**SVE Report** 

Appendix D

## 1.0 Introduction

This report provides progress reporting in conformance with Section VII.B.1 of Agreed Order No. 8191 (Order) and summarizes cleanup actions and monitoring conducted at the Boeing Renton Facility (the Facility) during the second quarter 2019. This work is required under the Resource Conservation and Recovery Act (RCRA) Corrective Action Program being performed at the Facility. Corrective action activities are performed for those solid waste management units (SWMUs), areas of concern (AOCs), and other areas where cleanup actions are ongoing. Monitoring, cleanup activities, and reporting are being conducted as part of the final remedy implementation described in the Engineering Design Report (EDR) (AMEC, 2014). The groundwater monitoring program is detailed in the Addendum to the Compliance Monitoring Plan (Wood, 2019), which contains changes to the revised Compliance Monitoring Plan (Amec Foster Wheeler, 2016a) that superseded the original plan presented in Appendix D of the EDR (AMEC, 2014).

Groundwater monitoring and final cleanup action implementation are being conducted at the following areas (the ongoing remedies for each of these areas are noted in parentheses):

- SWMU-168: (monitored natural attenuation [MNA]);
- SWMU-172 and SWMU-174: (bioremediation, soil vapor extraction [SVE] and monitored attenuation [MA]);
- Building 4-78/79 SWMU/AOC Group: (bioremediation, SVE, MNA, and MA);
- Former Fuel Farm AOC Group: (MNA);
- AOC-001 and AOC-002: (bioremediation and MA);
- AOC-003: (bioremediation and MA);
- AOC-004: (bioremediation and MA);
- AOC-060: (bioremediation and MA);
- AOC-090: (bioremediation and MA);
- Building 4-70: (bioremediation and MA);
- Lot 20/Former Building 10-71 Parcel: (bioremediation and MA); and
- Apron A: (bioremediation and MA).

The background and investigation history for each affected unit or group of units is described in the Cleanup Action Plan (CAP) (AMEC, 2012) and/or EDR (AMEC, 2014). It should be noted that monitoring for the Building 10-71 area and Building 4-70 area is included in this monitoring report to maintain continuity with the monitoring program that has been conducted for these areas for several years and as approved by the Washington State Department of Ecology (Ecology); these two areas are not addressed explicitly in the Compliance Monitoring Plan but are being addressed per Ecology's December 30, 2015, email to Boeing with comments on the revised Compliance Monitoring Plan. Monitoring for Apron A is also included, as semiannual monitoring began in this area starting in the fourth quarter 2016, as reported in the Apron A Investigation Results report (Amec Foster Wheeler, 2016b).

The goals for cleanup of groundwater at the Facility, as described in the CAP, include protection of groundwater for drinking water beneficial use at all areas of the site, and demonstration of protection of surface water beneficial uses at the conditional points of compliance (CPOCs) for each SWMU and AOC. Cleanup goals are discussed for each SWMU and AOC below. Discussions include comparisons to

protection of groundwater for drinking water beneficial uses by comparing concentrations to the Model Toxics Control Act (MTCA) or United States Environmental Protection Agency Maximum Contaminant Level (MCL), as well as to site specific cleanup levels (CULs), which are based on protection of surface water beneficial uses. Analytical data for groundwater presented in the tables are compared to the AOC/SWMU specific CULs established for the respective points of compliance.

This quarterly report:

- Describes work completed during the reporting quarter;
- Describes any deviations from corrective action tasks required under the Order and/or CAP;
- Describes revisions to the corrective action schedule;
- Describes work projected to occur during the next quarter, including any planned deviation from the CAP;
- Discusses remediation operation and maintenance activities conducted at the Facility during the reporting period;
- Documents monitoring activities conducted during the quarter;
- Describes and discusses trends in monitoring data;
- Assesses remediation at each area; and
- Assesses attainment CULs at the CPOCs.

This report presents this information for the second quarter 2019, the period from April through June 2019.

## 1.1 Quarterly progress reporting

In accordance with the requirements of the Order, corrective action activities were conducted at the Facility, as described in this report. As approved by Ecology in their letter dated November 18, 2015, progress reporting is conducted on a quarterly basis in conjunction with monitoring, operations, and maintenance activities conducted under the CAP.

## 1.1.1 Work completed in the second quarter 2019

The following work was completed during the second quarter 2019, the period from April through June 2019:

- Groundwater monitoring for the second quarter 2019 was completed during May 2019.
- On behalf of Boeing, Wood submitted the first quarter 2019 report to Ecology on May 15, 2019.
- On May 8, 2019, CALIBRE Systems, Inc. (CALIBRE) collected groundwater samples from Building 4-78/79 monitoring wells (GW031S and GW244S) and injection wells (B78-11, B78-13, B78-17, B78-18, and B78-20) as part of the nitrate study.
- On June 13 and 14, 2019, CALIBRE completed the soil investigation at Building 4-78/79, as described in the work plan submitted to Ecology on May 8, 2019.

## 1.1.2 Deviations from required tasks

No deviations from tasks required in the Order occurred during this activity period.

## 1.1.3 Deviations from CAP

There were no deviations from the CAP during this activity period, and there are no planned deviations from the CAP expected for the next activity period.

## 1.1.4 Schedule revisions

There were no significant revisions to the schedule for this reporting period and no revisions are expected for the next activity period.

## 1.1.5 Work projected for the next quarter

The following work is projected for the third quarter 2019:

- Reporting will be completed in accordance with the Order, CAP, EDR, and any changes approved by Ecology.
- Groundwater sampling and analysis will be completed.
- Nitrate and sulfate injections may be performed for the Building 4-78/79 area, depending on performance monitoring results.
- Soil with TPH exceeding cleanup levels within unsaturated and smear zones is planned for excavation
  on the east side of building 4-79. Groundwater elevations are currently being monitored to
  determine if water levels will be low enough to allow for sufficient excavations to occur this year.
- Performance monitoring to support the benzene plume study is currently scheduled to be conducted.

## 2.0 Groundwater sampling methodology

Groundwater was sampled and analyzed as described in Appendix A. These procedures are in accordance with the methods specified in the revised Compliance Monitoring Plan (Amec Foster Wheeler, 2016a). Table A-1 summarizes the current groundwater monitoring program and constituents of concern (COCs) specified in the CAP and revised in the Addendum to the Compliance Monitoring Plan (Wood, 2019) for all Facility corrective action areas. Table A-2 summarizes the current groundwater monitoring program for the corrective action areas that include MNA or MA as part of the cleanup remedy specified in the CAP. Tables A-1 and A-2 also include Building 4-70, Lot 20/Former Building 10-71, and Apron A, which were not included in the CAP. Any changes or exceptions to the sampling or analytical methods cited in Appendix A during the quarter are described in the applicable subsections in Section 3. The field data sheets, which document the groundwater sample collection and field parameter monitoring for each well sampled during this quarter, are included in Appendix B.

The analytical methods, field duplicate, lab duplicate, and matrix spike/matrix spike duplicate frequencies are specified in the Quality Assurance Project Plan (Amec Foster Wheeler, 2016c). The full analytical reports provided by the laboratory are provided separately on compact disc. The data validation memoranda are included in Appendix C.

## 3.0 Corrective action activities completed during quarter

This section describes the corrective action activities conducted at the Facility during the second quarter 2019. Operation of the SVE system at SWMU-172/174 continued during the second quarter, as discussed in Section 3.2.1.2. Quarterly compliance monitoring was conducted in accordance with the Addendum to the Compliance Monitoring Plan (Wood, 2019).

#### 3.1 SWMU-168

SWMU-168 is monitored semiannually during the first and third quarters; therefore, no monitoring was conducted for this area during the second quarter 2019.

## 3.2 SWMU-172 and SWMU-174

This section describes corrective action activities conducted at these two SWMUs. The cleanup remedy for SWMU-172 and SWMU-174 is a combination of bioremediation, SVE, and MA. Figure 1 shows the layout of the groundwater monitoring wells and the remediation system for these SWMUs.

## 3.2.1 Cleanup action activities

## 3.2.1.1 Installation/construction activities

No installation/construction activities were conducted for these SWMUs during the second quarter.

## 3.2.1.2 Soil vapor extraction and bioremediation operations

The SVE system at SWMU-172 and SWMU-174 operated normally during the second quarter. Details for system operations are included in the SVE operations and monitoring report prepared by CALIBRE and included as Appendix D.

## 3.2.2 Compliance monitoring plan deviations

No deviations from the Compliance Monitoring Plan occurred for this area during the second guarter.

#### 3.2.3 Water levels

Groundwater elevations for the SWMU-172 and SWMU-174 area measured during the second quarter 2019 are summarized in Table 1 and shown on Figure 1. The contoured data for May 2019 show that groundwater generally flows east from SWMU-172 and SWMU-174 toward the Cedar River Waterway, with an approximate horizontal gradient of 0.01.

## 3.2.4 Groundwater monitoring results

Groundwater in this area is monitored following the schedules presented in Tables A-1 and A-2 in Appendix A. Results for primary geochemical indicators are presented in Table 2; results for the SWMU-172 and SWMU-174 area COCs are presented in Table 3.

## 3.2.4.1 Monitored attenuation/geochemical indicators

The geochemical indicator results are presented in Table 2. Total organic carbon (TOC) concentrations ranged from 0.90 milligrams per liter (mg/L) to 7.10 mg/L for all SWMU-172 and SWMU-174 monitoring wells. The pH measurements in the source area monitoring wells were slightly depressed and near neutral in the downgradient and CPOC area wells. The other natural attenuation parameter results indicate that geochemical conditions were generally uniform and appropriate for reductive dechlorination of

chlorinated volatile organic compounds; the dissolved oxygen and oxidation/reduction potential results indicate reducing conditions were present.

## 3.2.4.2 COC results for source and downgradient plume areas

Table 3 lists second quarter 2019 analytical results for the SWMU-172 and SWMU-174 COCs. Figures 2 and 3 show historical trend plots for tetrachloroethene (PCE), trichloroethene (TCE), vinyl chloride (VC), and cis-1,2-dicholoethene (cis-1,2-DCE) in source area wells GW152S and GW153S, and in downgradient plume area wells GW172S and GW173S. Flow generally moves from the vicinity of source area well GW152S to downgradient plume area well GW172S, and from source area well GW153S to downgradient plume area well GW173S. PCE and TCE are the chlorinated solvents that were used at the Facility, and cis-1,2-DCE and VC are breakdown products resulting from biodegradation processes.

As shown in Table 3, cis-1,2-DCE, TCE, PCE, and VC concentrations exceeded the CPOC CULs in the groundwater from both source area and downgradient plume area wells. As shown in Figures 2 and 3, the concentrations of COCs in groundwater from source area wells GW152S and GW 153S and downgradient wells GW172S and GW173S generally remained stable during the second quarter, except for PCE, which shows decreasing concentrations in the groundwater from both source area wells.

Arsenic was detected above the CUL in the groundwater from all source area and downgradient plume area wells. As shown in Figure 4, the arsenic concentrations in the groundwater from both source area and downgradient wells either decreased or remained stable during the second quarter sampling event. Copper was detected in the groundwater from source area and downgradient plume area wells, but concentrations were below the CUL. Lead was detected above the CUL in the groundwater from source area well GW152S, but was not in the groundwater from the downgradient plume area wells.

While concentrations of select COCs in groundwater from source area and downgradient plume area wells exceed the CULs established at the CPOC, COC concentrations are below the applicable MCLs/MTCA criteria for potable water supply.

## 3.2.4.3 COC results for conditional point of compliance area

Results from the CPOC area wells are presented in Table 3 and trend charts for cis-1,2-DCE, TCE, and VC for all CPOC area wells are presented in Figure 5. As shown in Table 3, cis-1,2-DCE was detected at concentrations above the CUL, ranging from 0.0281 to 0.319 micrograms per liter (µg/L) in the groundwater from all CPOC area wells; TCE was detected above the CUL in the groundwater from all CPOC area wells except for GW234S; and VC was detected above the CUL in the groundwater from monitoring well GW232S. PCE was not detected in the groundwater from the CPOC wells and is not shown in Figure 5. As shown on Figure 5, concentrations of cis-1,2-DCE have exceeded the CUL in the CPOC wells since compliance monitoring began, but are generally stable. The concentrations of both TCE and VC generally appear to be stable.

Arsenic was detected above the CUL in the groundwater from all CPOC area wells except for GW233I and GW235I. Copper was not detected above the CUL in the groundwater from CPOC wells. Lead was detected above the CUL in the groundwater from CPOC well GW236S (Table 3). Figure 6 shows arsenic, copper, and lead trends since the beginning of compliance monitoring in groundwater from the CPOC area wells. As shown in Figure 6, though arsenic, copper and lead concentrations appear to vary over time, there are no apparent long-term increasing or decreasing trends in the groundwater from CPOC area wells.

While select COC concentrations exceed the CUL in the groundwater from select CPOC wells, as detailed above, COC concentrations are below the applicable MCLs/MTCA criteria for potable water supply in all CPOC wells.

## 3.3 Building 4-78/79 SWMU/AOC group

This section describes corrective action activities conducted at the Building 4-78/79 SWMU/AOC Group during the second quarter 2019. The cleanup remedy for this SMWU/AOC group is bioremediation, SVE, MNA, and MA. Figure 7 shows the location of groundwater monitoring wells, bioremediation wells, and SVE wells for this area.

## 3.3.1 Cleanup action activities

#### 3.3.1.1 Installation/construction activities

No installation/construction activities were conducted for these SWMUs during the second quarter.

## 3.3.1.2 Soil vapor extraction and bioremediation operations

As previously reported during 2018 monitoring events, the SVE system at Building 4-78/79 SWMU/AOC Group was shut down during the first quarter 2018, during which rebound testing was implemented. Soil samples were collected during the second quarter 2018 to assess the attainment of soil CULs, and results were reported in the second quarter monitoring report (Wood, 2018). The CULs were attained with one exception: the sample from 4.5 feet below ground surface at well PP13 had a concentration of total petroleum hydrocarbons as gasoline (TPH-G) of 147 milligrams per kilogram (mg/kg), and the field duplicate was 131 mg/kg, above the CUL of 30 mg/kg. A revised work plan (CALIBRE, 2019) for excavating the soils near PP13 and GW013S was submitted to Ecology on May 8, 2019, in response to a request from Ecology. The investigation described in the work plan was conducted on June 13 and 14, 2019, and the results will be presented to Ecology in a separate report.

As reported in the first quarter 2019 report, a sixth round of nitrate/sulfate injections was performed in March 2019. Groundwater samples were collected in February and May 2019. The results of the performance monitoring are shown in Table 3-1 of Appendix D. Concentrations of benzene and cis-1,2-DCE in the groundwater from all injection wells related to ongoing benzene treatment in this area are shown in Figure 8. As shown in Figure 8, benzene concentrations in groundwater from injection wells ranged from below the reporting limit of 0.20  $\mu$ g/L to 16.30  $\mu$ g/L. in the second quarter. The May 2019 benzene concentration in the source area well GW031S in was 7.13  $\mu$ g/L. Trend charts for TCE and VC in the injection wells are presented in Figure 9.

Details regarding injection concentrations for each event are provided in Appendix D.

## 3.3.2 Compliance monitoring plan deviations

No deviations from the compliance monitoring plan occurred for this area during the second quarter.

## 3.3.3 Water levels

Table 4 presents the groundwater elevations measured during the second quarter 2019 groundwater monitoring event at the Building 4-78/79 SWMU/AOC group. As shown in Figure 7, the observed direction of groundwater flow from the source area during May 2019 is generally to the west, with a hydraulic gradient of 0.0002.

## 3.3.4 Groundwater monitoring results

Results for primary geochemical indicators are presented in Table 5; results for the COCs for Building 4-78/79 SWMU/AOC Group are presented in Table 6. Groundwater at this area is monitored following the schedule presented in Tables A-1 and A-2 in Appendix A.

## 3.3.4.1 Natural attenuation/geochemical indicators

The geochemical indicator results are presented in Table 5. In general, source area, downgradient, and CPOC area wells had low levels of dissolved oxygen and oxidation/reduction potential, indicating that reducing conditions are present over the area and are generally favorable for reductive dechlorination of chlorinated volatile organic compounds. The pH in all monitoring wells was above 6.0 standard units during the second quarter monitoring period. Results for the other primary geochemical indicators were fairly consistent throughout this area. TOC concentrations in source area wells ranged from 4.80 to 28.09 mg/L.

## 3.3.4.2 COC results for source and downgradient plume areas

Table 6 lists second quarter 2019 analytical results for the Building 4-78/79 SWMU/AOC Group COCs. The CULs established in the CAP for the CPOC are also presented on Table 6. Figures 10 and 11 are trend charts showing historical trends for COCs for four groundwater monitoring wells that have a history of frequent detections. Trend charts have not been prepared for groundwater monitoring wells or COCs that do not have a history of frequent detections.

As shown in Table 6, benzene, cis-1,2-DCE, and VC were detected in groundwater from several source area wells at concentrations above the CPOC CULs. In source area wells GW034S, GW039S, and GW243I, all COCs were below CULs. TCE was not detected in the groundwater from source area wells. TPH-G was detected in the groundwater from source area well GW031S, at a concentration of 1,020  $\mu$ g/L (the field duplicate concentration was 848  $\mu$ g/L),. TPH-G was also detected in the groundwater from source area wells GW033S at a concentration below the CPOC CUL. No COCs were detected in the groundwater from the downgradient plume area wells.

Figure 10 shows trends for selected COCs for source area wells GW031S and GW033S, and Figure 11 shows trends for selected COCs for source area well GW034S and downgradient plume area well GW209S. COC concentrations in the groundwater from GW031S and GW033S are generally consistent with historical results and trends, though the concentration of VC decreased significantly during the second quarter in source area well GW033S. Groundwater from GW033S historically had the highest concentrations of cis-1,2-DCE and VC prior to the Duct Bank dewatering project.

COC concentrations in groundwater from source area well GW034S and downgradient plume area well GW209S (Figure 11) remain stable with concentrations below detection during the second quarter. Nitrate and sulfate injections described in Appendix D are continuing, in order to address remaining benzene present between GW210S and GW244S.

Concentrations of COCs in the groundwater from select source area wells remain above the MCLs/MTCA standard for potable water supply (specifically for benzene, VC, and TPH-G). Active treatment is ongoing. Concentrations of COCs in downgradient monitoring wells are below the applicable MCLs/MTCA criteria for potable water supply.

## 3.3.4.3 COC results for conditional point of compliance area

Groundwater monitoring results from the second quarter for the CPOC area are summarized in Table 6. Trends for CPOC wells GW143S, GW237S, and GW240D are shown in Figures 12 through 14. Benzene was detected at a concentration of 2.20  $\mu$ g/L, above the CUL, in the groundwater from CPOC area well GW237S; all other benzene results for the CPOC area were below detection (Table 6). As shown in Figure 12, benzene has been sporadically detected in the groundwater from CPOC area well GW237S but has not been detected above the CUL in the groundwater from any other CPOC wells. The benzene concentrations in the groundwater from CPOC well GW237S have remained lower than the concentrations observed during the first quarter. The only other COCs detected in the groundwater from the CPOC area

during the second quarter was VC at a concentration of 0.27  $\mu$ g/L in the groundwater from CPOC well GW240D.

## 3.4 Former Fuel Farm AOC group

The Former Fuel Farm AOC group is monitored semiannually in May and November. The final remedy for the Former Fuel Farm is MNA.

## 3.4.1 Cleanup action activities

No installation/construction activities were conducted for this cleanup action area during the second quarter.

## 3.4.2 Compliance monitoring plan deviations

No deviations from the compliance monitoring plan occurred for this area during the second quarter.

## 3.4.3 Water levels

Groundwater elevations for the Former Fuel Farm AOC Group measured during the second quarter 2019 are summarized in Table 7 and shown on Figure 15. Groundwater elevation contours are not shown on Figure 15 due to anomalous measurements.

## 3.4.4 Groundwater monitoring results

Results for primary geochemical indicators are presented in Table 8; results for COCs for the Former Fuel Farm AOC Group are presented in Table 9. Groundwater in this area is monitored following the schedule presented in Tables A-1 and A-2 in Appendix A.

#### 3.4.4.1 Monitored natural attenuation indicators

The geochemical indicator results are presented in Table 8. Results in Table 8 indicate that geochemical conditions are generally consistent throughout the Former Fuel Farm AOC Group. The pH in CPOC area wells GW212S and GW257S was below 6.0 standard units; low pH may interfere with biological degradation of site COCs. However, COCs are below CULs at these wells. The other geochemical indicators indicate that conditions are generally conducive to natural attenuation of the COCs for the Former Fuel Farm AOC Group.

## 3.4.4.2 COC results for source area

Table 9 lists second quarter 2019 analytical results for the Former Fuel Farm AOC Group COCs. The CULs established in the CAP are also presented on Table 9. As shown in Table 9, TPH in the diesel and Jet A ranges was not detected above the reporting limit in the groundwater from source area well GW255S.

## 3.4.4.3 COC results for conditional point of compliance area

CPOC area monitoring results are presented in Table 9. Figure 16 shows trend data for CPOC area wells GW211S, GW221S, and GW224S. TPH in the diesel range exceeded the CUL in the groundwater from CPOC area wells GW221S and GW224S, and was detected below the CUL in CPOC well GW211S. TPH in the Jet A range exceeded the CUL in the groundwater from CPOC area well GW224S, and was detected below the CUL in CPOC wells GW211S and GW221S. Figure 16 shows that the second quarter results for these wells are consistent with the historical monitoring results since late 2013.

Samples were analyzed for TPH in the diesel and Jet A ranges both with and without a silica gel cleanup which can be performed on samples to remove non-petroleum based biogenic interferences. As shown in Table 9, concentrations of TPH as diesel and Jet A were both lower after silica gel cleanup had been performed (except for sample GW221S). We propose to analyze samples GW211S, GW221S and GW224S with the silica gel procedure for future sampling events starting in the fourth quarter 2019.

#### 3.5 AOC-001 and AOC-002

This section describes corrective action activities conducted at these AOCs during the second quarter 2019. The cleanup remedy for this corrective action area is bioremediation and MA. Bioremediation commenced for this area in late 2004, following source area excavation. Figure 17 shows the location of groundwater monitoring wells and the bioremediation injection system for AOC-001 and AOC 002, as well as the groundwater elevations measured during this monitoring event.

## 3.5.1 Cleanup action activities

No installation/construction activities were conducted for this cleanup action area during the second quarter.

## 3.5.2 Compliance monitoring plan deviations

No deviations from the compliance monitoring plan occurred for this area during the second quarter.

#### 3.5.3 Water levels

Table 10 presents the groundwater elevations measured during the second quarter 2019 monitoring event at AOC-001 and AOC-002. Figure 17 shows the groundwater elevations from this event. Groundwater flow directions cannot be determined from the available groundwater elevation data.

## 3.5.4 Groundwater monitoring results

Groundwater in this area is monitored following the schedule presented in Tables A-1 and A-2 in Appendix A. Results for primary geochemical indicators are presented in Table 11; results for the AOC-001 and AOC-002 COCs are presented in Table 12. The COCs detected (cis-1,2-DCE and VC) are present at levels below the applicable MCLs/MTCA criteria for potable water supply in all wells.

#### 3.5.4.1 Monitored attenuation/geochemical indicators

The geochemical indicator results are presented in Table 11. The pH was near neutral in all CPOC wells and is conducive to microbial activity. Table 11 also suggests that geochemical conditions are appropriate for reductive dechlorination of the COCs in the AOC-001 and AOC-002 CPOC area, as indicated by the reducing conditions, low dissolved oxygen levels, and generally appropriate TOC concentrations.

#### 3.5.4.2 COC results for source and downgradient plume areas

Source area and downgradient wells are monitored semiannually in the first and third quarters; therefore, no monitoring for source area or downgradient plume area wells was conducted in the second quarter.

## 3.5.4.3 COC results for conditional point of compliance area

As shown in Table 12, 1,1-dichloroethene, benzene, and TCE concentrations in the groundwater from CPOC area wells were either below detection or below the CUL. Concentrations of cis-1,2-DCE were above the CUL in the groundwater from all CPOC area wells except for GW194S. VC was detected at

concentrations above the CUL in the groundwater from CPOC area wells 185S and 197S, and was detected at a concentration below the CUL in well 196D.

As shown in Figure 18, aside from the increase in concentrations of cis-1,2-DCE and VC observed in the in the groundwater from GW185S in the second and third quarters of 2016; concentrations of cis-1,2-DCE and VC in the CPOC area monitoring wells have been generally stable since compliance monitoring began. CPOC area wells GW194S and GW245S are not shown on Figure 18 because COCs are generally not detected in the groundwater from these wells. Similarly, the remaining COCs are generally below the CUL in the CPOC area monitoring wells and are not included on Figure 18.

As previously noted, CULs may need to be re-evaluated based on overly conservative COC concentration assumptions that were made prior to remedial action implementation, but that have changed over time, resulting in an over-estimation of total site risk based on current relative concentrations of individual COCs.

## 3.6 AOC-003

This section describes corrective action activities conducted at AOC-003 for the second quarter 2019. The cleanup remedy for this AOC is bioremediation and MA. Figure 19 shows the location of groundwater monitoring and bioremediation wells at AOC-003, as well as the groundwater elevations measured during this monitoring event.

## 3.6.1 Cleanup action activities

No installation/construction activities were conducted for this cleanup action area during the second quarter.

## 3.6.2 Compliance monitoring plan deviations

Groundwater samples were collected from the source and downgradient area wells during the second quarter. Following the schedule presented in Table A-1, source and downgradient area wells are sampled semiannually in the first and third quarters.

#### 3.6.3 Water levels

Table 13 presents the groundwater elevations measured during the second quarter 2019 monitoring event at AOC-003 and AOC-092. Figure 19 shows the groundwater elevations from this event. Groundwater flow directions cannot be determined from the available groundwater elevation data.

## 3.6.4 Groundwater monitoring results

Groundwater at AOC-003 is monitored following the schedule presented in Tables A-1 and A-2 in Appendix A. Results for geochemical indicators are presented in Table 14; results for the AOC-003 COCs are presented in Table 15.

## 3.6.4.1 Monitored attenuation//geochemical indicators

The geochemical indicator results are presented in Table 14. Results in Table 14 indicate that geochemical conditions are generally consistent throughout this AOC and are generally conducive to biodegradation of the COCs for this AOC.

## 3.6.4.2 COC results for source and downgradient plume areas

Source area and downgradient wells are monitored semiannually in May and November; therefore, no monitoring for source area or downgradient plume wells was conducted in the second quarter.

## 3.6.4.3 COC results for conditional point of compliance area

Groundwater from the two CPOC area wells had no detections of PCE, TCE or cis-1,2-DCE above their respective CULs. VC was detected at concentrations above the CUL in the groundwater from both CPOC wells (GW247S and GW248I), at concentrations of 0.497 and 0.551  $\mu$ g/L, respectively.

While VC concentrations exceed the CUL in the groundwater from CPOC wells, as detailed above, VC concentrations are below the applicable MCLs/MTCA criteria for potable water supply in both CPOC wells.

#### 3.7 AOC-004

AOC-004 is monitored semiannually during the first and third quarters; therefore, no monitoring was conducted for this area during the second quarter 2019.

#### 3.8 AOC-060

AOC-060 is monitored semiannually during the first and third quarters; therefore, no monitoring was conducted for this area during the second quarter 2019.

#### 3.9 AOC-090

AOC-090 is monitored semiannually during the first and third quarters; therefore, no monitoring was conducted for this area during the second quarter 2019.

## **3.10 Building 4-70 area**

The Building 4-70 Area is monitored semiannually during the first and third quarters; therefore, no monitoring was conducted for this area during the second quarter 2019.

## 3.11 Lot 20/Former Building 10-71 Parcel

This section describes corrective action activities conducted for this area during the second quarter 2019. Figure 20 shows the locations of the groundwater monitoring wells and the bioremediation injection system at the Lot 20/Former Building 10-71 Parcel, as well as the groundwater elevations measured during the second quarter. The Lot 20/Former Building 10-71 Parcel was not included in the EDR, but was later added to the Compliance Monitoring Plan (Amec Foster Wheeler, 2016a) and has been regularly monitored in conjunction with the Facility corrective action areas. The cleanup remedy for the Lot 20/Former Building 10-71 Parcel is bioremediation and MA. This area is monitored semiannually in the second and fourth quarters, in accordance with Table A-1 in Appendix A.

## 3.11.1 Cleanup action activities

No construction or operations work was conducted for the Lot 20/Former Building 10-71 Parcel during the second quarter.

## 3.11.2 Water levels

The groundwater elevations measured during the second quarter at the Lot 20/Former Building 10-71 Parcel are presented in Table 16 and on Figure 20. Groundwater contours are not shown on Figure 20 because the three monitoring wells measured are arranged nearly in a straight line and do not provide

enough water level data to prepare contours. Based on the second quarter water level measurements, the apparent groundwater flow appears to be generally to the northwest.

## 3.11.3 Groundwater monitoring results

Results for primary geochemical indicators for groundwater from the Lot 20/Former Building 10-71 Parcel monitoring wells are presented in Table 17; results for COCs for the Lot 20/Former Building 10-71 Parcel monitoring wells are presented in Table 18. Groundwater in this area is monitored following the schedule presented in Tables A-1 in Appendix A.

## 3.11.3.1 Monitored attenuation/geochemical indicators

The geochemical indicator results are presented in Table 17. The pH in groundwater from two of the Lot 20/Former Building 10-71 Parcel monitoring wells (10-71-MW1 and 10-71-MW2) was below 6 standard units. All remaining parameters in the groundwater from these monitoring wells appear uniform.

#### 3.11.3.2 COC results

Second quarter analytical results for the Lot 20/Former Building 10-71 Parcel COCs are presented in Table 18. The concentrations of all of the COCs—cis-1,2-DCE, toluene, TCE, and VC—in the groundwater from Lot 20/Former Building 10-71 Parcel monitoring wells were below detection, and hence below the applicable MCLs/MTCA criteria for potable water supply.

## 3.12 Apron A area

This section describes corrective action activities conducted at the Apron A area during the second quarter 2019. The cleanup remedy proposed for the Apron A area is bioremediation and MA. Figure 21 shows the locations of the groundwater monitoring wells in the Apron A area.

## 3.12.1 Cleanup action activities

No construction or operations work was conducted in the Apron A area during the second quarter.

#### 3.12.2 Water levels

The depth to groundwater measured during the second quarter at Apron A are presented in Table 19 and on Figure 12. Groundwater elevations are not available because the top of casing elevations were never surveyed.

## 3.12.3 Groundwater monitoring results

Results for primary geochemical indicators for groundwater from groundwater monitoring wells GW262S and GW264S are presented in Table 20; results for COCs from these wells are presented in Table 21. Groundwater in this area is monitored following the schedule presented in Tables A-1 and A-2 in Appendix A.

## 3.12.3.1 Monitored attenuation/geochemical indicators

Geochemical parameters are presented in Table 20. TOC concentrations in the monitoring wells were slightly elevated during the second quarter 2019 monitoring event. The other primary geochemical indicators show that reducing conditions were present and that conditions were conducive to biological degradation of the chlorinated volatile organic compounds.

## **3.12.3.2 COC results**

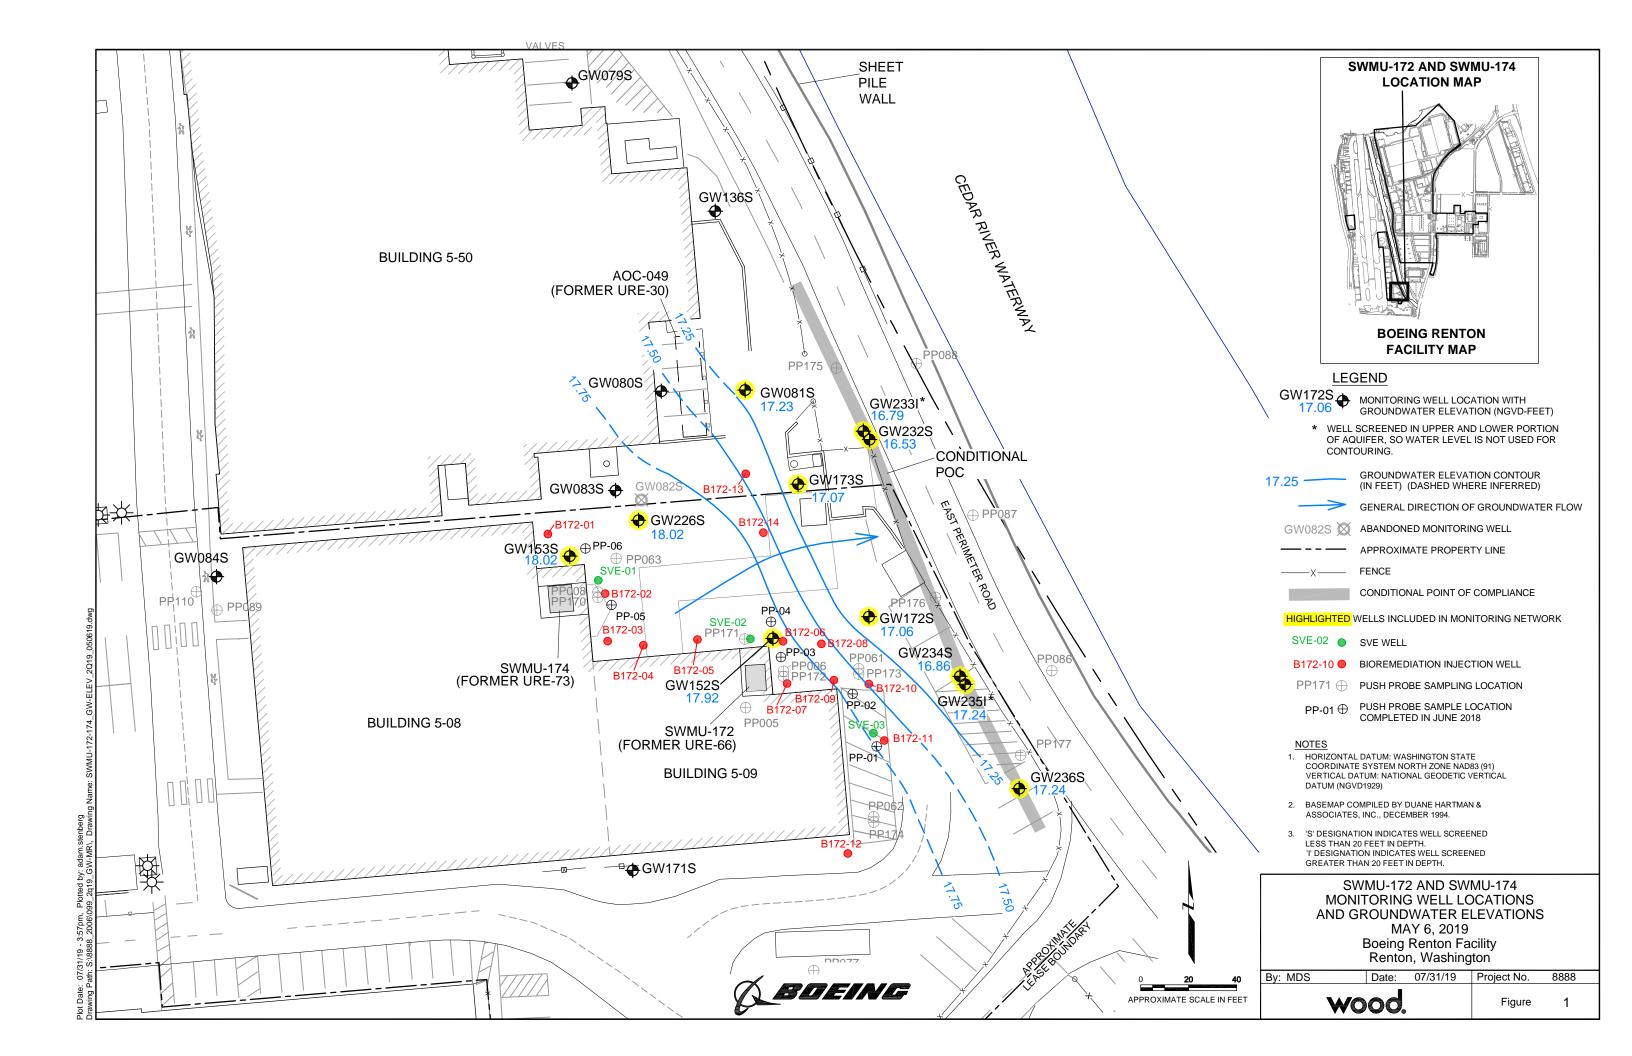

Second quarter analytical results for the Apron A COCs (cis-1,2-DCE and VC) are presented in Table 21. Cis-1,2-DCE was not detected in the groundwater from either GW262S or GW264S. VC was detected in the groundwater from monitoring well GW264S at a concentration of 1.39  $\mu$ g/L. VC was not detected in the groundwater from monitoring well GW262S.

#### Notes:

- 1. The EDR presents the groundwater monitoring frequency for each SWMU/AOC. For sites with semiannual monitoring frequency, specific quarters when monitoring will be conducted is indicated by 1 for quarter 1, 2 for quarter 2, etc.
- 2. Groundwater monitoring wells are also monitored for groundwater levels.
- 3. Additional wells are monitored for groundwater levels only.
- 4. In addition to COCs, primary geochemical indicators will be monitored during each regular monitoring event. Geochemical indicators are listed in Table A-2.
- 5. Details of analytical methods are specified in the Quality Assurance Project Plan, which is Appendix E to the Cleanup Action Plan (AMEC, 2012).
- 6. SIM methods will be used if the cleanup level is lower than the reporting limit achieved by the conventional 8021, 8260 or 8270 method. If cleanup levels become higher or if the conventional 8021, 8260 or 8270 methods are updated and able to achieve reporting limits below the cleanup levels, then the conventional method rather than the SIM method will be used.
- 7. GW228S will not be monitored on a semiannual basis only the CPOC wells will be monitored on a semiannual basis for SWMU-168.

#### Abbreviations:

AOC = area of concern cis -1,2-DCE = cis -1,2 dichloroethene COCs = constituents of concern

CPOC = conditional point of compliance

Cr = chromium

EDR = Engineering Design Report EPA = Environmental Protection Agency NA = not applicable PCE = tetrachloroethene
SIM = selected ion monitoring
SWMU = solid waste management unit
TCE = trichloroethene
TPH = total petroleum hydrocarbons

IPH = total petroleum hydrocarbonstrans -1,2-DCE = trans -1,2 dichloroethene

VC = vinyl chloride

VOCs = volatile organic compounds

#### **Notes**

- 1. In addition to COCs listed in Table A-1, primary geochemical indicators will be monitored during each regular monitoring event.
- 2. All primary geochemical indicators except TOC are monitored in the field during sampling. TOC is analyzed in the laboratory following methods specified in the Quality Assurance Project Plan, which is Appendix E to the Cleanup Action Plan (AMEC, 2012).
  The primary geochemical indicators differ slightly depending on whether the site is a fuel-related site or a solvent-related site.
  At a fuel related site, TOC is not necessary; at a solvent-related site, TOC is a measure of how much electron donor remains present.
- 3. The EDR presents the groundwater monitoring frequency for each SWMU/AOC. For sites with semiannual monitoring frequency, specific quarters when monitoring will be conducted is indicated by 1 for quarter 1, 2 for quarter 2, etc.
- 4. Primary geochemical parameters will not be collected at GW228S only at CPOC wells that are sampled semiannually.
- 5. TOC will only be analyzed in the groundwater from the source area well (GW189S).

#### Abbreviations:

AOC = area of concern

COCs = constituents of concern

CPOC = conditional point of compliance

EDR = Engineering Design Report

NA = not applicable

ORP = oxidation reduction potential

SWMU = solid waste management unit

TOC = total organic carbon

wood.

Subject: Summary Data Quality Review

May 2019 Boeing Renton Groundwater Sampling

SWMU-172/174

ARI Group Number: 19E0098

This memo presents the summary data quality review of 11 primary groundwater samples, one groundwater field duplicate, and one trip blank sample collected on May 6, 2019. The samples were submitted to Analytical Resources, Inc. (ARI), located in Tukwila, Washington, a laboratory accredited by the Washington State Department of Ecology (Ecology). The samples were analyzed for the following:

Project:

c:

0088880100.2019 Project File

- Volatile organic compounds (VOCs) (cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, and vinyl chloride) by U.S. Environmental Protection Agency (EPA) Method 8260C with selected ion monitoring (SIM);
- Total organic carbon (TOC) by Standard Method (SM) 5310B; and
- Total metals (arsenic, copper, and lead) by EPA Method 6020A.

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
RGWDUP1-190506	19E0098-01	all
RGW232S-190506	19E0098-02	all
RGW233I-190506	19E0098-03	all
RGW236S-190506	19E0098-04	all
RGW081S-190506	19E0098-05	all
RGW235I-190506	19E0098-06	all
RGW173S-190506	19E0098-07	all
RGW234S-190506	19E0098-08	all
RGW172S-190506	19E0098-09	all
RGW226S-190506	19E0098-10	all
RGW152S-190506	19E0098-11	all

Sample ID	Laboratory Sample ID	Requested Analyses
RGW153S-190506	19E0098-12	all
Trip Blank	19E0098-13	VOCs

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in the EPA guidance documents (EPA, 2014a and b).

ARI received the samples on May 7, 2019. The temperatures of the coolers were recorded upon receipt and were below the maximum acceptable temperature of 6 degrees Celsius.

### **Organic analyses**

Samples were analyzed for VOCs. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS/LCSD Acceptable
- 5. MS/MSD Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The project-specific control limit for field duplicate relative percent differences (RPDs) is 30 percent for concentrations greater than five times the reporting limit. The RPD is not calculated for results that are less than five times the reporting limit, as indicated on the table below by "NC." In these cases, the absolute value of the difference between the primary and duplicate result should not exceed the value of the reporting limit. The field duplicate RPDs were within the control limits.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (ng/L)	Duplicate Result (ng/L)	Reporting Limit (ng/L)	RPD (%)
	vinyl chloride	173	201	20	15
RGW152S-190506/	cis-1,2-dichloroethene	655	700	20	7
RGWDUP1-190506	trichloroethene	157	196	20	22
	tetrachloroethene	59.4	67.7	20	13

#### **Abbreviations**

ng/L = nanograms per liter

NC = not calculated

RPD = relative percent difference

7. Reporting Limits and Laboratory Flags – Acceptable

### **Inorganic analyses**

Samples were analyzed for total metals and TOC. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. LCS- Acceptable
- 4. MS/MSD Acceptable
- 5. Laboratory Duplicates Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The project-specific control limit for field duplicate RPDs is 30 percent for concentrations greater than five times the reporting limit. The RPD is not calculated for results that are less than five times the reporting limit, as indicated on the table below by "NC." In these cases, the absolute value of the difference between the primary and duplicate result should not exceed the value of the reporting limit. The field duplicate RPDs were within the control limits, except for total copper. The total lead results for samples RGW152S-190506 and RGWDUP1-190506 are qualified as estimated and flagged with a "J."

Sample ID/ Field Duplicate ID	Analyte	Primary Result (μg/L)	Duplicate Result (μg /L)	Reporting Limit (μg /L)	RPD (%)
	TOC	2.65 mg/L	2.58 mg/L	0.50 mg/L	3
RGW152S-190506/	total arsenic	4.49 µg/L	4.72 μg/L	0.200 μg/L	5
RGWDUP1-190506	total copper	2.35 µg/L	2.86 μg/L	0.500 μg/L	NC
	total lead	1.26 µg/L	1.65 μg/L	0.100 μg/L	27

Abbreviations:

 $\mu$ g/L = micrograms per liter mg/L = milligrams per liter

NC = not calculated

RPD = relative percent difference TOC = total organic carbon 7. Reporting Limits and Laboratory Flags – Acceptable

#### Overall assessment of data

The table below summarizes the data assessment. The completeness of work order number 19E0098 is 100 percent. The usefulness of these data was evaluated based on EPA guidance documents listed in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits. The data meet the project's data quality objectives.

Sample ID	Qualified Analyte	Qualified Result	Units	Qualifier Reason
RGWDUP1-190506	total copper	2.86 J	μg/L	field duplicate RPD
RGW232S-190506	none			
RGW233I-190506	none			
RGW236S-190506	none			
RGW081S-190506	none			
RGW235I-190506	none			
RGW173S-190506	none			
RGW234S-190506	none			
RGW172S-190506	none			
RGW226S-190506	none			
RGW152S-190506	total copper	2.35 J	μg/L	field duplicate RPD
RGW153S-190506	none			
Trip Blank	none			

#### **Abbreviations**

 $\mu$ g/L = micrograms per liter

J = the analyte is qualified as estimated

RPD = relative percent difference

Subject: Summary Data Quality Review

May 2019 Boeing Renton Groundwater Sampling

Building 4-78/79 SWMU/AOC Group

ARI Work Order Number: 19E0134 and 19E0145

This memo presents the summary data quality review of 16 primary groundwater samples, one field duplicate groundwater sample, and two trip blank samples collected on May 7 and 8, 2019. The samples were submitted to Analytical Resources, Inc. (ARI), located in Tukwila, Washington, a laboratory accredited by the Washington State Department of Ecology (Ecology). The samples were analyzed for the following:

Project:

c:

0088880100.2019 Project File

- Volatile organic compounds (VOCs) (limited suite: benzene, vinyl chloride, cis-1,2-dichloroethene, and trichloroethene) by U.S. Environmental Protection Agency (EPA) Method 8260C;
- Total petroleum hydrocarbons as gasoline (TPH-G) by Ecology Method NWTPH-G; and
- Total organic carbon (TOC) by Standard Method (SM) 5310B-00.

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
RGWDUP2-190507	19E0134-01	all
RGW241S-190507	19E0134-02	VOCs and TPH-G
RGW242I-190507	19E0134-03	VOCs and TPH-G
RGW240D-190507	19E0134-04	all
RGW239I-190507	19E0134-05	all
RGW238I-190507	19E0134-06	all
RGW210S-190507	19E0134-07	all
RGW031S-190507	19E0134-08	all
RGW143S-190507	19E0134-09	all
RGW237S-190507	19E0134-10	all
RGW244S-190507	19E0134-11	all
RGW209S-190507	19E0134-12	all
RGW034S-190507	19E0134-13	all

Sample ID	Laboratory Sample ID	Requested Analyses
Trip Blank	19E0134-14	VOCs and TPH-G
RGW039S-190508	19E0145-01	all
RGW243I-190508	19E0145-02	all
RGW033S-190508	19E0145-03	all
RGW038S-190508	19E0145-04	all
Trip Blank	19E0145-05	VOCs and TPH-G

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in EPA guidelines (EPA, 2014a and b).

ARI received the samples on May 8 and 9, 2019. The temperatures of the coolers were recorded upon receipt and were below the maximum acceptable temperature of 6 degrees Celsius. For work order 19E0134, bubbles were observed in one of five vials submitted for samples RGWDUP2-190507, RGW241S-190507, RGW242I-190507, RGW237S-190507, five of five vials submitted for sample RGW240D-190507, eight of 15 vials submitted for sample RGW239I-190507, three of five vials submitted for sample RGW143S-190507, and four of five vials submitted for sample RGW209S-190507.

For work order 19E0145, bubbles were observed in two of five vials submitted for samples RGW243I-190508 and RGW038S-190508.

The laboratory proceeded with analysis using unaffected vials, where possible. The sample results are not affected and are not qualified.

### **Organic analyses**

Samples were analyzed for VOCs and TPH-G. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS/LCSD Acceptable
- 5. MS/MSD Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The relative percent differences (RPDs) for the field duplicate are within the project-specific control limit of 30 percent for concentrations greater than five times the reporting limit. The RPD is not calculated for results that are less than five times the reporting limit, as indicated on the table below by "NC." In these cases, the absolute value of the difference between the primary and duplicate result should not exceed the value of the reporting limit. As shown in the table below, the field duplicate results are acceptable.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (µg/L)	Duplicate Result (μg/L)	Reporting Limit (µg/L)	RPD (%)
	vinyl chloride	0.29	0.27	0.20	NC
RGW031S-190507/	cis-1,2-dichloroethene	0.43	0.38	0.20	NC
RGWDUP2-190507	benzene	7.13	6.69	0.20	6
	TPH-G	1,020	848	100	18

#### **Abbreviations**

 $\mu$ g/L = micrograms per liter

NC = not calculated

RPD = relative percent difference

TPH-G = total petroleum hydrocarbons as gasoline

7. Reporting Limits and Laboratory Flags – Acceptable except as noted:

<u>VOCs by EPA 8260C:</u> the cis-1,2-dichloroethene results for samples RGWDUP2-190507 and RGW031S-190507 were flagged by the laboratory with an "M" to indicate an estimated value for a detected and confirmed analyte, with low spectral match parameters. The cis-1,2-dichloroethene results for samples RGWDUP2-190507 and RGW031S-190507 are qualified as estimated and flagged with a "J."

#### **Inorganic analyses**

Samples were analyzed for TOC. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. LCS/LCSD Acceptable
- 4. MS/MSD Acceptable
- 5. Laboratory Duplicates Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The RPDs are acceptable.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (mg/L)	Duplicate Result (mg /L)	Reporting Limit (mg /L)	RPD (%)
RGW031S-190507/ RGWDUP2-190507	TOC	9.53	9.09	0.50	5

#### **Abbreviations**

mg/L = milligrams per liter RPD = relative percent difference TOC = total organic carbon

7. Reporting Limits and Laboratory Flags – Acceptable

### Overall assessment of data

The table below summarizes the data assessment. The completeness of work order numbers 19E0134 and 19E0145 is 100 percent. Evaluation of the usefulness of these data is based on EPA guidance documents identified in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits. The data meet the project's data quality objectives.

Sample ID	Qualified Analyte	Qualified Result	Units	Qualifier Reason

Subject: Summary Data Quality Review

May 2019 Boeing Renton Groundwater Sampling

Former Fuel Farm AOC Group

ARI Work Order Number: 19E0099 and 19E0128

This memo presents the summary data quality review of 10 primary groundwater samples and one field duplicate collected on May 6 and 7, 2019. The samples were submitted to Analytical Resources Inc. (ARI), a Washington State Department of Ecology (Ecology)-accredited laboratory located in Tukwila, Washington. The samples were analyzed for total petroleum hydrocarbons as diesel (TPH-D), plus motor oil (TPH-O) and Jet A (TPH Jet A) ranges by Ecology Method NWTPH-Dx, both with and without silica-gel acid cleanup procedure to determine if concentrations are affected by natural organic material.

Project:

c:

0088880100.2019

Project File

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
RGW221S-190506	19E0199-01 and 05	all
RGW258S-190506	19E0199-02 and 06	all
RGW184S-190506	19E0199-03 and 07	all
RGW183S-190506	19E0199-04 and 08	all
RGWDUP3-190507	19E0128-01 and 02	all
RGW211S-190507	19E0128-03 and 04	all
RGW212S-190507	19E0128-05 and 06	all
RGW256S-190507	19E0128-07 and 08	all
RGW257S-190507	19E0128-09 and 10	all
RGW255S-190507	19E0128-11 and 12	all
RGW224S-190507	19E0128-13 and 14	all

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Memo June 26, 2019 Page 2 of 3

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in EPA guidelines (EPA, 2014).

ARI received the samples on May 7 and 8, 2019. The temperatures of the coolers were recorded upon receipt and were received at 9.6 degrees Celcius, which is above the maximum acceptable temperature of 6 degrees Celsius.

### **Organic analyses**

Samples were analyzed for TPH-D plus TPH-O and TPH Jet A ranges. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS Acceptable
- 5. MS/MSD Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of 5 percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The field duplicate relative percent difference (RPD) is within the project-specific control limit of 30 percent for concentrations greater than five times the reporting limit.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (mg/L)	Duplicate Result (mg/L)	Reporting Limit (mg/L)	RPD (%)
RGW224S-181112/	TPH-D C12-C24	1.21	1.13	0.100	7
RGWDUP3-181112	TPH Jet A C10-C18	1.32	1.10	0.100	18

#### **Abbreviations**

mg/L = milligrams per liter

RPD = relative percent difference

TPH = total petroleum hydrocarbons

TPH-D = total petroleum hydrocarbons as diesel

7. Reporting Limits and Laboratory Flags – Acceptable

#### Overall assessment of data

The table below summarizes the data review. The completeness of ARI work order numbers 19E0099 and 19E0128 is 100 percent. Evaluation of the usefulness of these data is based on EPA guidance documents listed in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits. The data meet the project's data quality objectives.

Subject: Summary Data Quality Review

May 2019 Boeing Renton Groundwater Sampling

AOC-001 and -002 and AOC-003 ARI Work Order Number: 19E0146

This memo presents the summary data quality review of eight primary groundwater samples, one field duplicate, and one trip blank sample collected on May 8, 2019. The samples were submitted to Analytical Resources, Inc. (ARI), located in Tukwila, Washington, a laboratory accredited by the Washington State Department of Ecology (Ecology).

The samples from AOC-001 and -002 were analyzed for the following:

- Volatile organic compounds (VOCs) (benzene only) by U.S. Environmental Protection Agency (EPA)
   Method 8260C;
- VOCs (vinyl chloride, 1,1-dichloroethene, trichloroethene, and cis-1,2-dichloroethene) by EPA Method 8260C with selected ion monitoring (SIM);
- Total organic carbon (TOC) by Standard Method (SM) 5310C.

Samples from AOC-003 were analyzed for the following:

- VOCs (cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, and vinyl chloride) by EPA Method 8260C SIM; and
- TOC by SM 5310C.

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
RGWDUP4-190508	19E0146-01	all AOC-001 and -002 analyses
RGW185S-190508	19E0146-02	all AOC-001 and -002 analyses
RGW197S-190508	19E0146-03	all AOC-001 and -002 analyses
RGW245S-190508	19E0146-04	all AOC-001 and -002 analyses
RGW195S-190508	19E0146-05	all AOC-001 and -002 analyses
RGW247S-190508	19E0146-06	all AOC-003 analyses
RGW196D-190508	19E0146-07	all AOC-001 and -002 analyses

Sample ID	Laboratory Sample ID	Requested Analyses
RGW248I-190508	19E0146-08	all AOC-003 analyses
RGW194S-190508	19E0146-09	all AOC-001 and -002 analyses
Trip Blank	19E0146-10	VOCs

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in the EPA guidance documents (EPA, 2014a and b).

ARI received the samples on May 9, 2019. The temperature of the cooler was recorded upon receipt and was below the maximum acceptable temperature of 6 degrees Celsius. The laboratory noted that bubbles were observed in one of five vials submitted for samples RGW185S-190508 and the trip blank, two of five vials submitted for sample RGW194S-190508, and four of five vials submitted for sample RGW196D-190508. The laboratory proceeded with analysis using unaffected vials, where possible. The sample results are not affected and are not qualified.

### **Organic analyses**

Samples were analyzed for VOCs. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS/LCSD Acceptable
- 5. MS/MSD Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The relative percent differences (RPDs) for the field duplicate are within the project-specific control limit of 30 percent for concentrations greater than five times the reporting limit. The RPD is not calculated for results that are less than five times the reporting limit, as indicated on the table below by "NC." In these cases, the absolute value of the difference between the primary and duplicate result should not exceed the value of the reporting limit.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (μg/L)	Duplicate Result (µg/L)	Reporting Limit (µg/L)	RPD (%)
RGW185S-190508/	cis-1,2-dichloroethene	0.120	0.118	0.020	2
RGWDUP4-190508	vinyl chloride	0.122	0.121	0.020	1

#### **Abbreviations**

μg/L = micrograms per liter RPD = relative percent difference

7. Reporting Limits and Laboratory Flags – Acceptable

### **Inorganic analyses**

Samples were analyzed for TOC. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. LCS Acceptable
- 4. MS/MSD Acceptable

Extra volume was not submitted for project specific MS/MSD analyses. Sample precision is evaluated based on LCS and LCSD recoveries. The MS/MSD project frequency requirement of one MS/MSD for every 20 samples was achieved with extra volume submitted at other sites included in this sampling event.

- 5. Laboratory Duplicates Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for TOC analysis during this sampling event, meeting the project frequency requirement of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The project-specific control limit for field duplicate RPDs is 30 percent for concentrations greater than five times the reporting limit. The field duplicate RPD was within the control limits.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (mg/L)	Duplicate Result (mg /L)	Reporting Limit (mg /L)	RPD (%)
RGW185S-190508/ RGWDUP4-190508	TOC	19.39	18.48	0.50	5

#### <u>Abbreviations</u>

mg/L = milligrams per liter RPD = relative percent difference TOC = total organic carbon

7. Reporting Limits and Laboratory Flags – Acceptable

### Overall assessment of data

The table below summarizes the data assessment. The completeness of work order number 19E0146 is 100 percent. The usefulness of these data was evaluated based on EPA guidance documents listed in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits.

Subject: Summary Data Quality Review

November 2018 Boeing Renton Groundwater Sampling

Building 10-71 Parcel

ARI Work Order Number: 19E0143

This memo presents the summary data quality review of three primary groundwater samples and one trip blank sample collected on May 8, 2019. The samples were submitted to Analytical Resources, Inc. (ARI), located in Tukwila, Washington, a laboratory accredited by the Washington State Department of Ecology (Ecology). The samples were analyzed for the following:

• Volatile organic compounds (VOCs) (vinyl chloride, cis-1,2-dichloroethene, trichloroethene, and toluene) by U.S. Environmental Protection Agency (EPA) Method 8260C.

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
10-71-MW2-190508	19E0143-01	VOCs
10-71-MW1-190508	19E0143-02	VOCs
10-71-MW4-190508	19E0143-03	VOCs
Trip Blank	19E0143-04	VOCs

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in EPA guidelines (EPA, 2014).

ARI received the samples on May 9, 2019. The temperature of the cooler was recorded upon receipt and was below the maximum acceptable temperature of 6 degrees Celsius .

### **Organic analyses**

Samples were analyzed for VOCs. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS/LCSD Acceptable
- 5. MS/MSD Acceptable

Extra volume was not submitted for project specific MS/MSD analyses. Sample precision is evaluated based on LCS and LCSD recoveries. The MS/MSD project frequency requirement of one MS/MSD for every 20 samples was achieved with extra volume submitted at other sites included in this sampling event.

6. Field Duplicates - Acceptable

Field duplicates were not collected at this site during this sampling event. The project frequency requirement of one field duplicate for every 20 samples was achieved with field duplicate samples collected at other sites included in this sampling event.

7. Reporting Limits and Laboratory Flags – Acceptable

#### Overall assessment of data

The table below summarizes the data assessment. The completeness of work order number 19E0143 is 100 percent. Evaluation of the usefulness of these data is based on EPA guidance documents listed in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits. The data are not qualified and meet the project's data quality objectives.

Sample ID	Qualified Analyte
10-71-MW2-190508	none
10-71-MW1-190508	none
10-71-MW4-190508	none
Trip Blank	none

Subject: Summary Data Quality Review

May 2019 Boeing Renton Groundwater Sampling

Apron A

ARI Work Order Number: 19E0129

This memo presents the summary data quality review of two primary groundwater samples, one groundwater field duplicate, and one trip blank sample collected on May 7, 2019. The samples were submitted to Analytical Resources, Inc., (ARI), located in Tukwila, Washington, a laboratory accredited by the Washington State Department of Ecology (Ecology). The samples were analyzed for the following:

• Volatile organic compounds (VOCs) (vinyl chloride and cis-1,2-dichloroethene) by U.S. Environmental Protection Agency (EPA) Method 8260C; and

• Total organic carbon (TOC) by Standard Method (SM) 5310B.

The samples and the analyses conducted on the samples are listed below.

Sample ID	Laboratory Sample ID	Requested Analyses
RGWDUP5-190507	19E0129-01	all
RGW262S-190507	19E0129-02	all
RGW264S-190507	19E0129-03	all
Trip Blank	19E0129-04	VOCs

Data were reviewed in accordance with the appropriate method procedures and criteria documented in the Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2016). The control limits provided in the QAPP are advisory limits; therefore, the most current control limits provided by the laboratory were used to evaluate the quality control data. In cases where the laboratory did not track limits for an analyte, the limits in the QAPP were used.

Holding times, method/trip blanks, surrogate recoveries, laboratory control samples (LCS) and laboratory control sample duplicates (LCSD), matrix spike/matrix spike duplicates (MS/MSD), field duplicates, and reporting limits were reviewed where available to assess compliance with applicable methods. If qualification was required, data were qualified based on the definitions and use of qualifying flags outlined in the EPA guidance documents (EPA, 2014a and b).

ARI received the samples on May 8, 2019. The temperature of the coolers were recorded upon receipt and was below the maximum acceptable temperature of 6 degrees Celsius. The laboratory logged the samples with the time on the chain-of-custody and proceeded with analysis.

## **Organic analyses**

Samples were analyzed for VOCs. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. Surrogates Acceptable
- 4. LCS/LCSD Acceptable
- 5. MS/MSD Acceptable

Extra volume was not submitted for project specific MS/MSD analyses. Sample precision is evaluated based on LCS and LCSD recoveries. The MS/MSD project frequency requirement of one MS/MSD for every 20 samples was achieved with extra volume submitted at other sites included in this sampling event.

6. Field Duplicates – Acceptable

One field duplicate, RGWDUP5-190507, was submitted with sample RGW262S-190507. Primary and duplicate samples were analyzed for each analysis during this sampling event, meeting the project frequency requirement of 5 percent, or one for every 20 samples. Primary and duplicate results were below detection; therefore, the field duplicate relative percent difference (RPD) is not calculated for samples in this work order.

7. Reporting Limits and Laboratory Flags – Acceptable

## **Inorganic analyses**

Samples were analyzed for TOC. Laboratory data were evaluated for the following parameters:

- 1. Preservation and Holding Times Acceptable
- 2. Blanks Acceptable
- 3. LCS Acceptable
- 4. MS/MSD Acceptable

Extra volume was not submitted for project specific MS/MSD analyses. Sample precision is evaluated based on LCS and LCSD recoveries. The MS/MSD project frequency requirement of one MS/MSD for every 20 samples was achieved with extra volume submitted at other sites included in this sampling event.

- 5. Laboratory Duplicates Acceptable
- 6. Field Duplicates Acceptable

One field duplicate was submitted for each analysis during this sampling event, meeting the project frequency of five percent, or one for every 20 samples. Primary and duplicate results are summarized in the table below. The RPDs are acceptable.

Sample ID/ Field Duplicate ID	Analyte	Primary Result (mg/L)	Duplicate Result (mg/L)	Reporting Limit (mg/L)	RPD (%)
RGW262S-181113/ RGWDUP5-181113	TOC	33.94	33.29	10.00	NC

**Abbreviations** 

mg/L = milligrams per liter

NC = not calculated

RPD = relative percent difference

TOC = total organic carbon

7. Reporting Limits and Laboratory Flags – Acceptable

## Overall assessment of data

The table below summarizes the data assessment. The completeness of work order number 19E0129 is 100 percent. The usefulness of these data was evaluated based on EPA guidance documents listed in the introduction to this report. Few problems were identified, and analytical performance was generally within specified limits. The data meet the project's data quality objectives.

Sample ID	Qualified Analyte
RGWDUP5-190507	none
RGW262S-190507	none
RGW264S-190507	none
Trip Blank	none

### 1.0 Introduction

CALIBRE Systems, Inc. (CALIBRE) prepared this Technical Memorandum (Tech Memo) for the Boeing Company to summarize remedial actions implemented at the Boeing Renton Facility in the second quarter of 2019 (between April 1 and June 30, 2019). The ongoing remedial actions include:

- Operation of one soil vapor extraction (SVE) system located at Solid Waste Management Unit (SWMU) designated as SWMU-172/174;
- Biological treatment to promote Enhanced Reductive Dechlorination (ERD) of volatile organic compounds (VOCs) in groundwater underway at several AOCs located throughout the Renton Facility, and;
- 3. Anaerobic biodegradation of benzene by nitrate/sulfate injections at the 4-78/79 Building.

CALIBRE completed the work described in this Tech Memo to support remedial activities described in the Engineering Design Report (EDR), (AMEC, 2014) as supplemented by a document describing the remedial approach for *in situ* treatment for benzene in groundwater (CALIBRE 2017).

## 1.1 Facility Location and Background

The Boeing Renton Facility is used for assembly of 737 airplanes and is located at the southern end of Lake Washington in Renton, Washington. The location of the Renton Facility and the locations of SWMU-172/174 and Building 4-78/79 within the Facility are shown on Figure 1-1. The locations of the other AOCs and SWMUs where groundwater treatment is ongoing are also included in Figure 1-1.

## 1.2 Objectives and Organization

The objective for this Tech Memo is to summarize work completed in accordance with the EDR in the second quarter of 2019. This includes operation and monitoring activities for the SVE system located at SWMU-172/174 and a summary of the ongoing biological treatment and monitoring of groundwater at the following areas:

SWMU-172/174
Building 4-78/4-79 SWMU/AOC Group (Building 4-78/79)
AOC-001/002
AOC-003
Lot 20/Former Building 10-71
AOC-060
AOC-090
Building 4-70, and
Apron A

This Tech Memo is organized as follows:

Section 1 - Introduction and Background

Section 2 – SVE System Operation and Monitoring

Section 3 – Groundwater Treatment

Section 4 – Conclusions and Recommendations

Section 5 - References

Attachment A - Field Data Sheets

Attachment B - Laboratory Report

## 2.0 SVE Systems Operation and Monitoring

SVE systems were installed in the Building 4-78/79 and SWMU-172/174 areas and began operation in April 2015. During the last quarter of 2017 photoionization detector (PID) results from both systems had shown low-level VOC concentrations removed at asymptotically low levels. Rebound stabilization tests were conducted in early 2018 followed by collection of soil confirmation samples from both areas in June 2018. Ecology approved the recommended shutdown of the Building 4-78/79 SVE system on November 1, 2018 after review and evaluation of the soil confirmation results for that area (CALIBRE 2018a). Operational modifications have continued at the SWMU-172/174 SVE system to optimize VOC removal for that area. The following sections summarize the operating conditions, operational changes, and performance monitoring/evaluation for the SWMU-172/174 SVE system performed in April – June 2019.

## 2.1 SWMU-172/174 SVE System

The SWMU-172/174 SVE system consists of three vapor extraction wells and a SVE equipment trailer as shown in Figure 2-1. The SVE system is equipped with two vapor-phase GAC vessels, each filled with 1,800 pounds of virgin carbon. The GAC vapor treatment system is configured to run in a lead-lag configuration with vapor from the outlet of the lead vessel passing through the lag vessel. The system also includes two smaller vessels each containing 200 pounds of zeolite impregnated with permanganate.

Routine maintenance including oil changes, drive-belt tensioning and inspection, inspection of the air filter, and inspection of the moisture separator was completed per the Operations Manual (CALIBRE, 2014). System monitoring includes regular monitoring of total organic vapor concentrations with a calibrated photo-ionization detector (PID).

## 2.1.1 TO-15 Laboratory Analysis of Vapor Samples

Two vapor samples were collected from the SWMU-172/174 SVE system for TO-15 analysis on June 20, 2019. The results showed tetrachloroethene (PCE) represented approximately 90% of the total VOCs for the SWMU-172/174 SVE system influent, SVE-1 and SVE-2 samples. Table 2-1 summarizes the TO-15 detections for the SWMU-172/174 SVE system for 15 TO-15 sampling events<sup>1</sup> that have been implemented since system startup. During this time, SVE-2 has continued to extract vapor while system operation modifications have been completed at SVE-1 and SVE-3 to alter the flushing patterns in the area of SVE-2, as described below. The laboratory report is included in Attachment B.

<sup>1</sup> Multiple changes to SVE system operations have been implemented over the period where data are shown. Changes to extraction flow rates by SVE wells are used to maximize the VOC mass removal and the corresponding SVE influent concentration is highly dependent on the flow rate from selected wells.

## 2.1.2 Summary of Operations and Operational Changes

The soil confirmation samples collected in the second quarter of 2018 identified a location between SVE-2 and SVE-3 which still showed elevated PCE levels in soil. During the third quarter of 2018, the SVE system was adjusted to alter the flushing pattern through this area by using SVE-3 as an inlet vent well with continued extraction through SVE-2 and SVE-1. Vapor concentrations, measured with a PID, showed some increase for approximately two weeks during that reporting period. Subsequent measurements during the fourth quarter 2018 reporting period showed vapor concentrations reducing to previous low level detections. Therefore, on December 5, 2018 the SVE system was adjusted to alter the flushing pattern around SVE-2 and SVE-3 by using SVE-1 as an inlet vent well with continued extraction from SVE-2 and reopening SVE-3 to extraction.

On June 20, 2019 (second quarter 2019) PID readings showed reduced VOC levels at SVE-2 while SVE-1 remained near 0 ppbv. Systems operation modifications were completed that day (following the collection of samples for TO-15 analysis) to adjust SVE-1 as an inlet vent well with extraction at SVE-2 and SVE-3. PID monitoring showed the system influent increasing for two hours after the system adjustment was made. The following site visit showed those detections reduced back to lower levels. Table 2-2 shows the PID readings for the wells in the SWMU 172/174 SVE system. Table 2-3 shows an operational summary for the system.

#### 2.1.3 Mass Removal Estimate

Between April 17, 2015 and June 27, 2019 the SWMU-172/174 SVE system has recovered an estimated 17.3 pounds of VOCs (primarily PCE), as shown in Table 2-3. Approximately 1.7 pounds of VOCs were removed during the current reporting period (second quarter 2019) based on PID measurements collected. Due to the differences observed in PID readings and 1<sup>st</sup> quarter 2019 TO-15 results, the recent samples for TO-15 analysis in 2<sup>nd</sup> quarter 2019 were completed with an expanded VOC list to help identify any possible analytes causing an interference with the PID. These results do not show any unusual detections. It is likely the PID is picking up other vapors from the 5-09 paint shop; the area around the 5-09 building can at times have a noticeable paint odor. The cumulative VOC mass removal for the SWMU-172/174 SVE system is shown in Figure 2-2.

## 2.2 Recommended Next Steps for the SVE Systems

In December 2018, Boeing submitted to Ecology a Tech Memo describing the planned approach for further evaluation of soils around probe point PP13 at the Building 4-78/79 area (CALIBRE 2018b). The single sample (PP13) which exceed cleanup standards for TPH-G was collected from a low permeable silty/clay layer. The objective of the soil evaluation is to identify the location and depth of utilities in the immediate area, determine the feasibility of excavating soil by delineating the extent of soil contamination around PP13 and to determine the extent of soil that can be removed.

Additional probe points were sampled in June 2019 and those results showed concentrations of TPH-G exceeding the cleanup level of 30 mg/L to a depth 11.5 ft bgs in certain areas, with the highest detections between 5 to 9 ft bgs. Boeing is currently monitoring the water table elevation in this area to determine if soil excavation will be feasible. A separate Tech Memo summarizing the sampling results along with figures and a plan for soil excavation will be provided to Ecology. It is expected that additional nitrate/sulfate injections will be completed following the soil excavation work.

TO-15 samples collected from SVE-1, SVE-2 and the system influent continue to show PCE as the primary chemical detected, comprising approximately 90% of the total VOCs detected. Modifying the SVE system flow at the SWMU-172/174 area on June 20, 2019 showed increases in VOC mass removal from the system influent for a number of hours following the adjustment. Subsequent monitoring during the following weeks of June 2019 and into July 2019 show vapor concentrations reducing at SVE-2 and SVE-3. If concentrations reduce to asymptotic levels the system will be modified to alternate flows between wells as has been done in the past (i.e. SVE-3 is extracting and will be changed to an inlet vent and vice versa for SVE-1). Summa can samples for TO-15 analysis will be planned for the 3<sup>rd</sup> Quarter 2019 to monitor changes in vapor concentrations if observed.

Additional modifications to the operation of this system should be considered to continue increased mass removal in the area between SVE-2 and SVE-3. These modifications may include opening SVE-1 and SVE-3 as an inlet vent or SVE-1 and SVE-2 as an inlet vent, to focus vapor removal in that area. It may also be beneficial to operate the SVE system in a pulsed mode in order to allow vapor concentrations to rebound followed by running the system for a period of time.

## 3.0 Ongoing Groundwater Treatment

Groundwater treatment is being implemented at several AOCs/SWMUs at the Renton Facility. The primary remedy being implemented is enhanced reductive dechlorination (ERD) of chlorinated solvents in targeted areas. The ERD treatment involves substrate injection using sucrose as a carbon source to stimulate biological degradation of the chlorinated solvents between December 2014 and March 2019.

Beginning in late 2017, anaerobic biodegradation of benzene using nitrate and sulfate injections was implemented for a small area at the 4-78/79 Building. Performance monitoring was completed at the injection and monitoring wells at this area in May 2019 and those results are summarized in Table 3-1. The results show that 5 of the 7 injection wells and the two monitoring wells are below baseline benzene concentrations. The two injection wells above baseline concentrations, B78-18 and B78-20, show benzene at 1.66 ug/L and 16.3 ug/L, respectively. Soil excavations are being considered for this area in September 2019 (third quarter 2019) and additional nitrate/sulfate injections would be completed following any excavation activities. Performance monitoring samples will be collected following the injection event.

Site wide groundwater sampling was conducted as part of the quarterly monitoring program during this reporting period and the results are discussed in the main text of the quarterly report. Table 3-2 presents a summary of those groundwater monitoring results, by area, related to groundwater treatment/ERD implementation, with recommendations for additional substrate injections at selected areas.

### 4.0 Conclusions and Recommendations

The soil confirmation samples in the second quarter of 2018 revealed that cleanup standards for CVOCs were met at all but one of the 24 samples at the 4-78/79 area. The single sample which exceed cleanup standards for TPH-G was collected from a low permeable silty/clay layer. TO-15 samples from the nearest extraction well to this location showed TPH-G was non-detect in both samples, indicating it is unlikely that continued SVE operation would have any impact on this low permeable layer. Subsequently, Ecology approved the shutdown of the Building 4-78/79 SVE system in November 2018. A separate work plan was provided to Ecology for review and approval outlining the proposed locations and depths of additional soil sampling (by Geoprobe) around PP13 for evaluation of soil excavation. Ecology has since approved the work plan and the additional probe points were sampled in June 2019. A separate Tech Memo summarizing the sampling results along with figures and a plan for soil excavation will be provided to Ecology.

SVE-2 and SVE-3, based on the elevated PCE detections observed during the soil confirmation sampling event in the second quarter of 2018. Increased vapor concentrations were observed at SVE-3 and the system influent following the system modification on 6/20/2019. It is recommended that SVE operations be continued for this area, with samples collected for TO-15 analysis in the third quarter of 2019 and additional modifications to include opening of SVE-1 and SVE-2 as inlet vents or SVE-1 and SVE-3 as inlet vents to allow focused vapor removal at SVE-2 and SVE-3. In addition, it may be beneficial to operate the SVE system in a pulsed mode to monitor for any VOC rebound in soil vapor.

Groundwater monitoring will continue according to the EDR, with supplemental VOC and TOC sampling at selected wells. Performance monitoring data related to benzene treatment at the Building 4-78/79 area show a majority of the wells at benzene concentrations below baseline results, many of these are at 90% reduction from baseline. Additional nitrate/sulfate injections are recommended following the soil excavation being considered for this area. Substrate injections for ERD treatment will be recommended following the review of the 3<sup>rd</sup> quarter 2019 monitoring results.

#### Notes:

All results are in parts per billion by volume (ppbv).

ND = non-detect

NA = not analyzed

DCE = Dichloroethene

PCE = tetrachloroethene

TCE = trichloroethene

Total Chlorinated = the sum of PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, 1,1,1-TCA, and 1,1-DCA.

Shaded cells are results from 2nd Quarter 2019.

Table 2-2 PID Monitoring - SWMU-172/174 SVE System

	Days in Operation							
Date	Since Startup 1	SVE-01	SVE-02	SVE-03	VPC Inlet	VPC Mid	VPC Outlet	Notes
4/8/2019	1,289	0	1,518	Vent	1,092		0	
4/18/2019	1,299	0	68	Vent	41		0

6/3/2019	1,345	75	314	Vent	175		0	
								Samples for TO-15 from SVE-1, SVE-2, and
								Influent. Adjusted system after sampling
								to open SVE-1 as vent well and SVE-3 for
6/20/2019	1,362	10	2,032	Vent	1,861		0	system extraction.
								System PID Readings 1 hour after
6/20/2019	1,362	Vent	1,665	2,766	4,356		0	adjustments.
6/27/2019	1,369	Vent	68	330	331		0	
7/2/2019	1,374	Vent	0	440	844		0	Changed blower oil
7/19/2019	1,391	Vent	56	350	148		0	
7/24/2019	1,396	Vent	0	570	385		0	

### Notes:

Operational change was made on 6/20/19. Due to reduced concentrations observed at SVE-1 and the influent, SVE-01 was opened as a vent well to promote focused flow towards SVE-02 and SVE-03.

Blank cells - Not all wells were measured with the PID during each sampling event.

 $<sup>^{\</sup>mathrm{1}}$  Days in operation since system startup on April 17, 2015.

Table 2-3 VOC Mass Removal Estimate - SWMU 172/174 SVE System

	PID Reading	Corrected Value	System Flow	Cumulative	VOCs removed in Operating Period Between Monitoring	Cumulative VOC Mass Removed Since Start of SVE Operations in April, 2015

7/19/2019	148	85	100	27,093	0.083	17.52
7/24/2019	385	222	98	27,205	0.059	17.58

### Notes:

PID = photoionization detector ppbv = parts per billion by volume cfm = cubic feet per minute

lbs = pounds

<sup>&</sup>lt;sup>1</sup> A correction factor of 0.57 has been applied to the PID vapor measurement for VOCs based on the mixture of analytes detected in the TO-15 analysis at the influent sample point from 6/20/19. This number is much higher than the TO-15 results.

<sup>&</sup>lt;sup>2</sup> These are based soley on the PID measurements collected this quarter; the TO-15 analysis indicates much lower mass. TO-15 analysis results showed Tetrachloroethene made up 88% of the total VOCs removed at the influent on 6/20/19.

#### Notes:

U = non-detect

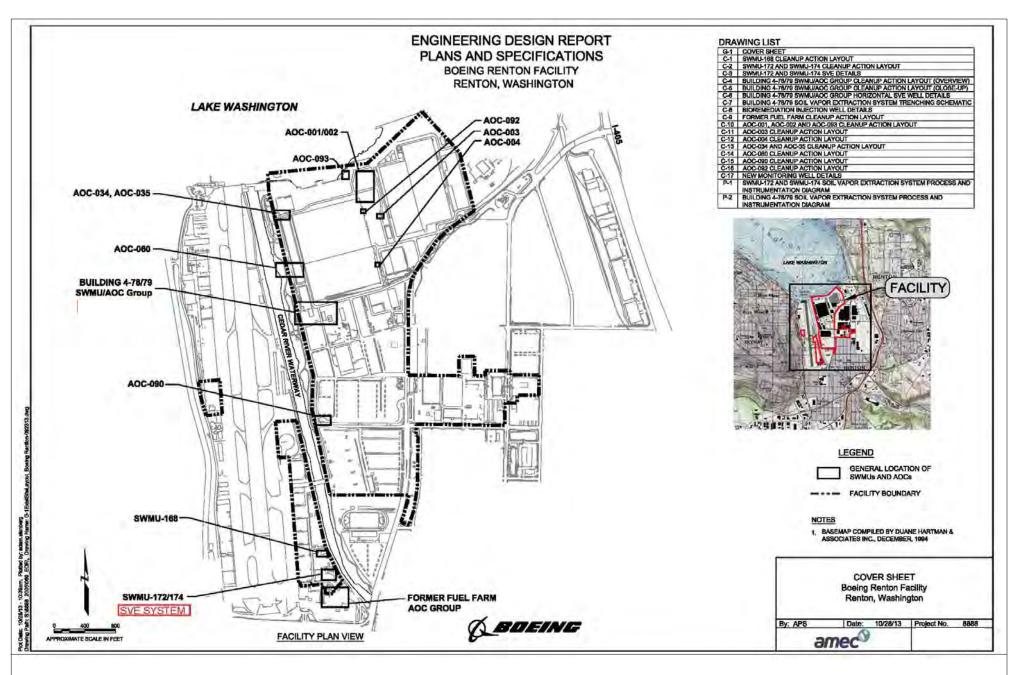

D = dilution

M = Estimated value for a GC/MS analyte detected and confirmed by an analyst but with low spectral match parameters. Samples in italics collected as part of the Renton quarterly groundwater monitoring program.

Table 3-2 Groundwater Monitoring Results Summary May 2019 and Recommended ERD Treatment

<b>GW Treatment Area</b>	Source and down gradient MWs	CPOC wells	Treatment IWs	ERD Treatment Recommendation
SWMU-172/174	PCE less than 0.1 ug/L and TCE less than 0.20 ug/L; cisDCE less than 0.70 ug/L; VC less than 0.25 ug/L.	All detections are at 0.35 ug/L or less.	Prior data Mar 2018, North and South IWS showed total CVOCs range from 0.03 ug/L to 6.90 ug/L. TOC near background.	Detections are very low and less than 1 ug/L throughout the site. Will consider additional injections if beneficial.
Building 4-78/4-79 SWMU/AOC Group	TCE, cisDCE and VC are ND or less than 0.55 ug/L at all but GW244S (cDCE at 2 ug/L and VC at 1.5 ug/L). One central well (GW033S) continues to show significant reductions in total CVOCs from 1,430 ug/L in Nov 2017. Recent data show 46 ug/L in Nov 2018, 4.1 ug/L in Mar 2019, and 0.94 ug/L in May 2019. Substrate was applied to this area after Mar 2019 sampling. Benzene decreased at source well GW031S (59 ug/L in Mar 2019 to 7.1 ug/L in May 2019). Nitrate/sulfate injected following Mar 2019 sampling.	All CPOC wells are ND for CVOCs except GW240D with VC at 0.27 ug/L (CUL is 0.20 ug/L). Northern well GW237S showed decrease in Benzene from 9.58 ug/L to 2.20 ug/L in May 2019.	Prior data May 2017, 4 of 5 wells with low detections where sum of CVOCs are less than 3 ug/L	Detections are very low throughout the site. Will consider additional injections if beneficial.  Nitrate/sulfate injections to be completed following planned soil excavations in benzene treatment area.
AOC-001/002	Prior data Mar 2019: Source MW: TCE is ND; cisDCE less than 0.60 ug/L and VC less than 0.07 ug/L. Down gradient wells less than 0.71 ug/L	All detections below 0.50 ug/L with the exception of GW1975 which showed an increase in VC from 0.0647 ug/L in Mar to 1.66 ug/L in May 2019.	Prior data Mar 2018, detections at or below 0.30 ug/L.	Consider injection at infiltration galleries at source (IPRA and IPRB) when area is accessible.
AOC-003	Prior data Mar 2019: All detections are less than 0.54 ug/L.	All detections are less than 0.55 ug/L.	Prior data May 2017 one of four IWs sampled – VC detection less than 0.30 ug/L	Substrate injection to be considered in conjunction with AOC-001/002.
Lot 20 / former 10-71	All wells are ND.	-	-	No action at this time.
AOC-60	Prior data Mar 2019: MW's with detections less than 0.30 ug/L; treatment MWs with total CVOCs less than 2.6 ug/L.	Prior data Mar 2019: Detections less than 0.15 ug/L.	-	Detections are very low throughout the site. Will consider additional injections if beneficial.
AOC – 90	Prior data Mar 2019: Treatment MW at source with total CVOCs at 1.6 ug/L total CVOCs down from 27 ug/L in Aug 2018; down gradient wells less than 0.30 ug/L.	Prior data Mar 2019: Detections less than 0.44 ug/L.	-	Detections are very low throughout the site. Will consider additional injections if beneficial.
Apron A	Two of three wells ND; other well shows VC at 1.39 ug/L.	-	-	Detections are very low throughout the site. Will consider additional injections if beneficial.
Building 4-70	-	Prior data Mar 2019: Detections less than 0.42 ug/L.	-	No action at this time.

### Attachment B: TO-15 Laboratory Data Package

7/8/2019 Mr. Justin Neste CALIBRE, Environmental Technology Solutions 20926 Pugh Rd NE

Poulsbo WA 98370

Project Name: Boeing Renton

Project #:

Workorder #: 1906480

Dear Mr. Justin Neste

The following report includes the data for the above referenced project for sample(s) received on 6/24/2019 at Air Toxics Ltd.

The data and associated QC analyzed by TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner

Project Manager

July Butte

## LABORATORY NARRATIVE EPA Method TO-15 CALIBRE, Environmental Technology Solutions Workorder# 1906480

Three 1 Liter Summa Canister samples were received on June 24, 2019. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

#### **Receiving Notes**

There were no receiving discrepancies.

#### **Analytical Notes**

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds. Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

A single point calibration for TPH referenced to Gasoline was performed for each daily analytical batch. Recovery is reported as 100% in the associated results for each CCV.

#### **Definition of Data Qualifying Flags**

Ten qualifiers may have been used on the data analysis sheets and indicates as follows:

- B Compound present in laboratory blank greater than reporting limit (background subtraction not performed).
  - J Estimated value.
  - E Exceeds instrument calibration range.
  - S Saturated peak.
  - Q Exceeds quality control limits.
- U Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.
  - UJ- Non-detected compound associated with low bias in the CCV
  - N The identification is based on presumptive evidence.
  - M Reported value may be biased due to apparent matrix interferences.
  - CN See Case Narrative.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

RE: Boeing Renton Regional GW Building 4-78/79

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclose Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, Inc.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in it entirety.

The Boeing Company Project: Boeing Renton Regional GW Building 4-78/79

P.O. Box 3707 MC 9U4-26 Project Number: Boeing Renton Regional GW Building 4-78/79 Reported:

Seattle WA, 98124 Project Manager: Carl Bach 21-May-2019 13:59

#### **Work Order Case Narrative**

#### Volatiles - EPA Method SW8260C

The sample(s) were run within the recommended holding times.

Initial and continuing calibrations were within method requirements.

Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

The method blank(s) were clean at the reporting limits.

The LCS/LCSD percent recoveries and RPD were within control limits.

#### **Wet Chemistry**

The sample(s) were prepared and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The method blank(s) were clean at the reporting limits.

The LCS percent recoveries were within control limits.

#### **Notes and Definitions**

<ul> <li>Flagged value is not within established control limits.</li> </ul>
---

D The reported value is from a dilution

E The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL)

U This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).

Y1 Raised reporting limit due to interference

DET Analyte DETECTED

ND Analyte NOT DETECTED at or above the reporting limit

NR Not Reported

dry Sample results reported on a dry weight basis

RPD Relative Percent Difference

[2C] Indicates this result was quantified on the second column on a dual column analysis.
