

Chehalis Generation Facility 1813 Bishop Road Chehalis, Washington 98532

July 6, 2016

Mr. John Rapp Voluntary Cleanup Program Site Manager Washington Department of Ecology Southwest Regional Office P.O. Box 47775 Olympia, WA, 98504-7775

RE: PacifiCorp Rocky Mountain Power Chehalis Power Plant Voluntary Cleanup Program VCP # SW 1246 Cleanup Action Report

PacifiCorp Rocky Mountain Power Chehalis Power Plant (Chehalis Power) submits the following documents for the Washington Department of Ecology (Ecology) Voluntary Cleanup Program (VCP). Included with this document is a VCP Request for Opinion Form and a Cleanup Action Report.

A VCP Application and Cleanup Action Report were submitted previously in August 2012 for an oil spill incident on January 20, 2011. A Generation Step Up Transformer #1 (GSU#1) containing non-PCB mineral oil experienced an explosive failure and subsequent fire which resulted in a release of mineral oil around the transformer and also impacting the stormwater system. Chehalis Power cleaned up the release and remediated the affected area immediately after the incident.

This Cleanup Action Report covers investigation and cleanup activities for the period 2013 to the present. Follow up investigation was initiated in Fall 2013. Then, in November 2013, GSU#3 failed similar to the 2011 incident, resulting in a mineral oil release. Chehalis Power cleaned up the release and remediated the affected area in January 2014.

As we have discussed with you, Chehalis Power has conducted a comprehensive investigation of soil and groundwater contamination. This Cleanup Action Report covers the 2013 oil spill and the subsequent investigation and groundwater monitoring for four quarters over one year, April 2015 to March 2016.

As described in the Cleanup Action Report, Chehalis Power has concluded site remediation is complete and a No Further Action opinion is appropriate. Chehalis Power requests that Ecology proceed to review Cleanup Action Report and provide an opinion to Chehalis Power under the VCP.

The VCP Application and the Cleanup Action Report are provided in both hard copy and Adobe PDF electronic file formats. In addition, the laboratory analysis data (along with other required information) in electronic format is in process in Ecology's Electronic Information Management (EIM) system.

If you have questions or need additional information, please contact Jeremy Smith or myself at 360-748-1300; or you may contact Lenora Westbrook, KTA Associates, Inc. at 360-250-7694.

Sincerely,

Mark A. Miller Plant Manager

### Attachment 1

VCP Request for Opinion Form

### **Voluntary Cleanup Program**

### Washington State Department of Ecology Toxics Cleanup Program

### **REQUEST FOR OPINION FORM**

Use this form to request a written opinion on your planned or completed independent remedial action under the Voluntary Cleanup Program (VCP). Attach to this form the plans or reports documenting the remedial action. Please submit only one form for each request.

### Step 1: IDENTIFY HAZARDOUS WASTE SITE

Please identify below the hazardous waste site for which you are requesting a written opinion under the VCP. This information may be found on the VCP Agreement.

Facility/Site Name: Chehalis Power Plant

Facility/Site Address: 1813 Bishop Road, Chehalis, WA 98532

Facility/Site No: 11776

VCP Project No.: SW1246

### Step 2: REQUEST WRITTEN OPINION ON PLAN OR REPORT

•	
What type of independent remedial action plan or report are you submitting to Ecology under the VCP? Please check all that apply.	for review
Remedial investigation plan	
Remedial investigation report	
Feasibility study report	
Property cleanup* plan (* cleanup of one or more parcels located within the	Site)
Property cleanup* report	
Site cleanup plan	
Site cleanup report	
Other – please specify:	
Do you want Ecology to provide you with a written opinion on the planned or of independent remedial action?	completed
🖂 Yes 📋 No	
Please note that Ecology's opinion will be limited to:	
• Whether the planned or completed remedial action at the site meets the service requirements of the Model Toxics Control Act (MTCA), and/or	ubstantive
Whether further remedial action is necessary at the site under MTCA.	

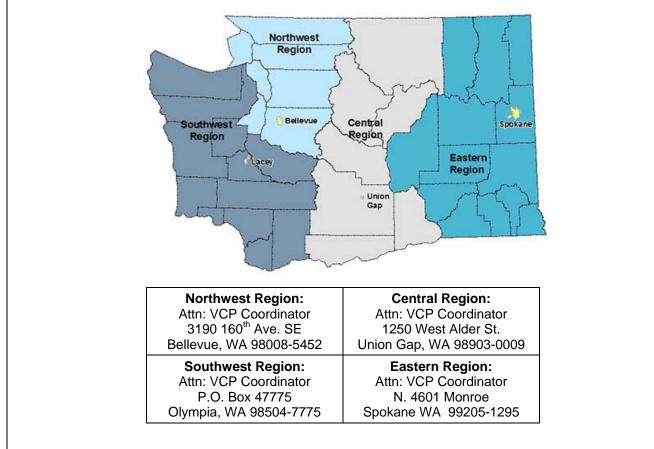

### Step 3: REPRESENTATIONS AND SIGNATURE

The undersigned representative of the Customer hereby certifies that he or she is fully authorized to request services from Ecology under the Agreement for this VCP Project.

Name: Mark A. Miller			Title: Plant Manager		
Signature:			Date:		Date:
Organization: PacifiCorp Rocky Mountain Power Chehalis Power Plant					
Mailing address: 1813 Bish	nop Road				
City: Chehalis	State: WA		Zi	Zip code: 98532	
Phone: 360-748-1300 Fax: 360-740-1891			E-mail: m	nark_a.	miller@pacificorp.com

### Step 4: SUBMITTAL

Please mail your completed form and the independent remedial action plan or report that you are requesting Ecology review to the site manager Ecology assigned to your Site. If a site manager has not yet been assigned, please mail your completed form to the Ecology regional office for the County in which your Site is located.

If you need this publication in an alternate format, please call the Toxics Cleanup Program at 360-407-7170. Persons with hearing loss can call 711 for Washington Relay Service. Persons with a speech disability can call 877-833-6341.

### 1.0 INTRODUCTION

KTA Associates, Inc. (KTA) has prepared this Cleanup Action Report (CAR) for the Chehalis Power Plant transformer oil spills which occurred on January 20, 2011 and November 22, 2013. The Chehalis Power Plant (Power Plant) is owned and operated by PacifiCorp Rocky Mountain Power (PacifiCorp) at 1813 Bishop Road in Chehalis. As established in Section 200 of Chapter 340 of Title 173 of the Washington Administrative Code (WAC 173-340-200), the "Site" is defined by the full lateral and vertical extent of contamination that resulted from the transformer oil spills.

The January 2011 incident from the Generator Step Up (GSU) #1 transformer released non-PCB mineral oil to the ground and to fire suppression water that overflowed the containment structure. The Site was limited to near-surface petroleum-contaminated soil and gravel near the transformer and in the stormwater collection system. The Site was remediated within weeks of the oil spill. PacifiCorp submitted a CAR for the GSU#1 transformer oil spill in August 2012 and entered the Voluntary Cleanup Program (VCP). Washington Department of Ecology VCP program issued a **Further Action Opinion Letter** on November 20, 2012. This letter is included in **Appendix A**.

In the fall of 2013, PacifiCorp and KTA met with VCP staff and planned for further investigation around GSU#1. Installation of monitoring wells, groundwater and soil sampling was conducted at the end of October 2013. In November 2013, a different transformer, GSU#3, failed and released mineral oil and fire suppression water from the containment to the ground and stormwater system. This site was cleaned up and remediated within weeks with removal and replacement of contaminated soil.

The areas impacted by the 2011 and 2013 transformer spills are herein, collectively referred to as the "Site".

In early 2015, a comprehensive plan was developed to confirm that mineral oil contamination from the 2011 and 2013 transformer spills was cleaned up. In April 2015, additional groundwater wells were installed, with soil sampling, and a program of four quarterly groundwater sample events was initiated. At the completion of four quarters of groundwater monitoring, the analysis results showed that the five wells had non-detectable levels of mineral oil during the year of sampling.

This CAR supplements the report submitted in August 2012 and includes the subsequent investigation of soil and groundwater investigation from the GSU#1 spill following the Ecology VCP Further Action letter, and the cleanup and investigation for the GSU#3 transformer oil spill in 2013.

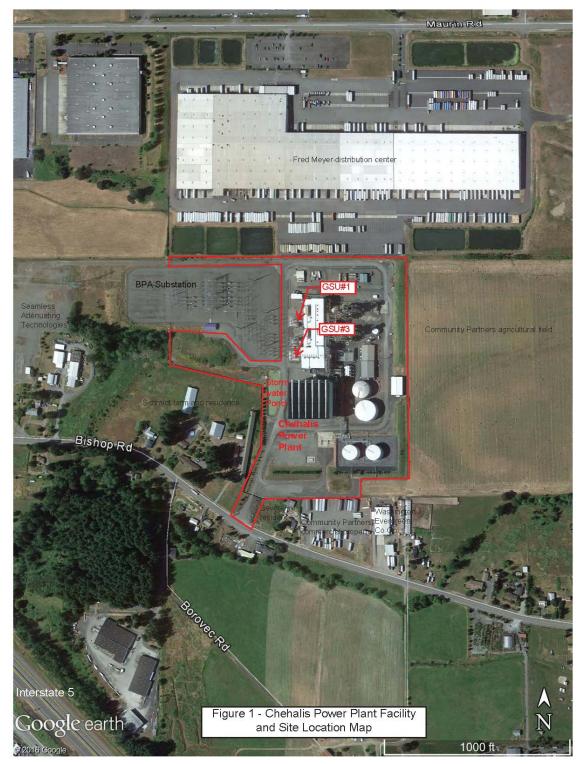

This CAR documents (1) the oil spill incidents, (2) the remediation of the Site, (3) site investigation, and (4) evaluation of the remedial actions.

### 1.1 PURPOSE

The purpose of this CAR is to satisfy the specific requirements of the Washington State Model Toxics Control Act (MTCA), in accordance with WAC 173-340-400 and 173-340-410, to obtain a determination of No Further Action (NFA) from the Washington State Department of Ecology (Ecology) through Ecology's Voluntary Cleanup Program.

### 1.2 SITE LOCATION AND DESCRIPTION

PacifiCorp Rocky Mountain Power owns and operates a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity (the "power plant"). The Site is located entirely within the property boundaries of the power plant as shown in Figure 1.

### 1.2.1 Site

The power plant is located at 1813 Bishop Road, Chehalis, Lewis County, in the Chehalis River Valley. The power plant completed construction and began operation in 2003. The facility is located on 20 acres of level graded property. The power plant is a large industrial facility including two combustion turbines, electrical transformers, heat recovery steam generators, air emissions control equipment, exhaust gas stacks, air-cooled steam condenser, water treatment equipment, operations and maintenance building. The power plant also includes several tanks primarily used for water. Two 1.7 million gallon fuel oil storage tanks in lined earthen containment are empty and have not been used since the initial startup of the power plant. The tanks were cleaned and closed in 2012.

The generator step up transformers convert the generated electrical power to high voltage for transmission at the BPA substation. The electrical transformers at the power plant use mineral oil as a dielectric fluid. The transformers are certified as Non-PCB, as is standard for transformers manufactured after the 1970s. The mineral oil in GSU#1 was tested after the failure in 2011 to confirm no PCBs were present.

The power plant is staffed 24 hours per day, 7 days per week and operates as needed for electrical generation demand. The facility is fenced and secured with automatic systems.

Stormwater collected from the power plant is directed by stormwater ditches and underground pipes to a retention pond. Stormwater is discharged from the pond to a waterway to nearby drainage under an Ecology Industrial Stormwater General NPDES Permit.

The Site subject to this CAR, includes surface water, soil, and groundwater affected by the two transformer oil spills. The information gathered after the spill indicates that the release did not affect any property outside the power plant. The areas affected by the spill are:

- Soil and gravel surrounding the failed transformers
- Surface water, soil and gravel in stormwater collection ditches
- Groundwater near the failed transformers and
- Stormwater pond surface water and soil/gravel on the pond banks.

### 1.2.2 Adjoining Properties

The property adjoining the Site is the power plant owned by PacifiCorp. The areas affected by the oil spill were confined to the power plant. The properties outside the power plant boundaries are typical of the area.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the town. The power plant is located 3 miles south of town and consists mostly of farms, small pockets of light industrial areas, rural homes and a few housing subdivisions. The power plant and commercial businesses in the area are located in the Chehalis Industrial Park developed by the Port of Chehalis. There are several roadways near the power plant, the closest being Bishop Road. Interstate 5 is 0.25 miles southwest of the power plant and Jackson Highway is 0.5 miles northeast of the plant.

The electrical substation property adjoining the power plant on the west side is owned by Bonneville Power Administration (BPA) and was constructed for Chehalis Power to transport power generated by the power plant to the BPA high voltage electrical transmission line less than one mile west. The fenced substation is surrounded by Chehalis Power property on three sides.

As shown in Figure 1, the other properties adjoining Chehalis Power include:

- East of the power plant is an open agricultural field planted with grass owned by Community Partners.
- Southeast of the power plant on Bishop Road is Washington Evergreen Co Op Inc., a commercial business.
- South of the power plant on Bishop Road is an open commercial property owned by Community Partners.
- South of the power plant, adjacent to the power plant driveway on Bishop Road, is a residence and shop owned by David and Sherry Devore.
- South and east of the power plant is a farm, incorporating a residence, garage, shop, barns and several acres of open pasture, owned by Shirley Schmidt.
- West of the power plant is property owned by Seamless Attenuating Technologies, Inc. with a light industrial power plant and a natural waterway and wetland adjoining the power plant stormwater waterway.
- Directly north of the power plant is a Fred Meyer retail distribution transportation warehouse and paved parking lot.

### 1.3 Site Property Land Use History

Chehalis Power was originally developed by independent power companies who purchased the property in the mid-1990s and began permitting for a power plant. Construction was delayed several years for siting and environmental permitting; construction began in May 2001 and was completed in October 2003. The power plant began operation in July 2003. Tractebel had developed and operated the power plant; later the company became part of SUEZ. PacifiCorp purchased the power plant in 2008. PacifiCorp Rocky Mountain Power operates power plants in several states in the western U.S.

Prior to construction, the power plant property was an agricultural field. The power plant is located on a relatively level open field. It is probable that the Site has been used for agriculture since the land was settled in the second half of the 19<sup>th</sup> century.

### 1.4 SITE FUTURE PROPERTY LAND USE

The power plant is a permanent installation designed for several decades of operation. It is expected that the plant will remain on the property and in operation for the foreseeable future. PacifiCorp plans to continue operating the power plant and does not plan to use the property for other purposes.

### 1.5 GEOLOGIC AND HYDROGEOLOGIC SETTING

### 1.5.1 Regional Hydrogeology

The power plant is located in the Chehalis River Valley, in the northwest-southeast Newaukum River drainage that flows northwest to the Chehalis River. The elevation of the power plant is 245 feet above sea level and rises to 300 feet 0.5-mile northeast at the Jackson Highway. Northeast of the highway, the

elevation rises to foothills. The lowest elevation of the valley in the area is the Newaukum River at 200 feet above sea level, one mile southwest of the power plant. The area around the power plant is a relatively flat bench of level soils used for agriculture. In general, the surface, and likely groundwater flow, is southwest from the foothills in the northeast to the river at the bottom of the drainage valley to the southwest.

A geotechnical subsurface investigation was conducted by URS Corporation (URS) in 2000 for the construction of the power plant. The Geotechnical Data Report was included as Appendix B in the August 2012 CAR.

### 1.5.2 Site Geology

The URS Geotechnical Data Report explains that the surficial geology beneath the power plant consists of late glacial sand and gravel deposits from the Hayden Creek Drift. Silt and clay deposits underlie the surface soils to a depth of 100 - 200 feet in the area.

The overall soil-type distribution at the Site consists of a low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil types are consistent with regional geologic mapping (Weigle and Foxworthy 1962) and a regional study for the Chehalis Generation Facility (Dames and Moore 1994).

These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread and is often described as blue-gray, clayey silt, It is reported to be more than 100 feet thick (Dames and Moore 1994).

### 1.5.3 Site Hydrology

The power plant yard areas are graded level with a layer of gravel in the transformer area. Surface water at the power plant flows to stormwater ditches along the roadway encircling the power plant which collects and directs stormwater to a retention pond. The pond outfall flows west in a gravel waterway (under an Industrial Stormwater permit) to Berwick Creek. Berwick Creek flows from east to west, under Bishop Road and Interstate 5, to Dillenbaugh Creek, which then flows into the Newaukum River.

The groundwater flow direction beneath the power plant travels southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semi-confined aquifer, primarily due to the low permeably silt cap immediately above the aquifer.

The field exploration for the URS Geotechnical Data Report was conducted in August 2000. At that time, the groundwater elevation was found to be 15 - 20 feet bgs. During the groundwater investigation in May 2011, the groundwater elevation was found to be 5 - 14 feet bgs. An evaluation of groundwater level and probable flow direction was conducted during April 2015 to March 2016, as explained in Section 3.3.2, the groundwater level varied between 3.5 and 7.4 feet bgs. These levels are likely higher than normal due to the high precipitation during the 2015-6 rainy season and associated seasonal changes.

#### 2.0 TRANSFORMER OIL RELEASE INCIDENTS

### 2.1 2011 TRANSFORMER FAILURE AND OIL RELEASE

Electrical Transformer GSU#1 at the power plant failed at 04:15 am on January 20, 2011, with an explosion and fire. Non-PCB mineral oil in the transformer sprayed onto the transformer containment structure and to the soil outside the containment. The transformer fire suppression system initiated automatically and sprayed water over the transformer. The Fire Department responded and extinguished the fire using water with aqueous fire-fighting foam. The water and foam pooled around the transformer, overflowed the containment, and flowed into adjacent stormwater ditches. The water was contaminated with small amounts

Figure 2 – Transformer Oil Spill Cleanup

of mineral oil. Some oily water reached the stormwater pond. However, PacifiCorp personnel had shutoff the discharge flow from the pond so that no oil contaminated water was discharged from the stormwater pond or from the power plant property.

Cowlitz Clean Sweep (CCS) of Longview, WA was retained for emergency spill response. The contractor arrived the morning of January 20, 2011 as the Fire Department wrapped up their operations. CCS initiated oil spill containment and remained on-site for several weeks for spill cleanup. CCS conducted extensive remediation, followed by sampling of the soil and water from the stormwater ditches, stormwater pond and the area around GSU#1. The contaminated soil and gravel in the ditches and pond were removed by CCS and replaced with clean material. It was necessary to excavate the west side of the transformer containment, in order to pour concrete for a larger foundation and containment structure for the replacement transformer. At this time, the stormwater ditch west of the transformer was replaced with a culvert, and covered by the new concrete containment structure.

A few weeks after the oil spill, the area around GSU#1 (approximately 70 by 80 feet) which was affected by the mineral oil sprayed during the transformer explosion release was remediated by excavating contaminated soil and gravel. Then clean fill was deposited in the excavated area and compacted.

CCS sampled the stormwater ditches, pond banks and around transformer GSU#1 for laboratory analysis to confirm that contaminated soil had been removed. In three locations, the mineral oil level exceeded 4,000 mg/kg. Two of the locations, a ditch and pond bank, further excavation and additional confirmation sampling were necessary and completed. The third location was under the new transformer foundation containment extension and was inaccessible for excavation and re-sampling. This Sample #D8 had a NWTPH-Dx result of 28,100 mg/kg, 20" bgs, sampled in early February 2011. This location had been in the stormwater ditch west of GSU#1.

In early February 2011, PacifiCorp retained KTA Associates Inc. (KTA) of Seattle, Washington, to prepare and coordinate oil spill remediation plans. CCS prepared a Mineral Oil Release Report describing the

response and cleanup activities with detailed information on sampling, lab analysis and waste disposal. The CCS report was included in the PacifiCorp Energy Chehalis Power Plant Transformer GSU#1 Oil Spill Status Report sent to agencies in May 2011. The status report was included in the 2012 CAR as Attachment C.

### 2.2 2013 TRANSFORMER FAILURE AND OIL RELEASE

On November 22, 2013, at 05:20 am, Generation Step Up Transformer #3 (GSU#3) at the power plant experienced an explosive failure and subsequent fire which resulted in a release of non-PCB mineral oil around the transformer and also impacted the stormwater system. The oil spill and cleanup efforts are described in detail in the PacifiCorp Energy Chehalis Power Plant Transformer GSU#3 Oil Spill Cleanup Status Report, February 2014, included in Appendix B of this CAR.

### 2.2.1 Spill Incident

Transformer GSU# 3 failed in a similar manner to GSU#1, resulting in an explosion and fire. The automatic fire suppression

Figure 3 – Stormwater Pond Cleanup after GSU#3 Spill

system controlled the fire, and water filled the concrete transformer containment and overflowed to the surrounding soil and gravel. The stormwater pond discharge valve was closed by Plant Operators immediately after the transformer failure. During this incident, the fire was out before the Fire Department arrived and no fire suppression foam or additional water was required. Water and transformer mineral oil flowed out from the containment across the gravel road to nearby stormwater ditches. Oil reached the stormwater pond, but was not released through the outfall, as the pond level was low due to the dry weather, and stormwater was not being discharged.

### 2.2.2 Spill Response and Cleanup

Cowlitz Clean Sweep (CCS) of Longview, Washington was called for spill response and cleanup and arrived approximately three hours after the incident. Oil absorbent socks and pads had been placed in stormwater ditches and the pond by Plant personnel to contain the spill. CCS initiated response and initial cleanup of the pond and then the transformer containment filled with water and oil.

Oil and water from the transformer containment flowed south and north to the stormwater ditch, east of the turbine building, and west across the road to stormwater ditches. The ditches to the south and west flow into the pond through underground culverts. Due to cold dry weather, the extent of the contamination was simple to observe and contain.

CCS conducted the spill cleanup for four weeks after the incident. Mineral oil and contaminated water were removed from the pond, ditches and transformer containment and stored in tanks on-site. An additional 40,000 gallons of water was treated and disposed to the Plant sanitary sewer under a permit

from the City of Chehalis. Discharge of stormwater from the pond was resumed on December 3, 2013, with Ecology's approval.

After the transformer was replaced, CCS excavated oilcontaminated gravel and soil around the transformer containment, stormwater ditches and pond banks. The soils were removed to a depth below the contamination level or to the compacted clay soil layer approximately 4-5 feet below ground surface. The materials were replaced and the excavated gravel and soils were stored on-site. All the waste oil/water and gravel/soil were removed and CCS completed on-site work on January 9, 2014.

### The CCS Spill Cleanup Report is included in Appendix B, Attachment 3.

### 2.2.3 Soil Cleanup Sampling and Status

After removing the contaminated soil and gravel shortly following the release, CCS conducted confirmation soil sampling of the remaining soil before replacement of the gravel and soil. Forty-five samples were taken throughout the extent of contamination, and the samples were analyzed by Dragon Analytical

Figure 4 – Installation of New GSU#3 with Groundwater Monitoring Culvert

Laboratory in Olympia. The sample locations are shown on the maps in the CCS report in Attachment 3 in Appendix B. Of the 45 samples, only two indicated detectable levels of mineral oil per NWTPH-Dx. The two locations were in stormwater ditches near the pond. The mineral oil concentrations were 128 mg/kg and 76.9 mg/kg. Both values are well under the MTCA A cleanup level for soil of 4,000 kg/mg. The sample analysis results are included in the **CCS Report in Appendix B**, **Attachment 3**.

At the conclusion of the soil excavation during cleanup activities by CCS in January 2014, an oil sheen was observed floating on the perched groundwater layer approximately five feet below ground surface. CCS installed a vertical open slotted culvert on the south side of the transformer containment, near the location where most of the oil/water flowed over the containment wall as shown in Figure 4. The culvert was installed by CCS to a depth just below the bottom of the perched groundwater layer, and some droplets of oil were present on the groundwater surface. Power plant staff inspected the groundwater level declined in the spring until the groundwater until it was no longer detected at five feet depth at the bottom of the culvert. When the groundwater level rose in the fall of 2014, initially a few droplets of oil were observed; but the groundwater surface has been clear of oil since that time.

### 3.0 SITE INVESTIGATION

### 3.1 PREVIOUS SITE INVESTIGATION

Shortly after the GSU#1 oil spill release in January 2011, most contaminated soil and surface water were removed. The extent of groundwater contamination was unknown. Therefore, KTA along with subcontractor, TEC (a respected national environmental consulting firm), conducted a Site investigation to ensure that the extent of contamination remaining on the Site was well understood. A summary of the Site investigation follows.

### 3.1.1 Establishment of Cleanup Standards for the Site

The Site, incorporating areas impacted by the transformer spills, is within the power plant property boundaries. Chehalis Power plans to continue use of the Site and surrounding property for the power plant operations in the foreseeable future. There are no plans to change usage or sell the power plant containing the Site.

Although site-specific cleanup standards can be developed for industrial properties, Chehalis Power and CCS decided to cleanup all contaminated soil and water to Model Toxics Cleanup Act (MTCA) Method A screening levels.

KTA reviewed the appropriate cleanup levels when planning the site investigation and determined that Model Toxics Cleanup Act (MTCA) Method A cleanup levels are appropriate for the Site. Soil and water samples from remediated areas were tested for NWTPH-Dx, as described in Section 2.0. The only hazardous substance detected was mineral oil. Therefore, cleanup levels for mineral oil from MTCA in WAC 173-340-900 are appropriate.

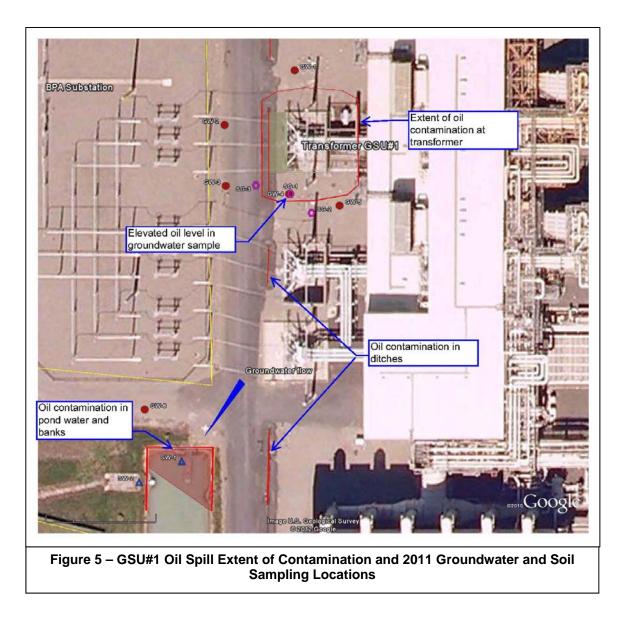

- MTCA A Soil cleanup levels of 4,000 mg/kg for mineral oil in WAC 173-340-900 Table 740-1
- MTCA A Groundwater cleanup levels of 500 µg/l for mineral oil in WAC 173-340-900 Table 740-2.

The point of compliance for the remedial action is at the point of release, the transformer, for soil and groundwater. Therefore, by complying with the cleanup standards at the transformer, there would be no future restrictions for Site use, even though Chehalis Power does not have other uses planned.

### 3.1.2 2011 Investigation Process

The Site Investigation report prepared by TEC was included in Attachment D to the 2012 CAR. Temporary monitoring wells were installed in the shallow water bearing zone within the six boreholes with a track mounted direct-push GeoProbe rig. Four temporary monitoring wells were placed downgradient of the transformer, one up gradient of the transformer, and one directly west from the transformer.

During the boring of the temporary monitoring wells, soil and gravel in the GeoProbe cores were inspected for evidence of oil. A limited oil sheen was detected in only one borehole, GW-4. Subsurface soil samples were collected from the gravel/clay soil interface at three locations (SG-1, SG-2 and SG-3) at or near GW-4 as described in the 2011 investigation report.

The extent of oil contamination from the GSU#1 spill and May 2011 sample locations are shown in Fig. 5.

### 3.1.3 2011 Site Investigation Results

Table 3-1 shows the results and screening levels for the 2011 groundwater samples. Locations near sampling conducted in the subsequent 2013 and 2015 investigations are also identified in Table 3-1. NWTPH-Dx was detected in only one temporary groundwater well, GW-4, at a concentration of 1100 ug/L. This is the temporary well within the transformer explosion spray area and nearest to transformer GSU#1. This concentration exceeds the Model Toxics Control Act (MTCA) Method A cleanup level for mineral oil in groundwater, 500 µg/l. The Concentrations of NWTPH-Dx exceeded the Model Toxics Control Act (MTCA) Method A cleanup level for mineral oil in groundwater, 500 µg/l.

Location Type (proximity to sample locations in later investigations)	Sample ID / Date	Depth To water (feet bgs)	NWTPH-Dx Results (µg/L)	TPH-Dx MTCA A Screening Level (µg/L)
GW Sample	GW-1 05/24/2011	13.56	ND	NA
GW Sample	GW-2 05/24/2011	10.58	ND	NA
GW Sample (near 2013 well MW-3)	GW-3 05/24/2011	13.37	ND	NA
GW Sample (next to 2013 well MW-2)	GW-4 05/24/2011	13.60	1100	500
GW Sample	GW-5 05/24/2011	5.38	ND	NA
GW Sample (near 2015 well MW-5)	GW-6 05/24/2011	13.80	ND	NA

### Table 3-1 Groundwater Sample Results and Screening Levels – May 2011

ND = not detected, NA = not applicable,  $\mu g/l$  = micrograms per liter, Bold = detected value above MTCA screening level

Table 3-2 shows the results and screening levels for the 2011 soil samples. Soil contamination was detected in only one soil sample, SG-1, at a concentration of 160 mg/kg. This is the soil sample nearest to transformer GSU#1 and to GW-4. This concentration does not exceed the Model Toxics Control Act (MTCA) Method A cleanup level for mineral oil in soil, 4,000 mg/kg.

Table 3-2 Soil Sample	Results and Screening	Levels – May 2011
-----------------------	-----------------------	-------------------

Location Type (proximity to sample locations in later investigations)	Sample ID / Date	Depth (inches bgs)	NWTPH-Dx Results (mg/kg)	TPH-Dx MTCA A Screening Level (mg/kg)
Soil (near 2013 SG-2)	SG-1 05/25/2011	~18	160	4,000
Soil (near 2013 SG-2)	SG-2 05/25/2011	~26	ND	NA
Soil (near 2013 SG-1)	SG-3 05/25/2011	~20	ND	NA

ND = not detected, NA = not applicable, mg/kg = milligrams per kilogram

#### 3.1.4 2011 Site Investigation Conclusions

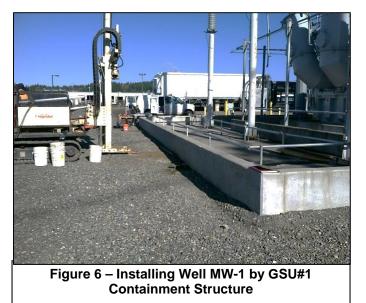

The Site investigation in May 2011 showed no soil, surface water or groundwater samples over MTCA A cleanup level, except one groundwater sample (1100 µg/l). Based on this information, groundwater

contamination impacts appeared to be localized within 50 feet of GSU#1 (and thus within the area sprayed with mineral oil when the transformer failed in January 2011).

One sample, D8, exceeded the MTCA A level of 4,000 mg/kg, at 28,100 mg/kg, as described in Section 2.2.3. This sample was collected by CCS from the ditch west of GSU#1, in February 2011, before the concrete foundation and containment was installed for the new larger replacement transformer. The TEC Site investigation was not able to access the D8 location to obtain a follow-up soil sample under the concrete.

### 3.2 2013 INVESTIGATION

After review of the 2012 CAR and VCP application, Ecology VCP prepared an opinion letter, dated November 20, 2012 on Further Action needed at the Site. The

Ecology VCP **Further Action letter** is included in **Appendix A**. Ecology concluded that most of the soil and groundwater contamination had been cleaned up, but there were two hotspots that would require additional investigation and potential cleanup.

In the fall of 2013, PacifiCorp and KTA followed up with Ecology and proposed further investigation of soil and groundwater near GSU#1 to determine if contamination exceeding MTCA A levels was still present. PacifiCorp, KTA and Ecology VCP staff agreed to investigate soil and groundwater in the two areas and characterize the local groundwater flow to determine if the mineral oil released from GSU#1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits.

### 3.2.1 2013 Investigation Process

KTA along with Cardno (formerly TEC) proceeded to construct, develop and sample three new groundwater monitoring wells at the Site. The well construction and associated well development took place on October 28 and 29, 2013. The groundwater sampling took place on November 1, 2013. The wells, sampling and analytical results are described in Cardno's report, **PacifiCorp Groundwater Investigation**, included in **Appendix C**.

Groundwater monitoring wells were installed in the shallow water bearing zone at two of the three locations. Monitoring well (MW-1) was positioned adjacent to the 2011 soil sample D8 which was collected under the transformer containment structure, as shown in Figure 6. Monitoring well (MW-2) was positioned near a previous groundwater sample location (GW-4). Monitoring well (MW-3) was positioned downgradient from the transformer in a location outside the spill containment area to triangulate groundwater level and flow direction.

Wells were installed at two locations (MW-1 and MW-3) using a track mounted direct-push GeoProbe rig. Monitoring wells were installed in accordance with Washington Administrative Code (WAC 173-160 and -

162), and developed using U.S. Environmental Protection Agency guidelines (US EPA, 1992). Details on the well installation, including boring log details are provided in the Cardno **PacifiCorp Groundwater Investigation** report in **Appendix C.** Only two of the groundwater monitoring wells were installed. This was due to encountering utilities during the construction of MW-2. After reaching the targeted depth of 30-feet below grade surface at soil boring #2 (SB-2), and collecting a soil sample, the GeoProbe sampling rods and core unit were removed from the boring. A small piece of HDPE plastic material, similar to material used for fire water supply pipe coating was found—excavation determined the well location was adjacent to a fire water supply line. However, prior to excavation, water was present in the borehole, and a groundwater grab sample was collected directly from the casing rods via the same methodology as the other site wells.

Samples of subsurface soil were collected during GeoProbe drilling activities at MW-1, SB-2 and MW-3. Material was collected continuously in five foot intervals. Each core sample was inspected visually for evidence of oil sheen, including wetting dry soil/gravel with clean water. Stainless steel spoons were used to collect material from the core samples at desired depths. Soil sample material was placed into stainless steel bowls and thoroughly homogenized prior to being placed directly into pre-labeled analytical jars. Soil and groundwater samples were analyzed by ARI Laboratories in Tukwila.

The 2013 investigation well construction information, groundwater sampling results and soil sampling are presented in Table 3-3 and Table 3-4.

### 3.2.2 2013 Site Investigation Conclusions

NWTPH-Dx was detected at location MW-2 at a concentration of 380  $\mu$ g/L, which is below the MTCA Method A cleanup level of 500  $\mu$ g/L for groundwater. As previously described, the NWTPH-Dx concentration in GW-4 in 2011 in the same location was 1100  $\mu$ g/L. This reduction suggests that natural processes are present resulting in a significant reduction of contamination over the 2.5-year period between sampling events.

None of the soil samples collected as part of the 2013 well installations had detectable levels of NWTPH-Dx. Monitoring well MW-1 was located as close as practical to 2011 soil sample D8 which had higher mineral oil levels. Sample SB-1 was collected from the borings of well MW-1, which is located four feet west of the 2011 soil sample D8, collected by CCS from the stormwater ditch before installation of the new transformer foundation and concrete containment extension. Therefore, no mineral oil was detected in the soil four feet from the location of sample D8.

### 3.3 2015 INVESTIGATION

The November 22, 2013 GSU#3 transformer failure and oil spill occurred shortly after the initial phase of the Cardno investigation was completed in 2013. Further sampling plans for the two wells MW-1 and MW-3 were suspended so a comprehensive investigation program could be developed for the 2011 GSU#1 and 2013 GSU#3 transformer oil spills. As described previously in Section 2.2, CCS conducted extensive sampling of the contaminated area in January 2014 to confirm that all soil contamination was cleaned up.

In February 2015, PacifiCorp and KTA met with Ecology VCP staff to review plans for installing new groundwater wells to supplement the existing wells around GSU#1. It was proposed to install three new

wells, near GSU#3 and downgradient for groundwater for both spill locations. The primary objective of the investigation was to determine if any residual impacts from mineral oil exposure exists in the subsurface soil and shallow groundwater in concentrations above Ecology's Model Toxics Control Act (MTCA) regulatory limits. In addition, the wells were located to provide characterization of the groundwater levels and flow direction.

The extent of mineral oil contamination and locations of the wells for the 2013 and 2015 investigations are shown in Figure 7.

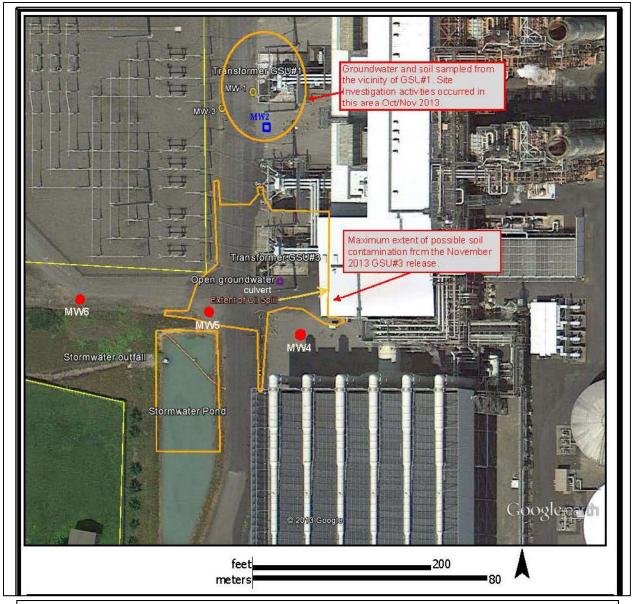

Figure 7 – GSU#3 Oil Spill Extent of Contamination and 2013-2015 Groundwater and Soil Sampling Locations

### 3.3.1 2015 Investigation Process

KTA along with their subcontractors Cardno and Clear Water Services conducted a groundwater investigation that included an assessment of potential impacts to subsurface soil and shallow groundwater within certain Site areas previously exposed to mineral oil releases in 2011 and 2013 at the power plant.

This project was divided into two main phases. The first phase includes monitoring well installation, in conjunction with various support tasks, as shown in Figure 8. The outcome of soil boring, subsurface soil sampling, monitoring well installation activities and associated environmental sampling

Figure 8 – Installing Well MW-5 by Pond

results are included within the **Monitoring Well Installation and Support Tasks Report** included in **Appendix D**. All field efforts for this first project phase were conducted between March 2015 and April, 2015.

The second phase of the project involves groundwater monitoring, which was conducted on a predetermined, scheduled basis (e.g. quarterly; April, June-Sept, December 2015 and March 2016). The groundwater monitoring process and results are described in the Cardno and Clear Water Services **Groundwater Monitoring Reports** in **Appendices E, F G, and H.** 

### 3.3.2 2015 Groundwater Elevation Measurements

A (relative) elevation survey of the monitoring well casings was conducted on April 15, 2016 to aid in the determination of groundwater flow direction.

Prior to sample collection, each monitoring well was opened allowed to equilibrate to the current ambient air pressure. An electronic interface probe was used to check for the presence/thickness of any accumulated free-phase hydrocarbon product and to measure the distance from the top edge of the PVC well casing to the surface of the water table (static water level) within each monitoring well. No hydrocarbon product was detected (to a minimum thickness of 0.01') at any of the wells.

The southwest corner of the GSU#1 transformer concrete containment wall was assigned an elevation of 100.00 feet above mean-sea level (amsl). A level survey was conducted to accurately determine the elevation of each monitoring well casing, using the assigned elevation of the GSU#1 containment wall corner as a benchmark. Water level measurements were subtracted from their well casing elevations to calculate (relative) elevation of the groundwater table beneath each well location. Site groundwater elevations were highest at MW-1 and lowest at MW-6. The initial well level results are included in the **Monitoring Well Installation and Support Tasks Report** included in **Appendix D**. The summary of the groundwater levels and flow direction assessment for all of the quarterly sampling events, results are described in Section 3.4.3

### 3.3.3 2015 Electrical Vault In-Flow Water Sampling

It was noted during a site visit in March, 2015 that the electrical utility vaults in the areas adjacent to GSU#1 and GSU#3, and areas in between, were at least partially filled with inflowing stormwater infiltration and groundwater that filled the utility trenches leading to these vaults. Water was seen freely flowing into several of these vaults as they were opened during the utility locating event.

The system of electrical vaults are equipped with submersible pumps to remove the in-flow water. Several of the vaults are connected to other vaults. In turn, pumps at certain vaults are connected to piping that discharges to the main stormwater drainage ditches running along the western boundary of the GSUs. Plant operators check the ditches and stormwater pond daily, and have not observed oil discharged into the ditches with the vault water. However, pumping out the in-flow water from the vaults is a potential mechanism for removal of any residual groundwater oil contamination since the oil spill cleanup.

The water inflow to the electrical vaults may have been impacted by the mineral oil releases from GSU#3 and GSU#1. Discussion about this water inflow was conducted between the representatives of PacifiCorp, KTA and Cardno, resulting in a decision to collect and analyze water samples from select vaults. Four electrical vault in-flow water samples were submitted to the laboratory for Mineral Oil analysis via NWTPH-Dx. Results were reported as Diesel Range Organics (DRO), Mineral Oil and Motor Oil (residual range organics or RRO). Low levels of diesel range and mineral oil were measured in the accumulated in-flow water of two vaults. The sampling conducted on April 8, 2015, and analysis results are described in Sections 3.4 and 4.3 of the Monitoring Well Installation and Support Tasks Report included in Appendix D.

### 3.4 2013 AND 2015 INVESTIGATION RESULTS

### 3.4.1 Subsurface Soil Sample Results

For assessment of subsurface soil samples, project analytical data are compared to values listed for MTCA Method A Cleanup Levels for Unrestricted Land Uses (WAC 173-340-740). Under this method mineral oil concentrations of 4,000 mg/Kg or less are acceptable (see parameter table listed under WAC 173-340-900).

Three subsurface and one duplicate (duplicate of SB-4) soil samples were submitted to ARI Laboratory in Tukwila, WA, for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Motor Oil (residual range organics or RRO). DRO quantitation was noted on chromatograph peaks in the range from Cl2 to C24. Mineral Oil quantitation was noted on chromatograph peaks in the range from Cl6 to C28. RRO quantitation was noted on chromatograph peaks in the DRO/RRO results indicate the total diesel range extended identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

Mineral Oil was detected in one sample, SB-5. It was detected at a concentration of 6.7 mg/Kg. The sample from SB-5 was collected at a depth of five feet bgs on the north side of the pond, which is within the extent of contamination shown in Figure 7.

The soil sampling results, for both the 2013 and 2015 investigations are presented in Table 3-3.

Sample ID Date	Depth Feet bgs	Parameter	Detection Limit mg/Kg	Reporting Limit mg/Kg	Result Value mg/Kg	TPH-Dx MTCA A Screening Level (mg/kg)
SB-1 10/28/13	5	DRO		32	ND	NA
SB-1 10/28/13	5	RRO		130	ND	NA
SB-2 10/28/13	6	DRO		30	ND	NA
SB-2 10/28/13	6	RRO		120	ND	NA
SB-3 10/29/13	5	DRO		32	ND	NA
SB-3 10/29/13	5	RRO		130	ND	NA
SB-4 04/07/15	5	DRO	1.8	6.8	ND	NA
SB-4 04/07/15	5	Mineral Oil	0	14	ND	NA
SB-4 04/07/15	5	RRO	0	14	ND	NA
SB-5 04/08/15	5	DRO	1.7	6.2	6.7	4,000
SB-5 04/08/15	5	Mineral Oil	0	12	ND	NA
SB-5 04/08/15	5	RRO	0	12	ND	NA
SB-6 04/08/15	5	DRO	1.7	6.3	ND	NA
SB-6 04/08/15	5	Mineral Oil	0	13	ND	NA
SB-6 04/08/15	5	RRO	0	13	13	NA

### Table 3-3 – Soil Sampling Results 2013-2016

ND = Non-detect NA = Not Applicable

#### 3.4.2 Groundwater Sample Results

The 2013 investigation included one set of groundwater samples from three wells, MW-1, MW-2, and MW3. As explained previously, it was not possible to install a well at MW-2, but a groundwater sample was taken from the borehole. The 2013 groundwater sampling results are shown in Table 3-4. NWTPH-

Dx was detected at location MW-2 at a concentration of 380  $\mu$ g/L, which is below the MTCA Method A cleanup level of 500  $\mu$ g/L for groundwater.

For the four quarterly sampling events during the period April 2015 to March, 2016, five groundwater samples, along with one duplicate were submitted to ARI Laboratory for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Residual Range Organics (RRO) / heavy fuel oil / motor oil. DRO quantitation would be noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation would be noted on chromatograph peaks in the range from C16 to C34. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results would indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

There were no reportable detections of DRO, RRO or Mineral Oil at any of the tested well locations, during the 2015 four quarterly groundwater sampling events.

The groundwater monitoring well sampling results for 2013 and 2015-2016 are presented in Table 3-4.

Sample ID	Parameter	Detection Limit µg/L	Reporting Limit µg/L	11/1/13 Result Value µg/L*	4/15/15 Result Value µg/L	7/9/15 Result Value µg/L	12/16/15 Result Value μg/L	3/22/16 Result Value µg/L

Data Qualifiers: U = non-detect; Y = the chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

#### 3.4.3 Groundwater Levels and Flow Direction Assessment

As described in Section 3.3.2, the groundwater level evaluation was conducted for each of the quarterly sampling events, April 2015 to March 2016.

Table 3-5 lists the well casing elevations, depth to product, static water level measurements and groundwater elevations calculated for each quarterly event.

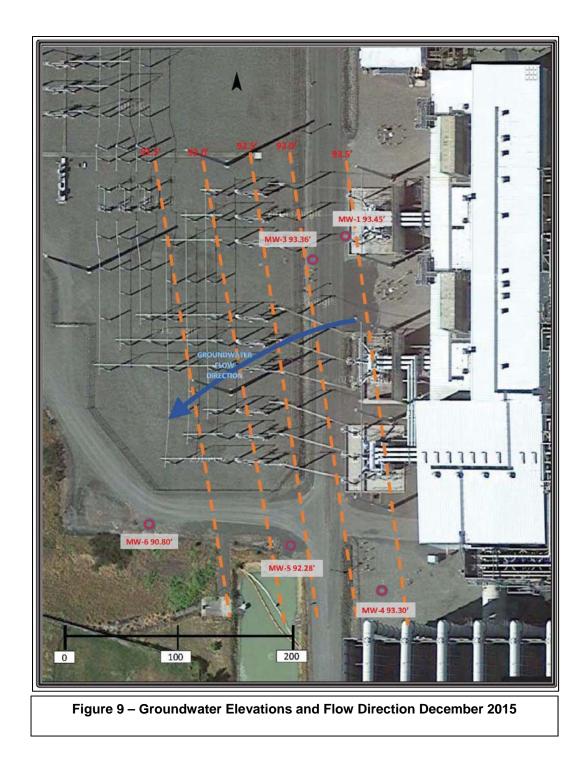

Groundwater elevation contours were constructed and the flow direction was assessed. In each sampling rounds, groundwater was noted to flow from east to southwest. A steepening gradient was noted toward the northern end and more even contour spacing was noted toward the southern end of the site. As seen in each sampling round the groundwater table is deflected southwesterly, flowing towards a small stream basin offsite in the same direction. Figure 9 shows the generalized groundwater flow direction along with the elevation contours for the 3<sup>rd</sup> sample event in December 2015, which reflects the time of year when the GSU#1 and GSU#3 spill occurred.

There are variations between each groundwater flow direction for each quarterly evaluation; flow direction diagrams are included in the Cardno and Clear Water Services **Groundwater Monitoring Reports** in **Appendices E, F G, and H.**

Table 3-5 - Water Level Measurements and Groundwater Elevations

<sup>1</sup>Relative survey elevations were measured from the top of the PVC casing at each monitoring well. The survey control point (SW corner of GSU#1 containment wall) was assigned an elevation of 100.00 ft above mean sea level (amsl).

# 4.0 REMEDIAL ACTION EVALUATION

# 4.1 SITE CLEANUP ALTERNATIVES

After the two transformer oil spills occurred and initial response and containment were completed, PacifiCorp directed CCS to remove contaminated soil, surface water and groundwater. The other alternative at the time would have been to wait for a Site investigation to define the extent of contamination before planning the remedial action; however, prompt replacement of the transformer was necessary for power plant operation. After the replacement of each transformer, in February 2011 and January 2014, were completed and the power plant operation restored, PacifiCorp, with CCS and KTA, decided to remediate the remaining mineral oil contaminated soil by excavation vertically and laterally at the Site.

Following the completion of these efforts, based on the sampling results after the bulk of the soil and surface water removal occurred, PacifiCorp decided to conduct more detailed sampling and analysis to determine whether further action was necessary.

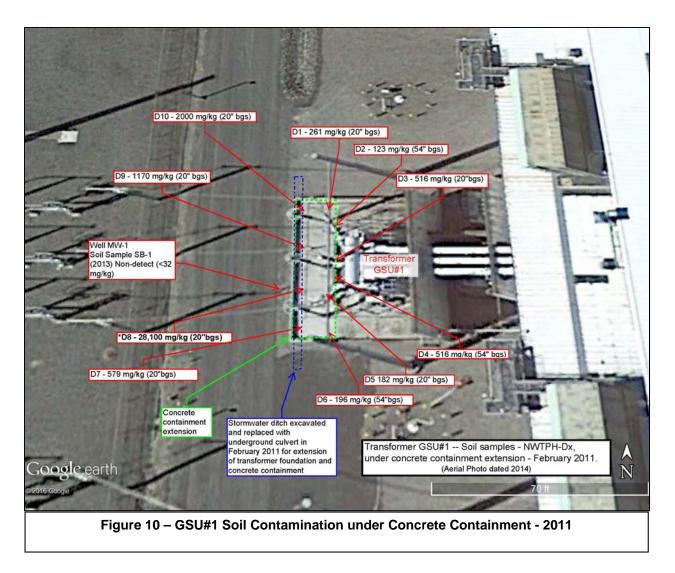

# 4.2 EVALUATION OF COMPLETED REMEDIAL ACTION

For both transformer oil spills, the oil-contaminated surface water in the stormwater ditches and stormwater pond had been removed for disposal. The ditch and pond banks were remediated by removing contaminated soil/gravel and replacing the soil and gravel.

Around Transformer GSU#1 and Transformer GSU#3, oil contamination of the Site was more extensive from the oil sprayed during the transformer explosion. The contaminated soil/gravel was removed and replaced to a point 4-6 inches below evidence of oil contamination. In 2011, oil was removed from the surface of the groundwater and a large volume of groundwater was removed during repair and expansion of the transformer foundation and containment. In 2013-4, the groundwater level was lower than 2011, due to dry cold weather and it appeared that there was minimal groundwater contamination because the groundwater level was below the level of contaminated soil. A vertical slotted culvert was installed to visually monitor groundwater at the location where oil contaminated fire suppression water had flowed over the concrete containment wall. Oil sheen and droplets on the groundwater were observed initially, but dissipated over a few months.

The approach to confirmation sampling for the transformer area, stormwater ditches and pond banks was to sample the soil systematically in contaminated areas. CCS conducted extensive sampling in locations shown in the PacifiCorp Energy Chehalis Power Plant Transformer GSU#1 Oil Spill Status Report, May 2011 in the 2012 CAR, Attachment C, and in the **PacifiCorp Energy Chehalis Power Plant Transformer GSU#3 Oil Spill Cleanup Status Report, February 2014,** included in **Appendix B** of this CAR.

In one location for the 2011 confirmation sampling for the GSU#1 spill, the mineral oil level exceeded 4,000 mg/kg. The hot spot identified in the confirmation sampling in early February 2011 is located beneath the transformer foundation/containment extension installed after sampling. It is therefore inaccessible for further sampling or remediation. Sample D8 showed 28,100 mg/kg mineral oil. The sample location was 20 inches bgs and is now covered by concrete. The hot spot is small and localized; the samples at locations four to five feet away showed NWTPH-Dx levels less than half the MTCA A level of 4,000 mg/kg. The location of the soil samples are shown in Figure 10.

Site investigation in May 2011, conducted both up gradient and down gradient from Transformer GSU#1, showed no soil, surface water, or groundwater samples over MTCA A cleanup levels, except one (GW-4, 1100  $\mu$ g/l) near transformer GSU#1, within the Site area directly affected by the spray of oil during the explosion. Therefore, the groundwater impacts were localized, within 50 feet of the transformer, and the mineral oil level in the groundwater was moderately low.

The follow up investigation in October 2013 included groundwater sampling at the same location of GW-4. The NWTPH-Dx level of the groundwater (MW-2) was determined to be 380  $\mu$ g/l levels, which is below the MTCA A level of 500  $\mu$ g/l. As described previously, a permanent groundwater monitoring well could not be installed at MW-2.

After the GSU#3 oil spill and cleanup, a comprehensive investigation was planned with five groundwater monitoring wells for residual contamination from the GSU#1 and GSU#3 spills. The groundwater monitoring wells were sampled from April 2015 to March 2016--none of the five wells had detectable levels of mineral oil, or DRO and RRO. Groundwater elevations and flow direction data collected over the

one-year period show a general flow direction to the southwest. In conclusion, groundwater at the Site including the two transformer spills is significantly below the MTCA A level of 500  $\mu$ g/l.

There are no direct results from the location of Sample D8 under the concrete on the west side of Transformer GSU#1 after the installation of that concrete pad. The soil boring SB-1 in October 2013, located approximately four feet from D8, showed no evidence of oil contamination, and the soil sample SB-1 was non-detect for NWTPH-Dx. The soil contamination has not impacted groundwater, as the adjacent monitoring well MW-1 showed no oil contamination in groundwater sampling in November 2013 and April 2015 to March 2016.

# 4.3 NEED FOR ADDITIONAL REMEDIAL ACTION

The confirmation sampling by CCS in February 2011 for GSU#1 spill and in January 2014 for the GSU#3 spill have demonstrated that the cleanup and remedial actions for the transformer mineral oil spills were successful. Further site investigation in May 2011, October 2013 and April 2015 to March 2016 have confirmed that the soil and groundwater cleanup has been successful. Groundwater monitoring for four quarters over one year, April 2015 to March 2016, showed all sampling results for five wells had non-detectable readings for oil, significantly below the MTCA A level of 500  $\mu$ g/l for mineral oil. The groundwater flow direction evaluation showed that groundwater flows to the southwest in the area of the Site. Therefore, it is highly unlikely that a plume of mineral oil contamination from the transformer oil spills would not have been detected by monitoring the five wells.

There may be a small quantity of oil contaminated soil directly beneath the transformer GSU#1 concrete containment structure 2011 extension. One soil sample of ten, now beneath the new transformer concrete containment structure, exceeded the MTCA Method A level for soil (D8 – 28,100 mg/kg) in 2011 as shown in Figure 10. The sample was obtained prior to the placement of the containment structure and the sample results were received following the placement of the containment structure. This timing resulted due to an urgent need to replace the transformer so that the plant could resume operation. As stated above, soil directly adjacent to the containment structure was later removed resulting in no exceedances of MTCA Method A levels for soil around the transformer. Based on this finding, and the 2013 soil sample SB-1 and monitoring at well MW-1 adjacent to the D8 location showing no detectable oil in the groundwater, no further remedial action is recommended for any remaining mineral oil contamination beneath containment structure.

Extensive confirmation soil sampling after the transformer oil spills demonstrated that the mineral oil cleanup to MTCA Method A levels was successful. During the period 2011 to 2016, three site investigations of soil and groundwater impacts, including four consecutive quarterly samples, has shown that groundwater near the spill locations and downgradient have non-detectable levels of mineral oil, significantly below exceed MTCA Method A levels. A determination opinion of No Further Action is supported and recommended.

# 4.4 TERRESTRIAL ECOLOGICAL EVALUATION

Under MTCA, a terrestrial ecological evaluation is necessary for releases of hazardous substances. However, the Site may be excluded from further evaluation if the Site meets the criteria in WAC 173-340-7491. The Site qualifies for the exclusion because the soil contamination has been cleaned up. In addition, the power plant is covered with a graded gravel surface over the industrial areas. The applicable exclusion is Barriers to Exposure; WAC 173-340-7491(1)(b), "All contaminated soil, is or will be covered by physical barriers (such as buildings or paved roads) that prevent exposure to plants and wildlife, and institutional controls are used to manage remaining contamination." The Terrestrial Ecological Evaluation Form was completed for the August 2012 CAR and continues to be applicable to this CAR.

# 5.0 CONCLUSIONS

As demonstrated in this Cleanup Action Report, PacifiCorp acted quickly to clean up two transformer oil spills in January 2011 and November 2013, which contaminated an extended area due to fire suppression water used for the transformer explosion and fire overflowing the containment. Soil and surface water were remediated after both spill incidents by CCS with confirmation sampling. Investigations of residual soil and groundwater contamination impacts were conducted in 2011, 2013 and 2015. In March 2016, the fourth quarterly set of samples of five wells showed no detections of mineral oil in the groundwater.

The confirmation sampling and site investigation indicated that no further action was necessary beyond the initial responses taken by CCS. Therefore, PacifiCorp recommends that a No Further Action opinion be granted to the Site through the Voluntary Cleanup Program.

# CHEHALIS POWER PLANT

#### Re: Further Action at the following Site:

- Site Name: Chehalis Power LP Generation Facility •
- Site Address: 1813 Bishop Road
- Facility/Site No.: 3336951
- Cleanup Site ID No.: 11776
- VCP Project No.: SW1246

Dear Mr. Sanchez:

S S The Washington State Department of Ecology (Ecology) received your request for an opinion on your independent cleanup of the Chehalis Power LP Generation Facility (Site). This letter provides our opinion. We are providing this opinion under the authority of the Model Toxics Control Act (MTCA), Chapter 70.105D RCW.

# **Issue Presented and Opinion**

Is further remedial action necessary to clean up contamination at the Site?

# YES. Ecology has determined that further remedial action is necessary to clean up contamination at the Site.

This opinion is based on an analysis of whether the remedial action meets the substantive requirements of MTCA, Chapter 70.105D RCW, and its implementing regulations, Chapter 173-340 WAC (collectively "substantive requirements of MTCA"). The analysis is provided below.

# **Description of the Site**

This opinion applies only to the Site described below. The Site is defined by the nature and extent of contamination associated with the following release:

Petroleum hydrocarbons and related constituents into the Soil, Groundwater, and Surface Water.

**Enclosure A** includes a detailed description and diagram of the Site, as currently known to Ecology.

Please note the parcels of real property can be affected by multiple sites. At this time, we have no information that the parcel(s) associated with this Site are affected by other sites.

# **Basis for the Opinion**

This opinion is based on the information contained in the following documents:

- 1. URS Corporation, Geotechnical Data Report-Subsurface Investigation Proposed Chehalis Generation Facility, Lewis County, Washington. September 13, 2000.
- 2. Cowlitz Clean Sweep, Inc., Chehalis Power Pacific Corp. Energy Mineral Oil Release (Initial Spill Cleanup Report), January 20, 2011.
- 3. PacificCorp Energy, Pacific Energy Chehalis Power Plant Transformer GSU#1 Oil Spill Status Report, April 29, 2011.

- 6. KTA Associates, Inc., Cleanup Action Report for Chehalis Power Plant Generator Stepup Transformer No.1 (GSU #1) Oil Spill, August 2012.
- 7. PacifiCorp Energy, PacifiCorp Energy Chehalis Power Plant Voluntary Cleanup Program Application, August 10, 2012.
- 8. Email communications with Mr. Patrick Sanchez, the Environmental Analyst of Chehalis Power Plant, with regard to clarifications on cleanup activities. October 23-31, 2012.
- 9. Ecology Industrial Stormwater Discharge Permit (WAR0087807) monitoring data for Chehalis Power Generation Facility, April 2011 to April 2012.

Those documents are kept in the Central Files of the Southwest Regional Office of Ecology (SWRO) for review by appointment only. You can make an appointment by calling the SWRO resource contact at (360) 407-6365.

This opinion is void if any of the information contained in those documents is materially false or misleading.

# Analysis of the Cleanup

Ecology has concluded that **further remedial action** is necessary to clean up contamination at the Site. That conclusion is based on the following analysis:

### 1. Characterization of the Site.

Ecology has determined your characterization of the Site is sufficient to establish cleanup standards and select a cleanup action. The Site is described above and in **Enclosure A**.

The Chehalis Power LP Generation Facility Site is located at 1813 Bishop Road, Chehalis, Lewis County, in the Chehalis River Valley. The Site is a 20-acre, level grade property occupied by a power generation facility. The facility also includes two 1.7 million gallon fuel oil aboveground storage tanks (ASTs) in a lined earthen containment. A stormwater collection ditch surrounds the facility to collect stormwater from the facility's graveled lot, and conveys the water to a stormwater pond located at the west side of the facility. The ditch is lined with gravel, and some segments are covered, galvanized pipes. The stormwater pond has a permitted outfall under Ecology's Industrial General Stormwater Permit (WAR008707) under the National Pollutant Discharge Elimination System (NPDES).

At 4:15am on January 20, 2011, a Generation Step Up transformer (GSU #1) containing non-Polychlorinated Biphenyls (PCB) mineral oil experienced an explosive failure and subsequent fire. An estimated 2000 gallons of the 11,000 gallons of mineral oil in the transformer sprayed onto the transformer containment structure and onto the soil outside the containment. The transformer suppression system initiated automatically and sprayed water over the transformer. The Fire Department responded and extinguished the fire using water and aqueous fire-fighting foam, which added significant amount of water to the Site.

During the fire fighting operations, the containment around GSU #1 was filled beyond capacity causing the spilled mineral oil to flow over the top. The mixture of oil, oil-contaminated water, and foam saturated the fill gravel and soil surrounding the containment and pooled around the transformer, and further flowed into the adjacent stormwater ditches. The oil-contaminated water reached the stormwater pond yet no water was discharged from the pond because the on duty staff was able to shut off the discharge outfall.

Cleanup effort was started subsequently by a spill response company, Cowlitz Clean Sweep (CCS), right after the fire was extinguished about two hours following the incident (see Section 4 of this letter for details).

Due to the emergency nature of the spill and contamination, cleanup was conducted without pre-cleanup characterization for any contaminated media (soil, groundwater, and

> surface water), rather, samples were collected after various cleanup efforts for confirmation purposes. Several months after the cleanup activities, a Site investigation was conducted to evaluate the status of groundwater contamination.

Based on a review of Site investigations and other available file information as well as the confirmation soil sampling during interim cleanup activities, Ecology has determined the investigations were sufficient to characterize the Site for soil, groundwater, and surface water for their extent and degree of contamination, and summarized as follows.

- 1. Stormwater Pond and Ditches: The stormwater pond and ditches were cleaned up through oil skimming, pumping, and soil excavation. Contaminated water was pumped into an AST for temporary storage (see Section 4 of this letter for details). A total of 23 soil samples were collected from the stormwater ditches on January 27, 2011, and 12 soil samples were collected from the stormwater pond on February 4, 2011 after the cleanup effort. Soil analysis results indicated that one location in the stormwater ditch and one location in the stormwater pond detected concentrations above the MTCA cleanup level for mineral oil. Additional excavation was conducted at these locations and two more confirmation samples, one each from stormwater ditch and pond, were collected on March 2, 2011, and the results met the MTCA Method A cleanup level for soil. One water sample from the stormwater pond also indicated that the stormwater in the pond met MTCA Method A cleanup level (Note: no surface water criteria exists for mineral oil, so the data were compared against MTCA Method A cleanup levels for groundwater). Since the stormwater system is permitted through Ecology's Industrial Stormwater NPDES Permit (WAR008707), the subsequent required quarterly monitoring indicated that the stormwater met the permit limitations and met the MTCA Method A cleanup level. The characterization of the stormwater system (water, bank liners and soil) was sufficient.
- 2. Soil Around GSU #1: Three separate confirmation soil sampling efforts were conducted to evaluate the cleanup of soil contamination surrounding the GSU#1 (see Fig. 3 of Enclosure A), and the results demonstrated that soil contamination still exists in a limited area under the extension portion of the newly enlarged GSU#1 containment structure.

After the spill incident, soil in the stormwater ditch segment immediately to the west of the GSU#1 containment structure was excavated in an effort to remediate the soil. Soil from the closest locations possible to the footing on the west side of the containment was also excavated in a limited extent. Six soil samples collected (January 28, 2011) detected no mineral oil above the MTCA Method A cleanup level. Second set of confirmation soil samples were collected on February 5, 2011, including one each from the three footing pits at 4.5 feet below ground surface (bgs) prior to the concrete footings being poured, and seven from the rest of the area, which was excavated to 20 inches bgs and to be covered by the extension of the containment. Out of the ten samples collected, only one soil sample (#D8) collected at 20 inches bgs detected mineral oil at 28,100 milligram per kilogram (mg/kg), exceeding the MTCA Method A cleanup level. The results came back after the concrete containment was completed because replacing the transformer was urgently needed so that the plant could resume operation. As such, no further excavation was conducted to the soil directly beneath the new containment structure, and contaminated soil remains and is now covered by the concrete containment. The containment extension is 14 feet wide in east-west direction and 51 feet long in south-north direction.

One month after the spill incident and after the completion of the new containment structure, soil surrounding the enlarged GSU#1 containment structure, in an area approximately 70 by 80 feet in dimension, was excavated to approximately 6 inches below the static groundwater table. Free product was present and absorbents were deployed in the excavated area to remove it. Confirmation soil samples were collected on February 21–22, 2011 from the saturated zone at the excavation bottom. The results indicated that the soil was either non-detect for mineral oil, or detected mineral oil at levels that were below the MTCA Method A cleanup level.

The soil cleanup and confirmation sampling demonstrated that no soil contamination went beyond the extent of the 70 foot by 80 foot area surrounding the GSU#1 containment. However, soil contamination remains in the area now covered under the extended portion of the enlarged GSU#1 containment structure. The sample from 20 inches bgs detected mineral oil at 28,100 mg/kg, which exceeded the MTCA Method A cleanup level.

3. Groundwater: Free product was observed and absorbents were used to remove free product in the area surrounding the enlarged GSU#1 containment, which confirmed the contamination of groundwater. Unknown amount of contaminated groundwater was pumped into the AST on Site for temporary storage but no groundwater samples were collected from excavation pits.

A Site investigation focused on groundwater was conducted in July 2012, several months after the soil excavation. Temporary wells were installed using a track mounted direct-push GeoProbe® rig. Five of the six wells were located down gradient of the transformer and one was located upgradient. The wells were screened from 5 to 15 feet bgs. Groundwater samples were collected from all six wells. One well (GW-4) detected diesel-range total petroleum hydrocarbon (TPH-Dx) at 1,100 microgram per liter (ug/L), which exceeded the MTCA Method A cleanup level of 500 ug/L. Other wells detected TPH-Dx at lower than the MTCA Method A cleanup level, or non-detect for TPH-Dx. With only one out of six wells detected mineral oil, at a location close to GSU#1, the groundwater contamination plume was sufficiently defined.

Ecology has the following additional comment:

In accordance with WAC 173-340-840(5) and Ecology Toxics Cleanup Program Policy 840 (Data Submittal Requirements), data generated for Independent Remedial Actions shall be submitted simultaneously in both a written and electronic format. For additional information regarding electronic format requirements, see the website http://www.ecy.wa.gov/eim. Be advised that according to the policy, any reports containing sampling data that are submitted for Ecology review are considered incomplete until the electronic data has been entered. Please ensure that data generated during on-site activities is submitted pursuant to this policy. **Data must be submitted to Ecology in this format for Ecology to issue a No Further Action determination.** Please be sure to submit all data in this format. Data collected prior to August 2005 (effective date of this policy) is not required to be submitted; however, you are encouraged to do so if it is available. Be advised that Ecology requires up to two weeks to process the data once it is received.

# 2. Establishment of cleanup standards.

Ecology has determined the cleanup levels and points of compliance you established for the Site meet the substantive requirements of MTCA.

MTCA Method A cleanup levels for soil and groundwater were used for the Site. Since no surface water criteria exists for mineral oil, the Method A cleanup level for groundwater was used to determine compliance in surface water. Standard points of compliance were used for the Site. The point of compliance for protection of groundwater was established in the soils throughout the Site. For soil cleanup levels based on human exposure via direct contact or other exposure pathways where contact with the soil is required to complete the pathway, the point of compliance was established in the soils throughout the Site from the ground surface to 15 bgs. In addition, the point of compliance for the groundwater was established throughout the Site from the uppermost level of the saturated zone extending vertically to the lower most depth that could potentially be affected by the Site.

# 3. Selection of cleanup action.

Ecology has determined the cleanup actions you selected for the Site have not met the substantive requirements of MTCA.

Cleanup actions selected included source removal (removal of spilled mineral oil on Site and migrated free product in stormwater pond, ditches and surface of groundwater table); contaminated soil excavation; and pumping and discharge of contaminated surface and groundwater. The discharge of the contaminated water and surface water was through a tank storage and was run through an oil/water separator. These cleanup actions did not

complete the contaminated soil and groundwater cleanup (please refer to Section 4 of this letter for details).

# 4. Cleanup.

Ecology has determined the cleanup you performed has not met the cleanup standards at the Site. The cleanup activities conducted so far at the Site included:

- 1. Stormwater pond and ditches cleanup:
  - Free product removal: containment boom was deployed to limit the migration of mineral oil in the stormwater pond. Absorbents were also deployed. Oil skimmer was used along with a vacuum truck to remove the oil from the pond surface. The same oil skimming process was employed to collect free product from the open channel segments of the stormwater ditches and the skimmed oil was also loaded into the vacuum truck.
  - Contaminated water cleanup and temporary storage: After the oil on the surface of the stormwater pond was cleaned, uncontaminated excess stormwater was pumped into the lined earthen containment for the two 1.7-million-gallon fuel oil ASTs for temporary storage to avoid stormwater pond overflow. The AST's containment area is a large bermed area, lined with heavy gauge vinyl material with a total capacity of 2 times 1.7 million gallons plus 10% of the AST's capacity. The pump was stopped when water was about 12 inches deep in the containment.

The potentially contaminated water from the stormwater pond, however, was pumped into one of the two empty 1.7-million-gallon ASTs for temporary storage (see Bullet #4 within this section for its disposal).

- Soil excavation and cleanup: Soil and line gravel along the bank of the stormwater pond and along the stormwater ditches were visually inspected and those impacted by the oil were excavated to approximate depth of 6 to 8 inches on average. One area of the pond was excavated to a lower extent due to a little tree at the location and a confirmation soil sample indicating higher than MTCA cleanup level concentration of mineral oil. Additional excavation was also conducted at an area of the stormwater ditch where higher than MTCA cleanup level contamination was identified after the first round of soil samples were analyzed. All the excavated fill rock and soil was loaded into dump trucks for subsequent disposal.
- 2. Soil cleanup around GSU#1:
  - Soil cleanup at area covered by the newly enlarged GSU#1 containment: After the spill incident, soil in a stormwater ditch segment immediately to the west of the GSU#1 containment structure was excavated in an effort to remediate the soil.

Soil from the closest locations possible to the footing on the west side of the containment was also excavated in a limited extent to construct an enlarged containment for the GSU#1. Soil was removed to 4.5 feet in three footing pits, and to 20 inches beneath the rest of the extended portion of the enlarged containment. Even though one of seven soil samples collected at 20 inches bgs detected mineral oil at level of 28,100 mg/kg, exceeding the MTCA cleanup level, no further cleanup action was conducted at this location because the results came back after the concrete containment was completed due to an urgent need to replace the transformer so that the plant could resume operation. As such, the soil directly beneath the new containment structure still contains contaminated soil and may be not feasible for further excavation. The area covered by the containment extension was 14 feet wide in east-west direction and 51 feet long in south-north direction.

- Soil cleanup in area surrounding the newly enlarged GSU#1 containment: One month after the spill incident, after the completion of the new containment structure, soil affected by the transformer oil release, approximately 70 by 80 feet in dimension surrounding the new GSU#1 containment structure, was excavated to approximately 6 inches below the static groundwater table. Confirmation soil samples collected (February 21–22, 2011) from the saturated zone at the excavation bottom indicated that the soil was either non-detect for mineral oil, or detected mineral oil at levels that were below MTCA cleanup level.
- 3. Groundwater cleanup around GSU#1:
  - Groundwater cleanup in area surrounding the GSU#1 containment: Free product
    was removed from the surface of groundwater table in the excavation pits during
    the soil excavation effort from under and surround GSU#1 containment.
    Contaminated groundwater was also pumped to the east AST from the excavation
    pits. However, no information was recorded with regard to how much
    groundwater was pumped. No confirmation groundwater samples were collected
    upon the completion of the excavation.
  - A Site investigation conducted in July 2011 demonstrated that groundwater contamination still exists in the area surrounding the enlarged GSU#1 containment structure (see Section 1 of this letter for details), yet no further cleanup action was taken.
- 4. Disposal of collected free product and contaminated soil/gravel:
  - Free product collected from the stormwater pond surface, from the stormwater ditches, and from groundwater surface using oil skimmers and vacuum trucks became emulsified oil and water. A total of 8,869 gallons of such fluid was transported off Site for disposal as non-hazardous waste to Oil Re-Refine Co. (ORRCO) in Portland, OR for recycle.

- A total of 845.51 tons of contaminated soil and gravel excavated from stormwater ditches, stormwater pond, and under and around the GSU#1 transformer was transported to the Weyerhaeuser transfer station, and subsequently disposed of at Weyerhaeuser Headquarter Landfill in Cowlitz County, WA.
- 5. Disposal of contaminated water collected during cleanup operations and stored temporarily in the containment and in the on Site AST:
  - The water stored in the containment of the two 1.7-million-gallon ASTs was authorized for discharge through Ecology's Industrial Stormwater NPDES Permit (WAR008707) after the water was tested and met the permit limitations before discharge.
  - The potentially contaminated water pumped from the stormwater pond, stormwater ditches, and from groundwater into one of the two 1.7-million-gallon empty ASTs on Site for temporary storage during the original spill cleanup effort was discharged or disposed of through several steps. The total amount of water filled the tank up to about 25% of its capacity and was estimated at 339,562 gallons. A 0.5 inch oil layer was present at the top of the water within the AST.

After sampling, the water beneath the oil layer was confirmed to meet the stormwater discharge limitations and was approved for discharge through Ecology's Industrial Stormwater NPDES Permit (WAR008707). The AST has a discharge pipe suction located in a sump below the floor of the AST and allows the discharge of water at lower portion of the AST being discharged without disturbing the oil layer at the top of the water surface. A total of 270,301 of the 339,562 gallons of water in the AST was discharged to the stormwater system. The water drained out of the AST was run through a three-compartment, opentop, 9,000-gallon oil/water separator. Best management practice was used, including the use of oil absorbent mats in the three compartments so any oil could be readily detected.

- The remaining 60,000 gallons of water, about 1.5-2 feet in depth, was drained through the plant's waste water system with the permanent oil/water separator as part of the in-line process, and essentially discharged to the City of Chehalis Wastewater Treatment Plant.
- The remaining oil in the AST was removed with a vacuum truck and transported to ORRCO in Portland, OR for recycle.

Based on review of the cleanup activities reported in the several documents in "Basis for the Opinion" section of this letter, residual contamination is still present in soil and groundwater. Ecology has following additional comments:

- Soil contamination was found in a limited pocket in the area under the newly extended portion of the GSU#1 containment. The concentration of mineral oil at 20 inches depth was 28,100 mg/kg, exceeding the MTCA cleanup level. The contaminated soil is now covered under the enlarged concrete containment structure. Additional remediation is needed. Alternatively, an environmental covenant may be put on the Site if additional remediation is deemed infeasible, in which case, please provide a brief feasibility study and disproportionate cost analysis that evaluates alternatives for cleanup in this area.
- 2. Free product was found on the surface of the groundwater right after the spill incident in the area immediately adjacent to the GSU#1 containment. One month after the incident, the free product was present on the surface of groundwater table in the area surrounding the enlarged GSU#1 containment. Even though free product was removed and contaminated groundwater was pumped out from the excavation pit, further investigation in July 2011, six months after the incident, indicated that mineral oil in groundwater still exceeded MTCA cleanup level within a limited area near the GSU#1 containment at a concentration of 1,100 ug/L. Additional groundwater remediation is warranted. Please note that Ecology requires four consecutive quarters of monitoring results below the MTCA cleanup levels to demonstrate compliance. This is to account for seasonal variation in groundwater levels.

# Limitations of the Opinion

### 1. Opinion does not settle liability with the state.

Liable persons are strictly liable, jointly and severally, for all remedial action costs and for all natural resource damages resulting from the release or releases of hazardous substances at the Site. This opinion **does not**:

- Resolve or alter a person's liability to the state.
- Protect liable persons from contribution claims by third parties.

To settle liability with the state and obtain protection from contribution claims, a person must enter into a consent decree with Ecology under RCW 70.105D.040(4).

# 2. Opinion does not constitute a determination of substantial equivalence.

To recover remedial action costs from other liable persons under MTCA, one must demonstrate that the action is the substantial equivalent of an Ecology-conducted or Ecology-supervised action. This opinion does not determine whether the action you performed is substantially equivalent. Courts make that determination. *See* RCW 70.105D.080 and WAC 173-340-545.

# 3. State is immune from liability.

The state, Ecology, and its officers and employees are immune from all liability, and no cause of action of any nature may arise from any act or omission in providing this opinion. See RCW 70.105D.030(1)(i).

# **Contact Information**

Thank you for choosing to clean up the Site under the Voluntary Cleanup Program (VCP). After you have addressed our concerns, you may request another review of your cleanup. Please do not hesitate to request additional services as your cleanup progresses. We look forward to working with you.

For more information about the VCP and the cleanup process, please visit our web site: <u>www.</u> <u>ecy.wa.gov/programs/tcp/vcp/vcpmain.htm</u>. If you have any questions about this opinion, please contact me by phone at (360) 407-6265 or by e-mail at <u>hqiu461@ecy.wa.gov</u>.

Sincerely,

<del>~\_\_\_\_\_</del>e

# **Enclosure** A

# **Description and Diagrams of the Site**

# **Site Description**

The Chehalis Power LP Generation Facility Site is located at 1813 Bishop Road, Chehalis, Lewis County, in the Chehalis River Valley. The Site is a 20-acre, level grade property occupied by a large industrial facility, including two combustion turbines, electrical transformers, heat recovery steam generators, air emissions control equipment, exhaust gas stacks, air-cooled steam condenser, water treatment equipment, and operations and maintenance buildings. The facility also includes two 1.7-million-gallon fuel oil aboveground storage tanks (ASTs) in a lined earthen containment. The tanks were never used for oil storage since the initial startup of the facility. A stormwater collection ditch surrounds the facility to collect stormwater from the facility. The ditch is lined with gravel, and some segments are covered, galvanized pipes. The stormwater pond has a permitted outfall under Ecology's Industrial General Stormwater National Pollutant Discharge Elimination System (NPDES) Permit (WAR008707). The pond outfall flows west in a gravel waterway to Berwick Creek. Berwick Creek flows from east to west to Dillenbaugh Creek, which then flows into the Newaukum River.

The geology beneath the Site consists of pre-Fraser Glaciation sand and gravel recessional outwash deposits. Bore holes revealed a silty clay layer within 5 feet of the land surface, a silty sand about 5 feet may exist in some areas beneath the silty clay layer. Below the silty sand lies the shallow aquifer, a sandy gravel layer about 30 to 40 feet thick. A silt layer at about 50 feet below ground surface perhaps serves as a confined layer. Groundwater table was at 15 to 20 during drilling and was observed between 4 to 14 feet during the cleanup activity period in 2011. Groundwater flow direction at the Site was assumed from northeast to south/southwest.

# RE: PacifiCorp Energy Chehalis Power Plant Transformer GSU#3 Oil Spill Cleanup Status Report

On November 22, 2013, at 05:20 am, Generation Step Up Transformer #3 (GSU#3) at the Chehalis Power Plant experienced a failure and subsequent fire which resulted in a release of non-PCB mineral oil around the transformer and also impacted the stormwater system. PacifiCorp Energy completed the verbal spill notifications to the required Federal and State agencies after the incident. Doug Stoltz, of Department of Ecology's Spill Response Program, visited the facility about 11:45 that day and provided coordination assistance in the days after the incident.

PacifiCorp Energy is providing this status report, per the requirements of WAC 173-340-310, Policy 310A, on the results of the cleanup efforts, initial investigation and plans for further investigation and remediation of the oil spill.

# Spill Incident

Transformer GSU# 3 failed resulting in an explosion and fire. The automatic fire suppression system controlled the fire, however, water filled the concrete transformer containment and overflowed to the surrounding soil and gravel. Water and transformer mineral oil flowed out from the containment to nearby stormwater ditches. Oil reached the stormwater pond, but was not released through the outfall, as the pond level was low due to the dry weather and stormwater was not being discharged. The discharge valve was closed by Plant Operators immediately after the transformer failure.

The spill incident and spill response were documented in a letter dated November 26, 2013, following up on verbal spill notifications. The letter included in Attachment A provides additional details on the incident.

# Spill Response

Cowlitz Clean Sweep (CCS) of Longview, Washington was called for spill response and cleanup and arrived approximately three hours after the incident. Oil absorbent socks and pads had been placed in stormwater

ditches and the pond by Plant personnel to contain the spill. CCS initiated response and initial cleanup of the pond and then the transformer containment filled with water and oil.

The extent of the oil contamination from the GSU#3 transformer failure and oil spill is shown on the figure in Attachment 2. Oil and water from the transformer containment flowed south and north to the stormwater ditch, east to the turbine building, and west across the road to stormwater ditches. The ditches to the south and west flow into the pond through underground culverts. Due to dry weather, the extent of the contamination was simple to observe and contain.

# Spill Cleanup

CCS conducted the spill cleanup for four weeks after the incident. Mineral oil and contaminated water were removed from the pond, ditches and transformer containment and stored in tanks on-site. An additional 40,000 gallons of water was treated and disposed to the Plant sanitary sewer under a permit from the City of Chehalis. Discharge of stormwater from the pond was resumed on December 3, 2013, with Ecology's approval.

After the transformer was replaced, CCS excavated oil-contaminated gravel and soil around the transformer containment, stormwater ditches and pond banks. The soils were removed to a depth below the contamination level or to the compacted clay soil layer approximately 4-5 feet below ground surface. The materials were replaced and the excavated gravel and soils were stored on-site. All the waste oil/water and gravel/soil were removed and CCS completed on-site work on January 9, 2014.

A Spill Cleanup Report prepared by CCS is included in Attachment 3.

# Quantity of Oil Released and Recovered

The GSU#3 transformer contained 11,100 gallons of non-PCB mineral oil. The quantity of oil released from the transformer during the incident was 4,337 gallons. Most of that oil was recovered from the transformer containment, ditches and stormwater pond. CCS transported oil/water off-site for energy recovery. Additional oil was recovered in the absorbents and waste water treatment system. CCS determined that 840 gallons of mineral oil had been released and not recovered prior to soil/gravel excavation. Of the 840 gallons, a substantial quantity was removed with 1270 tons of excavated soil and gravel. It is probable that the quantity of mineral oil not recovered, remaining in the soil and groundwater is a small fraction of the 840 gallons.

# Soil Cleanup Sampling

After removing the contaminated soil and gravel, CCS conducted confirmation soil sampling of the remaining soil before replacement of the gravel and soil. Forty-five samples were taken throughout the extent of contamination, and the samples were analyzed by Dragon Analytical Laboratory in Olympia. The sample locations are shown on the maps in the CCS report in Attachment 3. Of the 45 samples, only two indicated detectable levels of mineral oil per NWTPH-Dx. The two locations were in stormwater ditches near the pond. The mineral oil concentrations were 128 mg/kg and 76.9 mg/kg. Both values are well under the MTCA A cleanup level for soil of 4,000 kg/mg. The sample analysis results are included in the CCS Report in Attachment 3.

# Plans for Further Investigation and Remediation

At the conclusion of the cleanup activities by CCS, one portion of oil contamination from the spill remains to be cleaned up. There is remaining groundwater contamination from mineral oil. An oil sheen has been observed

floating on the perched groundwater layer approximately five feet below ground surface. Based on previous studies, the groundwater level is normally 4 -5 feet deep, and then rises during periods with precipitation and wet weather. PacifiCorp Energy is planning to pump contaminated groundwater for disposal from an open slotted culvert installed on the south side of the transformer containment, near the location where most of the oil/water flowed over the containment wall. The culvert was installed by CCS to a depth just above the bottom of the perched groundwater layer.

PacifiCorp Energy is planning further investigation of the area around the GSU#3 transformer. Installation of several permanent groundwater monitoring wells is planned to determine the extent of remaining oil contamination and future remedial actions.

Last fall, under Ecology's Voluntary Cleanup Program, two of three planned groundwater monitoring wells were installed for the GSU#1 2011 transformer oil spill. GSU#3 is 150 feet south (groundwater downgradient) from GSU#1. PacifiCorp Energy would like to discuss further plans for groundwater monitoring for the GSU#3 spill in conjunction with the on-going monitoring for the 2011 GSU#1 spill with Ecology.

At your convenience, we would like to set up a meeting with you and Hans Qui to discuss the follow-on plans identified above under the Voluntary Cleanup Program. In the meantime, if you have any questions or need additional information, please do not hesitate to contact me at 360-748-1300.

Sincerely,

1,00e\_

RE: PacifiCorp Energy Chehalis Power Plant Transformer GSU#3 Oil Spill - Incident #13-4385

PacifiCorp Energy Chehalis Power Plant (Plant) is providing follow-up information for an oil spill reported to you verbally on November 22, 2013.

#### Spill Incident Description

On Friday, November 22, 2013, at 05:20, Transformer GSU# 3 failed resulting in a release of transformer oil into and around the transformer secondary containment area. Transformer GSU#3 is a large voltage step up transformer delivering power from the Plant's steam turbine to the adjacent BPA substation and transmission lines. GSU# 3 is filled with 11,100 gallons of non-PCB mineral oil.

The transformer is located in a concrete containment structure; however, the containment filled with fire suppression water and overflowed to the surrounding gravel and soil. Oil and water flowed out from the containment approximately 50-90 feet and flowed into stormwater ditches to the south, west and north of the transformer. The south and west stormwater ditches are connected to the stormwater pond through a culvert under a roadway. Plant personnel immediately closed the plant's storm water pond discharge valve preventing a release of mineral oil from the plant site.

#### Spill Response

Plant management called Cowlitz Clean Sweep (CCS) of Longview, Washington for spill response – CCS arrived at 08:30.

Plant management notified the following agencies at 09:00:

- National Response Center (Case #1066576)
- Washington Emergency Management Division Spill Line (Incident # 13-4385)
- Washington Department of Ecology Southwest Regional Office
- Lewis County LEPC

Doug Stoltz of Ecology's Spill Response Program visited the spill site November 22, 2013, at approximately 11:45.

#### Spill Description

The quantity of mineral oil released was determined after the remaining oil was removed from the failed transformer. Quantity of oil released from the transformer = 4,337 gallons (a portion of the oil was retained in the containment structure).

Mineral oil and water were released to the soil and gravel around the transformer containment, to gravel-lined stormwater ditches, and to the stormwater pond as described above.

#### Cleanup Plans

The failed transformer has been removed, and the transformer supports and containment structure cleaned in preparation for siting the an on-site spare transformer.

CCS has removed most of the free oil from the ditches and pond, and the next step is to remediate the contaminated soil from the pond and ditches for environmental sampling. Water from the ditches and stormwater pond will be treated and disposed to the Plant's wastewater system during cleanup; treatment and disposal plans are being coordinated through the City of Chehalis and The Washing Department of Ecology. Storm water discharge from the pond will not resume until after approval by Ecology's Stormwater Program.

CCS is coordinating disposal of the oil contaminated water, soil, debris and absorbent materials. Waste material is being accumulated on site in suitable containers for future transport and disposal.

If you have questions or need additional information, please contact me at 360-748-1300.

Sincerely,

LUD, PASKST

Mr. Jeremey Smith Pacific Corp. 1813 Bishop Rd. Chehalis, WA

#### Spill Cleanup Report Mineral Oil Release Chehalis, Washington CCS Project # 9313352

Mr. Smith,

Pacific Corp. contracted CCS, a division of PNE Corp., to respond to and mitigate a release of mineral oil at the address 1813 Bishop Rd. Chehalis, WA. CCS performed these services Nov. 22, 2013 – Jan. 9<sup>th,</sup> 2014

#### Background

GSU# 3 had a failure, causing it to catch fire. The fire suppression system around the GSU was activated. The influx of water into the GSU and containment caused the oil in the GSU and containment to be displaced into the surrounding soil. The large volume of oil travel to the facilities storm water ditches located near the GSU. Oil then migrated to the storm water retention pond on site.

#### Initial Response

The on duty operator immediately shut the valve on the retention pond to prevent any of the oil from migrating off the site. Once the avenue for the oil to leave site was secured Pacific Corp. initiated a response from CCS.

Upon arrival the Response Manager from CCS preformed a scene size up. The fire at the GSU had been extinguished, all the oil released was contained to the storm water pond and surrounding soils. CCS immediately deployed a secondary containment in the pond to insure that oil would not leave the site.

#### Spill Cleanup and Site Restoration

CCS immediately addressed the gross contamination on the storm water ponds and surrounding ditches. Portable storage tanks were mobilized to the site to contain all recovered waste. Crews used liquid vacuum trucks along with absorbents to capture the gross contamination in the water. The containment

around the GSU was evacuated of all contamination and cleaned using degreaser and pressure washers. All wash waters were collected and transferred to the onsite storage. The remaining oil in GSU# 3 was removed and transferred to onsite storage. Pacific Corp. along with CCS contacted the local waste water treatment plant, and advised them that CCS and Pacific Corp, would like to treat the captured waste waters thru a carbon filter system then discharge the treated water to the waste water treatment plant under Pacific Corps. Storm water permit. Pacific Corp. was granted permission by the POTW.

With the approval a mobile carbon treatment system was then mobilized to the site. Upon arrival treatment was immediately implemented. The storm water pond was monitored and waters were removed during significant weather events to storage to prevent any possible contamination from leaving the site. All waters removed were treated and discharged to POTW.

Once the contaminated waters were addressed, CCS then focused on removing the impacted soils on site. Excavation was started around GSU# 3. Excavation depth was approx... 4' (to the water perch) some areas were excavated to a slightly shallower depth because of possible impacted to structural integrity of building and other surrounding structures. All contaminated soils removed were transferred to an onsite secured, stock pile area pending transportation for disposal. CCS controlled the extent of the excavation using visual, olfactory, and Photo Ionization Detector (PID) readings. Upon completion of removal of all impacted soils on site, the soil was transported the Weyerhaeuser landfill located in Castle Rock, WA. Liquids that were not able to be treated, (high oil to water ratio) were transported to ORRCO in Portland, Oregon

CCS removed 1,270.54 tons of soil from the affected area.

#### Sampling and Laboratory Analyses

CCS collected 45 soil samples to verify the cleanup of affected soils. Dragon Analytical Laboratory in Olympia analyzed soil samples for NWTPH-Dx. CCS collected samples from the areas most likely to contain residual contamination.

Sample locations are shown on the site map.

All results are below the MTCA cleanup standard of 4,000 mg/Kg advised by the Washington Department of Ecology.

#### Disposal

CCS transported 1,270.54 tons of soil under Manifest # 9313952 to the Weyerhaeuser MRF in Castle Rock, Washington for disposal as a non-hazardous waste.

CCS also transported 17, 225 gallons to ORRCO in Portland, Oregon for energy recovery.

A total of 40,000 gallons of contaminated waters were treated onsite and discharged to the local POTW.

If you have any questions or concerns please feel free to contact me here at the office (888) 423-6316 or on my cell phone (360) 957-2639. Thank you for the opportunity to provide services to you. Should you need additional assistance, please do not hesitate to contact me.

Sincerely, CCS – A Division of PNE Corp.

#### Re: Chehalis Power Plant GSU#1 Transformer Oil Spill Groundwater Investigation

Dear Jeremy and Mark,

KTA Associates, Inc. is pleased to provide the Groundwater Investigation Report prepared by CardnoTEC for the GSU#1 Transformer Oil Spill for the Chehalis Power Plant. The groundwater well installation was conducted October 28 – 29, 2013, with well sampling on November 1, 2013. Well MW-2 was not installed, however, a groundwater sample was obtained, therefore we have one complete set of groundwater and soil sample results. All of the samples were were non-detect for mineral oil, with the exception of MW-2, which was 380  $\mu$ g/L, below the groundwater MTCA A cleanup level of 500  $\mu$ g/L.

This report is provided in two versions, with and without the laboratory report from ALS Environmental, as the lab report is over 300 pages long. KTA and CardnoTEC appreciate the opportunity to support both you and PacifiCorp. We look forward to working with you on the continued remediation plans.

Sincerely, **KTA Associates, Inc**.

Lenon Destoroh

Lenora E Westbrook, PE Senior Environmental Engineer

## 1 Introduction

#### 1.1 Purpose

Cardno TEC Inc. (Cardno TEC) was contracted by KTA Associates, Inc. (KTA) to install, develop and sample three newly installed groundwater monitoring wells at the PacifiCorp Chehalis Plant located in Chehalis, Washington. The monitoring well installation and well development field work was conducted between October 28<sup>th</sup> and 29<sup>th</sup>, 2013. The groundwater sampling was completed on November 1, 2013. Figure 3-1 shows the newly installed monitoring well locations.

The primary objectives of the groundwater sampling activities were to:

• Determine if shallow groundwater has been impacted from areas with previously identified concentrations of mineral oil above regulatory limits.

#### 1.2 Original Scope

To meet the above stated objectives, the scope of work for this groundwater investigation consisted of the following field activities:

#### Groundwater Investigation

Installation of shallow (≤ 30' below grade surface) groundwater monitoring wells at three locations using a Geoprobe® direct push drill (DPT). Sample results will be used to determine if shallow groundwater has been impacted from a previous mineral oil spill.

#### Subsurface Soil Sampling Activities

Collect a minimum of one subsurface soil sample from each boring during monitoring well installation. Collect up to two additional soil samples from each boring if mineral oil impacted soil is encountered.

#### 1.3 Scope Modification

Of the three monitoring well installations originally scoped, only two were actually completed. This was due to encountering utilities beneath the cleared PacifiCorp approved location selected for MW-2. After reaching the targeted depth of 30-feet below grade surface at soil boring #2 (SB-2) (logging lithology and collecting the requisite soil sample) the DPT sampling rods and core unit were removed from the boring. A small piece of HDPE plastic material, similar to material used for fire water supply pipe coating was found in one of the five-foot sampler core units that were previously removed from the boring. The fire water supply line was known to be within this area, and was spray marked on the ground several feet away. The drill crew had re-tooled and driven down approximately 18-feet of larger diameter well casing rods (hitting refusal at this depth). Because PacifiCorp had concerns that the small piece of HDPE may have been generated due to a glancing blow to the fire water supply line, they requested that no further drilling / well installation activities occur at this location. Therefore no permanent well was completed at this location. However, prior to removing the well casing rods, as there was water in the borehole, a groundwater grab sample was collected directly from the casing rods via the same methodology as the other site wells (further explained below). Cardno TEC worked closely with on-site KTA and PacifiCorp personnel to determine a mutually-agreed upon course of action. This was the only modification of the original scope that occurred during the course of the planned field efforts.

#### 1.4 Report Organization

This SI Report has been organized into the following sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Sampling Events
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions of the procedures and methods of the groundwater investigation and data collected are presented in the main text of this report. The boring logs, water quality and well development forms are presented in Appendices A and B.

### 2 Site Background

#### 2.1 Site Description

PacifiCorp owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

#### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

#### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semi-confined aquifer, primarily due to the low permeably silt cap immediately above the aquifer.

#### 2.2 Previous Investigation/Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the PacifiCorp Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing contaminated material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near the transformer that caught fire and subsequently leaked mineral oil to the surrounding areas. Contaminated soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual). During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to the on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

### 2.3 **Previous Site Investigation**

Cardno TEC completed a Site Investigation (SI) (Cardno TEC 2011) at the PacifiCorp Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011 (Figure 2-1). Cardno TEC conducted the SI to determine the following:

- If groundwater has been impacted from the mineral oil spill;
- If the large AST used to contain the water collected during excavation activities exceeded any regulatory levels, and;
- If surface water in the stormwater pond has been impacted from the mineral oil spill.

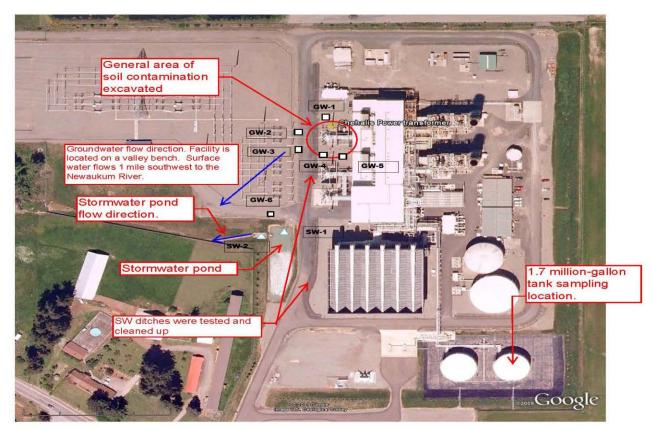

Cardno TEC completed the following activities during the SI:

- Installed and sampled six temporary monitoring wells placed within the shallow water bearing zone;
- Collected two water samples from the AST at varying depths;
- Collected two surface water samples from the stormwater pond, and;
- Collected three surface soil samples downgradient of the mineral oil spill.

The results are as follows:

- One groundwater location (GW-4) had a detection of 1100 ug/L, which exceeded the Model Toxics Control Act (MTCA) method cleanup level for groundwater;
- One AST sample (TS2) had a detection of 440 ug/L, which did not exceed the MTCA cleanup level;
- One surface water sample (SW1) had a detection of 360 ug/L, which did not exceed the MTCA cleanup level, and;
- One soil sample (SG1) had a detection of 160 mg/kg, which did not exceed the MTCA cleanup level.

# 3 Sampling Event

### 3.1 Groundwater Investigation

Installation and sampling of newly installed monitoring wells was conducted as a component of the groundwater investigation activities. Samples were analyzed for mineral oil using total petroleum hydrocarbons – diesel extended range (TPH-Dx).

The objective most pertinent to the groundwater investigation was to:

• Determine if shallow groundwater has been impacted from the previous 2011 mineral oil spill;

Sample locations are shown on Figure 3-1. A description of groundwater related investigation activities at the PacifiCorp Chehalis Plant is provided below.

### 3.1.1 Groundwater Sample Locations

Groundwater monitoring wells were installed in the shallow water bearing zone at two of the three locations as listed in Table 3-1 and shown in Figure 3-1. These wells were screened from 4.5 feet to 17 feet below ground surface (bgs) at MW-1 and from 4 feet to 19 feet bgs at MW-3 (Table 3-2). Monitoring well (MW-1) was positioned adjacent to a previous soil sample (D-8) which was collected under the transformer containment area. Monitoring well (MW-2) was positioned bear a previous groundwater sample location (GW-4). Monitoring well (MW-3) was positioned downgradient from the transformer in a location outside the spill containment area to triangulate groundwater level and flow direction.

### 3.1.2 Monitoring Well Installation Activities

Flush mount monitoring wells were installed at two locations (MW-1 and MW-3) using a track mounted directpush GeoProbe® rig by Cascade DRILLING L.P. The monitoring wells installed consisted of two-inch inside diameter polyvinyl chloride (PVC) pipe with GeoProbe® prepack well screens (10 slot) containing 20/40 grade environmental sand (Table 3-1). Monitoring wells were installed in accordance with Washington Administrative Code (WAC 173-160 and -162). Monitoring wells were properly developed using U.S. Environmental Protection Agency guidelines (US EPA, 1992). Boring log details are provided in Appendix A.

Location	Completion Type	Final Depth to water (bgs) <sup>1</sup>	Total Depth (bgs) <sup>1</sup>	Screen Length (bgs) <sup>1</sup>	Sand Pack (bgs) <sup>1</sup>	Bentonite Seal (bgs) <sup>1</sup>	Surface Seal (bgs) <sup>1</sup>
GW-1	Flush Mount	5	17	4.5-17	3-17	2-3	0-2
GW-2	NA	NA <sup>3</sup>	NA <sup>3</sup>	NA <sup>3</sup>	NA <sup>3</sup>	NA <sup>3</sup>	NA <sup>3</sup>
GW-3	Flush Mount	~18 to $20^{2}$	19	4-19	3-19	2-3	0-2

Table 3-1	Monitoring Well Construction detail
-----------	-------------------------------------

Notes:

<sup>1</sup> bgs - below grade surface <sup>2</sup> Water level collected from boring log, well was dry after completion

<sup>3</sup> Monitoring well could not be installed, sampled collected directly from boring.

### 3.1.3 Monitoring Well Survey Information

A relative survey of the monitoring well casings and the grade surface adjacent to each well was conducted. An auto-level and hand held survey grade stadia rod were used to collect the elevation measurements. An elevation of 100.00' was assigned to a point on the southwest corner of the containment wall surrounding GSU-1. A reference mark was placed on the top of the wall as close to the corner as possible. A back site was also established using the top of the southeast bolt of the A-Phase pole associated with GSU-1. Table 3-2 present the data collected during the site survey.

Location	Grade Surface elevation (ft)	Top PVC Casing (ft)	Backshot at start of survey event	Backshot at end of survey event
SW corner GSU-1 cont. wall	100.00	NA	98.26	98.26
GW-1	98.06	97.76	NA	NA
SB-2	98.14	NA	NA	NA
GW-3	97.93	97.58	NA	NA

\*All elevations are referenced to the top of the SW corner of the GSU-1 containment wall. The location was assigned an elevation of 100.00' above mean sea level.

### 3.1.4 Monitoring Well Sampling Activities

The newly installed monitoring wells (MW-1 and MW-3) were allowed to settle and equilibrate for two days prior to sampling activities. The presence of light non-aqueous phase liquid at each location was checked using an oil/water interface probe prior to sampling (Table 3-3).

A peristaltic pump with dedicated (i.e., disposable) tubing was used to obtain groundwater samples after purging each well location using low-flow sampling techniques. Monitoring wells were purged until water quality readings stabilized.

Parameter measurements recorded during purging were: conductivity, temperature, pH, dissolved oxygen (DO) and turbidity). Water quality parameters are presented in Table 3-3.

Water quality parameter information collected from each well includes purge rate, water level, and cumulative volume of groundwater purged from well at each interval (Appendix B).

Sample ID	Depth to water feet btoc) <sup>1</sup>	Depth to product (feet btoc) <sup>1</sup>	Screened interval (feet btoc) <sup>1</sup>	Time	Temp (°C)	рН	Sp. Cond. <sup>3</sup>	Turbidity <sup>4</sup>	DO⁵
GW1-110113	5.10	ND <sup>2</sup>	4.5-17	1040	16.08	6.72	0.196	83	0.86
GW2-102913	13.00	ND <sup>2</sup>	NA <sup>6</sup>	NA <sup>6</sup>	NA <sup>6</sup>	NA <sup>6</sup>	NA <sup>6</sup>	NA <sup>6</sup>	NA <sup>6</sup>
GW3-110113	13.50	ND <sup>2</sup>	4-19	1310	14.2	6.39	25.5	545	10.20

### Table 3-3 Monitoring Well Water Quality Readings

Notes:

<sup>1</sup> feet (btoc) – below top of casing

<sup>2</sup> ND – not detected
 <sup>4</sup> NTU – nephelometric turbidity units

<sup>3</sup> mS/cm – milli seimens/centimeter <sup>5</sup> mg/L – milligrams per liter

<sup>6</sup> Monitoring well could not be installed, sampled collected directly from boring.

### 3.1.5 Well Abandonment Procedures

Boring location (SB-2) was properly abandoned in accordance with WAC 173-160. A monitoring well could not be completed at SB-2 due to the presence of utilities in close proximity to this location, as noted above. Additional well installation efforts at SB-2 were discontinued per the client's direction.

### 3.2 Subsurface Soil Sampling Activities

Samples of subsurface soil were collected during DPT drilling activities at MW-1, SB-2 and MW-3. Material was collected continuously in five foot intervals using stainless steel Macro-Core® soil core units, which were each fitted with new, pre-cleaned disposable PVC liners. Stainless steel spoons were used to collect material from within the Macro-Core® liners at desired depths. Soil sample material was placed into stainless steel bowls and thoroughly homogenized prior to being placed directly into pre-labeled analytical jars. These jars were stored in clean insulated coolers containing ice. Table 3-4 shows the sampling depths and time for each subsurface soil sample collected.

Table 3-4	SubSurface Soil Sampling Depths
-----------	---------------------------------

Sample ID	Time	Sample depth (feet bgs <sup>1</sup> )	Material
SB1-5-102813	1115	4 to 5	Dark grey (2.5Y 4/1) and Olive Brown (2.5Y 4/4) slightly moist, mottled, w/ browns, reds, greys, Silt and silty lean Clay. (SM-CL)
SB2-6-102813	1450	5 to 6.5	Very dark greyish brown (2.5Y 3/2), very moist to wet, fine to coarse grain, well graded Sand, with trace silt and small pebbles. (SW)
SB3-5-102913	1100	3.5 to 5.5	Light olive brown (2.5Y 5/4) slightly moist, Clay, mottled color, very stiff to tight. (CH)

Notes:

<sup>1</sup> feet (bgs) – below ground surface

### 3.3 Field Methods

The following sections describe the use of additional field equipment as well as sample handling and documentation procedures during the sampling event.

### 3.3.1 <u>Utility Location</u>

All underground utilities were located and marked by PacifiCorp personnel prior to Geoprobe<sup>®</sup> DPT drilling activities.

### 3.3.2 Handling Procedures

After samples were placed in appropriately labeled containers they were immediately transferred to ice filled coolers to keep them out of the direct sunlight and to maintain a temperature of four degrees centigrade. Disposable nitrile gloves were used by personnel collecting and handling the samples and were changed frequently and in between each sample collection to avoid cross contamination.

Chain of Custody (CoC) forms were completed to accompany each cooler from the field to the laboratory. The date, time, sample location, number of containers, and analysis to be performed was recorded on each CoC. Samples were hand delivered by field staff to ALS Environmental of Kelso, WA at conclusion of the sampling event.

### 3.3.3 Record Keeping

A field activity log book was used to document the sampling procedures performed by field personnel. More specifically, the field log provided a record of specific sample location and collection information, noted other contractors involved during the field sampling and their role(s), described the major equipment used at each location and provided noteworthy observations, problems, or incidents. Field data sheets were completed for all groundwater sampling components of the study and were stored with the field activity log book. Copies of the field data sheets are included in Appendices A and B.

### 3.3.4 Lithology Documentation

The lithology from the boring locations were continuously logged during drilling (Appendix B). Information collected on the lithology logs included borehole location; drilling information; information such as logging intervals, recovery; and sample description information.

Lithologic descriptions of unconsolidated materials encountered in the boreholes were described in accordance with American Society for Testing and Materials (ASTM) D-2488-00 Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) (ASTM, 1990). Descriptive information recorded included:

- identification of the predominate particles size and range of particle sizes;
- percent of gravel, sand, fines, or all three;
- description of grading and sorting of coarse particles;
- particle angularity and shape; and
- maximum particle size or dimension. Separate identification of the Unified Soil Classification System (USCS) group symbol was also used.

Additional information recorded on the logs included the depth of the water table, caving or sloughing of the borehole, changes in drilling rate, presence of organic materials, and other noteworthy observation or conditions.

### 3.3.5 Sample Identification and Labeling

Samples collected in the field as part of this project were identified by their media type (i.e., GW and SB), location (i.e., 1, 2 or 3) and the corresponding date a sample was collected. Soil samples collected from each boring were also designated with the depth at which each sample was collected. Sample identification numbers, including sample media type, location number, media and depths were recorded on field sheets completed for each location or sample.

### 3.3.6 Instrument Calibration

All field instruments that require a zeroing and/or a user calibration were appropriately calibrated at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards were performed at the beginning and periodically throughout each field day to verify equipment operation.

Calibration data were recorded in the field logbook. All calibration media (i.e., gas, liquid or otherwise) were properly stored and managed per manufacturer's recommendations.

### 3.3.7 Decontamination Procedures

All non-disposable equipment that was exposed to site soils and then re-used for multiple sample collection was decontaminated after completing a temp well at each location. The decontamination wash consisted of:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and
- > de-ionized water rinse.

#### 3.3.8 Summary of Investigation-Derived Waste Characterization

Investigation-derived waste (IDW) generated by this project generally consisted of soil cuttings, excess groundwater generated during development and sampling activities and decontamination/rinse water. All IDW was containerized in two Department of Transportation (DOT) approved 55-gallon drums, which were segregated by media, and stored in a PacifiCorp approved storage area. All drums were properly labeled with their contents, date, where the waste came from and generation dates. After properly containing the project derived wastes and labeling of the containers, all further IDW management and disposal was handled directly by PacifiCorp.

## 4 Analytical Results

This section summarizes the results of the groundwater and subsurface soil sampling activities completed at the PacifiCorp Chehalis Plant.

### 4.1 TPH-Dx

TPH-Dx was detected at location MW-2 at a concentration of 380 Y ug/L, which is below the MTCA method A cleanup level of 500 ug/L for groundwater. None of the soil samples collected as part of the well installations exceeded the MTCA A soil cleanup standards. Results and screening levels for groundwater and soil samples are summarized in Tables 4-1 and 4-2. Complete groundwater and soil analytical sample results are provided in Appendices C and D, respectively.

Location Type	Sample ID	TPH-Dx Results (ug/L)	TPH-Dx MTCA A Screening Level (ug/L)
MW-1	GW1-110113	ND	500
MW-2	GW2-102913	380 Y	500
MW-3	GW3-110113	ND	500

#### Table 4-1 Groundwater Sample Results and Screening Levels

Notes:

ND – not detected ug/L – micrograms per liter

Y = the chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

Location Type	Sample ID	Sample depth (bgs)	TPH-Dx Results (mg/kg)	TPH-Dx MTCA A Screening Level (mg/kg)
MW-1	SB1-5-102813	5	ND	4,000
MW-2	SB2-6-102813	6	ND	4,000
MW-3	SB3-5-102913	5	ND	4,000

Notes:

ND - not detected

NA – not applicable

mg/kg - milligrams per kilogram bgs - below ground surface

Analytical Report for Service Request No: K1311913

Lenora Westbrook KTA Associates 3530 32nd Way NW Olympia, WA 98502

### RE: PacifiCorp-Chehalis Power Groundwater

Dear Lenora:

Enclosed are the results of the samples submitted to our laboratory on November 01, 2013. For your reference, these analyses have been assigned our service request number K1311913.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3364. You may also contact me via Email at Howard.Holmes@alsglobal.com.

Respectfully submitted,

ALS Group USA Corp. dba ALS Environmental

Howard Holmes

Project Manager

HH/ln

### Acronyms

	-
ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
М	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a
	substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater
	than or equal to the MDL.

#### **Inorganic Data Qualifiers**

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- O See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

#### **Metals Data Qualifiers**

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
   DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.caslab.com or at the accreditation bodies web site

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

# **Case Narrative**

#### ALS ENVIRONMENTAL

Client:KTA AssociatesProject:PacifiCorp-Chehalis Power GroundwaterSample Matrix:Water

Service Request No.: Date Received:

K1311913 11/01/13

#### Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

#### Sample Receipt

Three water samples were received for analysis at ALS Environmental on 11/01/13. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

#### **Diesel Range Organics by Method NWTPH-Dx**

#### Surrogate Exceptions:

The upper control criterion was exceeded for n-Triacontane in sample MW2-102913. No target analytes were detected in the sample. The error associated with an elevated recovery equated to a high bias. The quality of the sample data was not significantly affected. No further corrective action was appropriate.

#### Sample Notes and Discussion:

The chromatographic fingerprint for sample MW2-102913 did not match that of the light and heavy weight mineral oil standards analyzed with the field samples.

6

No other anomalies associated with the analysis of these samples were observed.

Analytical Report for Service Request No: K1311914

Lenora Westbrook KTA Associates 3530 32nd Way NW Olympia, WA 98502

#### RE: PacifiCorp-Chehalis Power Soil

Dear Lenora:

Enclosed are the results of the samples submitted to our laboratory on November 01, 2013. For your reference, these analyses have been assigned our service request number K1311914.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3364. You may also contact me via Email at Howard.Holmes@alsglobal.com.

Respectfully submitted,

ALS Group USA Corp. dba ALS Environmental

Howard Holmes Project Manager

## Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
М	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a
	substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater
	than or equal to the MDL.

#### **Inorganic Data Qualifiers**

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i  $\hfill The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.$
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

#### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
   DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.caslab.com or at the accreditation bodies web site

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

## **Case Narrative**

#### ALS ENVIRONMENTAL

Client: **KTA** Associates Project: PacifiCorp-Chehalis Power Groundwater Sample Matrix: Soil

Service Request No.: Date Received:

K1311914 11/01/13

#### **Case Narrative**

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

#### Sample Receipt

Three soil samples were received for analysis at ALS Environmental on 11/01/13. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

#### **Diesel Range Organics by Method NWTPH-Dx**

No anomalies associated with the analysis of these samples were observed.

U: Undetected at or above MDL J: Analyte detected above MDL, but below MRL B: Hit above MRL also found in Method Blank E: Analyte concentration above high point of ICAL N: Presumptive evidence of compound

Printed: 11/11/2013 08:29:10  $u:\\\ tealth\\\Crystal.rpt\\\quantl.rpt$ 

D: Result from dilution b: Kestar hom and an m: Manual integration performed d: Compound manually deleted NR: Analyte not reported from this analysis

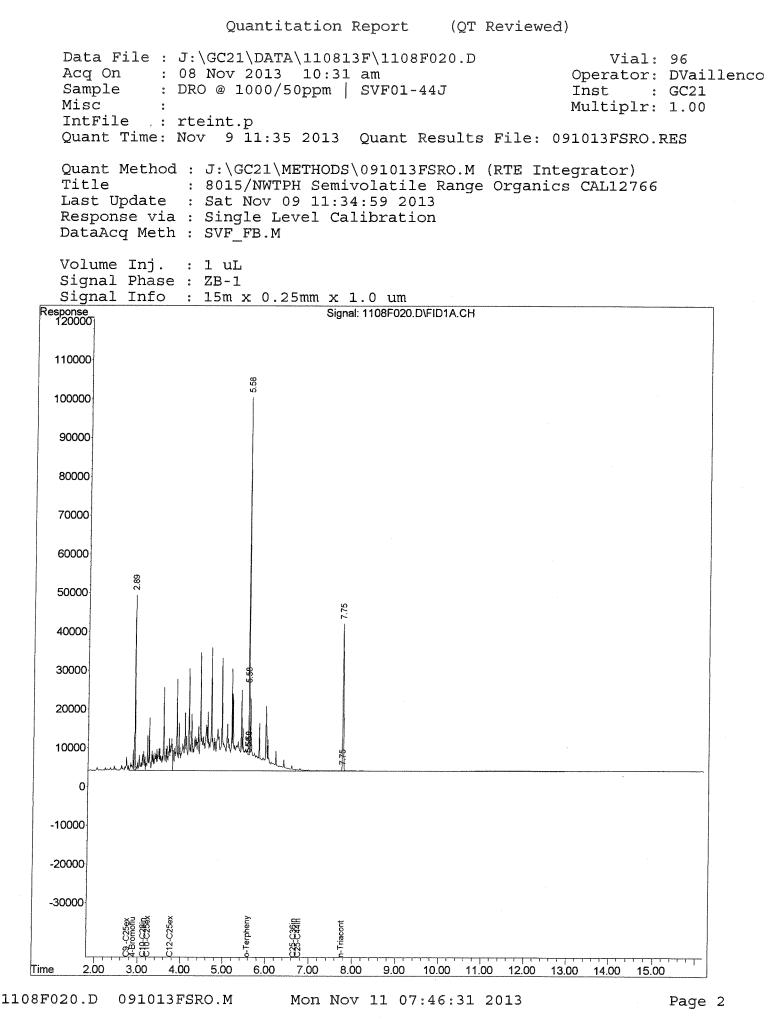

\*: Result fails acceptance criteria #: Acceptance criteria not applicable ?: Insufficient information to determine acceptance e: Result >= MRL, but MRL less than low point of ICAL c: check for co-elution

### 1 Introduction

#### 1.1 **Purpose and Objective**

Cardno was contracted by KTA Associates, Inc. (KTA) to conduct a groundwater investigation that included an assessment of potential impacts to subsurface soil and shallow groundwater within certain site areas previously exposed to mineral oil releases at the PacifiCorp (PC) power plant in Chehalis, WA. Mineral oil releases at the site (2011 and 2013) were due to malfunctions with the plant's Generator Step-up Unit (GSU)s. Mineral oil is used as insulting fluid in the GSUs.

The primary objective of this project is to determine if any residual impacts from mineral oil exposure exists in the subsurface soil and shallow groundwater in concentrations above the Washington Department of Ecology's (WADOE) Model Toxics Control Act (MTCA) regulatory limits. Site investigation activities are being conducted under the WA DoE's Voluntary Cleanup Program (VCP).

This project is divided into two main phases. The first phase includes monitoring well installation, in conjunction with various support tasks. The outcome of soil boring / monitoring well installation activities and associated environmental sampling results are included within this *Monitoring Well Installation and Support Tasks Report (MWIR)*. All field efforts for this first project phase were conducted between 13 March and 15 April, 2015.

The second phase of this project involves groundwater monitoring, which will be conducted on a pre-determined, scheduled basis (e.g. quarterly; April, June-Sept, December 2015 and March 2016). Future *Groundwater Monitoring Reports*, detailing field methods, water level measurements, groundwater table / flow direction assessment and sampling results will be drafted as appropriate and submitted to KTA under separate covers.

#### 1.2 Scope of Work

To meet the above stated objectives, the scope of work for the monitoring well installation and associated support tasks consisted of the following field activities:

- Pre- (field) mobilization and utility clearance tasks.
- Characterization of subsurface lithology and soil sampling at three newly positioned soil boring (SB)s.
- Monitoring well installation and development tasks, including well construction and surface completion, well development, and equipment decontamination.
- Re-development of pre-existing monitoring wells (MW1 and MW3) to prepare them for sampling.
- Sampling of water inflow at several nearby electrical vaults adjacent to the GSUs.

- Elevation survey of the top edge of the monitoring well casings, including re-surveying the monitoring wells installed in 2013.
- Handling and management of project collected environmental samples and field documentation. and,
- Supervision of investigation derived waste (IDW) collection and containment tasks.

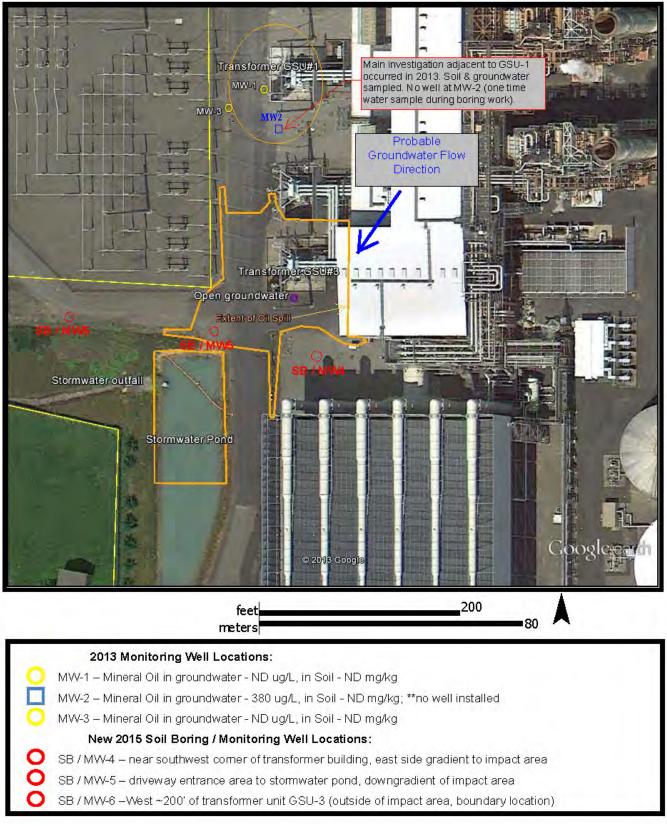

Prominent site features and soil boring / well locations are shown on Figure 1.

#### 1.3 Report Organization

This MWIR is organized into the following sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Field Efforts
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions regarding the procedures and methods for the groundwater investigation and results of the data collected are presented in the main text of this report. Utility Clearance Documentation, Health & Safety Tailgate Forms / CDI Daily Work Reports, Geologic Borehole Logs / Well Construction Logs, Monitoring Well Development Forms, Field Notebook entries, and Laboratory Chain-of-Custody Forms / Analytical Report are presented in Appendices A through F, respectively.

#### Figure 1. Site Map with Monitoring Well and Prominent Features

## 2 Site Background

#### 2.1 Site Description

PacifiCorp owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

#### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

#### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semiconfined aquifer, primarily due to the low permeably silt cap immediately above the aquifer.

#### 2.2 Previous Investigation/Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the PC Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing impacted material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near GSU-1, the first plant transformer that caught fire and subsequently released mineral oil to the surrounding areas. Impacted soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual).

During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the GSU-1 transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to the on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

Most recently, GSU-3 experienced a similar malfunction in late 2013 as the one that occurred at GSU-1 in early 2011. Consequently, this malfunction caused the release of mineral oil around the base of the transformer unit and impacted the surface areas adjacent to it, the roadway and ditches and the area around the southwest corner of the plant building. The release of mineral oil at GSU-3 was approached and conducted in a similar fashion to the previous cleanup at GSU-1.

#### 2.3 **Previous Site Investigation**

Cardno completed a Site Investigation (SI) at the PC-Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011. Cardno conducted the SI to determine the following:

- If groundwater has been impacted from the mineral oil spill;
- If the large AST used to contain the water collected during excavation activities exceeded any regulatory levels, and;
- If surface water in the stormwater pond has been impacted from the mineral oil spill.

Cardno completed the following activities during the 2011 SI:

- Installed and sampled six temporary monitoring wells placed within the shallow water bearing zone;
- Collected two water samples from the AST at varying depths;
- Collected two surface water samples from the stormwater pond, and;
- Collected three surface soil samples downgradient of the mineral oil spill.

The results of the 2011 SI are summarized as follows:

- One groundwater location (GW-4) had a detection of 1100 μg/L, which exceeded the MTCA Method A Cleanup Level of 500 μg/L for groundwater;
- One AST water sample (TS2) had a detection of 440 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level ;
- One surface water sample (SW1) had a detection of 360 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level, and;
- One soil sample (SG1) had a detection of 160 mg/kg, which did not exceed the MTCA Method A Soil Cleanup Level of 4000 mg/Kg.

Subsequent to the 2011 SI, a follow-up field investigation was undertaken by Cardno in October and November of 2013. These follow-up tasks were conducted after a review of all field efforts and sampling results to date by WADOE VCP staff. VCP identified two hot spots and near GSU#1. PacifiCorp, KTA and WADOE VCP agreed to investigate soil and groundwater in these two areas and characterize the local groundwater flow to determine if the mineral oil released from GSU-1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits. The *Groundwater Investigation Report* (Cardno, 2014) presented data from this effort. Efforts and sampling results contained in this report are summarized below;

Cardno completed the following activities during the 2013 SI:

- Drill, characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-1 thru SB-3 were analyzed for mineral oil.
- Install permanent wells at two of the drilling locations, MW-1 and MW-3. Due to utility interferences, a well was not set at the location for MW-2. These activities took place on October 28 and 29, 2013.
- A (relative) survey of the monitoring well casing elevations was conducted to aid in the determination of groundwater flow direction.
- Sample groundwater from MW-1 and MW-3, via well casing. A one-time groundwater sample was collected at MW-2 during the extraction of the drill rods. These activities took place on November 1, 2013 – except for the MW-2 sample, collected earlier (10/29/2013).

The results of the 2013 SI are summarized as follows:

- One groundwater sample had a detection of Mineral Oil at 380  $\mu$ g/L, which is below the MTCA Method A Cleanup Level for TPH-Dx of 500  $\mu$ g/L.
- There were no detections of Mineral Oil in any of the subsurface soil samples.

# 3 Field Efforts

This section details the field efforts that were employed during the 2015 monitoring well installation and support tasks. These tasks included pre-field mobilization planning / utility clearances, subsurface soil characterization and sampling, monitoring well installation and development, re-development of two existing site monitoring wells, electrical vault water inflow sampling, well casing elevation survey, handling and management of project collected environmental samples and field documentation, and supervision of IDW collection and containment tasks. Any discrepancies between the Work Plan (Cardno, 2015) and field methodologies are also described in this section.

#### 3.1 Pre-Field Mobilization Planning and Utility Clearances

A project Kick-Off (KO) Meeting was held on 13 March, 2015 at PC-Chehalis, WA Plant, satisfying the two-week lead-time requirement for the start of field work. The KO Meeting was attended by the PC Plant Environmental Analyst representative, the KTA Project Manager, the Cardno Project Manager and the Cardno Task Lead. Items discussed in detail at the meeting included; the overall project field schedule, health and safety concerns, site access, utility clearances, final placement of the new monitoring wells, site communications, and other project particulars (e.g. IDW, electrical vault access, etc.).

#### 3.1.1 Safety Orientation Course

A requirement of PC is that all plant personnel, consultants, subcontractors, and vendors attend a company and plant-specific video safety orientation course. This requirement also includes taking and passing an exam of the material covered in the video. This training provides all personnel an opportunity to receive current plant safety information, up-to-date emergency procedures and for site workers to become familiar with the site and associated operational particulars. All project personnel (KTA, Cardno, and associated subcontractors) completed this course and passed the exam prior to initialization of field work activities.

#### 3.1.2 <u>Utility Clearance Event</u>

All drilling locations were cleared for utility contact concerns by PC Chehalis plant staff, a thirdparty, qualified and licensed Utility Locator Contractor (All County Locating Services, Inc.), and the general public locating service, appropriate for Lewis County, WA (e.g. *Call Before U Dig* 800-424-5555 or 811). All County Locating was able to provide the necessary services to locate, map and mark all utilities in the work area of the project site, which include at least: electrical, gas, potable water, fire suppression water, communications, and sewer. The trace of each utility was marked on the ground surface with colored paint or marking whiskers according to the American Public Works Association (APWA) (see Cardno 2015 Work Plan). During this event representatives from PC, KTA and Cardno were present at the site to coordinate activities with the Utility Locator Contractor. All available and reasonable measures were untaken to ensure that plant and public utilities were clearly and accurately marked to protect against encountering these service lines during the planned intrusive subsurface work. Utility clearance tasks also provided a final opportunity for onsite pre-drilling coordination and discussions regarding boring positioning between PC/ KTA and Cardno. Utility clearance documentation is provided in Appendix A.

#### 3.1.3 <u>Health and Safety</u>

A Site Specific Health and Safety Plan (Cardno, 2015) was drafted for the work detailed in the Cardno 2015 Work Plan (Cardno, 2015) and in the contracted Scope of Services. At a minimum this Health and Safety Plan provided emergency contact information, routes to the nearest medical and/or aid facilities and site specific work task and environmental /physical hazard information. Prior to the initiation of any field tasks, a mandatory tailgate safety meeting was conducted each field day. The purpose of these Tailgate Meetings was to review any expected site specific hazards, general task hazards, current / changed site conditions, to receive a brief from PC, to discuss emergency procedures, and to review our daily work / task schedule. Health and Safety Tailgate Forms along with the drilling subcontractor's Daily Work Reports are included in Appendix B.

#### 3.2 Subsurface Soil Characterization and Sampling

Subsurface soils were investigated at three new boring locations during this current investigation. Boring locations are identified as SB-4, SB-5 and SB-6. Positioning of these borings is shown on Figure 1, descriptions are noted below.

- SB-4 is located south-southeast of the extent of soil contamination from the 2013 GSU#3 mineral oil release.
- SB-5 is located on the west side of the perimeter access road, at the northeast corner of the stormwater pond. This location is within the outer extent of the soil contamination from the 2013 GSU#3 mineral oil release. This location is southwest of GSU#3, which is assumed to be in the most likely direct pathway of groundwater flow.
- SB-6 is located west of the maximum extent of the soil contamination from the 2013 GSU#3 mineral oil release, near the PacifiCorp property boundary.

Characterization (logging) of subsurface soil was undertaken during drilling activities at SB's 4, 5 and 6 using a CME-85 hollow stem auger rig mounted on a twin-axle flatbed truck (Rig ID # 1211), provided and operated by Cascade Drilling,L.P. (CDI), of Portland, OR. Borings were drilled using 8.25-inch OD x 4.25-inch ID x 5-foot long hollow stem augers. Soils were collected and logged using Standard Penetration Test methods, driving an 18-inch long x two-inch outside diameter harden steel split barrel sampler down into undisturbed substrate.

In a progressive fashion, subsurface soil was continuously sampled from grade level down to a depth of six feet below grade surface (bgs). At SB-4, subsurface soil was continuously sampled down to 7.5 feet bgs. Then starting at the 10 feet bgs interval, subsurface soil was

logged at five-foot intervals, down to each borings termination depth. Total boring depths ranged from 26.5 feet bgs at SB-5 and SB-6 to 31.5 feet bgs at SB-4.

#### 3.2.1 <u>Lithological Description</u>

Split barrel sampler units from each logging interval were brought to the surface, carefully opened to retain as much lithologic material as possible, thus exposing the core of the recovered soil sample. Stainless steel spoons and/or spatulas were used to laterally dissect the soil cores to permit thorough examination of their contents. Lithological descriptions of unconsolidated subsurface materials contained in each sampler unit were described in accordance with American Society for Testing and Materials (ASTM) D-2488-00 Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) (ASTM, 1990). Descriptive information recorded included (but was not limited to):

- Color (based on Munsell Color System)
- Moisture content
- Identification of the predominate particles size based on the Unified Soil Classification System (ASTM D-2487-98) (Gravel, Sand, Silt, Clay, and organic range of particle sizes);
- Percent of gravel, sand, fines, or all three;
- Description of grading and sorting of coarse particles;
- Particle angularity and shape; and
- Maximum particle size or dimension.
- Separate identification of the Unified Soil Classification System (USCS) group symbols or combinations thereof were assigned to each logged interval.

Additional information recorded on the logs (at least partially) included soil sample information, sample depth indications, percent material recovery (from within sampler units), depth of the water table, SPT "blow counts", caving or sloughing of the borehole, changes in drilling rate, presence of organic materials, well construction information and other noteworthy observation or conditions. Geologic Borehole Logs are included in Appendix C.

#### 3.2.2 Soil Sample Collection

At desired and/or targeted depths from within each soil boring, subsurface material recovered from the split barrel samplers was placed into stainless steel bowls and thoroughly homogenized. Once this material was mixed it was placed directly into pre-labeled, laboratory supplied analytical jars. These jars were then stored in clean insulated coolers containing ice. Soil samples were hand-delivered to the laboratory, Analytical Resources, Incorporated (ARI) in Tukwila, WA. Table 1 provides sample collection information, including parameters, testing methods and number of samples and duplicates.

| Sample<br>Type         | Analytical<br>Parameter | Sample<br>Matrix | Analytical<br>Method | <sup>1</sup> No. of<br>Samples | No. of<br>Duplicates |  |
|------------------------|-------------------------|------------------|----------------------|--------------------------------|----------------------|--|
| Soil Boring<br>Samples | Mineral Oil             | Soil             | NWTPH-Dx             | 3                              | 1                    |  |
|                        | Total Solids            | Soil             | EPA 150.1            | 3                              | 1                    |  |

 Table 1. Soil Sample Collection Information

One subsurface soil sample was collected from each of the three new soil borings. These soil samples were obtained within the zone of continuous sampling (0-6 feet bgs), optimally targeting material from 4-6 feet bgs. This particular depth range was targeted in an attempt to sample soil that had the highest potential of being impacted by the 2013 GSU#3 mineral oil release event. If evidence of mineral oil impacts had been observed deeper in the boring column (below the 4-6 feet bgs range), up to two additional soil samples would have been collected to determine the basal extent of the contamination. To assess the presence of mineral oil contamination within the recovered soil boring material, several field screening methods were employed, including; visual observations, vapor screenings and water sheen tests. No such field evidence of contamination was found in any of the new borings at any depth. Table 2 lists the soil sample IDs, boring ID, sampling depths, and a description of the material and lithologic description for each subsurface soil sample that was collected for analysis.

| Sample ID           | Boring<br>ID | Sample<br>Depth<br>(feet bgs) | Material / Lithologic Description                                                                                                                                                                                                             |  |  |
|---------------------|--------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| SB4-5-040715        | SB-4         | 4.5 - 6                       | Yellowish Brown (10YR 5/4), moist, SILT and silty CLAY, with very fine to fine grain sand and little small-medium pebble size gravel, mottled appearance, no sheen, ML-CL                                                                     |  |  |
| SBDUP-01-<br>040715 | SB-4         | 4.5 - 6                       | Duplicate sample of SB4-5-040715, same material and lithologic description                                                                                                                                                                    |  |  |
| SB5-5-040815        | SB-5         | 4.5 - 6                       | Yellowish Brown (10YR 5/4), moist, silty CLAY, with little medium to very coarse grain sand and small pebble size gravel, mottled appearance, stiff to very stiff, no sheen, CL                                                               |  |  |
| SB6-4-040815        | SB-6         | 3.5 - 5                       | Yellowish Brown (10YR 5/6), very moist to moist, sandy / silty CLAY, with little small-large pebble size gravel and some fine to coarse grain sand, mottled, blackish granular material (~2-3 mm thick) near bottom of interval, no sheen, CL |  |  |

#### 3.3 Monitoring Well Installation and Development

All monitoring well tasks described herein adhered to the Minimum Standards for Construction and Maintenance of Wells set forth on Washington Administration Code (WAC) 173-160 and -162. The drilling Contractor was responsible for securing the required Monitoring Well Start Cards and submitting this information to the WA-DOE.

Three new groundwater monitoring wells, MW-4, MW-5 and MW-6, corresponding to the soil borings listed in Table 2, were installed within the shallow water bearing zone at locations shown on Figure 1. This section describes installation and development of the new project monitoring wells. Re-development of two existing monitoring wells, MW-1 and MW-3, is also discussed.

#### 3.3.1 Monitoring Well Installation and Completion Activities

Final well depths were determined during installation to capture the range of seasonal groundwater levels, to ensure adequate production of water for sampling, and to focus on the groundwater layers that may have been contaminated by the GSU#3 mineral oil release. The 2015 project monitoring wells were all set at a maximum depth of 25.5 feet bgs. At this depth each well was assured to maximize its encounter with the local seasonal groundwater table fluctuations. This depth range will also enabled future sampling of the upper portion of the groundwater aquifer most likely, if at all, impacted by the GSU#3 mineral oil release.

Monitoring well construction details are as follows;

- Each monitoring well was constructed with a six-inch long threaded end cap and 20 feet of two-inch diameter, 0.010-inch (#10 slot) slotted schedule 40 polyvinyl chloride (PVC) threaded screen. Well screens extended from 25 to 5 feet bgs at each 2015 well location.
- 10/20 graded clean (environmental) sand was utilized for filter pack applications at all project wells. Filter pack material was set by manually pouring the sand material through the augers and into the annular space between the outside of the PVC well casing and the soil formation. The filter pack was set according to the screen placement and extended to one foot above the top of the screened interval of the well. For this project, each well's sand filter was set from the boring's terminal depth to within four feet bgs.
- Bentonite was used as both a borehole sealant (as in MW-4, bentonite was used to seal off the bottom of the boring from 31.5 to 26.5 feet bgs) and as a filter pack sealant. A minimum one-foot thick, hydrated bentonite seal was placed atop the upper terminus of the filter pack at each monitoring well. Both pelletized and chipped bentonite was used for sealing applications.
- Redi-Mix concrete was used to seal each well construction. The concrete seal was approximately three feet thick at each well location, was set directly on top of the bentonite filter pack seal and extended to grade surface.

- Traffic rated flush-mounted wellhead access monuments were installed at the surface of each monitoring well. These monuments are 8-inches in diameter with 12-inch long steel skirts which extend down into the concrete borehole seal. Each monument has a removable lid secured into place with bolts. The monuments are surrounded on the surface by small concrete pads, generally not exceeding 24-inches in diameter and at least four-inches thick.
- The top of the PVC casing at each well was neatly trimmed to approximately half the distance between the underside of the monument lid and the top of the concrete seal within the vault. A lockable, water-tight expansion plug was properly fitted onto the top of each well casing. A metal tag, with the official WA-DOE unique Well ID number, was fastened to the upper portion of the well casing, fitting inside the monument vault when the lid is attached. The project well ID number (e.g. MW-4) was clearly stamped on the outside of the monument for future ease of identification. Well Construction Diagrams are presented in Appendix C.

Table 3 provides a summary of monitoring well construction details.

| Well ID | Surface<br>Completion | Total<br>Boring<br>Depth<br>(ft bgs) | Bottom<br>End Cap<br>Depth<br>(ft bgs) <sup>2</sup> | Screen<br>Length<br>(ft bgs) | 10/20<br>Sand Filter<br>Pack<br>(ft bgs) | Bentonite<br>Seal<br>(ft bgs) | Concrete<br>Surface<br>Seal<br>(ft bgs) |

 Table 3
 Monitoring Well Construction Detail

<sup>1</sup> MW-4 was backfilled from 31.5 to 26.5 feet bgs with bentonite. 10/20 Sand was placed from 26.5 to 25.5 feet bgs. <sup>2</sup> Bottom end caps are six inches long and extend from 25.5 to 25 feet bgs.

#### 3.3.2 <u>Monitoring Well Development</u>

A necessary step in preparing for the collection of representative formation water, for accurate water level measurement, for protection of the native formation surrounding the well, and proper continued future operation, is the development of the monitoring well's filter pack. In this process, lithic fines, suspended sediments, and native and non-formation fluids are removed from the filter pack and well casing as completely as possible, while causing the least disturbance or impact to the native formation and in a non-destructive manner to the well screen and filter pack itself.

Newly installed monitoring wells were appropriately developed, removing accumulated sediment and drilling fluids (potable water only, introduced to aid installation and development tasks) from inside of each well casing. Additional volumes of native formation water were also developed through the filter pack and removed. Well development was accomplished using a

combination of surge block tool, submersible pump and bailers. Monitoring wells were developed following U.S. Environmental Protection Agency guidelines (US EPA, 1992).

Development tasks were undertaken after allowing the well seal components (bentonite and concrete sections) ample time to cure, optimally greater than 12 hours. At least three well casing volumes of formation water (sans drilling fluid amount) were extracted during these procedures. Detailed notes of the development event at each well, noting total casing volume, water level, total volumes removed, turbidity assessments and other information are recorded Monitoring Well Development Forms, presented in Appendix D.

#### 3.3.3 <u>Re-Development of Existing Monitoring Wells</u>

Re-development of the two existing site monitoring wells (MW-1 and MW-3), which were installed in October of 2013, was conducted during the same event as the new wells. Accumulated sediment from within the well casing, lithic fines in the filter pack and stagnant groundwater was removed from each well. Development methods similar to those used for the new wells were applied to these pre-existing well locations. Table 4 presents the summary of well development particulars for all 5 site monitoring wells.

| Well<br>ID | Installation<br>Date | Development<br>Method                         | Total<br>Well<br>Casing<br>Depth<br>(ft TOC) | Initial<br>Water<br>Level<br>(ft TOC) | Static<br>Water<br>Column<br>Height<br>(ft) | Well<br>Casing<br>Volume<br>(gal) | Total<br>Volume<br>Removed<br>(gal) | Resultant<br>Turbidity               |

#### 3.4 Electrical Vault Water In-Flow Sampling

It was noted during a site visit in March, 2015 that the electrical utility vaults in the areas adjacent to GSU-1 and GSU-3, and areas in between, were at least partially filled with inflowing stormwater infiltration and groundwater that filled the utility trenches leading to these vaults. Water was seen freely flowing into several of these vaults as they were opened during the utility locating event. Various electrical vaults in the vicinity of the GSUs are shown on Figure 2.

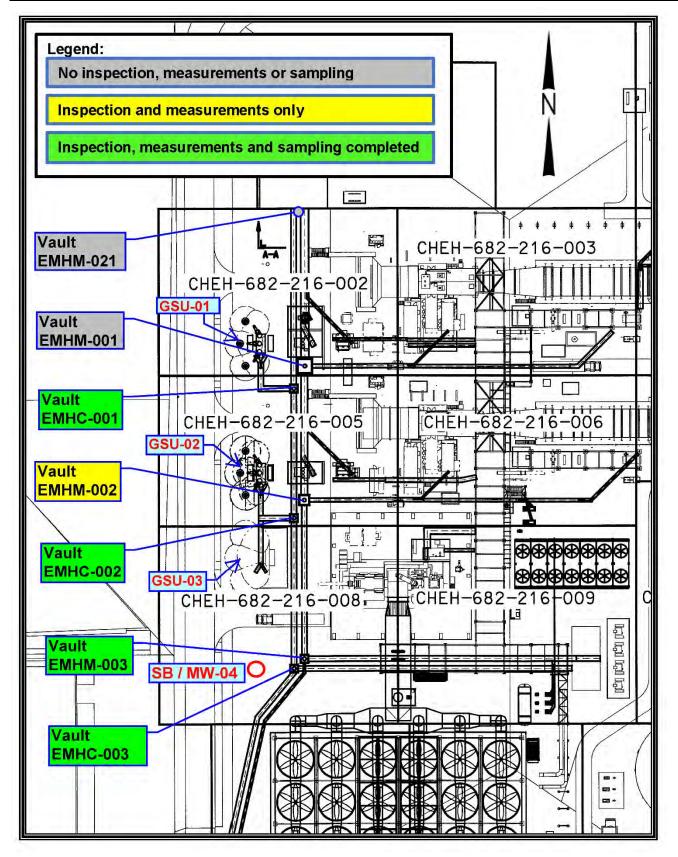

Figure 2. Electrical Vault Locations

The electrical vaults are equipped with submersible pumps to keep the in-flow water levels to a pre-set maximum before discharging their contents further downstream. Several of the vaults are connected to other vaults. In turn, pumps at certain vaults are then connected to piping that discharges to the main stormwater drainage ditches running along the western boundary of the GSUs.

Water inflow to the electrical vaults may have been impacted by the mineral oil releases from GSU#3 and GSU#1. Discussion about this water inflow was conducted between the representatives of PC, KTA and Cardno, resulting in a decision to collect and analyze water samples from select vaults. Water level measurements, visual inspections and samples were collected from four vaults (EMHC-001, EMHC-002, EMHM-003 and EMHC-003) via bailer grab methods. Water level measurements and visual inspections (only) were collected at vault EMHM-002. Two other vaults were considered, but ultimately not inspected or sampled. EMHM-021 was too far beyond and too far upgradient from the footprint of the mineral oil impact area. EMHM-001 is connected and drains to the adjacent vault, therefore its contents were represented by the sample from EMHC-001.

The following methods were used to characterize the contents of the vault in-flow water;

- Visual inspections of the vault water was completed to assess the presence of an oil sheen

   which may be indicative of impacts from mineral oil releases.
- Direct measurements of hydrocarbon presence, hydrocarbon thickness, water level and vault depth were collect with an Interface Probe.
- Water collection via grab methods were conducted using certified clean, single use, disposable polyethylene bailers. Vault in-flow water samples were submitted to ARI for analytical testing via NWTPH-Dx to assess the concentration of mineral oil.

Notes on visual inspections of the vaults, in particular the presence of any sheens or oil globules, were made in the field notebook. Field Logbook Entries are included in Appendix E. Table 5 lists the vault measurement details and sample collection information.

| Vault ID | Depth to<br>Product<br>(ft) | Depth to<br>Water (ft) | Total Vault<br>Depth (ft) | Water<br>Column<br>Height (ft) | Visual<br>Sheen<br>Noted<br>(Y/N) | Sample<br>Collected<br>for<br>Analysis | Duplicate<br>Sample<br>Collected |

#### 3.5 Well Casing Elevation Survey

An elevation survey that collected measurements of the top of the PVC casings at each monitoring well was conducted. An auto-level and hand held survey grade stadia rod were used to collect these elevation measurements. An elevation of 100.00' was assigned to a reference point on the southwest corner of the containment wall surrounding GSU-1. A mark was placed on the top of the wall as close to the corner as possible. This is the same reference location used during the 2013 survey event. Table 6 presents the data collected during the site survey.

| Location                         | Top PVC Casing<br>(ft amsl) | Backshot at start of<br>survey event (ft) | Backshot at end of<br>survey event (ft) |  |  |  |
|----------------------------------|-----------------------------|-------------------------------------------|-----------------------------------------|--|--|--|
| SW corner GSU-1 containment wall | 100.00 <sup>1</sup>         | 3.13                                      | 3.13                                    |  |  |  |
| MW-1                             | 97.76                       | 5.37                                      | 5.37                                    |  |  |  |
| MW-3                             | 97.57                       | 5.56                                      | 5.57                                    |  |  |  |
| MW-4                             | 97.64                       | 5.49                                      | 5.49                                    |  |  |  |
| MW-5                             | 97.08                       | 6.05                                      | 6.05                                    |  |  |  |
| MW-6                             | 96.18                       | 6.96                                      | 6.95                                    |  |  |  |

#### Table 6. Monitoring Well Survey Data

<sup>1</sup>All elevations are referenced to the top of the SW corner of the GSU-1 containment wall. The location was assigned an elevation of 100.00' above mean sea level.

#### 3.6 Sample Management, Field Documentation and Quality Assurance

This section discussed procedures used to handle and manage the environmental samples collected for laboratory analysis. Field documentation and project quality assurance methods are also detailed.

#### 3.6.1 Sample Handling Procedures

After samples were collected into laboratory supplied containers, they were appropriately labeled and iced in coolers. This was done to keep the samples out of the direct sunlight and to maintain a temperature of four degrees centigrade. Disposable nitrile gloves were used by

personnel collecting and handling all samples. Gloves were changed frequently and in between each sample collection to avoid cross contamination.

Chain of Custody (CoC) forms will be completed to accompany each cooler shipment from the field to the laboratory. Date, time, sample identification, number of containers, and analysis to be performed will be recorded on each CoC. Samples were hand delivered by Cardno staff to ARI of Tukwila, WA at the conclusion of the sampling event. CoC records are included in Appendix F.

#### 3.6.1.1 Sample Identification and Labeling

Samples were identified by their media type, location and the corresponding date a sample was collected. Any quality control samples (e.g. duplicates) were also be denoted. Soil samples were further designated with their collection depth. Sample identification numbers, including sample media type, location number, media and depths were recorded on field sheets completed for each location or sample.

#### 3.6.2 Field Documentation

A logbook was used to document sampling and other support procedures performed during field activities. More specifically, the Field Activities Logbook entries provide a record of specific sample locations and collection information, subcontractor activities, noting their role(s), describing the major equipment used at each sampling location and providing noteworthy observations, description of problems, or incidents and their resolutions. Completed field forms, planning and safety documents and the Field Activities Logbook were all stored in a weather-proof file box, maintained on site, during all project work activities. Field Activity Logbook entries and field forms used for recording and detailing utility locates, health and safety tailgate information, soil boring and logging, well construction and well development activities are included in various appendices, as noted in previous sections of this MWIR.

#### 3.6.3 **Quality Assurance Methods**

#### 3.6.3.1 Instrument Calibration

All field instruments that require a zeroing and/or a user calibration will be appropriately calibrated at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards will be performed at the beginning and periodically throughout each field day to verify equipment operation. Any calibration data was recorded in the field logbook. All calibration media (e.g. gas, liquid or otherwise) was properly stored and managed per manufacturer's recommendations and according to applicable PC Plant requirements.

#### 3.6.3.2 Decontamination Procedures

Any non-disposable equipment (except rigs, vehicles and large drilling equipment such as auger flights) that had not been previously decontaminated and ready for project use, or was exposed to site soils, groundwater or other non-sample media contact and slated for re-use at

multiple sample locations was decontaminated prior to its initial use and after completing a particular sampling or logging task. Decontamination wash consisted of the following:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and
- > De-ionized water rinse.
- > Drilling rigs, support vehicles, drill works, connection rods, augers and other large pieces of equipment were decontaminated by power washing with a high-pressure steam cleaner only as described in Section 4 of the 2015 Project Work Plan (Cardno, 2015).

#### 3.7 Investigation Derived Waste

Investigation-derived waste (IDW) generated by this project consisted of soil cuttings, excess groundwater generated during development and decontamination/rinse (steam cleaner washer) water. All IDW was containerized in Department of Transportation (DOT)-17H approved open head 55-gallon drums. All drums were properly labeled with their media contents, date of generation, location of origin, and contents' owner.

Waste streams were segregated by media, drummed, sealed and placed on pallets. Pallets of soil cuttings and development water drums were generally placed adjacent to their boring / well locations of origin. Decontamination water drums were placed on a common pallet within the project work site. Approximately 19 drums of IDW were generated during this project; these included 12 soil cuttings and seven decontamination / development water containers.

All drum/pallet placements were approved by the PC Environmental Analyst and stored wholly within PacifiCorp property. After properly containing, palletizing, and labeling the drums, all additional IDW tasks, including testing, further staging, manifesting and disposal is being managed directly by PacifiCorp. No IDW was transported off of the site by Cardno or the drilling Contractor.

#### 3.8 **Project Work Plan Discrepancies**

There were no significant or substantive changes, modifications, or revisions between the Project Work Plan (PWP) (Cardno, 2015) and the actual field tasks as performed. Methodologies as described in the PWP were followed to completion.

# 4 Analytical Results

This section summarizes the results of the subsurface soil and electrical vault water inflow sampling activities completed at the PacifiCorp Chehalis Plant. Samples were analyzed for mineral oil using Northwest methods for total petroleum hydrocarbons – diesel extended range (NWTPH-Dx). These results are compared to the appropriate WA DoE MTCA Cleanup Levels (WAC 173-340) and related stormwater benchmark values. The complete analytical report, including the CoC forms and electronic data deliverable table, are included in Appendix F.

#### 4.1 Comparison of Project Results to Regulatory Guidance

For assessment of subsurface soil samples, project analytical data are compared to values listed for WA DoE MTCA Method A Cleanup Levels for Unrestricted Soil Land Uses (WAC 173-340-740). Under this method Mineral Oil concentrations in soil of **4,000 mg/Kg** or less are acceptable (2,000 mg/Kg for other Dx components) (see parameter table listed under WAC 173-340-900). The definition of mineral oil under this section of MTCA means non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors, measured using NWTPH-Dx. The cleanup level is based on preventing the accumulation of free product on the groundwater, as described in WAC 173-340-747 (10). Additional PCB testing requirements of this section do not apply because PacifiCorp can demonstrate that: (1) The release originated from an electrical device that was manufactured after July 1, 1979; and (2) oil containing PCBs was never used in the equipment suspected as the source of the release.

Electrical vault inflow water analytical data are compared to permissible values from two sets of regulatory guidance. Mineral oil concentrations in vault water samples data are compared to values listed for MTCA Method A Cleanup Levels for Groundwater (WAC 173-340-720) and to benchmark values listed for the USEPA Industrial Stormwater General Permit (ISGP) with certain Standard Industrial Classification (SIC) codes related to Total Petroleum Hydrocarbon concentrations.

Similar to the MTCA soil requirements, mineral oil for groundwater assessment is defined as non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors measured using NWTPH-Dx. The MTCA Method A Groundwater Cleanup Level of **500 µg/L** is based on protection from noncarcinogenic effects during drinking water use. Additional PCB testing requirements listed under the MTCA groundwater section (173-340-720) do not apply to project sampling for the same reasons as listed above in the soil discussion.

PC's Chehalis, WA plant has an ISGP and is identified with SIC code of 4911. This SIC classification requires only standard monitoring (pH, metals, turbidity) and quarterly checks for visible oil sheen per Section 5 "*BENCHMARKS, EFFLUENT LIMITATIONS, AND SPECIFIC SAMPLING REQUIREMENTS, A. Benchmarks and Sampling Requirements,* Table 2. Benchmarks and Sampling Requirements Applicable to All Facilities. However, facilities with

SIC codes that make Section 5B, "Additional Sampling Requirements for Specific Industrial Groups", relevant and applicable are subject to additional sampling requirements. Facilities listed under the SIC codes for Primary Metals, Metal Mining, Automobile Salvage, Scrap Recyclers, Metal Fabricating, Hazardous Waste TSD facilities and Dangerous Waste Recyclers, Air Transportation and Transportation need to analyze stormwater samples for NWTPH-Dx. The benchmark for NWTPH-Dx per Table 3, Additional Benchmarks and Sampling Requirements Applicable to Specific Industries, is **10,000 µg/L**. Although PacifiCorp's ISGP SIC code is not included among those facility types listed above, the 10,000 µg/L benchmark for TPH could be referenced as a conservative concentration, which is relevant as an acceptable level of TPH in stormwater discharges from the electrical vaults at the PC Chehalis Plant.

#### 4.2 Subsurface Soil Sampling Results

Three subsurface and one duplicate (duplicate of SB-4) soil samples were submitted to the laboratory for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Motor Oil (heavy oil, residual range organics or RRO). DRO quantitation was noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation was noted on chromatograph peaks in the range from C16 to C28. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

SB-5 showed the only reportable detection of TPH, at 6.7 mg/Kg for DRO. There were no reportable detections of Mineral Oil in any of the soil samples. The SB-5 soil sample was collected at a depth of five feet bgs. The DRO detection was well below the MTCA Method A Soil Cleanup Level of 2,000 mg/Kg. Soil sampling results are presented in Table 7.

| Sample ID       | Parameter   | Detection Limit<br>mg/Kg | Reporting<br>Limit mg/Kg | Result Value<br>mg/Kg | Data<br>Qualifier |
|-----------------|-------------|--------------------------|--------------------------|-----------------------|-------------------|
| SB4-5-040715    | DRO         | 1.8                      | 6.8                      | 6.8                   | U                 |
| SB4-5-040715    | Mineral Oil | 0                        | 14                       | 14                    | U                 |

#### 4.3 Electrical Vault In-Flow Water Sampling Results

Four electrical vault in-flow water samples, along with one duplicate (duplicate from EMHC-002) were submitted to the laboratory for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Motor Oil (heavy oil, residual range organics or RRO). DRO quantitation was noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation was noted on chromatograph peaks in the range from C18 to C28. RRO quantitation was noted on chromatograph peaks in the range from C18 to C28. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

DRO was noted in the accumulated in-flow water at EMHC-003 (120  $\mu$ g/L), EMHC-002 (110  $\mu$ g/L), and in the EMHC-002 Duplicate (110  $\mu$ g/L). DRO detections at these vaults were below the MTCA Method A Groundwater Cleanup Level of **500**  $\mu$ g/L. There were no reportable detections of Mineral Oil identified at any of these locations.

Detections of DRO, Mineral and RRO were noted at EMHC-001 at 1900  $\mu$ g/L, 1300  $\mu$ g/L and 320  $\mu$ g/L, respectively. The RRO concentration was below the MTCA Method A Groundwater Cleanup Level of **500**  $\mu$ g/L. Although the DRO and Mineral Oil concentrations exceed the MTCA groundwater cleanup level threshold, they are well below the **10,000**  $\mu$ g/L ISGP Stormwater Benchmark for TPH. Electrical vault in-flow water sampling results are presented in Table 8.

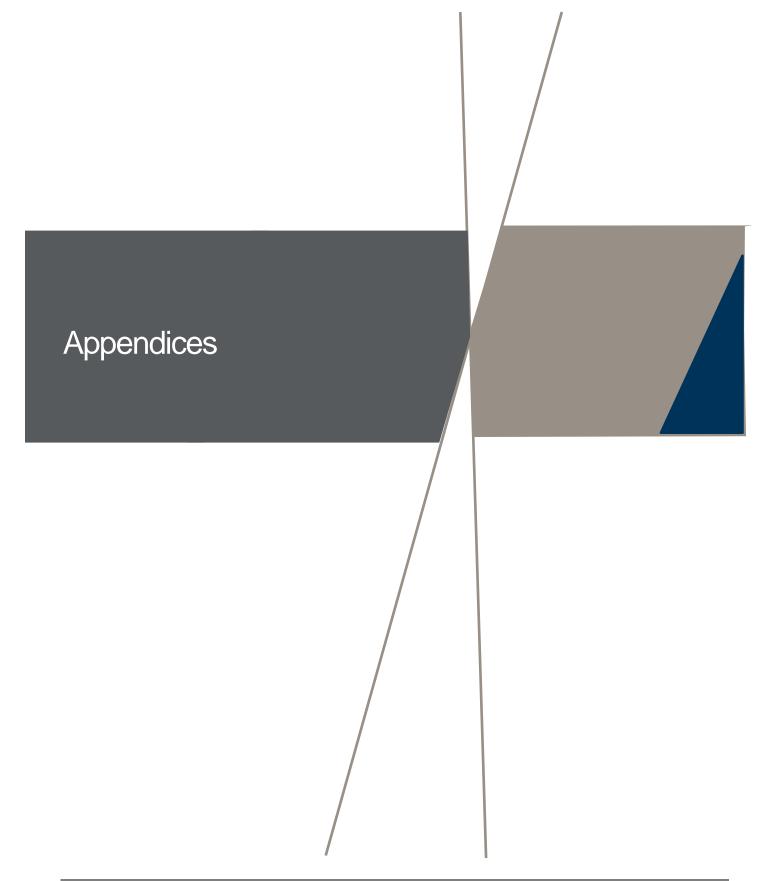

| Sample ID     | Parameter   | Detection Limit<br>µg/L | Reporting<br>Limit µg/L | Result Value<br>µg/L | Data<br>Qualifier |
|---------------|-------------|-------------------------|-------------------------|----------------------|-------------------|
| EMHC003-Vault | DRO         | 20                      | 100                     | 100                  | U                 |
| EMHC003-Vault | Mineral Oil | 0                       | 200                     | 200                  | U                 |
| EMHC003-Vault | RRO         | 0                       | 200                     | 200                  | U                 |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | JUL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 1
