Re: Summary of RI Data Gaps Investigation Results: Plant Site and Lower Haul Road
Reserve Silica, Ravensdale, Washington
Project No. 160315-002-04

Dear Marisa:

Introduction

This report presents the results of additional environmental investigation conducted at the Plant Site and Lower Haul Road portions of the Reserve Silica Corporation (Reserve) Property (herein identified as the Property) located in Ravensdale, Washington (Figure 1). Portions of the Property were historically used for coal and sandstone mining and processing and is divided into seven tax lots totaling 377 acres (Lots 1 through 6 and the Plant Site lot).

Aspect Consulting, LLC (Aspect) prepared a Remedial Investigation (RI) Report in November 2017 (Aspect, 2017). The RI Report summarized information collected to characterize the nature and extent of contamination at the Property. The RI Report was reviewed by the Washington State Department of Ecology (Ecology), who identified RI data gaps in a January 30, 2018, letter (Ecology, 2018).

The additional investigation, represented by this summary report, was performed in accordance with Aspect's July 26, 2018, "Work Plan to Investigate Data Gaps: Plant Site and Lower Haul Road" (Work Plan; Aspect, 2018) to address data gaps identified by Ecology for these areas of the Property. The Work Plan was reviewed by Ecology, who provided informal comments in an August 8, 2018, email. Changes to the scope of work based on Ecology's comments are summarized in the "Deviations from Work Plan" section below.

The additional investigation was conducted to address data gaps outlined by Ecology for the Plant Site and Lower Haul Road (Ecology, 2018). The environmental concerns at the Plant Site consist of the following: surface releases of hazardous substances in the fueling and vehicle maintenance area (referred to as the Hazardous Materials Storage Area); surface releases of petroleum hydrocarbons, and related substances, attributable to long-term operations on the Plant Site, including sandstone processing, storage and loading of sand, vehicle and heavy equipment use, and process water management; and potential spills or leaks from the diesel underground storage tank (UST). The environmental concern for the Lower Haul Road pertains to the presence, nature, and extent of arsenic and lead in soil associated with the past import of slag for the use in road construction. The specific data gaps identified by Ecology to further evaluate these environmental concerns are summarized in the following section.

Summary of Data Gaps

After reviewing the RI, Ecology identified the following data gaps for the Plant Site and at the Lower Haul Road:

Hazardous Materials Storage Area

1. **Hazardous materials storage area.** Additional sampling/testing of soil that could have been impacted by spills from the waste-oil tank and in the equipment storage area.

Main Processing Area

2. **Drainage Ditch Sediments.** Evaluate impact from historical spills and discharges containing fuel and oil, as documented in past Ecology site inspections.
3. **Boring AB-2 Area (near historical coal and sand processing).** Further delineation of naphthalene and carcinogenic polycyclic aromatic hydrocarbon (cPAH) concentrations detected in soil at previous exploration AB-2.
4. **Transformers.** Investigate soil in area for possible polychlorinated biphenyl (PCB) contamination or explanation of why it is not a concern.
5. **Diesel underground storage tank.** When tank is removed, perform soil, UST pit water and groundwater testing to evaluate extent of affected soil and confirm adequate soil removal.

Lower Haul Road

6. **Imported slag.** Evaluate leachability of arsenic and lead from imported slag used for roadbed construction using liquid that simulates groundwater with high pH.

The Hazardous Materials Storage Area and Main Processing Area are depicted on Figures 2 through 4. The Lower Haul Road is depicted on Figure 6. In order to evaluate data gaps 1 through 6 above, Aspect completed additional exploration that consisted of the excavation of test pits, collection of soil samples for laboratory analysis of the contaminants of concern (COCs), and further leachability testing of slag samples. The investigations were completed in general accordance with the scope of work and analytical approach described in the Work Plan. The results for the data gap investigation of the Plant Site and Lower Haul Road, including a brief summary of the scope of work, soil and groundwater conditions observed, the results of analytical testing, and any deviations from the Work Plan are summarized below.

Deviations from the Work Plan

Based on Ecology's comments on the Work Plan, the following adjustments were made to the scope of work:

- Three test pits were added to evaluate soil conditions around boring AB-4 in the Hazardous Materials Storage Area.
- One test pit was added to evaluate soil conditions near the sump pond in the Main Processing Area.

In addition, the following modifications to the scope of work were implemented because of logistical challenges:

- The UST has not yet been decommissioned. An electrical control box sits on a concrete pad over the UST, preventing access to the UST for its removal. Reserve is planning to decommission the UST by permanent removal as soon as the electrical control box can be relocated.
- The work planned to evaluate soil conditions at the Former Railroad Drainage Ditch[1] was modified because Reserve does not have access to the BNSF right-of-way. Instead of completing borings in the former ditch, test pit TP-26 was excavated at the head of the ditch, where oily water was historically observed by Ecology to be entering the ditch. The test pit is located nearest to the potential sources of oily water, which include former elevated fueling tanks and wastewater from the diesel-fired air scrubber in the sand processing area and are expected to represent the worst-case conditions.

The analytical approach presented in the Work Plan for the data gap investigation included analysis of soil samples where field indications of petroleum hydrocarbons or other contamination were observed. Otherwise, the Work Plan indicated that a soil sample collected between 2 and 3 feet below ground surface (bgs) would be submitted for laboratory analysis. This approach was developed because the shallow fill soil would most accurately reflect the presence of hazardous substances attributable to potential surface releases. However, in many test pits, the thickness of the fill soil overlying historic coal tailings was less than 2 feet; in these instances, samples of the fill soil were collected at shallower intervals to meet the objectives of the data gap investigation.

Plant Site Data Gaps Investigation

A total of 26 test pits were excavated across the Plant Site areas (Figures 3 and 4). Test pits were excavated to maximum depths of 6 feet bgs, refusal, groundwater, coal, or native soils, whichever occurred shallowest. Soils observed were classified in accordance with the ASTM International, Inc. (ASTM) Method D2488 *Standard Practice for Description and Identification of Soils,* and soil descriptions, field screening results, and other relevant details (staining, odors, etc.) were recorded on the test-pit logs provided in Appendix A. Photographs of the test pits are included in Appendix B.

Soils observed in test pits excavated at the Plant Site areas consisted primarily of orange-yellow sand and silty sand with variable amounts of gravel, mixed with coal and woody debris, interpreted to be fill soil. Below the fill soil, sand mixed with coal tailings (approximately 50 to 80 percent coal, with increasing coal with depth) was encountered in all test pits at depths ranging from 10 inches to 4.5 feet bgs, except where test pits were terminated due to refusal on concrete (TP-4 through TP-7), groundwater (TP-21), or the maximum exploration depth of 6 feet bgs (TP-09). Test pit TP-10 was excavated to 3.7 feet bgs, where a PVC pipe was encountered, and further excavation was not completed.

Groundwater was observed in only one test-pit excavation (TP-21) at approximately 4 feet bgs. Groundwater was measured in existing Plant Site wells (AMW-01 to AMW-05, Figure 5) between 5.68 feet bgs and 21.82 feet bgs, corresponding to elevations of 589.03 feet North American

[1] The historical ditch has been filled by ballast rock and soil and, based on an April 18, 2018 site inspection, it does not appear that active drainage is ongoing. Currently, surface water runoff flows into the Plant Site Drainage Ditch, into the sump pond.

Vertical Datum (NAVD88) and 585.43 feet NAVD88 (Table 1). Groundwater elevation contours are shown on Figure 5.

The chemical analytical results for soil samples collected during the data gaps investigation are summarized on Tables 2 and 3. The laboratory analytical reports are attached as Appendix C. The results for the data gaps investigation work are summarized below for the Main Processing Area and the Hazardous Material Storage Area. The chemical analytical results are compared to the Washington State Model Toxics Control Act (MTCA) cleanup regulation Method A or B cleanup levels for unrestricted land use.

Hazardous Material Storage Area

On February 26, 2019, Aspect observed eight test-pit explorations (TP-1 through TP-8) proximal to the Hazardous Material Storage Area to address data gap 1 (Figure 4). Field screening did not identify the presence of petroleum hydrocarbons or volatile compounds in soil collected from any of the test pits excavated in this area. One soil sample from each test pit was collected and submitted to Onsite Environmental for laboratory analysis of the following COCs:

- Gasoline-, diesel-, and oil-range petroleum hydrocarbons by Northwest Methods NWTPH-Gx and NWTPH-Dx
- Benzene, toluene, ethylbenzene and xylenes (BTEX) by U.S. Environmental Protection Agency (EPA) Method 8021B
- cPAHs and naphthalene by EPA Method 8270D/SIM
- PCBs by EPA Method 8082A
- Halogenated volatile organic compounds (HVOCs) by EPA Method 8260C
- Total lead by EPA Method 6010D
- Fuel additives and blending compounds consisting of dibromoethane; 1,2-(EDB); dichloroethane; 1,2-(EDC); and methyl tertiary-butyl ether (MTBE) by EPA Method 8260C

The subsurface observations indicate the presence of a buried concrete pad at depths of approximately 2 feet bgs in TP-4 through TP-7; the estimated extent of the concrete pad is depicted on Figure 4. The concrete pad was observed to be approximately 6 to 12 inches thick and sitting directly on top of coal tailings. In test pits where the concrete slab was observed, the fill soil overlying the concrete slab was targeted for sampling.

Results

Diesel-range and heavy oil-range petroleum hydrocarbons were detected in soil samples collected from seven of the eight test pits completed in the Hazardous s Material Storage Area (Table 2). The reported concentrations are below the MTCA Method A cleanup levels of 2,000 milligrams per kilogram (mg/kg), except for the following:

- The soil sample collected from TP-7, where oil-range petroleum hydrocarbons were reported at a concentration of 2,500 mg/kg in a sample collected from 1 foot bgs.

Concentrations of lead, naphthalenes, and cPAHs were detected in soil samples collected from the test pits; the reported concentrations are all below the applicable MTCA Method A or B cleanup levels (Table 2). The laboratory did not report concentrations of VOCs (including HVOCs, BTEX,

and fuel additives) or PCBs above the laboratory reporting limits in soil samples collected from test pit explorations in the Hazardous Material Storage Area (Tables 2 and 3).

Main Processing Area

On February 26 and 27, 2019, Aspect observed 18 test-pit explorations (TP-9 through TP-26), in and around the Main Processing Area and at the head of the Former Railroad Drainage Ditch, to address data gaps 2 through 5 (Figure 3). One soil sample from each test pit was obtained and submitted to Onsite Environmental in Redmond, Washington, for laboratory analysis of the following COCs:

- Gasoline-, diesel-, and oil-range petroleum hydrocarbons by Northwest Methods NWTPH-Gx and NWTPH-Dx
- BTEX by EPA Method 8021b
- cPAHs and naphthalene by EPA Method 8270D/SIM

Additionally, four surface soil samples (SS-1 through SS-4) were obtained from the base of the electrical transformer to address data gap 4. Surface soil samples were submitted for laboratory analysis of mineral oil-range petroleum hydrocarbons and PCBs by EPA Method 8082A.

During excavation of TP-21, an abandoned sump vault was encountered at approximately 2 feet bgs (Figure 3). The sump vault appeared filled with concrete or similar material. The soil in TP-21 exhibited petroleum-like odors and gray staining between 2 and 4 feet bgs. Soil was collected from this depth interval for chemical analysis.

Results

Diesel-range and heavy oil-range petroleum hydrocarbons were detected in soil samples collected from 15 of the 18 test pits completed in the Main Processing Area, but only 3 of the 18 samples contained concentrations exceeding the MTCA Method A cleanup levels (Table 2). The reported concentrations are below the MTCA Method A cleanup levels of 2,000 mg/kg, except for the following:

- The soil sample collected from TP-21 at a depth of 2 feet, located near the sump pond and abandoned sump vault, where oil-range petroleum hydrocarbons were detected at 2,400 mg/kg.
- Soil samples collected from TP-24 and TP-25 at a depth of 2 feet, located west of the Plant Site office, where concentrations of diesel-range petroleum hydrocarbons were detected at 3,200 and 8,500 mg/kg respectively (Figure 3). The analytical laboratory indicates that the petroleum in these samples is consistent with Diesel Fuel #2.

Total xylenes were detected in one test-pit soil sample (TP-25) at concentrations below the MTCA Method A cleanup level. Naphthalenes and cPAHs were detected in 10 of the 18 soil samples, all reported concentrations are below the applicable MTCA Method A or B cleanup levels.

One of the four surface soil samples collected from around the base of the electrical transformer contained mineral oil-range petroleum hydrocarbons at a concentration of 3,400 mg/kg (SS-2), which is below the MTCA Method A cleanup level of 4,000 mg/kg (Table 2). PCBs were not detected in any of the four surface soil samples (Table 2).

Lower Haul Road Investigation

The presence, nature, and extent of arsenic and lead in soil associated with reported placement of ASARCO slag as roadbed material in the Lower Haul Road was originally investigated in May 2017 to support preparation of the RI report. The 2017 investigation included advancing eight borings along the Lower Haul Road to observe and classify soil, and to collect soil samples for laboratory analysis of arsenic and lead in leachate, as tested by the Synthetic Precipitation Leaching Procedure (SPLP) that measures potential leachability of metals under natural pH conditions. Ecology identified an outstanding data gap and requested that further leachability testing be completed using liquid that simulates groundwater with high pH, which is more representative of conditions near the Lower Haul Road.

On April 5, 2018, Aspect observed four test-pit explorations (ATP-1 through ATP-4; Figure 6) excavated along the Lower Haul Road in the general area of the soil borings completed during previous RI field activities. Test pits were excavated to refusal, which occurred between approximately 3 feet and 5.5 feet bgs. Soils observed were classified in accordance with the ASTM Method D2488 *Standard Practice for Description and Identification of Soils,* and soil descriptions, field screening results, and other relevant details (staining, odors, etc.) were recorded on the test-pit logs provided in Appendix A. Photographs of the test pits are included in Appendix B.

Soils observed in the Lower Haul Road test pits primarily consisted of gravelly, silty sand with slag fragments and orange-yellow sand with coal and slag fragments to the maximum depths excavated (5.5 feet bgs in ATP-2). Anthropogenic debris (bricks and plastic fragments) were encountered in roadbed material in test pit ATP-2.

Bulk soil samples were obtained from each test pit where the highest percentage of slag fragments was observed. Bulk soil was processed to segregate and estimate the relative percentages of slag and soil. One bulk sample, consisting of soil mixed with slag fragments, and one sample of segregated slag from each test pit were submitted to Friedman and Bruya, Inc., in Seattle, Washington, for laboratory analysis of leachate obtained under basic conditions (pH = 12) to simulate conditions at the Property. The resulting leachate was analyzed for arsenic, lead, iron, and manganese. The chemical results are summarized in Table 4; the laboratory analytical report is included in Appendix C.

Results

Processing of samples obtained from the Lower Haul Road showed a range of slag content (in percent by weight) between 5 percent (ATP-3) and 53 percent (ATP-1), as summarized in Table 4.

Analysis of leachate from bulk soil samples showed one detection of arsenic (5.07 milligrams per liter [mg/L] in ATP-1) and two detections of iron (up to 9.44 mg/L in ATP-3). Analysis of the leachate from slag-only samples showed one detection of arsenic (1.7 mg/L in ATP-3), and one detection of iron (18.8 mg/L in ATP-3). Lead and manganese were not detected in any of the leachate samples analyzed.

Conclusions

Investigation Findings Summary – Plant Site

The results of the data gap investigation on the Plant Site are consistent with the results of the previous investigation. Low concentrations of petroleum hydrocarbons are present in shallow soil throughout the Plant Site. Petroleum hydrocarbons have been detected sporadically at concentrations exceeding the MTCA Method A cleanup levels in soil samples collected between 1 and 2.5 feet bgs. The findings with respect to specific data gaps on the Plant Site are summarized below, including consideration of data collected during the RI:

- Data Gap 1 – Soil impacted by the operations in the Hazardous Material Storage Area appears shallow and localized, likely the result of compounded surface spills and not significant release(s). A total of 11 explorations have been completed in the Hazardous Material Storage Area and the only COC exceedances of the MTCA cleanup levels in soil are in two locations: oil-range petroleum hydrocarbons at TP-7 during the data gap investigation and arsenic at AMW-5 during the initial investigation (Table 2). A groundwater sample collected from AMW-5 in April 2017 did not contain concentrations of petroleum hydrocarbons or arsenic above the laboratory reporting limits, indicating that contaminants in soil are not leaching to groundwater. The presence of the buried concrete slab in this area likely prevents downward migration of contaminants released to the ground surface, reducing the potential for impact to groundwater or deeper soils.
- Data Gaps 2 and 3 – Soil quality in the Main Processing Area does not appear to have been significantly impacted by the long history of operations, including past discharge and runoff of oily wastewater from sandstone processing operations. A total of 22 soil explorations have been completed in the Main Processing Area and the only COC exceedances of the MTCA cleanup levels are in two discrete areas: boring AB-2, where oil-range hydrocarbons and cPAHs were reported in shallow soil; and the area of test pits TP-21, TP-24 and TP-25, where diesel- and oil-range petroleum hydrocarbons are reported in shallow soil. Elsewhere, soil samples obtained from test pits excavated in the Main Processing Area contained low concentrations of petroleum hydrocarbons and cPAHs, all well below the MTCA cleanup levels.
- Data Gap 4 – Surface soil samples obtained from around the base of the electrical transformer pad suggest that historical surface spills of mineral oil have occurred. However, the detected concentration is below the MTCA Method A cleanup level of 4,000 mg/kg, and PCBs were not detected above the laboratory reporting limits.

Investigation Findings Summary – Lower Haul Road

The results of investigation into the road-base material of the Lower Haul Road in 2017 identified concentrations of total arsenic and lead in soil exceeding MTCA criteria for the protection of human health and ecological receptors (Aspect, 2017). However, the arsenic and lead were not found to be leachable under natural pH conditions (Aspect, 2017) in the 15 samples submitted for SPLP testing in the 2017 study.

The results of high-pH leachability testing completed as part of the data gaps investigation resulted in arsenic in leachate from one of the bulk soil samples and one of the slag-only samples. Although the highest concentration of arsenic in leachate was reported in the bulk soil sample with the greatest amount of slag by weight (ATP-1; Table 4), three of the four slag-only samples did not

contain leachable arsenic under high-pH conditions, suggesting that the slag is not the primary source of arsenic in leachate.

Outstanding Plant Site Data Gaps

Data Gap 5 – This data gap pertaining to the soil and groundwater quality in the vicinity of the diesel UST will be characterized during permanent decommissioning by removal of the tank through completion of a UST site assessment, as required by Washington Administrative Code (WAC) 173-360A-0730, and to be performed in accordance with Ecology's Guidance for Site Checks and Site Assessments for USTs (Ecology, 1991).

Notes:

[1]Petroleum hydrocarbons analyzed using Northwest Methods NWTPH-Gx and NWTPH-Dx.
[2]Benzene (B), toluene (T), ethylbenzene (E), and xylenes (X) analyzed using Environmental Protection Agency (EPA) method 8021E
[3]Total metals (As, Ba, Cd, Cr, Pb, Hg, Se, and Ag) by EPA method 6010C/7471E
[4]Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) and naphthalenes by EPA method 8270D/SIM
[5]Polychlorinated biphenols (PBCs) analyzed using EPA method 8082A

mg/kg = milligrams per kilogram (parts per million)
ft = feet below ground surface
MTCA= Model Toxics Control Act
J = the internal standard associated with the analyte is out of control limits and the reported concentration is an estimate.
ne = not established

X = Chromatographic pattern did not match fuel pattern.
-- = analyte not tested
U = analyte was not detected at a concentration greater than the indicated laboratory reporting limit.
* = Chromatigraphic pattern was interpretted to represent Diesel Fuel #2 by the laboratory
Bold denotes a detected concentration.
Shading indicates a concentration that exceeds the MTCA Method A cleanup level, or Method B cleanup level where Method A is not established.

Notes:

[1] Halogenated volatile organic compounds (HVOCs) analyzed by EPA Method 8260C.

mg/kg = milligrams per kilogram (parts per million)

MTCA= Model Toxics Control Act

U = analyte was not detected at a concentration greater than the indicated laboratory reporting limit.

J = the internal standard associated with the analyte is out of control limits and the reported concentration is an estimate.

-- = analyte not tested

ft = feet below ground surface

Bold denotes a detected concentration.

Shading indicates a concentration that exceeds the MTCA Method A regulatory cleanup level.

ne = not established

Table 4. Lower Haul Road Investigation - High pH Soil Leaching Results

Project No. 160315, Reserve Silica Ravensdale Site, Ravensdale, Washington

Sample Identification	%slag by weight	Sample Type	TCLP Metals (pH=12) (mg/L)			
			Arsenic	Lead	Iron	Manganese
ATP-1	53%	Bulk Soil	5.07	1 U	6.75	1 U
		Slag Only	1 U	1 U	5 U	1 U
ATP-2	6%	Bulk Soil	1 U	1 U	--	--
		Slag Only	1 U	1 U	--	--
ATP-3	5%	Bulk Soil	1 U	1 U	9.44	1 U
		Slag Only	1.7	1 U	18.8	1 U
ATP-4	20%	Bulk Soil	1 U	1 U	--	--
		Slag Only	1 U	1 U	--	--

Test Methods:

Aspect collected bulk soil samples from four test pits advanced in the Lower Haul Road, where previous investigation work identified slag fragments mixed in road bed soils. Half of each bulk soil sample was processed in Aspect's geotechnical laboratory to estimate the percent of slag, by weight, in each of the bulk samples. Following processing, slag only samples were collected for separate laboratory processing and analysis. Friedman & Bruya, Inc. tumbled bulk soil and slag only samples in deionized water, adjusted to pH 12 with sodium hydroxide. After tumbling, the pH was checked and confirmed to still be 12. The liquid was analyzed for TCLP Metals by EPA Method 6020A and 1311 mod.

Exploration Log TP-02
Sheet 1 of 1

OLD STANDARD EXPLORATION LOG TEMPLATE P:\GINT\WPROJECTS\RESERVE SILICA- 160315.GPJ March 22, 2019

Aspect CONSULTING	Reserve Silica--Ravensdale - 160315		Excavation Log	
	Project Address & Site Specific Location: 28131 Ravensdale-Black Diamond Rd., Ravensdale, WA 98051, SE of TP-01		Coordinates (Lat,Lon WGS84): 47.350, -121.991 (est)	Exploration Number: **TP-03**
Contractor: N/A	Equipment: Excavator	Sampling Method: Grab	Ground Surface (GS) Elev.: NA	
Operator: Dean	Exploration Method(s): Test Pit	Work Start/Completion Dates: 2/26/2019	Top of Casing Elev.: NA	Depth to Water (Below GS): No Water Encountered

Depth (feet)	Elev. (feet)	Exploration Completion and Notes	Sample Type/ID	Analytical Sample Number & Lab Test(s)	Field Tests	Material Type	Description	Depth (ft)
1		Backfilled with cuttings		TP-3-1.3 NWTPH-Gx, BTEX, NWTPH-Dx, PCBs, CPAHs, Naphth, HVOCs, EDB, EDC, MTBE, Lead	PID= 0.0 Sheen= None		**FILL** Moist, yellow to brown, gravelly SAND (SP); fine to medium sand, fine to coarse gravel; abundant wood, metal, and concrete debris, no odor.	1
2								2
3					PID= 0.0 Sheen= Slight		**COAL TAILINGS** Moist, black coal; no odor.	3
4							Bottom of exploration at 4 ft. bgs.	4

Re: Analytical Data for Project 160315
Laboratory Reference No. 1902-177

Dear Carla:

Enclosed are the analytical results and associated quality control data for samples submitted on February 27, 2019.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

Date of Report: March 8, 2019
Samples Submitted: February 27, 2019
Laboratory Reference: 1902-177
Project: 160315

Case Narrative

Samples were collected on February 26 and 27, 2019 and received by the laboratory on February 27, 2019. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

PAHs EPA 8270D/SIM Analysis

Samples TP-24-2.0 and TP-25-2.0 each had one surrogate recovery out of control limits. This is within allowance of our standard operating procedure as long as the recovery is above 10%.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1- Sample extract treated with a sulfuric acid/silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

Carla Brock, Project Manager
Aspect Consulting, LLC
401 2nd Ave S, Suite 201
Seattle, WA 98104

Dear Ms Brock:

Included are the results from the testing of material submitted on April 6, 2018 from the Reserve Silica 160315, F&BI 804118 project. There are 14 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on April 6, 2018 by Friedman & Bruya, Inc. from the Aspect Consulting, LLC Reserve Silica 160315, F&BI 804118 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Aspect Consulting, LLC
804118 -01	ATP-1-bulk
804118 -02	ATP-1-slag
804118 -03	ATP-2-bulk
804118 -04	ATP-2-slag
804118 -05	ATP-3-bulk
804118 -06	ATP-3-slag
804118 -07	ATP-4-bulk
804118 -08	ATP-4-slag

The samples were tumbled in deionized water adjusted to pH 12 with sodium hydroxide. After tumbling, the pH was checked and confirmed to still be 12.

All quality control requirements were acceptable.

Analysis for High pH Leachable Metals By EPA Method 6020A and 1311 Mod

Manganese	mg/L (ppm)	2.0	95	80-120

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The compound is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

APPENDIX D

Report Limitations and Guidelines for Use

REPORT LIMITATIONS AND USE GUIDELINES

Reliance Conditions for Third Parties

This report was prepared for the exclusive use of the Client. No other party may rely on this report or the product of our services without the express written consent of Aspect Consulting, LLC (Aspect). This limitation is to provide our firm with reasonable protection against liability claims by third parties with whom there would otherwise be no contractual conditions or limitations and guidelines governing their use of the report. Within the limitations of scope, schedule and budget, our services have been executed in accordance with our Agreement with the Client and recognized standards of professionals in the same locality and involving similar conditions.

Services for Specific Purposes, Persons and Projects

Aspect has performed the services in general accordance with the scope and limitations of our Agreement. This report has been prepared for the exclusive use of the Client and their authorized third parties, approved in writing by Aspect. This report is not intended for use by others, and the information contained herein is not applicable to other properties.

This report is not, and should not, be construed as a warranty or guarantee regarding the presence or absence of hazardous substances or petroleum products that may affect the subject property. The report is not intended to make any representation concerning title or ownership to the subject property. If real property records were reviewed, they were reviewed for the sole purpose of determining the subject property's historical uses. All findings, conclusions, and recommendations stated in this report are based on the data and information provided to Aspect, current use of the subject property, and observations and conditions that existed on the date and time of the report.

Aspect structures its services to meet the specific needs of our clients. Because each environmental study is unique, each environmental report is unique, prepared solely for the specific client and subject property. This report should not be applied for any purpose or project except the purpose described in the Agreement.

This Report Is Project-Specific

Aspect considered a number of unique, project-specific factors when establishing the Scope of Work for this project and report. You should not rely on this report if it was:

- Not prepared for you
- Not prepared for the specific purpose identified in the Agreement
- Not prepared for the specific real property assessed
- Completed before important changes occurred concerning the subject property, project or governmental regulatory actions

If changes are made to the project or subject property after the date of this report, Aspect should be retained to assess the impact of the changes with respect to the conclusions contained in the report.

Geoscience Interpretations

The geoscience practices (geotechnical engineering, geology, and environmental science) require interpretation of spatial information that can make them less exact than other engineering and natural science disciplines. It is important to recognize this limitation in evaluating the content of the report. If you are unclear how these "Report Limitations and Use Guidelines" apply to your project or site, you should contact Aspect.

Discipline-Specific Reports Are Not Interchangeable

The equipment, techniques and personnel used to perform an environmental study differ significantly from those used to perform a geotechnical or geologic study and vice versa. For that reason, a geotechnical engineering or geologic report does not usually address any environmental findings, conclusions or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. Similarly, environmental reports are not used to address geotechnical or geologic concerns regarding the subject property.

Environmental Regulations Are Not Static

Some hazardous substances or petroleum products may be present near the subject property in quantities or under conditions that may have led, or may lead, to contamination of the subject property, but are not included in current local, state or federal regulatory definitions of hazardous substances or petroleum products or do not otherwise present potential liability. Changes may occur in the standards for appropriate inquiry or regulatory definitions of hazardous substance and petroleum products; therefore, this report has a limited useful life.

Property Conditions Change Over Time

This report is based on conditions that existed at the time the study was performed. The findings and conclusions of this report may be affected by the passage of time (for example, Phase I ESA reports are applicable for 180 days), by events such as a change in property use or occupancy, or by natural events, such as floods, earthquakes, slope failure or groundwater fluctuations. If more than six months have passed since issuance of our report, or if any of the described events may have occurred following the issuance of the report, you should contact Aspect so that we may evaluate whether changed conditions affect the continued reliability or applicability of our conclusions and recommendations.

Phase I ESAs – Uncertainty Remains After Completion

Aspect has performed the services in general accordance with the scope and limitations of our Agreement and the current version of the “Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process”, ASTM E1527, and U.S. Environmental Protection Agency (EPA)'s Federal Standard 40 CFR Part 312 "Innocent Landowners, Standards for Conducting All Appropriate Inquiries".

No ESA can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with subject property. Performance of an ESA study is intended to reduce, but not eliminate, uncertainty regarding the potential for environmental conditions affecting the subject property. There is always a potential that areas with contamination that were not identified during this ESA exist at the subject property or in the study area. Further evaluation of such potential would require additional research, subsurface exploration, sampling and/or testing.

Historical Information Provided by Others

Aspect has relied upon information provided by others in our description of historical conditions and in our review of regulatory databases and files. The available data does not provide definitive information with regard to all past uses, operations or incidents affecting the subject property or adjacent properties. Aspect makes no warranties or guarantees regarding the accuracy or completeness of information provided or compiled by others.

Exclusion of Mold, Fungus, Radon, Lead, and HBM

Aspect’s services do not include the investigation, detection, prevention or assessment of the presence of molds, fungi, spores, bacteria, and viruses, and/or any of their byproducts. Accordingly, this report does not include any interpretations, recommendations, findings, or conclusions regarding the detection, assessment, prevention or abatement of molds, fungi, spores, bacteria, and viruses, and/or any of their byproducts. Aspect’s services also do not include the investigation or assessment of hazardous building materials (HBM) such as asbestos, polychlorinated biphenyls (PCBs) in light ballasts, lead based paint, asbestos-containing building materials, urea-formaldehyde insulation in on-site structures or debris or any other HBMs. Aspect’s services do not include an evaluation of radon or lead in drinking water, unless specifically requested.
