readings (I_o) were then taken by placing each cuvette in the read chamber of the Microtox® Analyzer and measurements were recorded on a data sheet. Light output was measured in each cuvette after an additional 5 minutes (I_5) and 10 minutes (I_{15}) of exposure. Test acceptability criteria is a mean control final light output greater than 72 percent of initial output and a test mean output not greater than 110 percent of the control mean output.

The data were evaluated statistically by conducting one-tailed t-tests on the change in light output over time for the test sediment porewaters compared to the control

A reference toxicant test using copper chloride was conducted in conjunction with the sediment porewater test to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 1. Summary of methods for the Microtox test.

Test date	December 5, 2013
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#12B4010, Expiry 2/15
Control	Saltwater (20 ppt) prepared with Crystal Sea Marine Mix
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea Marine Mix; pH adjustment to 7.9-8.2
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Copper Chloride

3.0 RESULTS

The results of toxicity tests conducted using Microtox® are provided in Tables 2 and 3. Sample WETSED 1 had a test mean output of less than 75 percent of the control mean output indicating a Washington State Department of Ecology Sediment Quality Standard (SQS) failure and a Cleanup Screening Level (CSL) failure for freshwater Sediments. The other samples did not exceed sediment quality standards for the State of Washington (WDOE 2008).

Table 2. Results of Microtox® tests.

Sample ID	Change in light output as a % of Control (5 minutes)	Change in light output as a % of Control (15 minutes)
WETSED 1	65	14
WETSED 2	103	98
WETSED 3	107	100

Table 3. Statistical analyses of Microtox results.

Sample ID	5-minute reading		15 minute reading	
	Mean % change in light output	Significantly different relative to the control	Mean % change in light output	Significantly different relative to the control
Control	91 ± 4	---	80 ± 4	---
WETSED 1	59 ± 3	Yes	11 ± 1	Yes
WETSED 2	94 ± 3	No	78 ± 4	No
WETSED 3	97± 2	No	80 ± 2	No

4.0 QA/QC

The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Results of reference toxicant test used to monitor laboratory performance and test organism sensitivity are provided in Table 4. The results for the reference toxicant test fell within the range of mean ± two standard deviations of historical results, indicating that test organisms were of an appropriate degree of sensitivity.

Table 4. Reference toxicant test results.

Exposure Duration	Test date	Toxicant	EC50	Acceptable Range	CV (%)
5 Minutes	December 5, 2013	Copper	1209µg/L	929-1666	14.2
15 Minutes			438 µg /L	425-613	9.1

$I_{(0)}$ is the light reading after the initial five minute incubation period

$I_{(5)}$ is the light reading five minutes after $I_{(0)}$

$I_{(15)}$ is the light reading fifteen minutes after $I_{(0)}$

$C_{(t)}$, $R_{(t)}$, and $T_{(t)}$ are the changes in light readings from the intial reading in each sample container for the control, reference sediment

Quality Control Steps:

1. Is control final mean output greater than or equal to 72% control initial mean output?

$I_{(5)}$:$F_{c(mean)}/I_{c(mean)}$: **91%** **YES**

$I_{(15)}$:$F_{c(mean)}/I_{c(mean)}$: **80%** **YES**

YES: Control results are acceptable and can be used for statistical analyses.
NO: Control results are unacceptable (use reference sediment for statistical analysis if available).

2. Are test initial mean values greater than or equal to 80% of control initial mean values?

S1 $I_{T(mean)}/I_{C(mean)}$: **71%** **NO**

S2 $I_{T(mean)}/I_{C(mean)}$: **88%** **YES**

S3 $I_{T(mean)}/I_{C(mean)}$: **82%** **YES**

S4 $I_{T(mean)}/I_{C(mean)}$: **#DIV/0!** **#DIV/0!**

S5 $I_{T(mean)}/I_{C(mean)}$: **#DIV/0!** **#DIV/0!**

INVALD: If the test sediment is greater than 110%, the results in uninterpretable
YES: If test sediment is reference, reference is acceptable

This report has been prepared based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party.

1.0 INTRODUCTION

Freshwater sediment samples were collected and evaluated for toxicity as part of a project being conducted by NewFields Northwest. Freshwater sediment samples were tested for toxicity using Microtox® tests.

2.0 METHODS

2.1 Sample Collection and Transportation

NewFields personnel collected three freshwater sediment subsamples on December 10, 2013. Samples were shipped by Fed Ex and received by Rainier Environmental on December 12, 2013. Sample containers were inspected upon receipt and the contents verified against information on the chain-of-custody form. The samples were stored at 4°C in the dark until used for testing.

2.2 Test Procedures

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox® tests. The bacteria were exposed to porewater extracted from the sediment samples and light readings were measured after a 5 minute incubation period and then after an additional 5 minutes and 10 minutes of exposure. Testing was performed using the Microtox® Model 500 Analyzer which measures light output and is equipped with a 15°C chamber to maintain test temperature in the samples and a 4°C chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot # 12B4010, Expiration date 2/15) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox® Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Washington Department of Ecology (WDOE, 2008) test protocol, which are summarized in Table 1. Approximately 25 milliliters (mL) of porewater was extracted from each sample by centrifugation for 30 minutes at 4500 G. Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea artificial sea salt. The dissolved oxygen (DO) in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L) and did not require aeration. The pH was adjusted to 7.9 to 8.2, as necessary, using NaOH or HCl. The laboratory control consisted of deionized water adjusted to 20 ppt with artificial seasalt. Each porewater was tested within 3 hours of extraction.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox® test wells and 1 mL of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 microliters (µL) were added to each test cuvette. After an initial incubation period of 5 minutes, the first control cuvette was placed in the read chamber of the Microtox® Analyzer to set the instrument. Initial light readings (I_o) were then taken by placing each cuvette in the read chamber of the Microtox® Analyzer and measurements were recorded on a data sheet. Light output was measured in each cuvette after an additional 5 minutes (I_5) and 10 minutes (I_{15}) of exposure. Test acceptability criteria is a mean control final light output greater than 72 percent of initial output and a test mean output not greater than 110 percent of the control mean output.

The data were evaluated statistically by conducting one-tailed t-tests on the change in light output over time for the test sediment porewaters compared to the control

A reference toxicant test using copper chloride was conducted in conjunction with the sediment porewater test to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 1. Summary of methods for the Microtox test.

Test date	December 13, 2013
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#12B4010, Expiry 2/15
Control	Saltwater (20 ppt) prepared with Crystal Sea Marine Mix
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea Marine Mix; pH adjustment to 7.9-8.2
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Copper Chloride

3.0 RESULTS

The results of toxicity tests conducted using Microtox® are provided in Tables 2 and 3. The samples did not exceed sediment quality standards for the State of Washington (WDOE 2008).

Table 2. Results of Microtox® tests.

Sample ID	Change in light output as a % of Control (5 minutes)	Change in light output as a % of Control (15 minutes)
9	104	98
6	104	102
3	107	107
1	107	107
0	106	110

Table 3. Statistical analyses of Microtox results.

Sample ID	5-minute reading		15 minute reading	
	Mean % change in light output	Significantly different relative to the control	Mean % change in light output	Significantly different relative to the control
Control	91 ± 3	---	79 ± 4	---
9	95 ± 5	No	77 ± 4	No
6	94± 3	No	80 ± 7	No
3	98 ± 3	No	84 ± 5	No
1	98 ± 2	No	85 ± 2	No
1	97± 1	No	86 ± 2	No

4.0 QA/QC

The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Results of reference toxicant test used to monitor laboratory performance and test organism sensitivity are provided in Table 4. The results for the reference toxicant test fell within the range of mean ± two standard deviations of historical results, indicating that test organisms were of an appropriate degree of sensitivity.

Table 4. Reference toxicant test results.

Exposure Duration	Test date	Toxicant	EC50	Acceptable Range	CV (%)
5 Minutes	December 13, 2013	Copper	1228 µg/L	948-1628	13.2
15 Minutes			432 µg/L	398-615	10.7

$I_{(0)}$ is the light reading after the initial five minute incubation period

$I_{(5)}$ is the light reading five minutes after $I_{(0)}$

$I_{(15)}$ is the light reading fifteen minutes after $I_{(0)}$

$C_{(t)}$, $R_{(t)}$, and $T_{(t)}$ are the changes in light readings from the intial reading in each sample container for the control, reference sediment

Quality Control Steps:

1. Is control final mean output greater than or equal to 72% control initial mean output?

$I_{(5)}$:$F_{c(mean)}/I_{c(mean)}$: **91%** **YES**

$I_{(15)}$:$F_{c(mean)}/I_{c(mean)}$: **79%** **YES**

YES: Control results are acceptable and can be used for statistical analyses.
NO: Control results are unacceptable (use reference sediment for statistical analysis if available).

2. Are test initial mean values greater than or equal to 80% of control initial mean values?

S1 $I_{T(mean)}/I_{C(mean)}$: **95%** **YES**

S2 $I_{T(mean)}/I_{C(mean)}$: **99%** **YES**

S3 $I_{T(mean)}/I_{C(mean)}$: **92%** **YES**

S4 $I_{T(mean)}/I_{C(mean)}$: **88%** **YES**

S5 $I_{T(mean)}/I_{C(mean)}$: **92%** **YES**

INVALD: If the test sediment is greater than 110%, the results in uninterpretable
YES: If test sediment is reference, reference is acceptable

RE: Client Project: Yakima Steel
ARI Job No.: XY02

Dear Bill:

Please find enclosed the Chain-of-Custody record (COC), sample receipt documentation, and the final data package for samples from the project referenced above.

Sample receipt and analytical details are discussed in the Case Narrative.

An electronic copy of this data and associated raw data will be kept on file with ARI. Should you have any questions or problems, please feel free to contact me at any time.

Sincerely,

ANALYTICAL RESOURCES, INC.

Cooler Receipt Form

ARI Client: Newfields | Project Name: Yakima Steel

COC No(s): _____ (NA) | Delivered by: (Fed-Ex) UPS Courier Hand Delivered Other: _____

Assigned ARI Job No: XY402 | Tracking No. 7978 0417 1370 NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler?	YES	(NO)
Were custody papers included with the cooler?	(YES)	NO
Were custody papers properly filled out (ink, signed, etc.)	(YES)	NO

Temperature of Cooler(s) (°C) (recommended 2.0-6 0 °C for chemistry)
Time: 1020 — 0.8 — — — —

If cooler temperature is out of compliance fill out form 00070F — Temp Gun ID# 90877952

Cooler Accepted by: AV Date: 2/4/14 Time: 1020

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?			(NO)
What kind of packing material was used?	Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____		
Was sufficient ice used (if appropriate)?	NA	(YES)	NO
Were all bottles sealed in individual plastic bags?		YES	(NO)
Did all bottles arrive in good condition (unbroken)?		(YES)	NO
Were all bottle labels complete and legible?		(YES)	NO
Did the number of containers listed on COC match with the number of containers received?		(YES)	NO
Did all bottle labels and tags agree with custody papers?		(YES)	NO
Were all bottles used correct for the requested analyses?		YES	(NO)
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)	NA	(YES)	NO
Were all VOC vials free of air bubbles?	(NA)	YES	NO
Was sufficient amount of sample sent in each bottle?		(YES)	NO
Date VOC Trip Blank was made at ARI.	(NA)	_____	

Was Sample Split by ARI: (NA) YES Date/Time: _____ Equipment: _____ Split by: _____

Samples Logged by: AV Date: 2/4/14 Time: 1132

Case Narrative

Client: Newfields
Project: Yakima Steel
ARI Job No.: XY02

Sample Receipt

Six water samples were received on February 4, 2014 under ARI job XY02. The cooler temperature measured by IR thermometer following ARI SOP was 0.8°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Metals by SW6010C

The samples and associated laboratory QC were digested and analyzed within the method recommended holding times.

The method blank was clean at the reporting limits. The LCS percent recoveries were within control limits.

Cooler Receipt Form

ARI Client: Newfields

Project Name: AT145

COC No(s): _____ NA

Delivered by: (Fed-Ex) UPS Courier Hand Delivered Other: _____

Assigned ARI Job No: XL701

Tracking No: 7977 1163 5 [illegible] NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler?	YES	NO
Were custody papers included with the cooler?	YES	NO
Were custody papers properly filled out (ink, signed, etc.)	YES	NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry): 7.6

Time: 1614

If cooler temperature is out of compliance fill out form 00070F

Temp Gun ID#: 90870457

Cooler Accepted by: TC Date: 12-5-13 Time: 1626

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?		YES	NO
What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____			
Was sufficient ice used (if appropriate)?	NA	YES	NO
Were all bottles sealed in individual plastic bags?		YES	NO
Did all bottles arrive in good condition (unbroken)?		YES	NO
Were all bottle labels complete and legible?		YES	NO
Did the number of containers listed on COC match with the number of containers received?		YES	NO
Did all bottle labels and tags agree with custody papers?		YES	NO
Were all bottles used correct for the requested analyses?		YES	NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)...	NA	YES	NO
Were all VOC vials free of air bubbles?	NA	YES	NO
Was sufficient amount of sample sent in each bottle?		YES	NO
Date VOC Trip Blank was made at ARI	NA		

Was Sample Split by ARI: NA YES Date/Time: _____ Equipment: _____ Split by: _____

Samples Logged by: TC Date: 12-5-13 Time: 1626

***** Notify Project Manager of discrepancies or concerns *****

Case Narrative

Client: Newfields
Project: AT/YS
ARI Job No.: XQ29

Sample Receipt

Three sediment samples were received on December 5, 2013 under ARI job XQ29. The cooler temperature measured by IR thermometer following ARI SOP was 0.6°C. The samples were analyzed for AVS/SEM, TOC, and Grain Size. Total metals results have been reported under a separate cover. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

AVS/SEM Metals by SW6010C

The samples were digested and analyzed within the method recommended holding times.

The method blank was clean at the reporting limits. The LCS percent recoveries were within control limits.

The matrix spike percent recoveries and duplicate RPDs were within control limits.

General Chemistry Parameters

The samples were prepared and analyzed within method recommended holding times.

The method blanks were clean at the reporting limits. The LCS percent recoveries were within control limits.

The SRM percent recovery was in control.

The matrix spike percent recoveries of Acid Volatile Sulfide and Total Organic Carbon were outside the control limits for sample **WETSED 1**. All other quality control parameters were met for these analyses. No corrective action was taken.

Geotechnical Parameters

A laboratory-specific narrative follows this page.

Notes to the Testing:

1. Organic matter was not removed prior to testing, thus the reported values are the "apparent" grain size distribution. See narrative for discussion of the testing.

RE: MARCH 2018—QUARTERLY GROUNDWATER MONITORING AND SAMPLING AND ANNUAL CONTAINMENT AREA INSPECTION PROGRESS REPORT
BAY CHEMICAL SITE
YAKIMA, WASHINGTON
FARALLON PN: 683-024

Dear Mr. Wend:

Farallon Consulting, L.L.C. (Farallon) has prepared this letter report on behalf of BNSF Railway Company (BNSF) to document the March 2018 quarterly groundwater monitoring and sampling activities and annual Containment Area inspection at the Bay Chemical Site in Yakima, Washington (herein referred to as the Site) (Figure 1). The quarterly groundwater monitoring and sampling was conducted under Consent Decree No. 07-2-01906 dated June 6, 2007 entered into by BNSF and the Washington State Department of Ecology (Ecology). The quarterly groundwater monitoring and sampling event was conducted in accordance with the *Compliance Monitoring Plan, Bay Chemical Site, Yakima, Washington* dated August 9, 2007, prepared by Farallon, to monitor groundwater quality and the performance of the Containment Area constructed on the Site as part of the cleanup action.

This letter report presents a brief Site background, a description of the quarterly groundwater monitoring and sampling activities, groundwater analytical results, a summary of the Containment Area inspection, and conclusions.

BACKGROUND

The Site is located in a mixed-use light industrial and commercial area of Yakima, Washington (Figure 2). A cleanup action was conducted at the Site from December 2006 to September 2009, which included excavation of soil with arsenic, cadmium, chromium, copper, lead, manganese, and mercury at concentrations exceeding the Site-specific cleanup levels defined in the *Cleanup Action Plan, Bay Chemical Site, Yakima, Washington* dated February 2006, prepared for the Site by Ecology (CAP). The excavated soil was removed from the Site and consolidated in a Containment Area constructed as part of the cleanup action. The Containment Area was constructed with an engineered cap on a portion of the Site that comprises the Former Bay Chemical Leased Property and the BNSF Property (Figure 2).

Details regarding the cleanup action are provided in the *Completion and Compliance Monitoring Report, Bay Chemical Site, Yakima, Washington* dated November 17, 2009, prepared by Farallon (Compliance Monitoring Report). The contaminants of concern for groundwater are total and dissolved cadmium, lead, manganese, and zinc, as outlined in the CAP.

GROUNDWATER MONITORING AND SAMPLING

Groundwater monitoring and sampling activities were conducted at monitoring wells MW-1 and MW-10 through MW-13, and piezometer PZ-1 on March 6, 2018. The locations of the monitoring wells are shown on Figure 2. Piezometer PZ-1 was used to collect water-level measurements only. Groundwater samples were collected in accordance with the Compliance Monitoring Report, and the *Low Stress (low flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells* dated July 30, 1996, revised January 19, 2010, prepared by U.S. Environmental Protection Agency (EPA) Region 1.

The locking well cap was removed from each monitoring well, and the groundwater level was allowed to equilibrate with atmospheric pressure for at least 15 minutes. The depth to groundwater was measured at each monitoring well from the northern side on the top of each well casing to the nearest 0.01 foot using an electronic water-level measuring device. The groundwater-level measurements for the monitoring wells were taken within a 1-hour period between the first and last measurements (Table 1). Reusable equipment was decontaminated prior to initial use and between uses at each monitoring well.

Monitoring wells MW-1 and MW-10 through MW-13 were purged using a peristaltic pump and dedicated polyethylene tubing. Before the monitoring wells were purged, the dedicated polyethylene tubing intake was placed at the approximate center of the screened interval in each monitoring well. Groundwater was purged from each monitoring well at a flow rate of 100 milliliters per minute. Prior to sampling, field measurements for pH, temperature, specific conductivity, dissolved oxygen, and oxidation-reduction potential were collected during purging of groundwater at each monitoring well using a Yellow Springs Instrument model Pro-DDS multi-parameter display system water-quality meter equipped with a flow-through cell. Turbidity was measured using a Hach 2100Q turbidity meter. Groundwater quality parameters and field measurements are presented in Table 2. Groundwater samples were collected after the parameters for pH, temperature, specific conductivity, oxidation-reduction potential, dissolved oxygen, and turbidity had stabilized. Stabilization is defined for pH as a change of $\pm$0.1 pH unit between readings for three consecutive measurements; for temperature and specific conductivity as a relative percent difference of less than 3 percent between readings for three consecutive measurements; for oxidation-reduction potential as a change of $\pm$10 millivolts between readings for three consecutive measurements; for dissolved oxygen as a relative percent difference of less than 10 percent for readings greater than 0.5 milligram per liter, or three consecutive readings of less than 0.5 milligram per liter; and for turbidity as a relative percent difference of less than 10 percent for readings greater than 5 nephelometric turbidity units, or three consecutive readings of less than 5 nephelometric turbidity units.

Following stabilization of groundwater quality parameters, groundwater samples were collected directly from the pump outlet. Groundwater samples were placed directly into laboratory-supplied sample containers preserved with nitric acid, with care taken to minimize turbulence and to prevent handling of the seal and/or lid of the container when the sample was placed into the containers. The samples collected for analysis for dissolved metals were filtered in the field using a 0.45-micron filter. The containers were filled, and the seal and/or lid was secured. The groundwater samples were placed on ice in a cooler and transported under standard chain-of-custody protocols to TestAmerica Laboratories, Inc. of Tacoma, Washington. The samples collected from each monitoring well included both a filtered and an unfiltered portion. Groundwater samples were collected and submitted for laboratory analysis for dissolved (filtered) and total (unfiltered) cadmium, lead, manganese, and zinc by EPA 6000/7000 Series Methods.

GROUNDWATER RESULTS

The results from the groundwater monitoring and sampling are summarized below. Groundwater elevation and groundwater quality parameters measured during each of the groundwater monitoring events are summarized in Tables 1 and 2, respectively. Analytical results were compared to Site-specific cleanup levels defined in the CAP, which are summarized in Table 3 and on Figure 3. The laboratory analytical report is provided in Attachment A. The depth to groundwater ranged from 8.09 (monitoring well MW-11) to 13.28 feet below the top of the monitoring well casing (monitoring well MW-1), with a groundwater flow direction to the south-southeast at an average hydraulic gradient of approximately 0.00437 foot per foot (Figure 3).

Total and dissolved cadmium were reported at concentrations exceeding the cleanup level in groundwater samples collected from monitoring wells MW-11 and MW-12. Cadmium was not reported at concentrations exceeding the cleanup level in the remaining groundwater samples collected from the Site. Total and dissolved zinc, lead, and manganese were reported at concentrations less than cleanup levels in all of the monitoring wells sampled during the March 2018 sampling event (Figure 3).

CONTAINMENT AREA ANNUAL INSPECTION

Annual inspections of the Containment Area are conducted for evidence of erosion, animal intrusion, and/or physical impacts such as vandalism. Following each inspection, impacts to the engineered cap are corrected, if necessary, to prevent possible exposure to the materials within the Containment Area.

The annual inspection of the Containment Area was performed on March 6, 2018. The inspection included observation of the Containment Area erosion layer, drainage provisions, and impacts to the surface of the Containment Area. Documentation of the inspection included photographs and field notes to document the condition of the Containment Area. Photographs taken during the inspection are provided in Attachment B. Figure 4 shows the location and perspective of each photograph taken during the inspection.

During the inspection, the erosion layer was found to be consistent with the original constructed condition. Tire tracks were observed on the northern portion of the Containment Area and on the eastern portion of the Containment Area near monitoring wells MW-11 and MW-12. The tire tracks were less than 1 inch in depth and did not appear to affect the integrity of the Containment Area. Minor evidence of animal intrusion was observed on the Containment Area near monitoring well MW-12. The animal intrusion was inspected and determined to be shallow (less than 6 inches), and did not penetrate the quarry spall layer. Farallon backfilled the shallow intrusions with gravel. Minor amounts of rubble and rock remain on the northern boundary of the Containment Area. These materials originally were stockpiled by BNSF during proximate track repairs conducted in 2011 and have not entirely been removed. No visible settlement or erosion was observed. No areas of runoff pooling or subsidence were observed.

The southern portion of the Containment Area was observed to have a similar amount of vegetation as observed during the March 2017 inspection. Drainage provisions around the cap were observed to be unobstructed, with no areas of runoff pooling or erosion observed. The cap and drainage provisions were determined to be in excellent condition. Other than placing gravel in the shallow burrows, no maintenance activities were performed in March 2018. The next Containment Area inspection is scheduled for March 2019.

CONCLUSIONS

Concentrations of total and dissolved cadmium and zinc reported in monitoring wells MW-11 and MW-12 have varied seasonally over time (Table 3). Total cadmium and zinc concentrations reported at the Site generally have been highest when the groundwater elevation has been historically higher in late summer and early fall, corresponding with irrigation in the region, and have been lowest when groundwater elevation has been lower in late winter and early spring. Groundwater elevations at the Site have increased by 1 to 2 feet across the Site since December 2015. Trends will continue to be monitored on a quarterly basis. The next groundwater monitoring and sampling event will be conducted in June 2018.

CLOSING

Please contact either of the undersigned at (425) 295-0800 if you have questions or need additional details.

Sincerely,

Farallon Consulting, L.L.C.

	12/6/2016			8.86	985.64
	3/2/2017			8.76	985.74
	6/6/2017			9.34	985.16
	9/6/2017			8.15	986.35
	12/20/2017			9.15	985.35
	3/6/2018			9.85	984.65

NOTES:
[1]Elevation in feet above mean sea level (National Geodetic Vertical Datum of 1929).
[2]Feet below top of well casing.

NOTES:

— denotes sample not analyzed.

NS denotes pH could not be collected due to a field equipment malfunction.

[1]Turbidity readings for December 2013 and March 2014 were recorded using a Horiba U-52 multiparameter water-quality meter, and might be suspect due to equipment error. All other turbidity readings were collected using a La Motte or Hach turbidity meter.

^{o}C = degrees Celsius
mg/l = milligrams per liter
mS/cm = milliSiemens per centimeter
mV = millivolts
NTU = nephelometric turbidity units
ORP = oxidation-reduction potential

Site-Specific Cleanup Levels for Groundwater[3]			**5**		**15**		**2,240**		**4,800**	

NOTES:

Results in **bold** denote concentrations at or exceeding applicable cleanup levels.

< denotes analyte not detected at or exceeding the reporting limit listed.

[1]Analyzed by U.S. Environmental Protection Agency Methods 6000/7000 Series.

[2]Actual sample names are followed by a "D" or a "T," indicating whether the groundwater sample was analyzed for dissolved (filtered) or total (unfiltered) metals.

[3]Washington State Model Toxics Control Act Cleanup Regulation Method A, B, or C cleanup levels for groundwater, as specified in Table 1 of the *Cleanup Action Plan, Bay Chemical Site, Yakima, Washington* dated February 2006, prepared by the Washington State Department of Ecology.

[4]The sample collected from monitoring well MW-11 on September 11, 2014 was reanalyzed by TestAmerica Laboratories, Inc. on November 6, 2014; monitoring well MW-11 was resampled by Farallon on November 6, 2014. The results from the reanalysis and resampling of monitoring well MW-11 groundwater were similar to the initial September 11, 2014 results.

Comments
No additional comments.

Receipt
The samples were received on 3/7/2018 3:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.1° C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

RE: **CONCEPTUAL SITE MODEL TECHNICAL MEMORANDUM**
AGRI-TECH AND YAKIMA STEEL FABRICATORS SITE
YAKIMA STEEL FABRICATORS
YAKIMA, WASHINGTON
AGREED ORDER NO. DE 6091
FARALLON PN: 765-001

Farallon Consulting, L.L.C. (Farallon) has prepared this technical memorandum to provide the Washington State Department of Ecology (Ecology) with a conceptual site model (CSM) for the property at 6 and 10½ East Washington Avenue in Yakima, Washington (herein referred to as the Site) (Figure 1). The CSM presented in this technical memorandum will support completion of a Feasibility Study for the Site. Farallon has prepared this technical memorandum on behalf of Yakima Steel Fabricators, Inc. (YSF) for the YSF and Agri-Tech, Inc. (Agri-Tech) properties that make up the Site (Figure 2).

The work described in this technical memorandum was performed to meet the requirements of *Agreed Order No. DE 6091* entered into by Ecology and YSF pursuant to the authority of the Washington State Model Toxics Control Act (MTCA) dated October 27, 2008 (Agreed Order), and the *First Amendment to Agreed Order No. DE 6091* dated October 17, 2016. This technical memorandum includes a brief description of the Site and adjacent properties; discussion of confirmed source areas on the Site; identification of constituents of concern (COCs) and their fate and transport; an exposure assessment; proposed cleanup levels; and points of compliance.

BACKGROUND

This section summarizes relevant background information on the historical Site use and use of the west-adjacent Bay Chemical property.

YSF AND AGRI-TECH SITE DESCRIPTION AND HISTORICAL USAGE

The Site consists of Yakima County Tax Parcel Nos. 19133141009 and 19133141409, which total 6.24 acres of land (Figure 2). Two structures currently are present at the Site: one single-story building currently used for steel fabrication and business offices on the YSF property (YSF building); and one single-story warehouse building on the Agri-Tech property (Agri-Tech building). The areas east and south of the YSF building are used for storage of steel and equipment. Currently, the Agri-Tech building is leased by the operator of YSF for steel fabrication operations.

Historical Site uses include the following (Attachment A, Figure 3):

- Construction and operation of a lime and sulfur formulating plant by Yakima Farmers Supply on the Agri-Tech property from approximately 1960 through 1971. The formulating plant was demolished between 1978 to 1982.
- Operation of a fruit packing supplies and equipment company on the Agri-Tech property from 1982 through 1989.
- Operation of a steel fabrication facility on the YSF property from approximately 1980 to the present.

Additional discussion of historical Site uses is provided in the *Revised Remedial Investigation Report, Agri-Tech & Yakima Steel Fabricators, 6 and 10 ½ East Washington Avenue, Yakima Washington* dated June 10, 2004, prepared by Farallon for Yakima Steel Fabricators (Farallon 2004) (Revised RI Report); and the technical memorandum regarding Metals Source Evaluation, Agri-Tech and Yakima Steel Fabricators Site, Yakima Steel Fabricators, Yakima, Washington dated June 9, 2017, from Messrs. Eric Buer and Jeff Kaspar of Farallon to Mr. Chris Wend of Ecology (Farallon 2017a) (Metals Source TM).

Based on the historical Site uses and physical characteristics, four areas of investigation have been established on the Site (Figure 2):

- Area 1 includes the former Yakima Farmer Supply lime and sulfur processing plant, and the area of the processing plant's waste pit (also referred to as the Area 1 waste pit).
- Area 2 includes the central and eastern portions of the YSF property between the YSF building and the east-adjacent automobile recycling facility, and is suspected to have included stockpiles of bulk lime and sulfur.
- Area 3 includes the portion of the Site south and southwest of the YSF building. Ecology identified Area 3 as a potential area of metals contamination due to historical activities at the west-adjacent Bay Chemical Company property. Area 3 also includes the Site wetland buffer area.
- Area 4 includes the topographically distinct (i.e., 3 to 5 feet below the surrounding Site topography) wetland on the southern portion of the Site. Area 4 has unique environmental conditions, including seasonal standing water and saturated surface soil, and is subject to sediment criteria that do not apply to other portions of the Site.

BAY CHEMICAL SITE DESCRIPTION AND HISTORICAL USAGE

The property west-adjacent to the Site, Yakima County Tax Parcel No. 19133141010, previously was owned by Northern Pacific Railroad, predecessor of current owner, Burlington-Northern Santa Fe Railroad (BNSF) (Figure 2). This property was leased to Bay Chemical Company, a manufacturer of soil micronutrients, from 1963 to late 1975 or early 1976. The BNSF-leased property makes up a portion of the Former Bay Chemical site (herein referred to as the Bay Chemical site), an Ecology-listed facility.

The Bay Chemical Company manufactured liquid zinc sulfate by reacting dry steel mill flue dust and sulfuric acid in wooden mixing tanks. Additional detail regarding Bay Chemical zinc sulfate production practices is provided in the Metals Source TM.

According to the *Former Bay Chemical Site Remedial Investigation Report, Volume 1* dated March 1997, prepared by ERC/Pacific Groundwater Group (1997) (Bay Chemical RI Report), metals associated with the flue dust at the Bay Chemical site included arsenic, antimony, cadmium, chromium, copper, lead, manganese, mercury, and zinc. These metals have been detected in soil and groundwater at the Bay Chemical site and at the Site (Attachment A, Figure 12; Attachment B, Table 7, respectively).

CONCEPTUAL SITE MODEL

This section identifies confirmed source areas of constituents of potential concern (COPCs) that have affected media of concern, including soil, groundwater, and sediment. The nature and extent of contamination, and contaminant fate and transport mechanisms, are also identified and/or discussed.

CONFIRMED SOURCE AREAS

Data collected as part of the remedial investigation (RI) indicate that multiple source areas of COPCs that have affected soil, sediment, and groundwater are present on the Site, off the Site within the Yakima Railroad Area (YRRA), and on the adjacent Bay Chemical site. Source areas that apply to each Area within the Site are discussed below. Additional details describing the nature and extent of COPCs identified during the RI are provided in the Revised RI Report. RI tables and figures are provided in Attachment A. Supplemental sampling of soil, groundwater, and sediment was conducted at the Site in 2011. Preliminary tables summarizing the results of the 2011 supplemental sampling event were provided to Ecology in July and August 2011 and are presented in Attachment B. Chain of Custody forms and laboratory analytical reports from the 2011 supplemental sampling event are also provided in Attachment B. The 2011 investigation and sampling results will be summarized in the Feasibility Study in accordance with the Agreed Order.

Area 1: Yakima Farmer Supply Waste Pit and Processing Plant

Confirmed source areas in Area 1 include the former waste pit constructed by Yakima Farmer Supply (Attachment A, Figure 3). Soil analytical data indicate that volatile organic compounds (VOCs) and chlorinated pesticides are present in soil at concentrations that exceed their respective cleanup levels for soil (Attachment A, Figures 9 and 10, Table 2). Halogenated volatile organic compounds (HVOCs), including tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-

dichloroethene (DCE), and vinyl chloride, were detected at concentrations that exceed their respective cleanup levels in groundwater samples collected from monitoring well WDOE-6, which is within the boundaries of the waste pit (Attachment A, Figure 20). HVOCs, including PCE, TCE, cis-1,2-DCE, and vinyl chloride, were also detected at concentrations that exceed their respective cleanup levels in groundwater samples collected from monitoring wells MW-2 and MW-6, down-gradient of the waste pit (Attachment A, Figure 9). These data indicate that the northern portion of the waste pit is a source of HVOCs to shallow groundwater.

The results of the Bay Chemical site cleanup confirmed the conclusion of the Bay Chemical RI Report that metals from the Bay Chemical site previously encroached upon the Site. The Bay Chemical site cleanup in Area 1 was terminated where the buildings were present and where the waste pit materials were encountered.

PCE concentrations in groundwater exceed the cleanup level at monitoring well MW-1; no source has been identified in the overlying soil (Attachment A, Figure 21). Groundwater samples from monitoring well MW-1 have consistently contained concentrations of PCE and associated degradation products since monitoring began, indicating that an up-gradient source of dissolved-phase PCE exists. Ecology has historically agreed that these constituents may be associated with one or more of the up-gradient YRRA facilities north of the Site.

Area 2: Bulk Lime and Sulfur Stockpiles

No source areas of COPCs have been identified for Area 2. Soil analytical results for HVOCs and pesticides are less than cleanup levels for soil. The observed HVOC concentrations in soil were not high enough or deep enough to be a source of HVOCs to groundwater in Area 2.

PCE periodically was detected at concentrations that exceed the cleanup level of 5 micrograms per liter (µg/l) in groundwater samples collected from monitoring well MW-3 (Attachment A, Figure 19). Monitoring well MW-3 is cross-gradient of the waste pit and its associated down-gradient monitoring wells MW-2 and MW-6. HVOC degradation compounds, including TCE, cis-1,2-DCE, and vinyl chloride, were reported non-detect at the laboratory practical quantitation limit (PQL) in the groundwater samples collected from monitoring well MW-3. Monitoring well MW-3 is screened at a depth between 9 and 29 feet below ground surface (bgs). These data suggest the HVOC impacts to groundwater in Area 2 are associated with an unknown up-gradient source, possibly associated with the YRRA PCE plume.

Area 3: South Site

The west-adjacent Bay Chemical site had been identified as a source of metals contamination in soil at Area 3 (Farallon 2004, 2017a). Cadmium, lead, manganese, and zinc were detected at concentrations exceeding their respective cleanup levels for soil (Attachment A, Figure 3). The west-adjacent Bay Chemical site is a documented source of cadmium, lead, zinc, and other heavy metals associated with dry steel mill flue dust used in production of zinc sulfate.

Wind transport of flue dust and metals-laden settling pond sludge onto the Site occurred throughout the period of active operation on the Bay Chemical site (Farallon 2017a). Overflow

from the Bay Chemical site settling pond, as noted in the Bay Chemical RI Report, resulted in transport of settling pond sludge and metals-contaminated water onto the southern portion of the Site at the wetland (Area 4) and the south-adjacent drainage/irrigation ditch, contaminating Site soils.

Total petroleum hydrocarbons as diesel-range organics (DRO) were detected at a concentration that exceeded the cleanup level of 2,000 milligrams per kilogram (mg/kg) in the soil sample collected from test pit I-TP3 at a depth of 3 feet bgs. DRO was reported non-detect at the laboratory PQL in the soil sample collected from test pit I-TP3 at a depth of 7 feet bgs (Attachment B, Table 1). DRO was reported non-detect at the laboratory PQL in the soil samples collected from test pits I-TP4 and I-TP6. The soil sampling data from test pit I-TP3 indicate a localized shallow source area of DRO is present at I-TP3. No other confirmed COPC source areas have been identified for Area 3.

Area 4: Wetland

As noted above, the west-adjacent Bay Chemical site has been identified as a source of metals contamination to sediment in Area 4 (Farallon 2017a, 2017b). Cadmium was detected at concentrations that exceeded the sediment cleanup screening level of 5.4 mg/kg in three sediment samples collected from Area 4 (Attachment C, Table 1; Attachment C, Figure 4). A fourth sediment sample collected from Area 4 exceeded the sediment cleanup objective of 2.1 mg/kg. No other COPC source areas have been identified for Area 4.

CONTAMINANT FATE AND TRANSPORT

This section includes a discussion of the fate and transport characteristics of the COPCs identified in the affected media at the Site that are relevant to the evaluation of potentially feasible remedial technologies.

Volatile Organic Compounds

Groundwater analytical data indicate very slow leaching of HVOCs from the soil matrix within the Area 1 waste pit to groundwater (Figure 3). The PCE identified in soil beneath the Agri-Tech building is present at relatively high concentrations, and is in direct contact with groundwater. The estimated extent of HVOCs in soil exceeding cleanup levels is shown on Figure 4. Based on soil concentrations, concentrations of PCE in groundwater should exceed those observed at monitoring well WDOE-6 within the waste pit, and down-gradient of monitoring wells MW-2 and MW-6. The estimated extent of HVOCs in groundwater exceeding cleanup levels based on the most-recent groundwater monitoring event (June 2011) is shown on Figure 5. Farallon previously evaluated VOC contributions to groundwater using Ecology cleanup level calculation spreadsheets for soil in direct contact with groundwater. The predicted concentrations of VOCs in groundwater using the Ecology spreadsheets exceed the empirical data for monitoring wells WDOE-6, MW-2, and MW-6 (Farallon 2004).

Farallon's analysis and groundwater monitoring data indicate that the VOC contribution to groundwater from the Area 1 waste pit is negligible and is not resulting in an exceedance of relevant cleanup levels. Furthermore, the soil and groundwater analytical data indicate that natural attenuation of PCE is occurring in the waste pit, as indicated by the presence of PCE degradation

products in groundwater samples collected from monitoring wells WDOE-6, MW-2, and MW-6 (Figure 3). Shallow monitoring wells MW-2, MW-6, and MW-7A are immediately down-gradient of the source of VOCs at the waste pit and historically have contained concentrations of VOCs that have been less than the laboratory PQL, further supporting the supposition that the contribution of contaminant mass from the source of VOCs at the waste pit is minimal.

Water quality and geochemical parameters indicate that conditions in the waste pit, and in the southern portion of Area 3 up-gradient of the Site wetland (Area 4), appear to be conducive to reductive dechlorination of PCE via biodegradation (Attachment A, Table 13). Reductive dechlorination actively degrades PCE to vinyl chloride and eventually to nonhazardous ethene and ethane. Groundwater monitoring performed in June 2011 confirmed that reductive chlorination is ongoing in Site groundwater (Figure 3).

PCE and TCE that are not fully dechlorinated and degraded before being transported into more aerobic groundwater conditions outside the waste pit are subsequently transported down-gradient of, and comingled with, the dissolved-phase plume attributed to an off-Site source within the YRRA. DCE isomers and vinyl chloride that migrate from the waste pit prior to complete anaerobic degradation appear to be degraded aerobically along the groundwater flow path. Concentrations of breakdown products consistently have been less than the cleanup levels for groundwater at down-gradient Site monitoring wells MW-4, MW-5, MW-7A, MW-7B, MW-10, and MW-11 (Figure 3).

The monitoring well pair MW-7A and MW-7B were installed to assess the vertical distribution of VOCs in groundwater on the southern portion of the Site. Monitoring well MW-7A is constructed with a well screen at a depth of 5 to 15 feet bgs. Monitoring well MW-7B is constructed with a well screen at a depth of 25 to 30 feet bgs. Cis-1,2-DCE is the only HVOC detected at monitoring well MW-7A; and PCE, TCE, and cis-1,2-DCE have been detected in groundwater at deep monitoring well MW-7B (Figure 3).

VOCs were not detected at concentrations exceeding cleanup levels in groundwater samples collected from monitoring wells MW-7A and MW-7B, both of which were constructed with screened intervals at the direction of Ecology. Monitoring well WDOE-6, in which HVOCs were detected at concentrations exceeding cleanup levels in groundwater samples, is screened from 11 to 17 feet bgs. Down-gradient monitoring wells MW-2 and MW-6 are screened from 2 to 12 feet bgs and 3 to 13 feet bgs, respectively, at the upper limit of the WDOE-6 well screen. While a gap exists between the bottom of the MW-7A well screen (15 feet bgs) and the top of the MW-7B well screen (25 feet bgs), it is unlikely HVOCs are present at concentrations that exceed their respective cleanup levels in groundwater at this depth interval and remain undetected. The episodic detections of HVOCs in groundwater collected from monitoring well MW-6 would be dispersed and diluted along the flow path between monitoring wells MW-6, MW-7A, and MW-7B. Previous investigations have not identified stratification of the shallow unconfined aquifer on the Site; and historical detections of PCE, TCE, and cis-1,2-DCE in groundwater collected from monitoring wells MW-7A and MW-7B were less than their respective cleanup levels.

Chloroform has been consistently detected in groundwater samples collected from monitoring wells screened at a depth below 20 feet bgs (Attachment A, Table 3), including:

- Monitoring well MW-1 up-gradient of the waste pit;
- Monitoring well MW-3 cross-gradient of the waste pit; and
- Monitoring wells MW-4 and MW-5 down-gradient of the waste pit.

These data suggest a vertical stratification of VOCs in groundwater and that VOCs detected at monitoring well MW-7B are most likely associated with the deeper regional YRRA plume.

Pesticides

Pesticides, including dieldrin, endrin, dichlorodiphenyldichloroethane (DDD), dichlorodiphenyldichloroethylene (DDE), aldrin, and heptachlor epoxide, were detected at concentrations that exceed their respective cleanup levels for soil in samples collected from the Area 1 waste pit. Pesticides have strong sorptive properties, have low solubility in water, and are relatively resistant to biodegradation processes. The detected pesticides are not expected to be mobile and likely will persist in the waste pit materials for an extended period of time depending on the mass of each contaminant present. The soil analytical data indicate that dieldrin, endrin, DDD, DDE, aldrin, and heptachlor epoxide are present primarily beneath the Agri-Tech building, with low concentrations identified in the central portion of the waste pit. The approximate extent of pesticides in soil exceeding applicable cleanup levels is shown on Figure 6.

The estimated extent of pesticides in groundwater exceeding cleanup levels based on the most-recent groundwater monitoring event (June 2011) is shown on Figure 8. Historical dieldrin detection limits exceed the current MTCA Method B cleanup level for groundwater; therefore, the full extent of dieldrin contamination at the Site cannot be determined with the currently available data. However, the suite of pesticides monitored in groundwater indicate that the area of pesticide-contaminated groundwater is stable, and there is minimal risk of pesticides migrating down-gradient in groundwater beyond the southern edge of the YSF building, or ultimately discharging to surface water in Area 4 or further down-gradient at concentrations that would require further action.

Metals

Metals are persistent contaminants that will remain in soil unless physical or chemical processes mobilize the metals. Concentrations of metals in groundwater generally are dictated by the concentrations of metals in soil that are in direct contact with groundwater and other physical and chemical properties that facilitate dissolution of metals from soil to groundwater.

According to the Metals Source TM, cadmium and lead were detected at concentrations that exceed their respective preliminary screening levels in test pits excavated by Ecology in the eastern portion of Area 3 (Attachment D, Table 1). Cadmium, lead, manganese, mercury, and zinc were detected at concentrations that exceed their respective cleanup levels in the western portion of Area 3 and were subsequently excavated to a maximum depth of 6 feet bgs as part of the Bay Chemical

site cleanup (Figure 9). The estimated extent of metals in soil at concentrations exceeding cleanup levels is shown on Figures 10a through 10c.

Cadmium was detected at concentrations that exceed the sediment cleanup screening level of 5.4 mg/kg dry weight in Area 4 sediment. However, bioassay testing of sediment collected from Area 4 did not exceed biological cleanup screening level criteria. Under Section 520 of Chapter 173-204 of the Washington Administrative Code (WAC 173-204-520), Sediment Management Standards, bioassay results override analytical chemistry results. Therefore, the metals detected do not qualify Area 4 for listing as a contaminated sediment site.

For one sampling event in 2011, both total and dissolved arsenic were detected at concentrations that slightly exceeded the cleanup level for groundwater of 5 µg/l in monitoring well MW-7A (Attachment B, Table 7). The source of the arsenic in groundwater is suspected to be naturally occurring and may be related to slightly reducing conditions proximate to Area 4 associated with the wetland area. Arsenic concentrations in soil at the Site and the Bay Chemical site predominantly have been less than levels that are considered to present a risk to groundwater.

No other metals were detected at concentrations that exceed groundwater cleanup levels in groundwater samples collected on the Site. However, metals have been detected in Bay Chemical site monitoring wells MW-11 and MW-12, which are located adjacent to the western Site boundary near the wetlands in Area 4. This groundwater is suspected to be the primary source of water to the wetlands, although standing water has not been observed for several years since up-valley irrigation ceased. Surface water has not been sampled and evaluated in the wetlands to determine whether metals pose a risk.

TERRESTRIAL ECOLOGICAL EVALUATION

A Terrestrial Ecological Evaluation (TEE) is required by WAC 173-340-7490 at any site where there has been a release of a hazardous substance to soil. The regulation requires that one of the following actions be taken:

- Documenting a TEE exclusion using the criteria presented in WAC 173-340-7491;
- Conducting a simplified TEE in accordance with WAC 173-340-7492; or
- Conducting a site-specific TEE in accordance with WAC 173-340-7493.

A simplified TEE was conducted in accordance with WAC 173-340-7492. The simplified TEE results indicated the following:

- Chlorinated pesticides were detected at concentrations that exceed the values listed in Table 749-2 for industrial sites. The areas of exceedance are under the concrete floors of the YSF and Agri-Tech buildings and/or other paved areas, which act as engineered barriers and prevent completion of the exposure pathway for terrestrial ecologic receptors under WAC 173-340-7492(2)(b).
- Soil in the areas defined by sampling locations I-TP3, J-TP2, J-TP3, and Pit K; and M-TP1, Pit-M, and TP-8 currently exceed the values identified for metals on industrial sites

in Table 749-2 (Figure 11). However, these areas likely will be excavated as part of a future cleanup action, eliminating current ecologic risk posed by the affected soil.

The engineered barriers provided by the YSF and Agri-Tech building floors and surrounding paved areas render the soil exposure pathway incomplete for pesticides in soil that exceed simplified TEE screening criteria on the Site. Remediation of the small area identified above for metals will eliminate the exposure pathway for metals in soil in the central portion of the Site. Institutional controls will likely be implemented as a component of a future cleanup action to ensure compliance with WAC 173-340-7492(3) and prevent future exposure to plants or soil biota in the event of a change in land use. The institutional controls may include a restrictive covenant that identifies where pesticides remain in soil below engineered barriers and places restrictions on accessing areas where contaminated soil remains.

No further analysis is required by WAC 173-340-7490. The Ecology TEE form for the Site is provided in Attachment E.

TECHNICAL ELEMENTS

This section presents the technical elements of the CSM, including applicable or relevant and appropriate requirements (ARARs), media of concern, COCs, and an exposure pathway assessment. These technical elements will be used in the Feasibility Study to evaluate cleanup technologies and alternatives.

APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

Cleanup of contaminated media at the Site will be conducted under the Ecology Agreed Order No. DE 6091. The primary ARARs related to the remedial action include:

- MTCA, Chapter 70.105D of the Revised Code of Washington (RCW 70.105D) and WAC 173-340;
- Washington State Solid Waste Management Laws and Regulations, RCW 70.95, WAC 173-351, and WAC 173-304;
- Washington State Dangerous Waste Regulation, WAC 173-303; and
- Washington State Sediment Management Standards, WAC 173-204.

These primary ARARs are anticipated to be the most applicable to the remedial action, because they provide the framework for the remedial action, including applicable and relevant regulatory guidelines, cleanup standards, waste disposal criteria, references for additional ARARs, and standards for documentation of the remedial action.

Other applicable ARARs for cleanup of the Site include:

- Occupational Safety and Health Act, Part 1910 of Title 29 of the Code of Federal Regulations (29 CFR 1910);

- Safety Standards for Construction Work, WAC 296-155; and
- Accreditation of Environmental Laboratories, WAC 173-50.

EXPOSURE ASSESSMENT

The two types of exposure risk associated with the presence of COPCs at the Site are related to human and terrestrial ecological receptors. This subsection presents the evaluation and conclusions pertaining to the exposure pathways at the Site. The goal of this subsection is to identify potential exposure scenarios that will assist in selection of appropriate cleanup levels for the Site and for evaluation of technically feasible cleanup alternatives during the Feasibility Study.

Soil Pathway

The exposure pathways for shallow soil containing COPCs include the direct contact and inhalation pathways. Direct contact may include dermal contact and ingestion pathways for both human and ecological receptors. Inhalation pathways may include volatilization of volatile COPCs, or in the case of the nonvolatile COPCs such as metals and pesticides, particulate dust. Complete direct contact and inhalation pathways for soil include direct contact with affected soil in Areas 2 and 3 where soil is exposed or covered with a shallow layer of gravel.

Human and ecological exposure to the soil in Area 1 within the former waste pit would require compromising either the building structures or the pavement cap overlying the waste pit that currently mitigates exposure to routine site workers and visitors, neither of which is anticipated. Temporary construction workers conducting subsurface work on utilities or other unique services could be at risk of exposure. Therefore, the direct exposure pathway for Area 1 soil is not complete, with the exception of temporary construction workers conducting work that could result in exposure to affected soil. The inhalation pathway is considered complete for volatile COPCs since no evaluation of soil gas or indoor air has been conducted.

Groundwater Pathway

Potential exposure pathways for COPCs in groundwater include the direct contact (i.e., dermal contact and ingestion) and inhalation pathways. No production or irrigation wells are located on or proximate to the Site, reducing risk of direct contact to standard workers and visitors. Temporary construction workers conducting subsurface work would have exposure risk. Groundwater monitoring analytical data for monitoring wells down-gradient of Area 1 and the YRRA indicate concentrations of COPCs in groundwater, particularly PCE and associated HVOCs, are less than the preliminary screening levels before reaching the Site boundary (Figure 3). The direct contact pathway would be incomplete, with the exception of temporary construction workers conducting subsurface work that could result in exposure to affected groundwater.

The inhalation pathway for groundwater at the Site is considered complete since volatile COPCs are present in Area 1 that may represent a vapor intrusion risk, and that air pathway has not been evaluated during the RI.

Groundwater, including groundwater flowing from the west-adjacent Bay Chemical site proximate to monitoring wells MW-11 and MW-12, is the primary source of water in the wetlands, although standing surface water has not been observed in Area 4 for several years. Surface water has not been sampled and evaluated in the wetlands (Area 4) to determine whether COPCs are present at concentrations that pose a risk to human or ecological receptors. Metals have been identified in groundwater samples collected from Bay Chemical site monitoring wells located near the wetlands, including monitoring wells MW-11 and MW-12, and it is possible that metals-impacted groundwater may be discharging to surface water in the wetlands. Metals associated with residual flue dust contamination (arsenic, cadmium, chromium, copper, lead, manganese, mercury, and zinc) on the Bay Chemical site in soil and groundwater may pose a risk through the groundwater to surface water pathway. The surface water pathway is retained as a complete pathway pending evaluation of surface water quality in the wetlands or groundwater quality near the wetlands.

CLEANUP STANDARDS

As defined in WAC 173-340-700, cleanup standards include establishing cleanup levels and the points of compliance at which the cleanup levels are to be attained. The cleanup standards for the Site have been established in accordance with WAC 173-340-700 through 173-340-760 to be protective of human health and the environment.

CLEANUP LEVELS

The cleanup levels are the concentrations of COCs that are to be met for each medium of concern at the point of compliance defined for the Site. Cleanup levels for the media of concern, soil, groundwater, surface water, and indoor air are presented in Tables 1 through 4. The selected cleanup levels provide the basis for evaluation of cleanup alternatives during the Feasibility Study, define the COCs, and define the media of concern.

POINTS OF COMPLIANCE

The point of compliance is defined in WAC 173-340-200 as the location(s) where cleanup levels established in accordance with WAC 173-340-720 through WAC 173-340-760 will be attained to meet the requirements of MTCA.

The point of compliance for soil is defined as all soil at the Site where analytical results of in-situ soil samples report concentrations of COCs exceeding their respective MTCA cleanup (i.e., the standard point of compliance under MTCA). The point of compliance for soil will not exceed the boundary of the Site.

The standard point of compliance for groundwater is defined as the uppermost level of the saturated zone extending vertically to the lowest depth that potentially could be impacted by the COCs throughout the Site (i.e., the standard point of compliance under MTCA). The point of compliance for groundwater will be selected during a later phase of the cleanup process to comply with WAC 173-340-720(8)(c), Conditional Point of Compliance. The uppermost level of the saturated zone is approximately 2.5 feet bgs. The lowest depth that could be affected by the COCs

is approximately 30 feet bgs. Groundwater monitoring wells that may be used as point of compliance wells include monitoring wells MW-3, MW-4, MW-5, MW-7A, and MW-7B (Figure 2).

MEDIA OF CONCERN

The RI work has confirmed that soil and groundwater are media of concern on the Site. Sampling of shallow groundwater that seasonally discharges to the near-surface in Area 4 indicates surface water, when present, may be an affected media and is retained as a media of concern, but has not been confirmed as such. Bioassay testing indicates that sediment is not a media of concern. Indoor air has been retained as a media of concern, but has not been confirmed as an affected media. Soil gas and indoor air quality historically have not been evaluated during the RI work due to the absence of regulatory criteria that required evaluation of this pathway/media at the time the RI was completed.

CONSTITUENTS OF CONCERN

The COCs are defined as the chemicals that have been detected at concentrations exceeding their respective cleanup levels or are suspected to exceed cleanup levels for pathways that have not been fully evaluated (i.e., surface water and indoor air pathways), which are presented in Tables 1 through 4. Provided below are the COCs identified by medium of concern.

Soil

HVOCs, including PCE, TCE, and cis-1,2-DCE; 1,2-dichloropropane; pesticides, including aldrin and dieldrin; total petroleum hydrocarbons as DRO; and metals, including cadmium, copper, lead, mercury, and zinc, have been identified as COCs for soil (Table 1).

Groundwater

The HVOCs PCE, TCE, cis-1,2-DCE, vinyl chloride, and 1,2-dichloropropane and the pesticides 4,4-DDD, 4,4-DDE, and dieldrin have been identified as COCs for groundwater (Table 2; Figures 3 and 7). Metals have not been retained as COCs for groundwater based on historical groundwater analytical data (Table 2).

Surface Water

Metals, including arsenic, cadmium, chromium, copper, lead, manganese, mercury, and zinc, have been identified as COCs for Area 4 surface water (when present) based on groundwater analytical results from Bay Chemical monitoring wells near Area 4 and information regarding other metals associated with the Bay Chemical flue dust (Table 3).

Soil Gas and Indoor Air

PCE, TCE, and vinyl chloride have been identified as COCs for soil gas and indoor air based on soil and groundwater data from the waste pit (Table 4).

NOTES:

Bold denotes selected cleanup level.

[1] Cleanup level is based on standard Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method B (unrestricted land use) or Method C (industrial land use) values from the Cleanup and Risk Calculations tables (CLARC).

[2] Cleanup level is based on MTCA Table 749-2: Priority Contaminants of Ecological Concern for Sites that Qualify for the Simplified Terrestrial Ecological Evaluation Procedure.

"Not Applicable" is used where the constituent of concern will not affect the media of potential concern due to an incomplete pathway or no pertinent standard exists.

C = Celsius

cPAH = carcinogenic polycyclic aromatic hydrocarbons

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DRO = total petroleum hydrocarbons as diesel range organics

mg/kg = milligrams per kilogram

ORO = total petroleum hydrocarbons as oil-range organics

TEC = toxicity equivalent concentration

Table 2
Groundwater Constituents of Concern and Cleanup Levels
Yakima Steel Fabricators
Seattle, Washington
Farallon PN: 765-001

Manganese	Non-Carcinogen	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Yes
Mercury	Non-Carcinogen	Not Applicable	Not Applicable	2.1	**0.012**	Not Applicable	Not Applicable	1.4	0.77	2.1	**0.012**	Yes
Zinc	Non-Carcinogen	Not Applicable[4]	Not Applicable	calc[3]	calc[3]	Not Applicable[4]	Not Applicable[4]	120	120	110	**100**	Yes

NOTES:

Bold denotes selected cleanup level.

[1]Cleanup level is based on standard Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method B (unrestricted land use) values from the Cleanup and Risk Calculations tables (CLARC).

[2]Value from Table 240, Section 250 of the Water Quality Standards for Surface Waters of the State of Washington, as established in Chapter 173-201A of the Washington Administrative Code (WAC 173-201A), as amended on August 1, 2016.

[3]Site-specific value to be calculated using hardness values for surface water samples from the Site. Calculations are based on formulas in Table 240, Section 250 of the Water Quality Standards for Surface Waters of the State of Washington (WAC 173-201A), as amended on August 1, 2016.

[4]Method B equations and human health criteria for surface water are based on the assumption that surface water has the potential to support fish or shellfish populations. This criteria does not apply to the wetland on the Site.

"Not Applicable" is used where no standard has been established for the constituent of concern.

calc = calculated value

CFR = Code of Federal Regulations

CWA = Clean Water Act

µg/l = micrograms per liter

NTR = National Toxics Rule

WAC = Washington Administrative Code

NOTE:

All volatile organic compounds analyzed by EPA Method 8240 (PLSA), SW-846 (Ecology), or EPA Method 8260B (AGRA & Farallon).

Results in **bold** denote concentrations above preliminary screening levels.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

< denotes concentration of compound is not above the laboratory practical quantitation limit indicated.

[1]Depth below ground surface in feet.

[2]Preliminary screening level has been selected for preliminary evlauation of analytical data for the Remedial Investigation only.

[3] Cleanup level identified in Table 1 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[4] Washington State Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, https://fortress.wa.gov/ecy/clarc/CLARCDataTables.aspx, unless otherwise noted. Downloaded October 2018.

[5] Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013.

COC = constituent of concern
CSM = Conceptual Site Model
MEK = methyl ethyl ketone
NA = not applicable/not analyzed
NE = not established
PCE = tetrachloroethene
RI = Remedial Investigation
TCE = trichloroethene

RI Preliminary Screening Level[8]		**0.365**	**0.257**	**0.0055**	**0.1**
CSM Selected Cleanup Levels for COCs[9]		**0.36**	**0.26**	**0.0055**	**---**
MTCA Cleanup Levels for Other Analytes[10]		**---**	**---**	**---**	**0.1**

NOTE:

Results in **bold** denote concentrations above preliminary screening levels.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

< denotes concentration of compound is not above the laboratory practical quantitation limit indicated.

— denotes CSM cleanup level not applicable. MTCA cleanup levels provided for analytes not identified as COCs in the CSM Technical Memo.

COC = constituent of concern

CSM = conceptual site model

NA = Not Analyzed

ND = Not Detected above PQL for each PCB aroclor

PCBs = polychlorinated biphenyls

[1] Analyzed by EPA Method 8081.

[2] Analyzed by EPA Method 8080.

[3] Field Duplicate of Groundwater Sample Collected from Monitoring Well MW-6.

[4] Field Duplicate of Groundwater Sample Collected from Monitoring Well MW-2.

[5] Field Duplicate of Groundwater Sample Collected from Monitoring Well MW-4.

[6] Field Duplicate of Groundwater Sample Collected from Monitoring Well WDOE-6.

[7] Equipment Rinsate Blank

[8] Preliminary screening level has been selected for preliminary evlauation of analytical data for the Remedial Investigation only.

[9] Cleanup level identified in Table 2 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[10] Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013.

Total Carcinogenic PAHs	2	0.042	C	No	0.1	2	0.137	—	—	—	18	—	—	—	**0.137**	No

NOTE:

ND denotes not detected above the laboratory Practical Quantitation Limit.

Not Available denotes there was no information in State or Federal regulations available for standard cleanup levels or MCLs or additional parameters needed to calculate site-specific soil or groundwater cleanup levels.

— denotes calculation of cleanup level not performed.

[1] Frequency of detection is based on all soil samples collected between 1992 and 2002. The total number of soil samples is 51.

[2] Standard Model Toxics Control Act (MTCA) Methods A, B, and C soil (direct contact pathway [ingestion only]) cleanup levels obtained from Ecology Publication, Cleanup levels and Risk Calculations (CLARC) Version 3.1, November 2001.

[3] Modified Methods B and C soil and groundwater cleanup levels have been calculated using Ecology worksheet for calculating soil cleanup levels for unrestricted and industrial land use. Modified Methods B and C soil cleanup levels presented are the more stringent cleanup levels for the direct contact, ingestion, and dermal pathways.

COPC = constituent of potential Concern

HQ = hazard quotient

NT = not tested.

PAHs = polycyclic aromatic hydrocarbons

PCBs = polychlorinated biphenyls

TPH = total petroleum hydrocarbons

TPH as Oil Range Organics	None	ND	NC	No	500		Not Available	—	Not Available	—	Not Available	Not Available	**500**	No
Total Carcinogenic PAHs	None	ND	C	No	0.1		0.0120	—	0.120	—	Not Available	Not Available	**0.0120**	No

NOTE:

ND denotes not detected above the laboratory Practical Quantitation Limit.

NONE denotes COPC was not detected in any of the groundwater samples collected between 1992 and 2002.

Not Available denotes there was no information in State or Federal regulations available for standard cleanup levels or MCLs or additional parameters needed to calculate site-specific soil or groundwater cleanup levels

— denotes calculation of cleanup level not performed.

[1]Standard Model Toxics Control Act (MTCA) Method A, B, and C groundwater cleanup levels obtained from Ecology Publication 94-145, Cleanup Levels and Risk Calculations (CLARC) Version 3.1, November 2001.

[2]MCLs reported as presented in the CLARC, November 2001 which consider Federal and State ARARs for potable groundwater.

[3]Modifed Method B and C groundwater cleanup levels have been calculated using Ecology worksheet for calculating soil cleanup levels for unrestricted and industrial land use.

COPC = Constituent of Potential Concern

MCL = Maximum Contaminant Level

NT = Not tested. Analysis for the analyte was not performed.

PAHs = Polycyclic Aromatic Hydrocarbons

PCBs = Polychlorinated Biphenyls

TPH = Total petroleum hydrocarbons

NOTE:

< denotes concentration of compound is not at or above the laboratory practical quantitation limit indicated.

[1] Depth below ground surface in feet.

[2] Analyzed by Ecology Method NWTPH-Dx. Acid silica gel cleanup used to remove contribution of organic materials observed in soil.

[3] Analyzed by EPA Method 8270-SIM. Carcinogenic PAHs are depicted only.

[4] Total carcinogenic polycyclic aromatic hydrocarbons derived using the total toxicity equivalency method in Section 708(8) of Chapter 173-340 of the Washington Administrative Code.

[5] For concentrations reported at less than the laboratory reporting limit, half the reporting limit was used to calculate the TEC.

[6] Preliminary screening level has been selected for preliminary evlauation of analytical data for the Remedial Investigation only.

[7] Cleanup level identified in Table 1 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[8] Washington State Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, https://fortress.wa.gov/ecy/clarc/CLARCDataTables.aspx. Downloaded October 2018.

COC = constituent of concern
cPAHs = carcinogenic polycyclic aromatic hydrocarbons
CSM = Conceptual Site Model
DRO = TPH as diesel-range organics
NA = not applicable to noncarcinogenic PAHs
ORO = TPH as heavy-oil-range organics
PAHs = polycyclic aromatic hydrocarbons
RI = Remedial Investigation
TEC = toxic equivalent concentration
TPH = total petroleum hydrocarbons

NOTE:

Results in **BOLD** indicate the analyte was not detected at a concentration above the laboratory practical quantitation limit.

NA = Not Analyzed

< denotes concentration of compound is not at or above the laboratory practical quantitation limit initiated.

NOTE:

Highlighted analyte exceeds preliminary screening level.

Deep denotes the groundwater monitoring well was designed to monitor deeper regional groundwater up to a depth of 33 feet bgs.

NA denotes that the soil or groundwater sample was not analyzed for this substance.

No denotes compound has not been detected at a concentration above the preliminary screening level selected for the Remedial Investigation.

Shallow denotes the groundwater monitoring well was designed to monitor shallow groundwater in direct contact with the waste pit materials.

Yes denotes that the compound has been detected at a concentration above the preliminary screening level selected for the Remedial Investigation.

[1]Depth below ground surface in feet.

[2]Indicator Hazarous Substances represent those constituents of potential concern that have been detected in two or more soil samples or have been detected at a minimum frequency of one groundwater sampling event for groundwater samples. The concentrations of these substances have also exceeded the preliminary screening level selected for the Remedial Investigation.

NOTES:

Results in **bold** denote concentrations above preliminary screening levels.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

< denotes analyte not detected at or above the laboratory reporting limit listed.

— denotes CSM cleanup level not applicable. MTCA cleanup levels provided for analytes not identified as COCs in the CSM Technical Memo.

[1] Depth in feet below ground surface.

[2] Analyzed by Northwest Method NWTPH-Dx.

[3] Compound was not retained as a COPC following completion of the June 2004 Revised Remedial Investigation Report.

[4] Preliminary screening level as identified in the May 2011 Feasibility Study Work Plan.

[5] Cleanup level identified in Table 1 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[6] Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013.

COC = constituent of concern

COPC = constituent of potential concern

CSM = Conceptual Site Model

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

FS = Feasibility Study

ORO = TPH as oil-range organics

NA = not applicable

Y = The chromatographic response resembles a typical fuel pattern.

NOTES:

Results in **bold** denote concentrations above preliminary screening levels.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

– = denotes sample not analyzed

< denotes analyte not detected at or above the laboratory reporting limit listed.

— denotes CSM cleanup level not applicable. MTCA cleanup levels provided for analytes not identified as COCs in the CSM Memo.

[1] Depth in feet below ground surface.

[2] Analyzed by U.S. Environmental Protection Agency Methods 6000/6010/7000 Series.

[3] Constituent was not retained as a COPC following completion of the June 2004 Revised Remedial Investigation Report.

[4] Identified and retained as COPC in June 2004 Revised Remedial Investigation Report.

[5] Preliminary screening level as identified in the May 2011 Feasibility Study Work Plan.

[6] Washington State Department of Ecology Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Version 3.1 Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway.

[7] Cleanup level identified in Table 1 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[8] Washington State Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, https://fortress.wa.gov/ecy/clarc/CLARCDataTables.aspx. Downloaded October 2018.

COC = constituent of concern

COPC = constituent of potential concern

CSM = Conceptual Site Model

FS = Feasibility Study

L = A negative instrument reading had an absolute value greater than the reporting limit.

NOTES:

Results in **bold** denote concentrations at or above the Preliminary Screening Level indicated.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

< denotes analyte not detected at or above the reporting limit listed.

— denotes CSM cleanup level not applicable. MTCA cleanup levels provided for analytes not identified as COCs in the CSM Memo.

[1] Depth in feet below ground surface.

[2] Analyzed by U.S. Environmental Protection Agency Method 8081.

[3] Compound was not retained as a COPC following completion of the June 2004 Revised Remedial Investigation.

[4] Identified and retained as a COPC in the June 2004 Revised Remedial Investigation Report.

[5] Preliminary screening level as identified in the May 2011 Feasibility Study Work Plan.

[6] Washington State Department of Ecology Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Version 3.1 Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway.

[7] Cleanup level identified in Table 1 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[8] Washington State Cleanup Levels and Risk Calculations under the Washington State Model Toxics Control Act Cleanup Regulation, Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, https://fortress.wa.gov/ecy/clarc/CLARCDataTables.aspx. Downloaded October 2018.

^ = Instrument-related quality control exceeds the control limits.

* = Response or retention time outside acceptable limits.

COC = constituent of concern

COPC = constituent of potential concern

CSM = Conceptual Site Model

FS = Feasibility Study

H = Sample was prepped or analyzed beyond the specified holding time.

NE = Not established

P = The analyte was detected on both chromatographic columns, but the quantified values differ by ≥40 percent relative percent difference with no obvious chromatographic interference.

DRAFT - Issued for Client Review

Groundwater Analytical Restults for Organochlorine Pesticides
Yakima Steel Fabricators
Yakima, Washington
Farallon PN: 765-001

Location	Lab Report	Sample Date	Analytical Results (micrograms per liter)[1]			
			4,4-DDD [2]	4,4-DDE [2]	Dieldrin [2]	gamma-Chlordane [3]
MW-7A	580-26540-1	12/3/2002	--	--	--	--
		6/2/2011	<0.020	<0.020	<0.020	<0.0099
MW-7B	580-26540-1	12/3/2002	--	--	--	--
		6/2/2011	<0.020	<0.020	<0.020	<0.010
MW-10	580-26540-1	6/2/2011	<0.020	<0.020	<0.020	<0.010
MW-11	580-26540-1	6/2/2011	<0.020	<0.020	<0.020	<0.010
RI Preliminary Screening Level[5]			**0.365**	**0.257**	**0.0055**	**0.25**
CSM Selected Cleanup Levels for COCs[6]			**0.36**	**0.26**	**0.0055**	**---**
MTCA Cleanup Levels for Other Analytes[7]			**---**	**---**	**---**	**0.25**

Notes:

Results in **bold** denote concentrations above preliminary screening levels.

Results highlighted in orange denote concentrations exceeding CSM selected cleanup levels or MTCA levels where CSM cleanup levels are not applicable.

< denotes analyte not detected at or above the reporting limit listed.

-- denotes sample not analyzed

— denotes CSM cleanup level not applicable. MTCA cleanup levels provided for analytes not identified as COCs in the CSM Technical Memo.

COC = constituent of concern

COPC = constituent of potential concern

CSM = conceptual site model

RI = Remedial Investigation

[1] Analyzed by U.S. Environmental Protection Agency Method 8081A.

[2] Identified and retained as COPC in June 2004 Revised Remedial Investigation Report.

[3] Constituent was not retained as a COPC following completion of the June 2004 Revised Remedial Investigation Report.

[4] Monitoring well MW-5 was decommissioned in 2007 during the Bay Chemical cleanup.

[5] Preliminary screening level as identified in the June 2004 Revised Remedial Investigation Report.

[6] Cleanup level identified in Table 2 of the 2018 Conceptual Site Model (CSM) Technical Memo.

[7] Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Cleanup Levels and Risk Calculations, Standard Method B Values for Groundwater, https://fortress.wa.gov/ecy/clarc/CLARCHome.aspx. Downloaded October 2018.

Laboratory: TestAmerica Seattle

Narrative

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC Semi VOA - Method 8081A
The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 90711 exceeded control limits for the following analytes: Heptachlor epoxide. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have "*" flagged and been reported.

Surrogate recovery for the following samples were outside control limits: E-WetSed-1-052311 (580-26360-1), E-WetSed-2-052311 (580-26360-2), E-WetSed-3-052311 (580-26360-3). Evidence of matrix interference is present, sample contain high percent moisture; therefore, re-extraction and/or re-analysis was not performed. The data have been "X" flagged and reported.

The continuing calibration verification (CCV) for Heptachlor epoxide recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been "^" flagged and reported.

The following sample E-WetSed-1-052311 (580-26360-1), E-WetSed-2-052311 (580-26360-2), E-WetSed-3-052311 (580-26360-3) were prepared and/or analyzed outside the method defined holding time because the request for the test was made after the holding time for the sample expired. The data have been "H" flagged and reported.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry - Method 160.3
Constant weight was not achieved after 3 drying cycles for the following samples: (580-26360-1DU), E-WetSed-1-052311 (580-26360-1), E-WetSed-2-052311 (580-26360-2), E-WetSed-3-052311 (580-26360-3). The last weight recorded was used for calculation.

General Chemistry - Method 9060 PSEP
These samples were frozen as they had very little hold time remaining due to instrument issues. The hold time is now 6 months on these samples and were analyzed within hold. The "H" flags have been removed and the data reported.

No other analytical or quality issues were noted.

Geotechnical
No analytical or quality issues were noted.

Subcontract Work
Methods Amphipod mortality 10 days (Hyalella azteca), Microtox®100% porewater extract 15 Min. (Virio fischeri), Midge larvae mortality and growth 21 days (Chironomus tentans): These methods were subcontracted to Nautilus Environmental. The subcontract certifications are different from those listed on the TestAmerica cover page of this final report.

Organic Prep - Method 3550B
The following samples were prepared outside of preparation holding time: Samples (580-26360-1DU), E-WetSed-1-052311 (580-26360-1), E-WetSed-2-052311 (580-26360-2), E-WetSed-3-052311 (580-26360-3) were all prepared 43 days past the holding time. They were added to the backlog already outside of holding time by the project manager. Extraction continued as normal. Method 3550B, 8081A. Batch 90711.

No other analytical or quality issues were noted.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
H	Sample was prepped or analyzed beyond the specified holding time
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis.
EPA	United States Environmental Protection Agency
ND	Not Detected above the reporting level.
MDL	Method Detection Limit
RL	Reporting Limit
RE, RE1 (etc.)	Indicates a Re-extraction or Reanalysis of the sample.
%R	Percent Recovery
RPD	Relative Percent Difference, a measure of the relative difference between two points.

This report has been prepared based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party.

1.0 INTRODUCTION

On May 23rd, 2011 Test America collected freshwater sediments for biological testing. Test America contracted with Nautilus Environmental to provide toxicity-testing services for the project. The three sediment samples selected for testing included samples E-WetSed-1-052311 (WETSED-1), E-WetSed-2-052311 (WETSED-2), and E-WetSed-3-052311 (WETSED-3). No reference sample was collected in conjunction with this project. The freshwater sediment samples were tested for toxicity using the *Chironomus dilutus* (aka *tentans*) 20-day survival and growth bioassay (USEPA 2000 and ASTM 2000), the *Hyalella azteca* 10-day survival bioassay (USEPA 2000 and ASTM 2000), and the 15-minute 100 percent porewater Microtox® bacteria bioluminescence test. All tests met negative and positive control criteria.

Results were evaluated by comparing test data to the criteria in the Sediment Evaluation Framework for the Pacific Northwest (RSET 2009) guidance document. *C. dilutus*, *H. azteca*, and Microtox results were compared to control results, and examined for statistically significant effects ($\alpha = 0.05$). Acceptability criteria from the literature are summarized in Table 1.

Table 1 Acceptability criteria for bioassays

Test Type	***C. dilutus* 20-Day**	***H. azteca* 10-Day**	**Microtox**
Endpoint	Survival and Growth	Survival	Luminescence
Source	RSET 2009	RSET 2009	RSET 2009
Test Criteria	One-hit failure is mortality > control mortality + 25% and/or biomass <60% of control biomass and significant difference Two-hit failure is mortality > control mortality + 15% and/or biomass <75% of control biomass and significant difference	One-hit failure is mortality > control mortality + 25% and significant difference Two-hit failure is mortality > control mortality + 10% and significant difference	One-hit failure is Luminescence <75% of control luminescence and significant difference Two-hit failure is Luminescence <85% of control luminescence and significant difference
Control Criteria	Negative control ≤32% mortality and growth ≥0.48 mg/ind. ash-free dry weight	Negative control ≤20% mortality	Negative control final light output > 72% of initial output

2.0 SAMPLES

Upon receipt of samples from Test America, samples were matched with the chain-of-custody form and inspected. Samples were stored at 4 ± 2°C in the dark prior to test initiation. Toxicity tests were initiated within 2 weeks of collection (Table 2). Total ammonia levels in the porewater ranged from <1.0 to 2.7 milligrams per liter (mg/L). Both overlying ammonia and sulfides were also measured during testing, and the results are reported in the QA/QC sections for each test.

Sample ID	Collection Date	Microtox Test Initiation Date	*H. azteca* Test Initiation Date	*C. dilutus* Test Initiation Date
E-WetSed-1-052311	May 23, 2011	June 6, 2011	June 7, 2011	June 9, 2011
E-WetSed-2-052311				
E-WetSed-3-052311				

3.0 *CHIRONOMUS DILUTUS* TEST

3.1 Methods

C. dilutus were exposed to test sediments for 20 days to determine the effects of site sediment on survival and growth. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 3.

C. dilutus egg cases were obtained from Aquatic BioSystems (Fort Collins, Colorado) and arrived at the laboratory on June 8, 2011. The egg cases were transported in insulated containers in oxygen-saturated water contained in 500-mL plastic bottles. Upon arrival at the laboratory, water quality parameters were measured and observations of organism condition were made. The egg cases were 20°C at receipt, and were cultured at 23°C. The organisms emerged from the egg cases on June 9th and tests were initiated the same day.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml of sediment was distributed to each of eight labeled test chambers for each of the samples, and

175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Twelve organisms were directly added to each test chamber, in random order.

Each test chamber was provided 1.5 mL of food daily (after the second renewal) starting on Day -1. The food consisted of a mixture of 4 g ground Tetrafin® flakes mixed with 1 L diluted mineral water. The feeding regime was reduced if the presence of excess food was observed on the sediment surface in several test chambers, which occurred on Day 8 only. Abnormal conditions or unusual animal behavior, if observed, were noted daily.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while alkalinity, hardness, ammonia and sulfides were measured on Days 5, 10, and 15. Water was renewed twice daily.

At test termination, subsamples of overlying water were collected from each water quality replicate for ammonia, hardness, alkalinity, and sulfide analyses. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. Animals were removed from the screen and the number of survivors counted and recorded. Presence of pupae, flies, or exuviae (molts) were noted. The larvae were rinsed with deionized water and placed into pre-ashed, pre-weighed weigh boats. The weigh boats were placed in an oven at 60°C for at least 24-hours, then placed in a dessicator until dry weight could be measured. The weigh boats were then placed in a muffle furnace at 550°C for two hours, placed in a dessicator to cool, then weighed again to determine the ash weight. The ash weight was subtracted from the dry weight to determine the ash-free dry weight (AFDW). The number and AFDW of surviving chironomids were evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitney U-test, as appropriate, to determine whether the samples exhibited a significant

decrease in survival or growth relative to the control ($p<0.05$). Survival data were arcsine transformed, while growth data was either square root or log transformed as needed to stabilize the variances and improve normality of the data prior to performing the t-test. Data that failed to meet parametric assumptions even after transformations were analyzed with the non-parametric Mann-Whitney U-test. Site performance was evaluated against the sediment acceptability criteria outlined in RSET 2009 (Table 1). The criteria for acceptable test performance were an average of ≤32 percent mortality of control organisms, and an average of at least 0.48 mg/individual AFDW per surviving control organism.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the tests on the sediments to determine whether the sensitivity of the test organisms was appropriate. This test was run with four replicates, ten animals per replicate, in diluted mineral water at 23°C, with a small amount of clean control sand as a substrate. Tetrafin® slurry (1.25 mL of 4 g/L Tetrafin) was added to each chamber on days 0 and 2.

Table 3 Summary of methods for the 20-day test with *Chironomus dilutus*

Test initiation date	June 9, 2011
Test termination date	June 29, 2011
Test organism source	Aquatic BioSystems; Fort Collins, Colorado
Organism age at test initiation	< 4 hours post-emergence from egg case
Feeding	1.5 mL of 4.0 g/L Tetrafin mixture every day; frequency reduced if excess food observed
Test chamber	475-mL glass beaker
Test sediment volume	100 mL
Dilution water type & volume	175 mL diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	12
Number of replicates/sample	8 plus water quality surrogates
Test temperature	23± 1°C
Illumination	16 hours light : 8 hours dark
Aeration	Started on Day 13
Reference toxicant	Copper chloride
Acceptability Criteria	≤32% mortality, 0.48 mg/individual AFDW

3.2 Results

The results of toxicity tests conducted using *C. dilutus* are provided in Table 4. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 4 **Results of *Chironomus dilutus* tests. Samples with statistically reduced survival or growth are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]**

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference From	Ash-Free Dry Weight per Org (mg)	Ash-Free Dry Weight Percent of Control
Control	6.3 ± 7.4	--	0.91 ± 0.11	--
WETSED-1	20.8 ± 21.4	14.6	1.11 ± 0.46	123
WETSED-2	24.0 ± 12.9	17.7	0.87 ± 0.22	96
WETSED-3	**63.5 ± 31.2**	**57.3**	0.60 ± 0.57	66

[1]Criteria for one-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 15% of control (RSET 2009)

3.3 QA/QC

The *C. dilutus* were received in good condition for the June 9, 2011 test. All water quality parameters remained within acceptable ranges throughout the tests. A summary of the water quality parameters is presented in Table 5. Dissolved oxygen levels were decreased to a level on concern on day 13, and all replicates were aerated from that point forward. There were no deviations from the protocols. The toxicity test for mortality with this species met the control acceptability criterion (<32 percent mortality; >0.48 mg/ind AFDW).

Table 5 **Summary of water quality parameters for *C. dilutus* tests (means and ranges). Required values are shown in brackets.**

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
	Mean (Min-Max)			
Temp. (°C) [23 ± 1°C]	22.0 (21.7-22.2)	22.0 (21.8-22.2)	21.9 (21.7-22.1)	21.9 (21.7-22.1)
DO (mg/L) [>2.5 mg/L]	6.7 (3.3-9.0)	6.7 (3.5-9.0)	7.1 (5.2-9.1)	7.0 (5.2-9.0)
pH [6-9]	7.34 (6.58-7.99)	7.18 (6.43-7.89)	7.13 (6.46-7.80)	7.35 (6.80-7.99)
Cond. (µS/cm) [NA]	208 (127-296)	180 (149-227)	249 (158-413)	251 (192-382)
Alkalinity (mg/L $CaCO_3$) [<50% variable]	58 (48-72)	65 (60-68)	69 (64-72)	85 (80-88)

Total Overlying Sulfides (mg/L) [NA]	0.035[a] (<0.010-0.058)	0.028[a] (<0.010-0.054)	0.044[a] (<0.010-0.044)	0.020[a] (<0.010-0.021)

[a] estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 6. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 6 ***C. dilutus* reference toxicant test results.**

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Chironomus dilutus	June 23, 2011	Cu	571 µg/L	401 – 1070 µg/L	22.7

3.4 Discussion

Mortality in the samples ranged from 20.8 to 63.5 percent, compared with 6.3 percent in the control. Sediment samples WETSED-2 and WETSED-3 were significantly different from control and were more than 15 percent higher than the control, failing the two-hit criterion for survival. WETSED-3 was also more than 25 percent higher than the control, failing the one-hit criterion for survival. Survival in WETSED-1 was not significantly different from the control, due to high

variability in the sample. Growth in the samples ranged from 0.60 to 1.11 mg/individual AFDW, compared with 0.91 mg/individual AFDW in the control. Growth in sample WETSED-1 was greater than the control. Growth in WETSED-2 and WETSED-3 was not significantly different from the control. Therefore none of the sites fail either the one- or two-hit failure requirements.

The total ammonia level reached 1.3 mg/L in the test sediments, which was well below the reported 4-day lethal concentration for 50% of test organisms (LC_{50}) range for *C. dilutus* of 82 to 370 mg/L (USEPA 2000). While sulfide toxicity thresholds are not available for this species, they were measured as part of the Ecology reference site study (Nautilus 2008), and samples with porewater sulfide values similar (0.226 to >0.600 mg/L) to the values found in the current study (0.010 to 0.054 mg/L) did not result in measurable effects. Therefore, it is unlikely that ammonia or sulfide levels caused the observed increases in mortality in the test sediments.

4.0 *HYALELLA AZTECA* TEST

4.1 Methods

H. azteca were exposed to test sediments for 10 days to determine the effects of site sediments on survival. These tests were conducted according to methods presented in USEPA (2000) and ASTM (2000), and are summarized in Table 7.

H. azteca were obtained from Aquatic Indicators (St. Augustine, Florida) and arrived at the laboratory on June 2, 2011. The organisms were transported in insulated boxes in oxygen-saturated water contained in plastic bags with fine screens as a substrate. Upon arrival at the laboratory, water quality parameters were measured and observations of animal condition were made. The organisms were acclimated to test conditions prior to test initiation over a 96-hour time period. During the acclimation period, the animals were observed for any indication of stress or significant mortality and any observations were recorded.

One day prior to test initiation (Day –1), the sediment samples were homogenized, 100-ml sediment was distributed to each of eight labeled test chambers for each of the samples, and 175-ml diluted mineral water (prepared by diluting two parts Perrier® into eight parts deionized water) was added to each container. Control sediment consisted of clean, rinsed silica sand (50/50 mix of #30 and #70) mixed with peat moss (1/2 Tbsp) that was rinsed

overnight in diluted mineral water. Eight test chambers were also prepared for the control sediment. An additional replicate was included for each sediment sample and the control sediment as a sacrificial test chamber for routine water quality measurements.

The test chambers were randomized and the sediments were left to settle overnight. On Day 0, overlying ammonia, sulfide, hardness, alkalinity, dissolved oxygen (DO), pH, conductivity, and temperature were measured. Organisms were carefully separated into groups of 10 amphipods in 30 mL cups containing diluted mineral water. The number of organisms was then recounted and any animals exhibiting signs of stress were replaced. The organisms were then gently added to the test chambers, two cups for each test chamber for a total of 20 organisms per chamber.

Temperature, DO, pH, and conductivity were monitored daily in the water quality replicate for each sample, while overlying ammonia, sulfide, hardness, and alkalinity were monitored on Day 5. Water was renewed twice daily in all chambers. Abnormal conditions or unusual animal behavior, if observed, were also noted daily. Each test chamber was fed 1 ml of Yeast Trout Chow (YTC) daily after the second renewal.

At test termination, subsamples of overlying water were collected for ammonia, hardness, alkalinity, and sulfides analyses, from each water quality replicate. The contents of each test chamber were gently mixed to suspend the sediment and poured through a 0.5-mm Nitex screen. The sediment was rinsed through the screen using dechlorinated tap water. The screen was then placed in diluted mineral water and the number of survivors counted and recorded. The number of surviving amphipods was evaluated statistically by one-tailed t-test, or one-tailed Mann-Whitey U-test, as appropriate, to determine whether the samples exhibited a significant decrease in survival relative to the control ($p<0.05$). Survival data was arcsin transformed as needed to stabilize the variances and improve normality of the data. Site performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A 96-hour reference toxicant test using copper chloride ($CuCl_2$) was conducted concurrently with the sediment tests to determine whether the sensitivity of the test organisms was within the range typically observed. The test was run with four replicates, ten animals per replicate, in diluted mineral water with a square of nitex screen as a substrate.

Table 7 Summary of methods for the 10-day test with *Hyalella azteca*.

Test initiation date	June 7, 2011
Test termination date	June 17, 2011
Test organism source	Aquatic Indicators, St. Augustine, Florida
Organism age at test initiation	8 days
Feeding	1 ml of YTC daily
Test chamber	475-ml glass beaker
Test sediment volume	100 ml
Dilution water type & volume	175 ml diluted mineral water
Water renewal	Twice daily
Control sediment	Sand mixed with peat (1/2 Tbsp)
Number of organisms/replicate	10
Number of replicates/sample	8 plus water quality surrogate
Test temperature	23 ± 1°C
Illumination	16 hours light: 8 hours dark
Aeration	None
Reference toxicant	Copper chloride
Acceptability criterion for control	≥80% survival

4.2 Results

The results of toxicity tests conducted using *H. azteca* are provided in Table 8. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 8 **Results of *Hyalella azteca* tests. Samples with statistically reduced survival or are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]**

Sample	Percent Mortality (Mean ± SD)	Mortality Percent Difference from Control
Control	1.3 ± 2.3	--
WETSED-1	**100 ± 0.0**	98.7
WETSED-2	13.8 ± 11.6	12.5
WETSED-3	3.8 ± 4.4	2.5

[1]Criteria for one-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 25% of control (RSET 2009), [2]Criteria for two-hit failure is significant decrease in mortality ($p<0.05$), **and** mortality greater than 10% of control (RSET 2009)

4.3 QA/QC

The *H. azteca* were received in good condition and the toxicity tests with this species met the control acceptability criterion (<20 percent mortality). A summary of the water quality parameters is provided in Table 10. All water quality parameters remained within acceptable ranges throughout the tests. Instead of the 10 animals per replicate required by the protocol, 20 animals were added to each replicate. As the controls still met acceptability criteria and water quality stayed within ranges for the test, this deviation is not expected to have affected the results. There were no other deviations from the protocol.

Table 9 **Summary of water quality parameters for *H. azteca* analyses (means and ranges). Required values are shown in brackets.**

Analyte	Control	WETSED-1	WETSED-2	WETSED-3
		Mean (Min-Max)		
Temp. (°C) [23 ± 1°C]	22.3 (21.9-23.4)	22.2 (21.9-23.3)	22.2 (21.9-23.3)	22.2 (21.8-23.2)
DO (mg/L) [>2.5 mg/L]	7.0 (5.8-8.4)	6.3 (5.4-7.3)	6.4 (5.4-7.2)	6.5 (5.6-7.3)
pH [6-9]	7.26 (6.50-7.79)	6.83 (6.22-7.20)	6.83 (6.35-7.18)	7.01 (6.63-7.37)
Cond. (µS/cm) [NA]	172 (145-189)	188 (164-262)	283 (190-418)	223 (159-343)

Total Overlying Sulfides (mg/L) [<50% variable]	0.091[a] (<0.010-0.125)	0.114 (0.014-0.293)	0.058 (0.012-0.126)	0.091[a] (<0.010-0.107)

[a]estimated value

The result of the reference toxicant test conducted in conjunction with this testing program is provided in Table 10. Bench sheets and control charts are provided in Appendix E. This test was run with the same batch of organisms used in the testing program. The result of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 10 H. Azteca reference toxicant test results.

Species	Test date	Toxicant	LC50	Acceptable Range	CV (%)
Hyalella azteca	June 2, 2011	Cu	188 µg/L	0 – 1360 µg/L	74.6

4.4 Discussion

Mortality in the samples ranged from 3.8 to 100 percent, compared with 1.3 percent in the control. Sediment samples WETSED-1 and WETSED-2 were significantly different from control and were more than 10 percent higher than the control, failing the two-hit criterion for survival. WETSED-1 was more than 25 percent higher than the control, failing the one-hit criterion for survival.

5.0 MICROTOX® TEST

5.1 Methods

The luminescent marine bacterium *Vibrio fischeri* was used as the test organism for the Microtox test. The bacteria were exposed to porewater extracted from sediment samples and light readings were measured after 5 and 15 minutes of exposure. Test equipment included the Microtox Model 500 Analyzer, which measures light output and is equipped with a 15ºC chamber to maintain test temperature in the samples and a 4ºC chamber to keep the rehydrated bacteria chilled.

Vials of freeze-dried bacteria (Microtox® Acute Reagent Lot #s 10K1032, expiration date 10/2012) were obtained from Strategic Diagnostics, Inc. and stored at -20°C until use. On the day of the test, a vial was rehydrated with 1.0 ml of Microtox Reconstitution Solution, mixed thoroughly, and allowed to equilibrate for 30 minutes at 4°C. The bacteria were used within 2 hours of rehydration.

The tests were conducted in accordance with Ecology (2008) test protocol; these methods are summarized in Table 11. Approximately 50 ml of porewater was extracted from each sample by centrifuging for 30 minutes at 4500 G. Each porewater extract was adjusted to a salinity of 20 parts per thousand (ppt) with Crystal Sea Marine Mix artificial seasalt. The DO ranged from 7.2 to 8.2 mg/L in the adjusted samples. Since the DO in each sample was between 50 and 100 percent saturation (5.0 to 10.2 mg/L), the samples did not require aeration. The pH was adjusted to 7.8 to 8.2 using NaOH or HCl. None of the porewater samples were diluted below 90 percent. The control was deionized water adjusted to 20 ppt with artificial seasalt. Each porewater was tested within 3 hours of extraction.

Tests were conducted using five replicates. Disposable glass cuvettes were placed in the Microtox test wells and 1 ml of salinity-adjusted porewater was added. The rehydrated bacteria (reagent) were thoroughly mixed and 10 µl was added to each test cuvette, with mixing after each addition. After an initial incubation period of 5 minutes, the control cuvette was placed in the read chamber of the Microtox Analyzer to set the instrument. Initial light readings (I_0) were then taken by placing each cuvette in the read chamber of the Microtox Analyzer and measurements were recorded on a data sheet. Light output was measured at 5 minutes (I_5) and 15 minutes (I_{15}) of exposure after the initial light reading (I_0).

Test acceptability criteria were final mean control light output greater than or equal to 72 percent of initial control mean output, and test mean output not greater than 110 percent of control mean output. The data were evaluated statistically by conducting one-tailed t-tests or Mann-Whitney U-tests on the change in output over time for test sediment porewaters compared to the control porewater (where light output was lower than the control). Sediment performance was evaluated against sediment acceptability criteria outlined by the Northwest Regional Sediment Evaluation Framework (RSET 2009), as presented in Table 1.

A reference toxicant test using phenol was conducted in conjunction with the sediment tests to ensure that the sensitivity of the test was within the acceptable range of historical values determined in this laboratory.

Table 11 Summary of methods for the Microtox test.

Test dates	June 6, 2011
Test organism source	Strategic Diagnostics
Batch number and expiration date	Lot#10K1032, Expiration 10/2012
Control	Saltwater (20 ppt) prepared with Crystal Sea artificial seasalt
Sample preparation	Centrifugation at 4500 G for 30 minutes; salinity adjustment to 20 ppt using Crystal Sea salt; pH adjustment to 7.8-8.2 ppt; DO 5.0 to 10.2 mg/L
Test chamber	Glass cuvette
Test volume	1 mL
Volume of inoculum/replicate	10 µL
Number of replicates/sample	5
Test temperature	15 ± 1°C
Aeration	None
Reference toxicant	Phenol
Acceptability criteria	Final control light output ≥72% initial; test output ≤110% control

5.2 Results

The results of toxicity tests conducted using Microtox are provided in Table 12. Statistics were conducted using Biostat software, which follows the flowchart recommended by RSET. Comparisons are shown to the control. A detailed summary of results is provided in Appendix A. Summary and detailed statistical analyses for endpoint measurements are provided in Appendix B. Summaries of water quality data are provided in Appendix C. Benchsheets are provided in Appendix D.

Table 12 Results of Microtox tests. Samples with statistically reduced luminescence are underlined, and values failing two-hit RSET criteria are shaded gray, while samples failing one-hit RSET criteria are bold.[1, 2]

Sample	5 minute reading		15 minute reading	
	Mean % of initial light output	Significantly different relative to the control	Mean % of initial light output	Significantly different relative to the control
Control	96 ± 3	--	84 ± 3	--
WETSED-1	**68 ± 4**	Yes	**17 ± 1**	Yes
WETSED-2	**72 ± 1**	Yes	**25 ± 1**	Yes
WETSED-3	81 ± 1	Yes	**35 ± 2**	Yes

[1]Criteria for one-hit failure is luminescence less than 75% of control luminescence **and** significant difference (RSET 2009); [2]Criteria for two-hit failure is luminescence less than 85% of control luminescence **and** significant difference (RSET 2009)

5.3 QA/QC

A summary of the water quality parameters for the Microtox tests is provided in Table 13. The Microtox tests met control acceptance criteria and there were no deviations from protocol.

Table 13 Summary of sites water quality parameters for Microtox analyses

Analyte	Mean (st.dev)	Minimum	Maximum	Number of Readings	Met Requirements
Initial Salinity (ppt)	1.1 (0.3)	0.8	1.3	3	N/A
Final Salinity (ppt)	19.9 (0.4)	19.5	20.2	3	Y
Initial DO (mg/L)	7.3 (0.2)	7.2	7.5	3	N/A
Final DO (mg/L)	7.3 (0.2)	7.2	7.5	3	Y
Initial pH	7.5 (0.4)	7.2	7.9	3	N/A
Final pH	7.9 (0.02)	7.9	7.9	3	Y
Final Concentration (%)	99.9 (0.0)	99.0	100	3	Y
Total NH3 (mg/L)	2.0 (1.0)[1]	<1.0	2.7	3	N/A

[1]estimated value

Results of the reference toxicant test conducted in conjunction with this testing program are provided in Table 14. Bench sheets and control charts are provided in Appendix E. The test was run with the same batch of organisms used in the testing program. The results of this test fell within the range of mean ± two standard deviations of historical results, indicating that the sensitivity of the test organisms was appropriate.

Table 14 Microtox reference toxicant test results.

Species	Test date	Toxicant	EC50	Acceptable Range (mean ± 2 S.D.)	CV (%)
Microtox	June 6, 2011	Phenol	5 min: 19.6 mg/L 15 min: 40.9 mg/L	5 min: 24.2 – 55.1 15 min: 31.0 – 92.2	19.5 24.8

5.4 Discussion

Change in light output in the samples at 15 minutes ranged from 17 to 35 percent, compared with 84 percent in the controls. Samples WETSED1, WETSED2, and WETSED3 were all significantly different from the controls and had luminescence less than 75% of controls, failing the one-hit criteria for luminescence.

6.0 CONCLUSIONS

WETSED-1 failed the one-hit criterion for *H. azteca* survival and the one-hit criterion for Microtox luminescence, but did not have a hit in the *C. dilutus* survival or growth criterion (RSET 2009). WETSED-2 failed the two-hit criterion for *C. dilutus* and *H. azteca* survival, and failed the one-hit criterion for Microtox luminescence (RSET 2009). WETSED-3 failed the one-hit criterion for *C. dilutus* survival and Microtox luminescence (RSET 2009).

Table 15 One-hit/Two-hit criteria summary results table

Site	*C. dilutus* Survival	*C. dilutus* Growth	*H. azteca* Survival	Microtox Luminescence

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	False	6.8°C
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
580-26377-1

Receipt
The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): . Two 4oz. soil jars received, not on COC. These were both for sample "I-TP3-052411-0.0-0.5" collected on 05-24-2011 at 11:00. These samples were added to the end of the COC and logged-in.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 8260B:
Ethylbenzene-d10 and 4-Bromofluorobenzene surrogate recovery for the following sample were outside control limits: I-TP3-052411-3.0 (580-26377-22). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Several target compounds exceeded calibration range in the direct sparge soil (DSS) analysis of sample I-TP3-052411-3.0 (580-26377-22). A request to schedule for methanolic analysis for the target compounds sec-Butylbenzene; n-Propylbenzene; 4-Isopropyltoluene; n-Butylbenzene; 1,2,4-Trimethylbenzene; and Naphthalene has been made to the project manager. The listed compounds have been marked as not needed in the DSS analysis and will be reported from the methanolic analysis. The re-analysis was performed outside the method required holding time affected sample hasbeen qualified "H".

The initial calibration curve was outside acceptance criteria for Carbon Disulfide. As Carbon Disulfide was not a requested analyte at the time of sample analysis, it cannot be reported. The analyte was flagged rejected in the CCVIS and set to not needed in the associated samples and QC. 580-26377-21 and 580-26377-22

No other analytical or quality issues were noted.

GC Semi VOA
Method(s) 8081A:
The capping continuing calibration verification (CCV) analyzed on instrument TAC035, analytical batch 87207, did not meet criteria on both columns for the following analytes: CCV/17 - 4,4-DDT, DCB, Endosulfan sulfate and Endrin aldehyde were all recovering below lower control limits. CCV/23 - 4,4-DDE, 4,4-DDT, Aldrin, alpha-Chlordane, beta-BHC, DCB, Dieldrin, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin aldehyde, Endrin ketone and gamma-Chlordane were all recovering below lower control limits. CCV/24 - Toxaphene was recovering below lower control limits. The associated samples were analyzed twice with similar results. Data has been qualified "^" and reported.

Surrogate recovery for the following sample(s) was outside control limits: 580-26377-3, 580-26377-4, 580-26377-7, 580-26377-8, 580-26377-11, 580-26377-15, 580-26377-20, 580-26377-23 and 580-26377-28 MS. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed. Data qualified "X" and reported.

The capping continuing calibration verification (CCV) in analytical batch 87303 on instrument TAC035 did not meet criteria on both columns for the following analytes: CCV/18 - 4,4-DDT, DCB, Endosulfan II, Endosulfan sulfate, Endrin aldehyde and Methoxychlor were recovering below lower control limits. CCV/31 - 4,4-DDT, DCB and Methoxychlor were recovering below lower control limits. CCV/36 - 4,4-DDT, DCB and Mtthoxychlor were recovering below lower control limits. The associated samples were analyzed twice with similar results. Data has been qualified "^" and reported.

Method(s) NWTPH-Dx/NWTPH-HCID:
For samples 580-26377-21 and 580-26377-22, the results in the C10-C24 range are due to a weathered diesel range product. The affected analyte range is qualified with the "Y" qualifier and reported.

No other analytical or quality issues were noted.

Metals
Method(s) 6010B:
The absolute value for some elements was above the RL value. The ICB, MB and CCB's were all within limits. Sample qualifed "L". No

Job ID: 580-26377-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

bias is indicated.

No other analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	Indicates the presence of an interference, recovery is not calculated.
X	Surrogate is outside control limits
H	Sample was prepped or analyzed beyond the specified holding time

GC Semi VOA

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
H	Sample was prepped or analyzed beyond the specified holding time
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
I	Indicates the presence of an interference, recovery is not calculated.
X	Surrogate is outside control limits
Y	The chromatographic response resembles a typical fuel pattern.
F	MS or MSD exceeds the control limits

Metals

Qualifier	Qualifier Description
F	Duplicate RPD exceeds the control limit
L	A negative instrument reading had an absolute value greater than the reporting limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	False	Received extra samples not listed on COC.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	Not needed.
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	No VOA rec'd.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

No additional comments.

Receipt
COC not with samples. Received via email next day.

Some samples leaking because they were submerged in water. One soil jar for sample "E-WETSOIL.2-052611-1.0-2.0" was broken upon receipt. Some of sample volume was salvaged and placed in a 4oz. jar. One stir bar for sample "B-TP3-052611-5.5" was broken and could not be salvaged.

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): . One MeOH preserved and one DI water & stir bar vial were received as trip blanks, but no listed on the COC. These two vials were added to the COC and logged-in.

Also, sample "H-TP2-052611-1.0-1.5" as listed on the COC is listed as "H-TP2-052611-0.0-0.5" on the 4oz. soil jar label. Collection date and time were matched to find the correct sample set.

Sample "D-TP3.2-052611-4.5" as listed on the COC lists "D-TP3-052611-4.5" on its soil jar label. Collection date and time were matched to find the correct sample set.

Sample "G-WETSOIL-052611-0.0-0.5" as listed on the COC lists "G-WETSOIL-052611-0.5-1.0" on both soil jar labels. Collection date and time were matched to find the correct sample set.

All ID discrepancies were labeled according to the COC.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 5035:
The following samples were prepared outside of preparation holding time due to the sample being received after the 48 hour preservation window for method 5035: B-TP1-052611-6.0 (580-26451-39), E-WETSOIL-052611-0.5-1.0 (580-26451-47), E-WETSOIL-2-052611-1.0-2.0 (580-26451-49), G-WETSOIL-052611-0.0-0.5 (580-26451-44), H-TP2-052611-2.0-2.5 (580-26451-24), H-TP3-052611-0.0-0.5 (580-26451-26). Samples were recieved in bulk soil jars all sample containers contained head space. Sample qualified "H".

Method(s) 8260B:
Surrogate recovery for the following sample(s) was outside the upper control limit: E-WETSOIL-052611-0.0-0.5 (580-26451-46), H-TP2-052611-1.0-1.5 (580-26451-23), H-TP3-052611-0.0-0.5 (580-26451-26). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Internal standard response for the following sample exceeded the lower control limit: E-WETSOIL-052611-0.0-0.5 (580-26451-46). As such, the sample results may be biased high. As the sample did not contain any target compounds above the reporting limit, the data have been qualified as appropriate and reported.

The Trifluorotoluene (TFT) surrogate recovery for the blank associated with batch 580-87535 was outside recovery limits. As the deficient recovery indicated a potential high bias, no target compounds were detected in the method blank above the reporting limit, and all associated sample TFT surrogate recoveries fell within acceptance criteria, the data have been reported.

The following sample(s) was analyzed outside of the 14 day analytical holding time due to system recalibration required following a heavily contaminated sample B-TP1-052611-6.0 (580-26451-39), E-WETSOIL-052611-0.5-1.0 (580-26451-47), E-WETSOIL-2-052611-0.5-1.0 (580-26451-48), E-WETSOIL-2-052611-1.0-2.0 (580-26451-49), G-WETSOIL-052611-0.0-0.5 (580-26451-44), H-TP2-052611-2.0-2.5 (580-26451-24), H-TP3-052611-0.0-0.5 (580-26451-26).

Job ID: 580-26451-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

No other analytical or quality issues were noted.

GC Semi VOA
Method(s) 8081A:

Samples 580-26451-1, 580-26451-2, 580-26451-3, 580-26451-4 and 580-26451-5 requied re-extraction due to an laboratory error with the inital extraction. Samples are qualified "H".

Surrogate recovery for the following sample(s) was outside control limits: 580-26451-28, 580-26451-29, 580-26451-30, 580-26451-32, 580-26451-33, 580-26451-34, 580-26451-35, 580-26451-45 and 580-26451-46. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample(s) was outside control limits: 580-26451-11, 580-26451-15, 580-26451-16, 580-26451-17, 580-26451-20, 580-26451-22 and 580-26451-24. Evidence of matrix interference is present indicated by high percent moisture; therefore, re-extraction and/or re-analysis was not performed.

The capping continuing calibration verification (CCV) analyzed on instrument TAC035, analytical batch 88098, did not meet criteria on both columns for the following analytes: CCV/24 - Recovering below lower control limits for 4,4-DDT. CCV/37 - Recovering below lower control limits for 4,4-DDT, DCB, Endosulfan II, Endosulfan sulfate, Endrin aldehyde and Methoxychlor. CCV/41 - Recovering below lower control limits for 4,4-DDT and DCB. CCV/38 - Recovering below lower control limits for Toxaphene. The associated samples were analyzed twice with similar results. Data has been qualified "^" and reported.

No other analytical or quality issues were noted.

Metals
Method(s) 6010B: The absolute value for some elements was above the RL value. The ICB, MB and CCB's were all within limits. Sample qualifed "L". No bias is indicated.

No other analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
H	Sample was prepped or analyzed beyond the specified holding time
*	ISTD response or retention time outside acceptable limits

GC Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
F	MS or MSD exceeds the control limits
I	Indicates the presence of an interference, recovery is not calculated.
X	Surrogate is outside control limits
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
F	RPD of the MS and MSD exceeds the control limits

Metals

Qualifier	Qualifier Description
L	A negative instrument reading had an absolute value greater than the reporting limit
F	Duplicate RPD exceeds the control limit
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
F	MS or MSD exceeds the control limits
F	RPD of the MS and MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Login Sample Receipt Checklist

Client: Farallon Consulting LLC

Job Number: 580-26451-1

Login Number: 26451

List Source: TestAmerica Seattle

List Number: 1

Creator: Kalicki, Samantha

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	Melted upon rec't. Samples in water.
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	False	COC not present upon rec't. Rec'd via email.
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	False	Refer to Job Narrative for details.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	Not needed.
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	No H2O VOA rec'd.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Laboratory: TestAmerica Seattle

Narrative

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 8260B: Trifluorotoluene (TFT) surrogate recovery for the following sample(s) was outside control limits: E-WetSed-1-053111 (580-26502-1). Evidence of matrix interference is present as similar depressed but in control TFT recoveries were seen in the other two samples in the work order; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Client: Farallon Consulting LLC
Project/Site: Yakima Steel

TestAmerica Job ID: 580-26502-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	Indicates the presence of an interference, recovery is not calculated.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	Containers submerged in water.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	Not needed.
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	No H2O VOA rec'd.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Narrative

Job Narrative
580-26520-1

Comments
No additional comments.

Receipt
One unpreserved one liter amber received broken. This was from sample MW-3-06111.

Sample set MW-4-060111 without collection time on containers. Sample containers labeled per time found on COC for this sample.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

GC VOA
Method(s) RSK-175: Due to the high concentration of Methane, the matrix spike / matrix spike duplicate (MS/MSD) for batch 205123 could not be evaluated for accuracy and precision for Methane. The associated laboratory control sample (LCS) met acceptance criteria.

No other analytical or quality issues were noted.

GC Semi VOA
Method(s) 8081A: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 87465 exceeded control limits for the following analytes: Endrin ketone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	False	Containers received broken. No volume could be salvaged for analysis.
Sample collection date/times are provided.	False	One sample set without sample time. Logged in per COC.
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 8260B: The Trifluorotoluene (TFT) surrogate recovery for the blank associated with batch 580-87535 was outside recovery limits. As the deficient recovery indicated a potential high bias, no target compounds were detected in the method blank above the reporting limit, and all associated sample TFT surrogate recoveries fell within acceptance criteria, the data have been reported.

Method(s) 8260B: Surrogate recovery for the following sample(s) was outside the upper control limit: I-TP4-052711-2.5 (580-26530-1), I-TP6-052711-4.5 (580-26530-10). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8260B: The target compound Carbon Disulfide was added by the client after sample data had been calculated and reported. Therefore the detected concentration of Carbon Disulfide in sample 580-26530-10 was not known at time of initial data work up.

No other analytical or quality issues were noted.

GC Semi VOA
Method(s) 8081A: The continuing calibration verification (CCV) for analytical batch 87956 exceeded control criteria low for DDT and DCB. The closing CCV also failed on re-analysis confirming matrix interference as the reason for CCV failure. Original results have been reported and qualified "^".

Method(s) NWTPH-Dx:
For sample 580-26530-1, the results in the C10-C24 range are due to a mixture of heavily weathered diesel fuel and overlapping results from the motor oil range.

For sample 580-26530-10, the results in the C10-C24 range are due to what most closely resembles a mineral oil range product.

The affected analyte ranges have been qualified with the "Y" qualifier and reported.

Method(s) NWTPH-HCID:
For sample 580-26530-1, the results in the C12-C24 range are due to a mixture of heavily weathered diesel fuel and overlapping results from the motor oil range.

For sample 580-26530-10, the results in the C12-C24 range are due to what most closely resembles a mineral oil range product.

The affected analyte ranges are qualified with the "Y" qualifier and reported.

No other analytical or quality issues were noted.

Metals
Method(s) 6010B: The absolute value fopr Cd is higher than the RL. The associated ICB, MB and CCB's were all within limits sample qualified "L". No bias is indicated.

No other analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Job ID: 580-26530-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

Organic Prep

No analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
Y	The chromatographic response resembles a typical fuel pattern.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.

Metals

Qualifier	Qualifier Description
L	A negative instrument reading had an absolute value greater than the reporting limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Number: 1

Creator: Luna, Francisco

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	False	Rec'd past hold time for 48hour extraction of bulk volatile.
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	Not needed.
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	No VOA rec'd.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Narrative

Job Narrative
580-26540-1

Comments
No additional comments.

Receipt
Method(s) RSK-175: One or more containers for the following sample(s) was received broken or leaking: BLIND (580-26540-7).One sample vials was received with the bottom gone from the vial..

All other samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
Method(s) 8081A: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for batch 87465 exceeded control limits for the following analytes: Endrin ketone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8081A: The continuing calibration verification (CCV) for Endrin ketone and Methoxychlor are both recovering above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Client: Farallon Consulting LLC
Project/Site: YSF Yakima Steel

TestAmerica Job ID: 580-26540-1

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

General Chemistry

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis.
%R	Percent Recovery
EDL	Estimated Detection Limit (Dioxin)
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or method detection limit if shown).
PQL	Practical Quantitation Limit
RE, RE1 (etc.)	Indicates a Re-extraction or Reanalysis of the sample.
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points.
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Number: 1

Creator: Blankinship, Tom

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

Sediment Cleanup Screening Level[5]						--	--	**0.86**	**0.9**	**8.1**	**9.3**	--	--	--	--	--	--	--

NOTES:

Results in **bold** denote concentrations at or exceeding the Preliminary Screening Level indicated.

< denotes analyte not detected at or above the reporting limit listed.

[1] Depth in feet below ground surface.

[2] Analyzed by U.S. Environmental Protection Agency Method 8081.

[3] Constituent was not retained as a COPC following completion of the *Revised Remedial Investigation Report, Agri-Tech & Yakima Steel Fabricators, 6 and 10 1/2 East Washington Avenue, Yakima, Washington* dated June 10, 2004, prepared by Farallon Consulting, L.L.C. (Revised RI Report).

[4] Identified and retained as a COPC in the Revised RI Report.

[5] Table VI, *Freshwater Sediment Cleanup Objectives and Cleanup Screening Levels Chemical Criteria* , of Section 563 of Chapter 173-204 of the Washington Administrative Code (WAC 173-204-563).

* = Response or retention time outside acceptable limits.

COPC = constituent of potential concern

H = sample was prepared or analyzed beyond the specified holding time

NE = not established

Table 5
Bioassay Results Summary
Agri-Tech and Yakima Steel Fabricators Site
Yakima, Washington
Farallon PN: 765-001

Bioassay Evaluation	Screening Criteria		WETSED-1		WETSED-2		WETSED-3	
	SCO	CSL	Nautilus	Environ	Nautilus	Environ	Nautilus	Environ
10-day *H. azteca* Mortality (M_T-M_C)	>15%	>25%	100%	91%	14%	-4%	4%	-4%
20-day *C. dilutus* Mortality (M_T-M_C)	>15%	>25%	15%	14%	18%	17%	58%	20%
20-day *C. dilutus* Growth (MIG_C-MIG_T)/MIG_C	>0.25	>0.40	-0.22	0.12	0.04	-0.31	0.34	-0.01

Table based on Attachment C, Table 24, Summary of Sediment Chemistry and Test Results, Agri-Tech/YSF, 2011 and 2013.

NOTES:

Result exceeds sediment cleanup objective.

Result exceeds sediment cleanup screening level.

CSL = Cleanup Screening Level
Environ = Ramboll-Environ Corporation
M_C = Control group mortality
MIG_C = Control group mean individual growth
MIG_T = Test group mean individual growth
M_T = Test group mortality
Nautilus = Nautilus Environmental
SCO = Sediment Cleanup Objective

NOTE:
ROSE DIAGRAMS SHOW THE DIRECTION OF TRANSPORT FOR THE FASTEST 1- AND 2-MINUTE WIND INTERVAL RECORDED EACH DAY. 1-MINUTE DATA COVERS THE PERIOD FROM 1965 TO 2015. 2-MINUTE DATA COVERS THE PERIOD FROM 1995 TO 2015. THE LENGTH OF EACH PETAL ON THE ROSE REFLECTS THE TOTAL NUMBER OF DAYS THE MAXIMUM WIND WAS RECORDED BLOWING THAT DIRECTION.

NOTES:

− denotes sample not analyzed.

< denotes analyte not detected at or exceeding the laboratory reporting limit listed.

B denotes blank contamination.

L denotes a negative instrument reading with an absolute value exceeding the reporting limit.

J denotes the associated value is an estimated quantity.

<J denotes the material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

Voluntary Cleanup Program

Washington State Department of Ecology
Toxics Cleanup Program

TERRESTRIAL ECOLOGICAL EVALUATION FORM

Under the Model Toxics Control Act (MTCA), a terrestrial ecological evaluation is necessary if hazardous substances are released into the soils at a Site. In the event of such a release, you must take one of the following three actions as part of your investigation and cleanup of the Site:

1. Document an exclusion from further evaluation using the criteria in WAC 173-340-7491.
2. Conduct a simplified evaluation as set forth in WAC 173-340-7492.
3. Conduct a site-specific evaluation as set forth in WAC 173-340-7493.

When requesting a written opinion under the Voluntary Cleanup Program (VCP), you must complete this form and submit it to the Department of Ecology (Ecology). The form documents the type and results of your evaluation.

Completion of this form is not sufficient to document your evaluation. You still need to document your analysis and the basis for your conclusion in your cleanup plan or report.

If you have questions about how to conduct a terrestrial ecological evaluation, please contact the Ecology site manager assigned to your Site. For additional guidance, please refer to www.ecy.wa.gov/programs/tcp/policies/terrestrial/TEEHome.htm.

Step 1: IDENTIFY HAZARDOUS WASTE SITE	
Please identify below the hazardous waste site for which you are documenting an evaluation.	
Facility/Site Name: Agri-Tech/Yakima Steel Fabricators	
Facility/Site Address: 6 and 10 1/2 East Washington Avenue, Yakima, Washington	
Facility/Site No: 479	VCP Project No.:

Step 2: IDENTIFY EVALUATOR			
Please identify below the person who conducted the evaluation and their contact information.			
Name: Eric Buer			Title: Associate Geologist
Organization: Farallon Consulting, LLC			
Mailing address: 1809 7th Avenue			
City: Seattle		State: WA	Zip code: 98101
Phone: (424)394-4418	Fax: (425)295-0850	E-mail: ebuer@farallonconsulting.com	

Step 3: DOCUMENT EVALUATION TYPE AND RESULTS

A. Exclusion from further evaluation.

1. Does the Site qualify for an exclusion from further evaluation?

☐ Yes *If you answered **"YES,"** then answer **Question 2**.*

☒ No or Unknown *If you answered **"NO" or "UKNOWN,"** then skip to **Step 3B** of this form.*

2. What is the basis for the exclusion? *Check all that apply. Then skip to **Step 4** of this form.*

Point of Compliance: WAC 173-340-7491(1)(a)

☐ All soil contamination is, or will be,* at least 15 feet below the surface.

☐ All soil contamination is, or will be,* at least 6 feet below the surface (or alternative depth if approved by Ecology), and institutional controls are used to manage remaining contamination.

Barriers to Exposure: WAC 173-340-7491(1)(b)

☐ All contaminated soil, is or will be,* covered by physical barriers (such as buildings or paved roads) that prevent exposure to plants and wildlife, and institutional controls are used to manage remaining contamination.

Undeveloped Land: WAC 173-340-7491(1)(c)

☐ There is less than 0.25 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site and any of the following chemicals is present: chlorinated dioxins or furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, heptachlor epoxide, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, or pentachlorobenzene.

☐ For sites not containing any of the chemicals mentioned above, there is less than 1.5 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site.

Background Concentrations: WAC 173-340-7491(1)(d)

☐ Concentrations of hazardous substances in soil do not exceed natural background levels as described in WAC 173-340-200 and 173-340-709.

* An exclusion based on future land use must have a completion date for future development that is acceptable to Ecology.

[±] "Undeveloped land" is land that is not covered by building, roads, paved areas, or other barriers that would prevent wildlife from feeding on plants, earthworms, insects, or other food in or on the soil.

[#] "Contiguous" undeveloped land is an area of undeveloped land that is not divided into smaller areas of highways, extensive paving, or similar structures that are likely to reduce the potential use of the overall area by wildlife.

B. Simplified evaluation.

1. Does the Site qualify for a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No or Unknown *If you answered **"NO"** or **"UNKNOWN,"** then skip to **Step 3C** of this form.*

2. Did you conduct a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 3** below.*

☐ No *If you answered **"NO,"** then skip to **Step 3C** of this form.*

3. Was further evaluation necessary?

☐ Yes *If you answered **"YES,"** then answer **Question 4** below.*

☒ No *If you answered **"NO,"** then answer **Question 5** below.*

4. If further evaluation was necessary, what did you do?

☐ Used the concentrations listed in Table 749-2 as cleanup levels. *If so, then skip to **Step 4** of this form.*

☐ Conducted a site-specific evaluation. *If so, then skip to **Step 3C** of this form.*

5. If no further evaluation was necessary, what was the reason? *Check all that apply. Then skip to **Step 4** of this form.*

Exposure Analysis: WAC 173-340-7492(2)(a)

☐ Area of soil contamination at the Site is not more than 350 square feet.

☐ Current or planned land use makes wildlife exposure unlikely. Used Table 749-1.

Pathway Analysis: WAC 173-340-7492(2)(b)

☐ No potential exposure pathways from soil contamination to ecological receptors.

Contaminant Analysis: WAC 173-340-7492(2)(c)

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations that exceed the values listed in Table 749-2.

☒ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations that exceed the values listed in Table 749-2, and institutional controls are used to manage remaining contamination.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays, and institutional controls are used to manage remaining contamination.

C. Site-specific evaluation. A site-specific evaluation process consists of two parts: (1) formulating the problem, and (2) selecting the methods for addressing the identified problem. Both steps require consultation with and approval by Ecology. *See* WAC 173-340-7493(1)(c).

1. Was there a problem? *See* WAC 173-340-7493(2).

☐ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No *If you answered **"NO,"** then identify the reason here and then skip to **Question 5** below:*

- ☐ No issues were identified during the problem formulation step.
- ☐ While issues were identified, those issues were addressed by the cleanup actions for protecting human health.

2. What did you do to resolve the problem? *See* WAC 173-340-7493(3).

- ☐ Used the concentrations listed in Table 749-3 as cleanup levels. *If so, then skip to **Question 5** below.*
- ☐ Used one or more of the methods listed in WAC 173-340-7493(3) to evaluate and address the identified problem. *If so, then answer **Questions 3 and 4** below.*

3. If you conducted further site-specific evaluations, what methods did you use?
Check all that apply. See WAC 173-340-7493(3).

- ☐ Literature surveys.
- ☐ Soil bioassays.
- ☐ Wildlife exposure model.
- ☐ Biomarkers.
- ☐ Site-specific field studies.
- ☐ Weight of evidence.
- ☐ Other methods approved by Ecology. If so, please specify:

4. What was the result of those evaluations?

- ☐ Confirmed there was no problem.
- ☐ Confirmed there was a problem and established site-specific cleanup levels.

5. Have you already obtained Ecology's approval of both your problem formulation and problem resolution steps?

☐ Yes If so, please identify the Ecology staff who approved those steps:

☐ No

Step 4: SUBMITTAL

Please mail your completed form to the Ecology site manager assigned to your Site. If a site manager has not yet been assigned, please mail your completed form to the Ecology regional office for the County in which your Site is located.

Northwest Region: Attn: VCP Coordinator 3190 160th Ave. SE Bellevue, WA 98008-5452	**Central Region:** Attn: VCP Coordinator 1250 West Alder St. Union Gap, WA 98903-0009
Southwest Region: Attn: VCP Coordinator P.O. Box 47775 Olympia, WA 98504-7775	**Eastern Region:** Attn: VCP Coordinator N. 4601 Monroe Spokane WA 99205-1295
