                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

15 April 2015

### RE: Client Project: PacifiCorp-Chehalis

Dear Lenora:

Please find enclosed the original chain of custody record and the final results for the samples from the project referenced above. Four soil samples and five water samples were received on April 9, 2015. The samples were analyzed foe NWTPH-Dx as requested.

There were no problems associated with these analyses.

A copy of these reports will remain on file at ARI. Should you have any questions or need additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

70. C. Daus

Mark D. Harris Project Manager 206/695-6210 markh@arilabs.com

## Data Reporting Qualifiers

Effective 12/31/13

### Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- \* Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but  $\geq$  the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

## **Organic Data**

- U Indicates that the target analyte was not detected at the reported concentration
- \* Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Analytical Resources, Incorporated Analytical Chemists and Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (Dioxin/Furan analysis only)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (Dioxin/Furan analysis only)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (Dioxin/Furan analysis only)

Analytical Resources, Incorporated Analytical Chemists and Consultants

## **Geotechnical Data**

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

Reported in mg/L (ppm)

EFV-Effective Final Volume in mL. DL-Dilution of extract prior to analysis. RL-Reporting limit.

Diesel range quantitation on total peaks in the range from C12 to C24. Mineral Oil range quantitation on total peaks in the range from C18 to C28. Motor Oil range quantitation on total peaks in the range from C24 to C38. HC ID: DRO/RRO indicates results of organics or additional hydrocarbons in ranges are not identifiable.

### 1 Introduction

#### 1.1 **Purpose and Objective**

Cardno was contracted by KTA Associates, Inc. (KTA) to conduct a site investigation that included an assessment of potential impacts to subsurface soil and shallow groundwater within certain areas at PacifiCorp (PC)'s Chehalis, WA power plant that were previously exposed to Mineral Oil releases in 2011 and 2013. These releases were due to malfunctions with the plant's Generator Step-up Unit (GSU)s #1 and #3. Mineral Oil is used as insulting fluid in these GSUs.

The primary objective of this project is to determine if any residual impacts from Mineral Oil exposure exists in the subsurface soil and shallow groundwater at concentrations above the Washington Department of Ecology's (WADOE) Model Toxics Control Act (MTCA) regulatory limits. Site investigation activities are being conducted under the WA DoE's Voluntary Cleanup Program (VCP).

This project is divided into two main phases. The first phase included monitoring well installation, in conjunction with various support tasks. The outcome of soil boring / monitoring well installation activities and associated environmental sampling results are included within the *Monitoring Well Installation and Support Tasks Report (MWIR)* (Cardno, May 2015).

The second phase of this project involves groundwater monitoring, conducted on a quarterly basis, including events scheduled for April, June-Sept, December 2015 and March 2016. Groundwater Monitoring Report (GWMR)s, detailing field methods, water level measurements, groundwater table elevations, flow direction assessment and sampling results will be drafted as appropriate and submitted to KTA under separate covers. All field efforts for this first quarterly groundwater monitoring effort were conducted on 15 April, 2015.

#### 1.2 Scope of Work

To meet the above stated objectives, the scope of work for quarter groundwater monitoring consisted of the following field activities:

- Coordination of pre- (field) mobilization tasks.
- Collection of static groundwater level measurements.
- Sampling of five groundwater monitoring wells.
- Handling of project collected environmental samples.
- Documentation of field activities. and,
- Containment of investigation derived waste (IDW).

Prominent site features and well locations are shown on Figure 1.

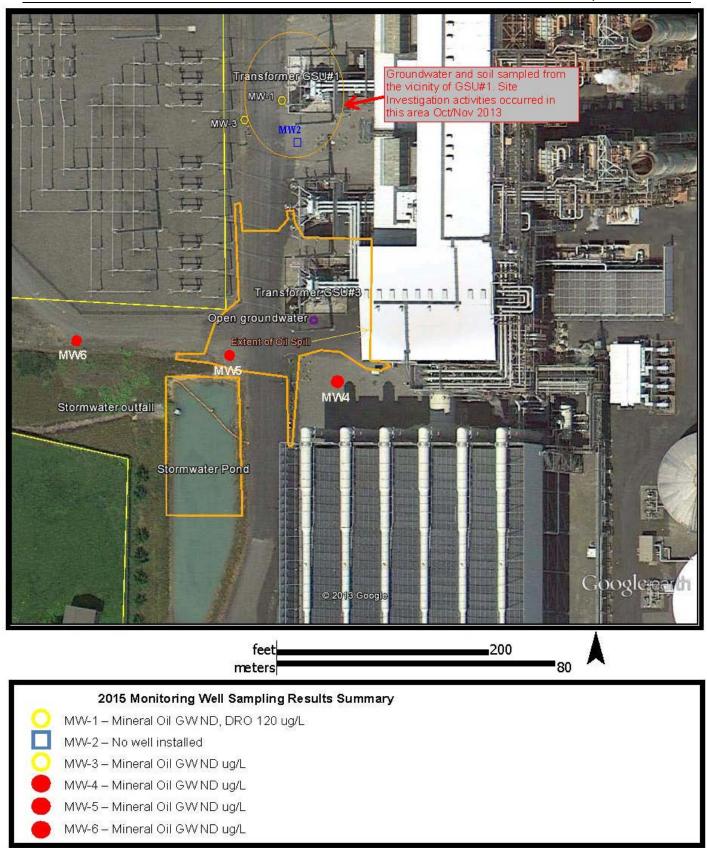

#### 1.3 Report Organization

This GWMR is organized into the following sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Field Efforts
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions regarding the procedures and methods utilized for the groundwater monitoring tasks and subsequent results of the data collected are presented in the main text of this GWMR report. Health & Safety Tailgate Forms, Monitoring Well Sampling and Water Quality Measurement Forms, Field Notebook entries, and Laboratory Chain-of-Custody Forms / Analytical Report are presented as Appendices A through D, respectively.

Groundwater Monitoring Report 1<sup>st</sup> Quarterly Event – April 2015 PacifiCorp Chehalis Plant

#### Figure 1. Site Map with Monitoring Well and Prominent Features

### 2 Site Background

#### 2.1 Site Description

PacifiCorp owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

#### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

#### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semiconfined aquifer, primarily due to the low permeably silt cap immediately above the aquifer.

#### 2.2 Previous Mineral Oil Releases and Site Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the PC Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing impacted material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near GSU-1, the first plant transformer that caught fire and subsequently released mineral oil to the surrounding areas. Impacted soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual).

During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the GSU-1 transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to the on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

Most recently, GSU-3 experienced a similar malfunction in late 2013 to the one that occurred at GSU-1 in early 2011. Consequently, this malfunction caused the release of mineral oil around the base of the transformer unit and impacted the surface areas adjacent to it, the roadway and ditches and the area around the southwest corner of the plant building. The management of the release of mineral oil at GSU-3 was approached by PC and conducted by CCS in a similar fashion to the previous cleanup at GSU-1.

#### 2.3 **Previous Site Investigations**

Cardno completed a Site Investigation (SI) at the PC-Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011. Cardno conducted the SI to determine the following:

- If groundwater has been impacted from the mineral oil spill;
- If the large AST used to contain the water collected during excavation activities exceeded any regulatory levels, and;
- If surface water in the stormwater pond has been impacted from the mineral oil spill.

Cardno completed the following activities during the 2011 SI:

- Installed and sampled six temporary monitoring wells placed within the shallow water bearing zone;
- Collected two water samples from the AST at varying depths;
- Collected two surface water samples from the stormwater pond, and;
- Collected three surface soil samples downgradient of the mineral oil spill.

The results of the 2011 SI are summarized as follows:

- One groundwater location (GW-4) had a detection of 1100 μg/L, which exceeded the MTCA Method A Cleanup Level of 500 μg/L for groundwater;
- One AST water sample (TS2) had a detection of 440 µg/L, which did not exceed the MTCA Method A Cleanup Level;
- One surface water sample (SW1) had a detection of 360 µg/L, which did not exceed the MTCA Method A Cleanup Level, and;
- One soil sample (SG1) had a detection of 160 mg/kg, which did not exceed the MTCA Method A Cleanup Level of 4000 mg/Kg.

Subsequent to the 2011 SI, a follow-up field investigation was undertaken by Cardno in October and November of 2013. These follow-up tasks were conducted after a review of all field efforts and sampling results to date by WADOE VCP staff. VCP identified two hot spots and near GSU#1. PacifiCorp, KTA and WADOE VCP agreed to investigate soil and groundwater in these two areas and characterize the local groundwater flow to determine if the mineral oil released from GSU-1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits. The *Groundwater Investigation Report* (Cardno, 2014) presented data from this effort. Efforts and sampling results contained in this report are summarized below;

Cardno completed the following activities during the 2013 SI:

- Drill, characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-1 thru SB-3 were analyzed for mineral oil.
- Install permanent wells at two of the drilling locations, MW-1 and MW-3. Due to utility interferences, a well was not set at the location for MW-2. These activities took place on October 28 and 29, 2013.
- A (relative) survey of the monitoring well casing elevations was conducted to aid in the determination of groundwater flow direction.
- Sample groundwater from MW-1 and MW-3, via well casing. A one-time groundwater sample was collected at MW-2 during the extraction of the drill rods. These activities took place on November 1, 2013 – except for the MW-2 sample, collected earlier (10/29/2013).

The results of the 2013 SI are summarized as follows:

- One groundwater sample (MW-2) had a detection of Mineral Oil at 380 μg/L, which is below the MTCA Method A Cleanup Level for TPH-Dx of 500 μg/L in groundwater.
- There were no detections of Mineral Oil in any of the subsurface soil samples.

Following the release of Mineral Oil from GSU#3 in November 2013 and associated site cleanup efforts, PacifiCorp continued its environmental protection efforts in conjunction with their ongoing VCP actions. Through cooperative agreements between PC and WA DoE, a site investigation similar to those previously designed by KTA and Cardno was implemented in the areas adjacent to and downgradient from GSU#3. Results of subsurface soil and electrical vault in-flow water testing are presented in the *MWIR* (Cardno, May 2015). These SI efforts were undertaken on April 7-15, 2015.

Cardno completed the following activities during the 2015 SI:

- Characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-4 thru SB-6 were analyzed for NWTPH-Dx / Mineral Oil.
- Install permanent wells at all three 2015 boring locations. These wells are MW-4, MW-5 and MW-6. The three new wells, along with the two previous wells (MW-1 and MW-3) were developed / re-developed. These activities took place on April 7 9, 2015.
- A (relative) elevation survey of the monitoring well casings was conducted to aid in the determination of groundwater flow direction. This was completed on April 15, 2015.
- A one-time sampling event was completed to test in-flow water within four deep electrical vaults adjacent to GSU's #1 and #3. Water samples from these vaults was submitted for NWTPH-Dx / Mineral Oil. These activities took place on April 7, 2015.

The Results presented in the MWIR are summarized as follows:

- Soil from a depth of 5' bgs collected at SB5 had a detection of DO at 6.7 mg/Kg, which is below the MTCA Method A Soil Cleanup Level of 4,000 mg/Kg.
- EMHM003 had a detection of DRO at 120  $\mu$ g/L, which is below the MTCA Method A Groundwater Cleanup Level of 500  $\mu$ g/L.
- EMHC002 and its Duplicate (DUP-vault) had detections of DRO at 110 μg/L μg/L, which is below the MTCA Method A Groundwater Cleanup Level of 500 μg/L.
- EMHC001 had detections of DRO, Mineral Oil and RRO at 1900 μg/L, 1300 μg/L and 320 μg/L, respectively. DRO and Mineral Oil detections exceed MTCA Method A Groundwater Cleanup Level, but are, comparatively, below the 10,000 μg/L ISGP Stormwater Benchmark for TPH.

### 3 Field Efforts

Section 3 details the field efforts that were employed during the April 2015 quarter groundwater sampling event and support tasks. These tasks included pre-field mobilization planning, collection of static groundwater level measurements, sampling of five monitoring wells, handling of project collected environmental samples, documentation of field activities and containment of IDW. Any discrepancies between the *Groundwater Investigation and Quarterly Monitoring Work Plan 2015/2016* (Cardno, April 2015) and the actual field methodologies are also described in this section.

#### 3.1 Pre-Field Mobilization Planning

The April 2015 quarterly groundwater monitoring was scheduled for and conducted on April 15, 2015. Cardno coordinated the scheduling of this event with PC and KTA staff to minimize any logistical impacts to the yearly plant maintenance outage. This scheduled had been discussed and approved during the planning phase and at the Kick-Off Meeting held on 13 March, 2015. Pre field mobilization items considered also included health and safety concerns, coordination with the analytical testing facility and reservation / ordering / procurement / rental of all necessary field sampling equipment, monitoring instruments, personal protective equipment, and field consumables.

Within several days prior to initiation of groundwater sampling, Cardno was in direct contact with the PC Environmental / Safety Analyst, Project Manager to finalize event coordination, site access and to receive the latest health & safety and site condition reports. The laboratory was consulted during this period and an order was placed for the sampling containers, as wells as other necessary laboratory supplies. Cardno retrieve the containers and supplies directly from the laboratory during the mobilization to the site.

#### 3.1.1 <u>Health and Safety</u>

A Site Specific Health and Safety Plan was drafted for the groundwater sampling events and is included in the Cardno 2015 Work Plan (Cardno, April 2015). At a minimum this Health and Safety Plan provides emergency contact information, routes to the nearest medical and/or aid facilities and site specific work task and environmental /physical hazard information. Prior to the initiation of any field tasks, a mandatory tailgate safety meeting is conducted each field day. The purpose of these Tailgate Meetings is to review any expected site specific hazards, general task hazards, current / changed site conditions, to receive a briefing from PC, to discuss emergency procedures, and to review our daily work / task schedule. Health and Safety Tailgate Forms are included in Appendix A.

#### 3.2 Groundwater Level Measurements and Flow Direction Assessment

Prior to sample collection, each monitoring well was opened and its expansion plug was removed. Ample time was allotted for each well to equilibrate to the current ambient air pressure. An electronic interface probe was used to measure both the presence/thickness of any accumulated free-phase hydrocarbon product and the distance from the edge of the well casing to the surface of the water table (static water level) within each monitoring well.

The SW corner of the GSU-1 containment wall was assigned an elevation of 100.00 feet above mean-sea level. Water level measurements were subtracted from their relative well casing elevations to calculate the (relative) elevation of the groundwater table beneath each well location. MW-1 is the high point at 93.49 feet and MW-6 is the low point at 91.11 feet above mean-sea level. Once the groundwater table elevations where calculated at each well, groundwater contours were constructed and groundwater flow direction was assessed. Based on assessment of the groundwater table elevations and the derived water table contours, the groundwater at the site appears to flow east to west and bends sharply to the south-southwest.

Table 1 lists the well casing elevations, depth to product, static water level measurements and groundwater elevations calculated for this quarterly event. Figure 2 shows the generalized groundwater flow direction.

| Location                         | Top PVC Well<br>Casing<br>(ft amsl) | Depth to Product<br>(ft) | Static Water Level<br>Measurements (ft) | Groundwater<br>Elevation (ft amsl) |
|----------------------------------|-------------------------------------|--------------------------|-----------------------------------------|------------------------------------|
| SW corner GSU-1 containment wall | 100.00 <sup>1</sup>                 | Not Detected             | NA                                      | NA                                 |
| MW-1                             | 97.76                               | Not Detected             | 4.27                                    | 93.49                              |
| MW-3                             | 97.57                               | Not Detected             | 5.03                                    | 92.54                              |
| MW-4                             | 97.64                               | Not Detected             | 4.90                                    | 92.74                              |
| MW-5                             | 97.08                               | Not Detected             | 4.98                                    | 92.10                              |
| MW-6                             | 96.18                               | Not Detected             | 5.07                                    | 91.11                              |

 Table 1. Water Level Measurements and Groundwater Elevations

<sup>1</sup>All elevations are referenced to the top of the SW corner of the GSU-1 containment wall. The location was assigned an elevation of 100.00' above mean sea level (amsl).

#### 3.3 Groundwater Sampling

Groundwater sampling events are scheduled for completion on a quarterly basis. This first event was completed on April 15, 2015. Subsequent events are tentatively planned for 3<sup>rd</sup> quarter 2015 (July – September), 4<sup>th</sup> quarter 2015 (December) and mid-late 1<sup>st</sup> quarter 2016

(February-March). Groundwater sampling activities were conducted using U.S. Environmental Protection Agency Low-Flow Sampling Techniques and WA Department of Ecology accepted methodology. Monitoring wells at the PC-Chehalis Plant were sampled and analyzed for mineral oil using the total petroleum hydrocarbons – diesel extended range (TPH-Dx) method. Monitoring well locations are presented on Figure 1.

Prior to sampling, all five site monitoring wells were properly and effectively developed / redeveloped on April 9, during the 2015 SI field event. All monitoring wells were allowed to settle and equilibrate for at least three days prior to sampling activities. Well construction and development details are included in the MWIR (Cardno, May 2015).

A peristaltic pump with dedicated platinum-cured Tygon® tubing, connected to dedicated, Teflon®-lined polyethylene tubing, was used to purge and to obtain groundwater samples at each well location using low-flow sampling techniques (where pumping rates are matched to achieve minimal drawdown of the water column during pumping). Monitoring wells were purged until water quality readings had stabilized or a maximum of three casing volumes had been removed. Water quality parameter measurements were recorded during sample purging (stabilization assessment) and included: specific conductivity, temperature, pH, dissolved oxygen (DO) and turbidity. A summary of the collected water quality measurements are presented in Table 2.

Samples were collected from the mid-screen depth or from the middle of the existing water column, whichever of these two scenarios is the deepest level. Table 3 lists water sample information, including parameters, testing methods and number of samples and duplicates. Sampling and water quality information collected at each well includes purge rate, water level, parameter measurements and cumulative volume of groundwater purged from well at each well volume interval. Monitoring Well Sampling and Water Quality Measurement Forms are include in Appendix B.

| Well ID | Date /<br>Sample<br>Time | Average<br>Purge<br>Rate<br>(ml/min) | Total<br>Purge<br>Volume<br>(gal) | Temp.<br>(C°) | рН   | Sp. Cond<br>(µS/cm) | Turbidity<br>(NTU) | Dissolved<br>Oxygen<br>(mg/L) |

#### Table 3. Groundwater Sample Collection Information

#### 3.4 Sample Handling, Field Documentation and Quality Assurance

This section discussed field documentation and procedures used to handle and manage the environmental samples collected for laboratory analysis. Project quality assurance methods are also detailed.

#### 3.4.1 Field Documentation

A logbook was used to document sampling and other support procedures performed during field activities. More specifically, the Field Activities Logbook entries provide a record of specific sample locations and collection information, any subcontractor activities, noting their role(s), describing the major equipment used at each sampling location and providing noteworthy observations, description of problems, or incidents and their resolutions. Completed field forms, planning and safety documents and the Field Activities Logbook were all stored in a weather-proof file box, maintained on site, during all project work activities. Field Activity Logbook entries are included in Appendix C.

#### 3.4.2 Sample Handling Procedures

After samples were collected into laboratory supplied containers, they were appropriately labeled and placed on ice within insulated coolers. This was done to keep the samples out of the direct sunlight and to maintain a temperature of four degrees centigrade. All project samples were hand-delivered to the contracted laboratory, Analytical Resources, Incorporated (ARI) laboratory in Tukwila, WA.

Disposable nitrile gloves were used by personnel collecting and handling all samples. Gloves were changed frequently and in between each sample collection to avoid cross contamination.

#### 3.4.2.1 Sample Identification, Labeling and Chain of Custody

Samples were identified by their location and corresponding date of collection. Any quality control samples (e.g. duplicates) were also properly denoted. Sample identification numbers, including sample media type, location number, and other pertinent descriptions were recorded on field sheets completed for each location and sample.

Chain of Custody (CoC) forms, detailing sample container, collection and possession information, were completed and accompanied each cooler shipment from the field to the laboratory. Date, time, sample identification, number of containers, analysis to be performed, and sampler/s in possession were recorded on each CoC. CoC records are included in Appendix D.

#### 3.4.3 Quality Assurance Methods

#### 3.4.3.1 Instrument Calibration

All field instruments that required a zeroing and/or a user calibration were appropriately calibrated at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards were performed at the beginning and periodically throughout each field day (if necessary / required) to verify equipment operation. Any calibration data was recorded in the field logbook. All calibration media (e.g. gas, liquid or otherwise) was properly stored and managed per manufacturer's recommendations and according to applicable PC Plant requirements.

#### 3.4.3.2 Decontamination Procedures

Any non-disposable equipment (except rigs, vehicles and large drilling equipment such as auger flights) that had not been previously decontaminated and ready for project use, or was exposed to site soils, groundwater or other non-sample media contact and slated for re-use at multiple sample locations was decontaminated prior to its initial use and after completing a particular sampling or logging task. Decontamination wash consisted of the following:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and
- > De-ionized water rinse.
- > Drilling rigs, support vehicles, drill works, connection rods, augers and other large pieces of equipment would be decontaminated by power washing with a high-pressure steam cleaner only as described in Section 4 of the 2015 Project Work Plan (Cardno, April 2015).

#### 3.5 Investigation Derived Waste

Investigation-derived waste (IDW) generated during this quarterly groundwater sampling event consisted of excess groundwater purge and decontamination/rinse water. All IDW was containerized in Department of Transportation (DOT)-17H approved open head 55-gallon drums. Drums were properly labeled with their media contents, date of generation, location of origin, and contents' owner. All drums were sealed with fitted, gasketed lids and bolted bands, then placed on pallets. Approximately 10.5 gallons of purge and decontamination water were generated during this quarterly sampling event.

All drum/pallet placements were approved by the PC Environmental / Safety Analyst – Project Manager and stored wholly within PacifiCorp property. Additional IDW tasks, including testing, further staging, manifesting and disposal are being managed directly by PacifiCorp. No IDW was transported off of the site, nor manifested by Cardno.

#### 3.6 Project Work Plan Discrepancies

There were no significant or substantive changes, modifications, or revisions between the Project Work Plan (PWP) (Cardno, April 2015) and the actual field tasks as performed. Methodologies as described in the PWP were followed and conducted and completed accordingly.

### 4 Analytical Results

This section summarizes the results of the groundwater sampling activities completed at the PacifiCorp Chehalis Plant on April 15, 2015. Samples were analyzed for mineral oil using Northwest methods for total petroleum hydrocarbons – diesel extended range (NWTPH-Dx). These results are compared to the appropriate WA DoE MTCA Method A Cleanup Levels (WAC 173-340). The complete analytical report, including the CoC forms and electronic data deliverable table, are included in Appendix D.

#### 4.1 Comparison of Project Results to Regulatory Guidance

Assessment of mineral oil in groundwater sample data results are compared to permissible values listed for WA DoE MTCA Method A Cleanup Levels for Groundwater (WAC 173-340-720). MTCA's definition of Mineral Oil means non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors measured using NWTPH-Dx. The MTCA Method A Groundwater Cleanup Level for Mineral Oil of **500 µg/L** is based on protection from noncarcinogenic effects during drinking water use. Additional PCB testing requirements listed under the MTCA groundwater section (173-340-720) do not apply to project sampling because PacifiCorp can demonstrate that: (1) The release originated from an electrical device that was manufactured after July 1, 1979; or (2) oil containing PCBs was never used in the equipment suspected as the source of the release; or (3) it can be documented that the oil released was recently tested and did not contain PCBs.

#### 4.2 Groundwater Sampling Results

Five groundwater samples, along with one duplicate (duplicate from MW-4) were submitted to ARI Labs for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Residual Range Organics (RRO) / heavy fuel oil. DRO quantitation was noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation was noted on chromatograph peaks in the range from C18 to C28. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

DRO was noted at reportable quantities from one location, MW-1, near GSU#1, having a concentration of 120  $\mu$ g/L. DRO detection at this well was below the MTCA Method A Groundwater Cleanup Level for Mineral Oil of **500**  $\mu$ g/L. There were no other reportable detections of DRO/RRO or Mineral Oil at any of the project tested well locations. Groundwater sampling results are presented in Table 4.

| Sample ID | Parameter   | Detection Limit<br>µg/L | Reporting<br>Limit µg/L | Result Value<br>µg/L | Data<br>Qualifier |
|-----------|-------------|-------------------------|-------------------------|----------------------|-------------------|
| MW-1      | DRO         | 20                      | 100                     | 120                  |                   |
| MW-1      | Mineral Oil | 40                      | 200                     | 200                  | U                 |
| MW-1      | RRO         | 0                       | 200                     | 200                  | U                 |
| MW-3      | DRO         | 20                      | 100                     | 100                  | U                 |
| MW-3      | Mineral Oil | 40                      | 200                     | 200                  | U                 |

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

20 April 2015

Lenora Westbrook KTA Associates, Inc. 3530 32<sup>nd</sup> Way NW Olympia, WA 98502-3230

#### RE: Client Project: PacifiCorp-Chehalis

Dear Lenora.

Please find enclosed the original chain of custody record and the final results for the samples from the project referenced above. Six water samples were received on April 15, 2015. The samples were analyzed for NWTPH-Dx as requested.

There were no problems associated with these analyses.

A copy of these reports will remain on file at ARI. Should you have any questions or need additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Mark D Harris

Project Manager 206/695-6210 markh@arilabs.com

# Data Reporting Qualifiers

Effective 12/31/13

#### Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- \* Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but  $\geq$  the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

#### Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- \* Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Page 1 of 3

Version 14-003 12/31/13

Analytical Resources, Incorporated Analytical Chemists and Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (Dioxin/Furan analysis only)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (Dioxin/Furan analysis only)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (Dioxin/Furan analysis only)

Laboratory Quality Assurance Plan

Analytical Resources, Incorporated Analytical Chemists and Consultants

### **Geotechnical Data**

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

### 1 Introduction

#### 1.1 **Purpose and Objective**

Cardno was contracted by KTA Associates, Inc. (KTA) to conduct a site investigation that included an assessment of potential impacts to subsurface soil and shallow groundwater within certain areas at PacifiCorp (PC)'s Chehalis, WA power plant that were previously exposed to Mineral Oil releases in 2011 and 2013. These releases were due to malfunctions with the plant's Generator Step-up Unit (GSU)s #1 and #3. Mineral Oil is used as insulating fluid in these GSUs.

The primary objective of this project is to determine if any residual impacts from Mineral Oil exposure exists in the subsurface soil and shallow groundwater at concentrations above the Washington Department of Ecology's (WADOE) Model Toxics Control Act (MTCA) regulatory limits. Site investigation activities are being conducted under the WA DoE's Voluntary Cleanup Program (VCP).

This project is divided into two main phases. The first phase included monitoring well installation, in conjunction with various support tasks. The outcome of soil boring / monitoring well installation activities and associated environmental sampling results are included within the *Monitoring Well Installation and Support Tasks Report (MWIR)* (Cardno, May 2015).

The second phase of this project involves groundwater monitoring, conducted on a quarterly basis, including events scheduled for April, June-Sept, December 2015 and March 2016. This Groundwater Monitoring Report (GWMR) details field methods, water level measurements, groundwater table elevations, flow direction assessment and sampling results for the second quarterly field event. All field efforts, in support of this second quarterly groundwater monitoring event, were conducted on 08 July, 2015.

#### 1.2 Scope of Work

To meet the above stated objectives, the scope of work for quarter groundwater monitoring consisted of the following field activities:

- Coordination of pre- (field) mobilization tasks.
- Collection of static groundwater level measurements.
- Sampling of five groundwater monitoring wells.
- Handling of project collected environmental samples.
- Documentation of field activities. and,
- Containment of investigation derived waste (IDW).

Prominent site features and well locations are shown on Figure 1.

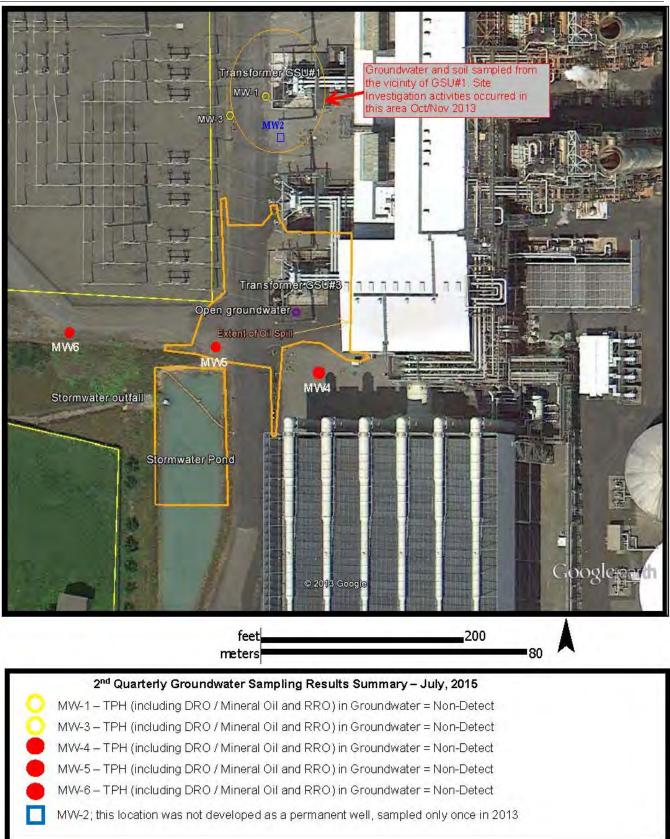

#### 1.3 Report Organization

This GWMR is organized into the following sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Field Efforts
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions regarding the procedures and methods utilized for the groundwater monitoring tasks and subsequent results of the data collected are presented in the main text of this GWMR report. Health & Safety Tailgate Forms, Monitoring Well Sampling and Water Quality Measurement Forms, Field Notebook entries, and Laboratory Chain-of-Custody Forms / Analytical Report are presented as Appendices A through D, respectively.

Groundwater Monitoring Report 2<sup>nd</sup> Quarterly Event – July 2015 PacifiCorp Chehalis Plant

#### Figure 1. Site Map with Monitoring Well and Prominent Features

## 2 Site Background

#### 2.1 Site Description

PacifiCorp owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

#### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

#### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semiconfined system, primarily due to the low permeably silt cap immediately above the aquifer.

#### 2.2 Previous Mineral Oil Releases and Site Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the PC Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing impacted material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near GSU-1, the first plant transformer that caught fire and subsequently released mineral oil to the surrounding areas. Impacted soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual).

During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the GSU-1 transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to an on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

Most recently, GSU-3 experienced a similar malfunction in late 2013 to the one that occurred at GSU-1 in early 2011. Consequently, this malfunction caused the release of mineral oil around the base of the transformer unit and impacted the surface areas adjacent to it, the roadway and ditches and the area around the southwest corner of the plant building. The management of the release of mineral oil at GSU-3 was approached by PC and conducted by CCS in a similar fashion to the previous cleanup at GSU-1.

#### 2.3 **Previous Site Investigations**

Cardno completed a Site Investigation (SI) at the PC-Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011. Cardno conducted the SI to determine the following:

- If groundwater had been impacted from the mineral oil spill;
- If the water contained in the large AST, which was collected during excavation activities, exceeded any regulatory levels, and;
- If surface water in the stormwater pond had been impacted from the mineral oil spill.

Cardno completed the following activities during the 2011 SI:

- Installed and sampled six temporary monitoring wells placed within the shallow water bearing zone;
- Collected two water samples from the AST at varying depths;
- Collected two surface water samples from the stormwater pond, and;
- Collected three surface soil samples downgradient of the mineral oil spill.

The results of the 2011 SI are summarized as follows:

- One groundwater sample (GW-4) had a detection of Mineral Oil at 1100 μg/L, which exceeded the MTCA Method A Groundwater Cleanup Level of 500 μg/L;
- One AST water sample (TS2) had a detection of Mineral Oil at 440 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level;
- One surface water sample (SW1) had a detection of Mineral Oil at 360 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level, and;
- One soil sample (SG1) had a detection of Mineral Oil at 160 mg/kg, which did not exceed the MTCA Method A Soil Cleanup Level of **4000 mg/Kg**.

Subsequent to the 2011 SI, a follow-up field investigation was undertaken by Cardno in October and November of 2013. These follow-up tasks were conducted after a review of all field efforts and sampling results to date by WADOE VCP staff. The VCP identified two hot spots near GSU#1. PacifiCorp, KTA and WADOE VCP agreed to investigate soil and groundwater at these two areas and characterize the local groundwater flow to determine if the mineral oil released from GSU-1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits. The *Groundwater Investigation Report* (Cardno, 2014) presented data from this effort. Main investigative tasks and sampling results contained in this report are summarized below;

Cardno completed the following activities during the 2013 SI:

- Drill, characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-1 thru SB-3 were analyzed for mineral oil.
- Install permanent wells at two of the drilling locations, MW-1 and MW-3. Due to utility interferences, a well was not set at the location for MW-2. These activities took place on October 28 and 29, 2013.
- A (relative) survey of the monitoring well casing elevations was conducted to aid in the determination of groundwater flow direction.
- Groundwater was sampled from site wells MW-1 and MW-3. A one-time groundwater sample was collected at MW-2 during the extraction of the drill rods. These activities took place on November 1, 2013 except for the MW-2 sample, which was collected earlier (10/29/2013).

The results of the 2013 SI are summarized as follows:

- One groundwater sample (MW-2) had a detection of Mineral Oil at 380 µg/L, which is below the MTCA Method A Groundwater Cleanup Level for Diesel Range Organics (DRO) – Mineral Oil of **500 µg/L**.
- There were no detections of Mineral Oil in any of the subsurface soil samples.

Following the release of Mineral Oil from GSU#3 in November 2013 and associated site cleanup efforts, PacifiCorp continued its environmental protection efforts in conjunction with their ongoing VCP actions. Through cooperative agreements between PC and WA DoE, a site investigation similar to those previously designed by KTA and Cardno was implemented in the areas adjacent to and downgradient from GSU#3. Results of subsurface soil and electrical vault in-flow water sampling are presented in the *MWIR* (Cardno, May 2015). These SI efforts were undertaken on April 7-15, 2015.

Cardno completed the following activities during the 2015 SI:

- Characterize and sampled subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-4 thru SB-6 were analyzed for Northwest Total Petroleum Hydrocarbon – Diesel range extended (NWTPH-Dx) / Mineral Oil.
- Installed permanent wells at all three 2015 boring locations. These wells are MW-4, MW-5 and MW-6. The three new wells, along with the two previous wells (MW-1 and MW-3) were developed / re-developed. These activities took place on April 7 9, 2015.
- A (relative) elevation survey of the monitoring well casings was conducted to aid in the determination of groundwater flow direction. This was completed on April 15, 2015.
- A one-time sampling event was completed to test in-flow water within four deep electrical vaults adjacent to GSU's #1 and #3. Water samples from these vaults was submitted for NWTPH-Dx / Mineral Oil. These activities took place on April 7, 2015. Figure 2 shows the location of these electrical vaults at the site relative to the GSUs and other site features.

The Results presented in the MWIR are summarized as follows:

- Soil from a depth of 5' bgs collected at SB5 had a detection of DRO at 6.7 mg/Kg, which is below the MTCA Method A Soil Cleanup Level of **4,000 mg/Kg**.
- Electrical vault in-flow water from EMHM003 had a detection of DRO at 120 µg/L, which is below the MTCA Method A Groundwater Cleanup Level of **500 µg/L**.
- Electrical vault in-flow water from EMHC002 and its Duplicate (DUP-vault) had detections of DRO, both at 110  $\mu$ g/L, which are below the MTCA Method A Groundwater Cleanup Level of **500 \mug/L**.
- Electrical vault in-flow water from EMHC001 had detections of DRO, Mineral Oil and Residual Range Organics (RRO) at 1900 µg/L, 1300 µg/L and 320 µg/L, respectively. DRO and Mineral Oil detections exceed the MTCA Method A Groundwater Cleanup Level, but are, comparatively, below the 10,000 µg/L Industrial Stormwater General Permit (ISGP) Stormwater Benchmark for TPH.

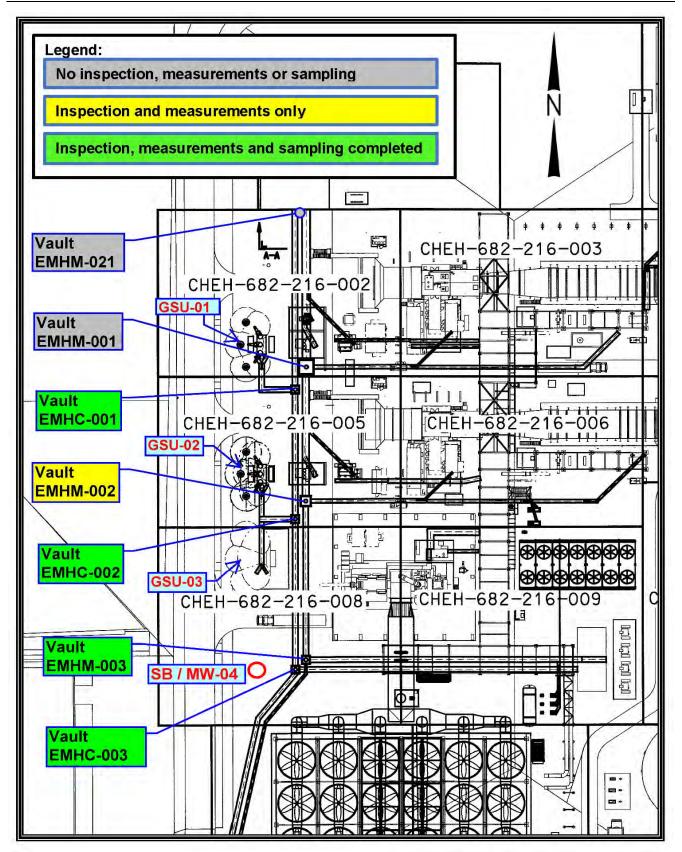

Figure 2. Electrical Vault / In-Flow Water Sampling Locations

## 3 Field Efforts

Section 3 details the field efforts that were employed during the July 2015 quarterly groundwater sampling event and support tasks. These tasks included pre-field mobilization planning, collection of static groundwater level measurements, sampling of five monitoring wells, handling of project collected environmental samples, documentation of field activities and containment of investigation-derived waste (IDW). Any discrepancies between the *Groundwater Investigation and Quarterly Monitoring Work Plan 2015/2016* (Cardno, April 2015) and the actual field methodologies utilized are also described in this section.

#### 3.1 Pre-Field Mobilization Planning

The second quarterly groundwater monitoring event was scheduled for and conducted on July 8, 2015. Cardno coordinated the scheduling of this event with PC and KTA staff to minimize any logistical impacts to plant operations. The overall schedule had been discussed and approved during the planning phase and at the Kick-Off Meeting held on 13 March, 2015. Pre field mobilization items considered also included health and safety concerns, coordination with the analytical testing facility and reservation / ordering / procurement / rental of all necessary field sampling equipment, monitoring instruments, personal protective equipment, and field consumables.

Several days prior to initiation of groundwater sampling, Cardno was in direct contact with the PC Environmental / Safety Analyst and the KTA Project Manager to finalize event coordination, site access and to receive the latest health & safety and site condition reports. The laboratory was consulted during this period and an order was placed for the sampling containers, as well as other necessary laboratory supplies. Cardno retrieve the containers and supplies directly from the laboratory during the mobilization to the site.

#### 3.1.1 <u>Health and Safety</u>

A Site Specific Health and Safety Plan was drafted for the groundwater sampling events and is included as an Appendix to the *Groundwater Investigation and Quarterly Monitoring Work Plan*, *2015/2016* (Cardno, April 2015). At a minimum this Health and Safety Plan provides emergency contact information, routes to the nearest medical and/or aid facilities and site specific work task and environmental /physical hazard information. Prior to the initiation of any field tasks, a mandatory tailgate safety meeting is conducted each field day. The purpose of these Tailgate Meetings is to review any expected site specific hazards, general task hazards, current / changed site conditions, to receive a briefing from PC, to discuss emergency procedures, and to review our daily work / task schedule. Such a Tailgate meeting was conducted on July 8, 2015, preceding the start of groundwater sampling tasks. Health and Safety Tailgate Forms are included in Appendix A.

#### 3.2 Groundwater Level Measurements and Flow Direction Assessment

Prior to sample collection, each monitoring well was opened and its expansion plug was removed. Ample time was allotted for each well to equilibrate to the current ambient air pressure. An electronic interface probe was used to gauge the presence/thickness of any accumulated free-phase hydrocarbon product and the distance from the top edge of the well casing to the surface of the water table (static water level) within each monitoring well. A trace amount ( $\leq 0.01$  feet) of hydrocarbon product was gauged at MW-3, but was not otherwise observed in the purge water or the collected sample.

The southwest corner of the GSU-1 containment wall was assigned an elevation of 100.00 feet above mean-sea level. A level survey was conducted to accurately assign each monitoring well casing an elevation, which was based on the assigned elevation of the GSU-1 containment wall corner. Water level measurements were subtracted from their well casing elevations to calculate (relative) elevation of the groundwater table beneath each well location. MW-1 is the high point at 92.54 and MW-6 is the low point at 88.79 feet above mean-sea level (amsl), respectively. On average the water table was 1.41 feet lower than during the first round of sampling, with the least difference of 0.24 feet at MW-3 and the greatest difference of 2.32 feet at MW-6. Table 1 lists the well casing elevations, depth to product, static water level measurements and groundwater elevations calculated for this quarterly event.

Groundwater elevation contours were constructed and groundwater flow direction was assessed. As was noted in the previous sampling round, groundwater flows east to west and bends sharply to the south-southwest. It was noted during this round that the contours were locally deflected (humped) to the northeast along an axis extending between MW-1 and MW-6. Figure 3 shows the generalized groundwater flow direction along with the elevation contours.

| MW-5       | 97.08                                                                                          | Not Detected | 6.70                                    | 90.38                              |  |
| MW-6 96.18 |                                                                                                | Not Detected | 7.39                                    | 88.79                              |  |

 Table 1. Water Level Measurements and Groundwater Elevations

<sup>1</sup>All elevations are relative, as they are referenced to the top of the SW corner of the GSU-1 containment wall. The location was assigned an elevation of 100.00' amsl.

#### 3.3 Groundwater Sampling

Groundwater sampling events are scheduled for completion on a quarterly basis. This second event was completed on July 8, 2015. Subsequent events are tentatively planned for the 4<sup>th</sup> quarter 2015 (December) and mid-late 1<sup>st</sup> quarter 2016 (February-March). Groundwater sampling activities were conducted using U.S. Environmental Protection Agency Low-Flow Sampling Techniques (USEPA, 1996, Rev 2010) (where pumping rates are matched to achieve minimal drawdown of the water column during pumping) and WA Department of Ecology (WADOE, 2011) accepted methodology. Groundwater samples at the PC-Chehalis Plant were collected and analyzed for mineral oil using the Northwest total petroleum hydrocarbons – diesel extended range (NWTPH-Dx) method. Monitoring well locations are presented on Figure 1.

Prior to sampling, all five site monitoring wells were properly and effectively developed / redeveloped on April 9, during the 2015 SI field event. All monitoring wells were allowed to settle and equilibrate for at least three days prior to initial sampling activities. Well construction and development details are included in the MWIR (Cardno, May 2015). Monitoring wells were not re-developed between quarterly sampling rounds.

A peristaltic pump setup with dedicated platinum-cured Tygon® tubing, connected to dedicated, Teflon®-lined polyethylene tubing, was used to purge aquifer formation water from the well casings and to obtain groundwater samples at each well location. Monitoring wells were purged until water quality readings had stabilized or a maximum of three casing volumes had been removed. Water quality parameter measurements were recorded during sample purging (stabilization assessment) and included: specific conductivity, temperature, pH, dissolved oxygen (DO) and turbidity. A summary of the final water quality measurements collected prior to sampling are presented in Table 2.

| Well ID           | Date /<br>Sample<br>Time | Average<br>Purge<br>Rate<br>(ml/min) | Total<br>Purge<br>Volume<br>(gal) | Temp.<br>(C°) | рН   | Sp. Cond<br>(µS/cm) | Turbidity<br>(NTU) | Dissolved<br>Oxygen<br>(mg/L) |

\*\*All wells are 2-inch diameter Sch40 PVC

<sup>a</sup>Duplicate sample was collected at MW-1

Samples were collected from the mid-screen depth or from the middle of the existing water column, whichever of these two scenarios was the deepest level. Table 3 lists water sample information, including parameters, testing methods and number of samples and duplicates. Sampling and water quality information collected at each well included purge rate, water level, parameter measurements and cumulative volume of groundwater purged from well at each well volume interval. Detailed well measurement, purging and sampling information is contained on the Monitoring Well Sampling and Water Quality Measurement Forms, which are include in Appendix B.

| Sample Type                                 | Analytical  | Sample | Analytical | No. of  | No. of     |

#### 3.4 Sample Handling, Field Documentation and Quality Assurance

This section discussed field documentation and procedures used to handle and manage the environmental samples collected for laboratory analysis. Project quality assurance methods are also detailed.

#### 3.4.1 Field Documentation

A logbook was used to document sampling and other support procedures performed during field activities. More specifically, the Field Activities Logbook entries provide a record of specific sample locations and collection information, any subcontractor activities, noting their role(s), describing the major equipment used at each sampling location and providing noteworthy observations, description of problems, or incidents and their resolutions. Completed field forms, planning and safety documents and the Field Activities Logbook were all stored in a weather-proof file box, maintained on site, during all project work activities. Field Activity Logbook entries are included in Appendix C.

Groundwater Monitoring Report 2<sup>nd</sup> Quarterly Event – July 2015 PacifiCorp Chehalis Plant

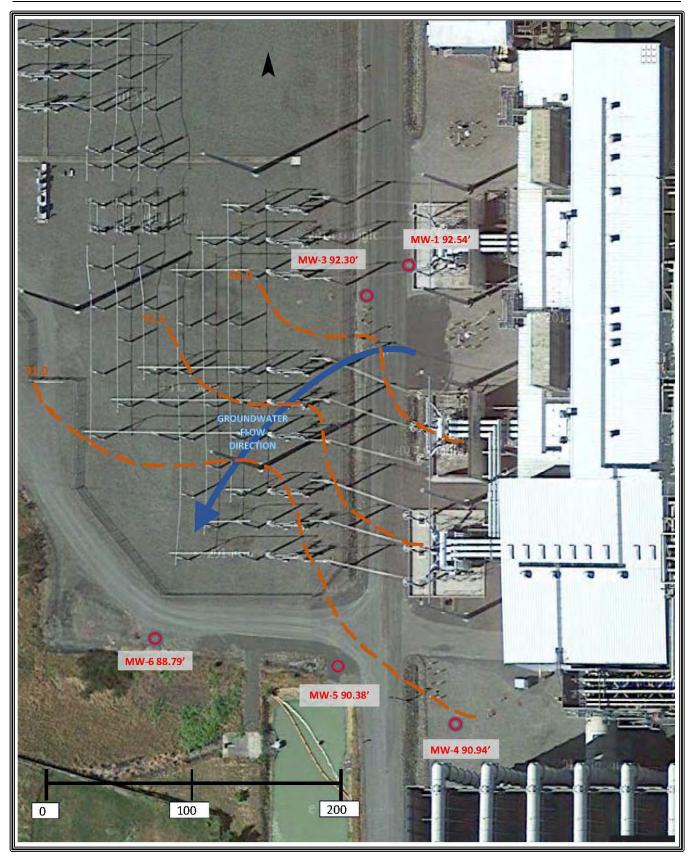

Figure 3. Groundwater Elevations and Flow Direction

#### 3.4.2 Sample Handling Procedures

Disposable nitrile gloves were used by personnel collecting and handling all samples. Gloves were changed frequently and in between each sample collection to avoid cross contamination. Samples were collected into certified clean, laboratory supplied containers, with pre-measured amounts of preservatives, as appropriate.

After the samples were collected they were appropriately labeled and placed in insulated coolers containing ice. This was done to keep the samples out of the direct sunlight and to maintain a temperature of as close to four degrees centigrade as possible. All project samples were hand-delivered to the contracted laboratory, Analytical Resources, Incorporated (ARI) laboratory in Tukwila, WA.

#### 3.4.2.1 Sample Identification, Labeling and Chain of Custody

Samples were identified by their location and corresponding date of collection. Any quality control samples (e.g. duplicates) were also properly denoted. Sample identification numbers, including sample media type, location number, and other pertinent descriptions were recorded on field sheets completed for each location and sample.

Chain of Custody (CoC) forms, detailing sample container, collection and possession information, were completed and accompanied each cooler shipment from the field to the laboratory. Date, time, sample identification, number of containers, analysis to be performed, and sampler/s in possession were recorded on each CoC. CoC records are included in Appendix D.

#### 3.4.3 **Quality Assurance Methods**

#### 3.4.3.1 Instrument Calibration

All field instruments that required a zeroing and/or a user calibration were appropriately calibrated at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards were performed at the beginning and periodically throughout each field day (if necessary / required) to verify equipment operation. Any calibration data was recorded in the field logbook. All calibration media (e.g. gas, liquid or otherwise) was properly stored and managed per manufacturer's recommendations and according to applicable PC Plant requirements.

#### 3.4.3.2 Decontamination Procedures

Any non-disposable equipment was decontaminated prior to its initial use and after completing a particular sampling or logging task. Decontamination wash consisted of the following:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and
- > De-ionized water rinse.

> Drilling rigs, support vehicles, drill works, connection rods, augers and other large pieces of equipment would be decontaminated by power washing with a high-pressure steam cleaner only as described in Section 4 of the 2015 Project Work Plan (Cardno, April 2015).

No such decontamination of any equipment was necessary in the field during this quarterly groundwater sampling round.

#### 3.5 Investigation Derived Waste

Investigation-derived waste (IDW) generated during this quarterly groundwater sampling event consisted of excess purge water produced during well pumping and general soils waste debris (spent gloves, paper, etc.). All purge water containerized into a Department of Transportation (DOT)-17H approved open head 55-gallon drum. This drum was properly labeled with its media contents, date of generation, location of origin, and contents' owner. The drum was sealed with a fitted, gasketed lid and bolted band and placed on a pallet. A "common" drum, used for this same purpose, was initiated during the first quarterly sampling event. Approximately 8 gallons of purge water generated during this quarterly sampling event was placed into the "common" groundwater sampling drum. To date there is approximately 18 gallons of water in this drum.

The drum/pallet placement was approved by the PC Environmental / Safety Analyst – Project Manager. The storage location is secure and wholly within the PacifiCorp Chehalis property boundary. Additional IDW tasks, including testing, further staging, manifesting and disposal are being managed directly by PacifiCorp. No IDW was transported off of the site, nor manifested by Cardno.

#### 3.6 **Project Work Plan Discrepancies**

There were no significant or substantive changes, modifications, or revisions to the Project Work Plan (PWP) (Cardno, April 2015), nor discrepancies between the actual field tasks as performed and the PWP. Methodologies as described in the PWP were followed and conducted and completed accordingly.

## 4 Analytical Results

This section summarizes the results of the groundwater sampling activities completed at the PacifiCorp Chehalis Plant on July 8, 2015. Samples were analyzed for mineral oil using Northwest methods for total petroleum hydrocarbons – diesel extended range (NWTPH-Dx). These results are compared to the appropriate WA DoE MTCA Method A Cleanup Levels (WAC 173-340). The complete analytical report, including the CoC forms and electronic data deliverable table, are included in Appendix D.

#### 4.1 Comparison of Project Results to Regulatory Guidance

Assessment of mineral oil in groundwater sample data results are compared to permissible values listed for WA DoE MTCA Method A Cleanup Levels for Groundwater (WAC 173-340-720). MTCA's definition of Mineral Oil means non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors measured using NWTPH-Dx. The MTCA Method A Groundwater Cleanup Level for Mineral Oil of **500 µg/L** is based on protection from noncarcinogenic effects during drinking water use. Additional PCB testing requirements listed under the MTCA groundwater section (173-340-720) do not apply to project sampling because PacifiCorp can demonstrate that: (1) The release originated from an electrical device that was manufactured after July 1, 1979; or (2) oil containing PCBs was never used in the equipment suspected as the source of the release; or (3) it can be documented that the oil released was recently tested and did not contain PCBs.

#### 4.2 Groundwater Sampling Results

Five groundwater samples, along with one duplicate (duplicate from MW-1) were submitted to ARI Labs for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Residual Range Organics (RRO) / heavy fuel oil. DRO quantitation was noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation was noted on chromatograph peaks in the range from C18 to C28. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

There were no reportable detections of DRO/RRO or Mineral Oil at any of the project tested well locations during this quarterly groundwater sampling event. Groundwater sampling results are presented in Table 4.

| Sample ID | Parameter   | Detection Limit<br>µg/L | Reporting<br>Limit μg/L | Result Value<br>µg/L | Data<br>Qualifier |
|-----------|-------------|-------------------------|-------------------------|----------------------|-------------------|

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or cosigned agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

### RE: Client Project: PacifiCorp GW Investigation

Dear Lenora:

Please find enclosed the original chain of custody record and the final results for the samples from the project referenced above. Six water samples were received on July 8, 2015. The samples were analyzed for NWTPH-Dx as requested.

All samples were initially analyzed on 7/10/15. The percent difference was not within control limits for the CCAL that bracketed the analyses of these samples. All samples were re-analyzed on 7/13/15. The re-analyses proceeded without incident of note. The results for the re-analyses only have been submitted.

There were no further problems associated with these analyses.

A copy of these reports will remain on file at ARI. Should you have any questions or need additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Mol? Mul Mark D Harris

Project Manager 206/695-6210 markh@arilabs.com

Analytical Resources, Incorporated Analytical Chemists and Consultants

# **Data Reporting Qualifiers**

Effective 12/31/13

## **Inorganic Data**

- U Indicates that the target analyte was not detected at the reported concentration
- \* Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but  $\geq$  the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

## Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- \* Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Analytical Resources, Incorporated Analytical Chemists and Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (Dioxin/Furan analysis only)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (Dioxin/Furan analysis only)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (Dioxin/Furan analysis only)

Laboratory Quality Assurance Plan

## **Geotechnical Data**

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

### 1 Introduction

### 1.1 **Purpose and Objective**

Clear Water Services (CWS) was contracted by KTA Associates, Inc. (KTA) to conduct a site investigation at PacifiCorp (PC)'s Chehalis, WA power plant. Site investigation activities focused on the assessment of potential impacts to subsurface soil and shallow groundwater within certain areas of the plant that were previously exposed to Mineral Oil releases in 2011 and 2013. These releases were due to malfunctions with the plant's Generator Step-up Unit (GSU)s #1 and #3. Mineral Oil is used as insulating fluid in these GSU transformers.

The primary objective of this project is to determine if any residual impacts from Mineral Oil exposure exists in the subsurface soil and shallow groundwater at concentrations above the Washington Department of Ecology's (WADOE) Model Toxics Control Act (MTCA) regulatory limits. Site investigation activities are being conducted under the WA DoE's Voluntary Cleanup Program (VCP).

This project is divided into two main phases. The first phase included monitoring well installation, in conjunction with various sampling and support tasks. The outcome of soil boring / monitoring well installation activities and associated environmental sampling results are included within the *Monitoring Well Installation and Support Tasks Report (MWIR)* (Cardno, May 2015).

The second phase of this project involves groundwater monitoring, conducted on a quarterly basis, including events completed in April, July and December 2015. There is one remaining event scheduled for March 2016. This Groundwater Monitoring Report (*GWMR*) details field methods, water level measurements, groundwater table elevations, flow direction assessment and sampling results for the third quarterly field event. All field efforts, in support of this third quarterly groundwater monitoring event, were conducted on 16 December, 2015.

### 1.2 Scope of Work

To meet the above stated objectives, the scope of work for quarterly groundwater monitoring consisted of the following field activities:

- Coordination of pre- (field) mobilization tasks.
- Collection of static groundwater level measurements.
- Sampling of five groundwater monitoring wells.
- Handling of project collected environmental samples.
- Documentation of field activities. and,
- Containment of investigation derived waste (IDW).

Prominent site features and well locations are shown on Figure 1.

### 1.3 Report Organization

This *GWMR* is organized into the following five sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Field Efforts
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions regarding the procedures and methods utilized for the groundwater monitoring tasks and subsequent results of the data collected are presented in the main text of this *GWMR*. Health & Safety Tailgate Forms, Monitoring Well Sampling and Water Quality Measurement Forms, Field Notebook entries, and Laboratory Chain-of-Custody Forms / Analytical Report are presented as Appendices A through D, respectively.

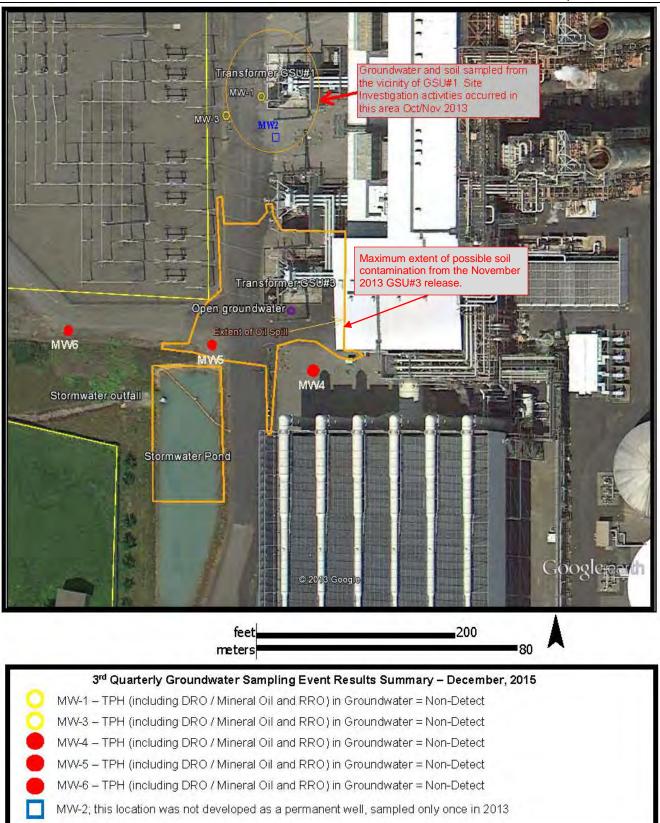

Figure 1. Site Map with Monitoring Well and Prominent Features

# 2 Site Background

### 2.1 Site Description

PacifiCorp owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semiconfined system, primarily due to the low permeably silt cap immediately above the aquifer.

### 2.2 Previous Mineral Oil Releases and Site Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the PC Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing impacted material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near GSU-1, the first plant transformer that caught fire and subsequently released mineral oil to the surrounding areas. Impacted soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual).

During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the GSU-1 transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to an on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

Most recently, GSU-3 experienced a similar malfunction in late 2013 to the one that occurred at GSU-1 in early 2011. Consequently, this malfunction caused the release of mineral oil around the base of the transformer unit and impacted the surface areas adjacent to it, the roadway and ditches and the area around the southwest corner of the plant building. The management of the release of mineral oil at GSU-3 was approached by PC and conducted by CCS in a similar fashion to the previous cleanup at GSU-1.

### 2.3 **Previous Site Investigations**

A Site Investigation (SI) was completed at the PC-Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011. The SI was conducted to determine the following:

- If groundwater had been impacted from the mineral oil spill;
- If the water contained in the large AST, which was collected during excavation activities, exceeded any regulatory levels, and;
- If surface water in the stormwater pond had been impacted from the mineral oil spill.

The following activities were completed during the 2011 SI:

- Six temporary monitoring wells were installed and sampled within the shallow water bearing zone;
- Two water samples were collected from the AST at varying depths;
- Two surface water samples were collected from the stormwater pond, and;
- Three surface soil samples were collected downgradient of the mineral oil spill.

The results of the 2011 SI are summarized as follows:

- One groundwater sample (GW-4) had a detection of Mineral Oil at 1100 μg/L, which exceeded the MTCA Method A Groundwater Cleanup Level of 500 μg/L;
- One AST water sample (TS2) had a detection of Mineral Oil at 440 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level;
- One surface water sample (SW1) had a detection of Mineral Oil at 360 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level, and;
- One soil sample (SG1) had a detection of Mineral Oil at 160 mg/kg, which did not exceed the MTCA Method A Soil Cleanup Level of **4000 mg/Kg**.

Subsequent to the 2011 SI, a follow-up field investigation was undertaken in October and November of 2013. These follow-up tasks were conducted after a review of all field efforts and sampling results to date by WADOE VCP staff. The VCP stakeholders identified two hot spots near GSU#1. With concurrence from WADOE VCP staff, PacifiCorp and KTA agreed to investigate soil and groundwater at these two areas. This was undertaken to characterize the local groundwater flow to determine if the mineral oil released from GSU-1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits. The *Groundwater Investigation Report* (Cardno, 2014) presented data from this effort. Main investigative tasks and sampling results contained in this report are summarized below;

The following activities were completed during the 2013 SI:

- Drill, characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-1 thru SB-3 were analyzed for mineral oil.
- Install permanent wells at two of the drilling locations, MW-1 and MW-3. Due to utility interferences, a well was not set at the location for MW-2. These activities took place on October 28 and 29, 2013.
- A (relative) survey of the monitoring well casing elevations was conducted to aid in the determination of groundwater flow direction.
- Groundwater was sampled from site wells MW-1 and MW-3. A one-time groundwater sample was collected at MW-2 during the extraction of the drill rods. These activities took place on November 1, 2013 – except for the MW-2 sample, which was collected earlier (10/29/2013).

The results of the 2013 SI are summarized as follows:

- One groundwater sample (MW-2) had a detection of Mineral Oil at 380 μg/L, which is below the MTCA Method A Groundwater Cleanup Level for Diesel Range Organics (DRO) – Mineral Oil of 500 μg/L.
- There were no detections of Mineral Oil in any of the subsurface soil samples.

Following the release of Mineral Oil from GSU#3 in November 2013 and associated site cleanup efforts, PacifiCorp continued its environmental protection efforts in conjunction with their ongoing VCP actions. Through cooperative agreements between PC and WA DoE, a site investigation, similar to those previously implemented at the GSU#1 area, was implemented in the areas adjacent to and downgradient from GSU#3. Results of subsurface soil and electrical vault in-flow water sampling are presented in the *MWIR* (Cardno, May 2015). These SI efforts were undertaken on April 7-15, 2015.

The following activities were completed during the 2015 SI:

- Subsurface soil from 3 locations to ~30-feet below grade surface was characterized and sampled. Soil samples from the borings at SB-4 thru SB-6 were analyzed for Northwest Total Petroleum Hydrocarbon – Diesel range extended (NWTPH-Dx) / Mineral Oil.
- Permanent wells were installed at all three 2015 boring locations. These wells are MW-4, MW-5 and MW-6. The three new wells, along with the two previous wells (MW-1 and MW-3) were developed / re-developed. These activities took place on April 7 9, 2015.
- A (relative) elevation survey of the monitoring well casings was conducted to aid in the determination of groundwater flow direction. This was completed on April 15, 2015.
- A one-time sampling event was completed to test in-flow water within four deep electrical vaults adjacent to GSU's #1 and #3. Water samples from these vaults was submitted for NWTPH-Dx / Mineral Oil. These activities took place on April 7, 2015. Figure 2 shows the location of these electrical vaults at the site relative to the GSUs and other site features.

The Results presented in the 2015 *MWIR* are summarized as follows:

- Soil from a depth of 5' bgs collected at SB5 had a detection of DRO at 6.7 mg/Kg, which is below the MTCA Method A Soil Cleanup Level of **4,000 mg/Kg**.
- Electrical vault in-flow water from EMHM003 had a detection of DRO at 120 µg/L, which is below the MTCA Method A Groundwater Cleanup Level of **500 µg/L**.
- Electrical vault in-flow water from EMHC002 and its Duplicate (DUP-vault) had detections of DRO, both at 110  $\mu$ g/L, which are below the MTCA Method A Groundwater Cleanup Level of **500 \mug/L**.
- Electrical vault in-flow water from EMHC001 had detections of DRO, Mineral Oil and Residual Range Organics (RRO) at 1900 µg/L, 1300 µg/L and 320 µg/L, respectively. DRO and Mineral Oil detections exceed the MTCA Method A Groundwater Cleanup Level, but are, comparatively, below the 10,000 µg/L Industrial Stormwater General Permit (ISGP) Stormwater Benchmark for TPH.

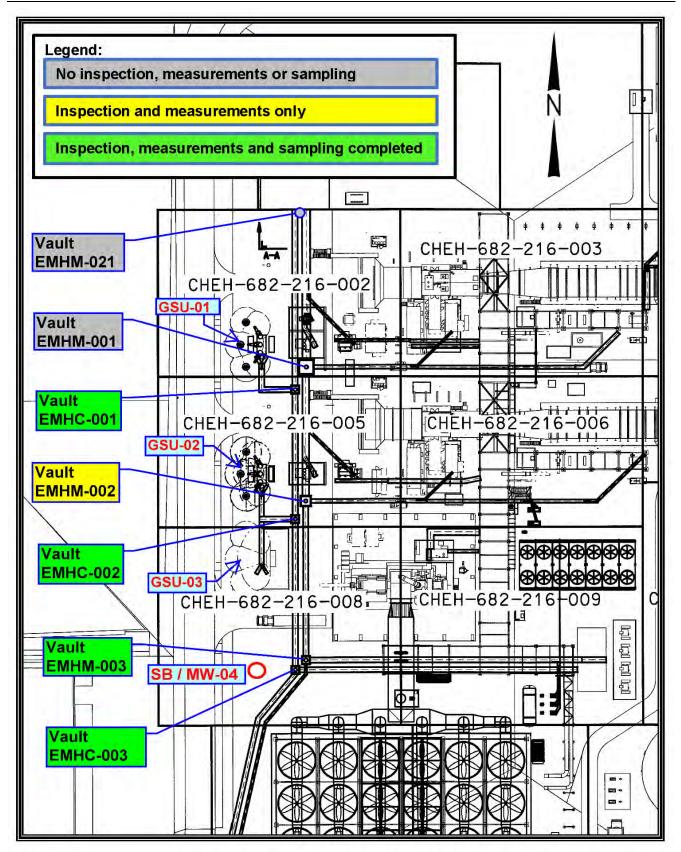

Figure 2. Electrical Vault / In-Flow Water Sampling Locations

# 3 Field Efforts

Section 3 details the field efforts that were employed during the December 2015 quarterly groundwater sampling event and support tasks. These tasks included pre-field mobilization planning, collection of static groundwater level measurements, sampling of five monitoring wells, handling of project collected environmental samples, documentation of field activities and containment of investigation-derived waste (IDW). Any discrepancies between the *Groundwater Investigation and Quarterly Monitoring Work Plan 2015/2016* (Cardno, April 2015) and the actual field methodologies utilized are also described in this section.

### 3.1 Pre-Field Mobilization Planning

The third quarterly groundwater monitoring event was scheduled for and conducted on December 16, 2015. CWS coordinated the scheduling of this event with PC and KTA staff to minimize any logistical impacts to plant operations and to the sampling event itself. The overall schedule had been discussed and approved during the planning phase and at the Kick-Off Meeting held on 13 March, 2015. Pre field mobilization items considered also included health and safety concerns, coordination with the analytical testing facility and reservation / ordering / procurement / rental of all necessary field sampling equipment, monitoring instruments, personal protective equipment, and field consumables.

Several days prior to initiation of groundwater sampling, CWS was in direct contact with the PC Environmental / Safety Analyst and the KTA Project Manager to finalize event coordination, site access and to receive the latest health & safety and site condition reports. The laboratory was consulted during this period and an order was placed for the sampling containers, as well as other necessary laboratory supplies. CWS retrieved the containers and supplies directly from the laboratory during mobilization to the PC site.

### 3.1.1 <u>Health and Safety</u>

A Site Specific Health and Safety Plan was drafted for the groundwater sampling events and is included as an Appendix to the *Groundwater Investigation and Quarterly Monitoring Work Plan*, *2015/2016* (Cardno, April 2015). CWS adopted the appropriate sections of this plan. At a minimum this Health and Safety Plan provides emergency contact information, routes to the nearest medical and/or aid facilities and site specific work task and environmental /physical hazard information. Prior to the initiation of any field tasks, it is a mandatory requirement to conduct a tailgate safety meeting. The purpose of the Tailgate Safety Meetings is to review any expected site specific hazards, general task hazards, current / changed site conditions, to receive a briefing from PC, to discuss emergency procedures, and to review the daily work / task schedule. Such a Tailgate meeting was conducted on December 16, 2015, preceding the start of groundwater sampling tasks. Health and Safety Tailgate Meeting Forms are included in Appendix A.

#### 3.2 Groundwater Level Measurements and Flow Direction Assessment

Prior to sample collection, each monitoring well was opened and its expansion plug was removed. Ample time was allotted for each well to equilibrate to the current ambient air pressure. An electronic interface probe was used to gauge the presence/thickness of any accumulated free-phase hydrocarbon product and the distance from the top edge of the well casing to the surface of the water table (static water level) within each monitoring well. No hydrocarbon product was detected (to a minimum thickness of 0.01') at any of the well, or otherwise observed in the purge water or the collected samples.

The southwest corner of the GSU-1 containment wall was assigned an elevation of 100.00 feet above mean-sea level. A level survey was conducted to accurately determine the elevation of each monitoring well casing, based on the assigned elevation of the GSU-1 containment wall corner. Water level measurements were subtracted from their well casing elevations to calculate (relative) elevation of the groundwater table beneath each well location. Site groundwater elevations were highest at MW-1 and lowest at MW-6, at 93.45 and 90.80 feet above mean-sea level (amsl), respectively. On average the water table was 1.65 feet higher than during the previous round of sampling. The least difference of 0.91 feet (higher) was noted at MW-1 and the greatest difference of 2.36 feet (higher) was noted at MW-4. Table 1 lists the well casing elevations, depth to product, static water level measurements and groundwater elevations calculated for this quarterly event.

Groundwater elevation contours were constructed and the flow direction was assessed. As in the previous sampling rounds, groundwater flow was noted to be generally east to west. Although not as pronounced as in the previous sampling round, there is a southwesterly pull on the groundwater table, flowing towards a small stream basin offsite in the same direction. Figure 3 shows the generalized groundwater flow direction along with the elevation contours.

 Table 1. Water Level Measurements and Groundwater Elevations

<sup>1</sup>All elevations are relative, as they are referenced to the top of the SW corner of the GSU-1 containment wall. This reference location has been assigned an elevation of 100.00' amsl.

### 3.3 Groundwater Sampling

Groundwater sampling events are scheduled for completion on a quarterly basis. This third event was completed on December 16, 2015. The groundwater sampling round was conducted on April 15<sup>th</sup> and the 2<sup>nd</sup> on July 8<sup>th</sup>, 2015. The remaining scheduled event is tentatively planned for late 1<sup>st</sup> quarter 2016 (March). Groundwater sampling activities were conducted using U.S. Environmental Protection Agency Low-Flow Sampling Techniques (USEPA, 1996, Rev 2010) (where pumping rates are matched to achieve minimal drawdown of the water column during pumping) and WA Department of Ecology (WADOE, 2011) accepted methodology. Groundwater samples at the PC-Chehalis Plant were collected and analyzed for mineral oil using the Northwest total petroleum hydrocarbons – diesel extended range (NWTPH-Dx) method. Monitoring well locations are presented on Figure 1.

Prior to sampling, all five site monitoring wells were properly and effectively developed / redeveloped on April 9, during the 2015 SI field event. All monitoring wells were allowed to settle and equilibrate for at least three days prior to initial sampling activities. Well construction and development details are included in the MWIR (Cardno, May 2015). Monitoring wells were not re-developed between or prior to quarterly sampling rounds.

A peristaltic pump, setup with dedicated platinum-cured Tygon® tubing, connected to dedicated, Teflon®-lined polyethylene tubing, was used to purge aquifer formation water and to obtain groundwater samples at each well location. Monitoring wells were purged until water quality readings had stabilized or a maximum of three casing volumes had been removed. Water quality parameter measurements were recorded during sample purging (stabilization assessment) and included: specific conductivity, temperature, pH, dissolved oxygen (DO) and turbidity. A summary of the final water quality measurements collected prior to sampling are presented in Table 2.

| Well ID             | Date /<br>Sample<br>Time | Average<br>Purge<br>Rate<br>(ml/min) | Total<br>Purge<br>Volume<br>(gal) | Temp.<br>(C°) | рН   | Sp. Cond<br>(µS/cm) | Turbidity<br>(NTU) | Dissolved<br>Oxygen<br>(mg/L) |
|---------------------|--------------------------|--------------------------------------|-----------------------------------|---------------|------|---------------------|--------------------|-------------------------------|
| **MW-1              | 12/16/15<br>(1245)       | 100                                  | 1.5                               | 13.49         | 5.83 | 119                 | 28                 | 3.61                          |

#### Table 2 Summary of Water Quality Measurements

\*\*All wells are 2-inch diameter Sch40 PVC

<sup>a</sup>Duplicate sample was collected at MW-5

Samples were collected from the mid-screen depth or from the middle of the existing water column, whichever of these two scenarios was the deepest level. Table 3 lists water sample information, including parameters, testing methods and number of samples and duplicates. Sampling and water quality information collected at each well included purge rate, water level, parameter measurements and cumulative volume of groundwater purged from well at each well volume interval. Detailed well measurement, purging and sampling information is contained on the Monitoring Well Sampling and Water Quality Measurement Forms, which are include in Appendix B.

| Sample Type                                 | Analytical  | Sample | Analytical | No. of  | No. of     |
|---------------------------------------------|-------------|--------|------------|---------|------------|
|                                             | Parameter   | Matrix | Method     | Samples | Duplicates |
| Quarterly<br>Groundwater<br>Sampling Events | Mineral Oil | Water  | NWTPH-Dx   | 5       | 1          |

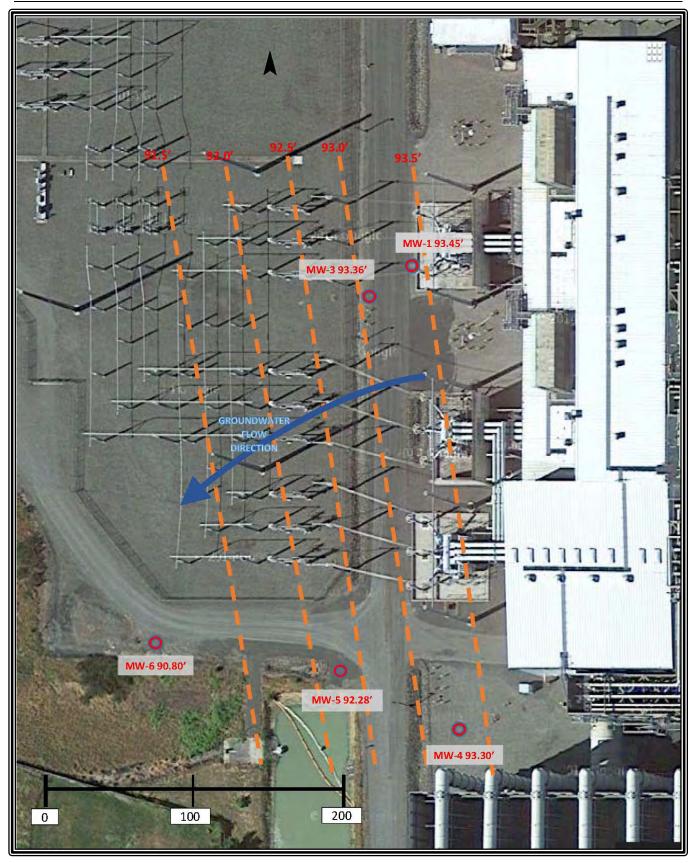

### Table 3. Groundwater Sample Collection Information

### 3.4 Sample Handling, Field Documentation and Quality Assurance

This section discussed field documentation and procedures used to handle and manage the environmental samples collected for laboratory analysis. Project quality assurance methods are also detailed.

### 3.4.1 Field Documentation

A logbook was used to document sampling and other support procedures performed during field activities. More specifically, the Field Activities Logbook entries provide a record of specific sample locations and collection information, any subcontractor activities, noting their role(s), describing the major equipment used at each sampling location and providing noteworthy observations, description of problems, or incidents and their resolutions. Completed field forms, planning and safety documents and the Field Activities Logbook were all stored in a weather-proof file box, maintained on site, during all project work activities. Field Activity Logbook entries are included in Appendix C.

### 3.4.2 Sample Handling Procedures

Disposable nitrile gloves were used by personnel collecting and handling all samples. Gloves were changed frequently and in between each sample collection to avoid cross contamination. Samples were collected into certified clean, laboratory supplied containers, with pre-measured amounts of preservatives, as appropriate.

After the samples were collected they were appropriately labeled and placed in insulated coolers containing ice. This was done to keep the samples out of the direct sunlight and to maintain a temperature of as close to four degrees centigrade as possible. All project samples were hand-delivered to the contracted laboratory, Analytical Resources, Incorporated (ARI) laboratory in Tukwila, WA.

### 3.4.2.1 Sample Identification, Labeling and Chain of Custody

Samples were identified by their location and corresponding date of collection. Any quality control samples (e.g. duplicates) were also properly denoted. Sample identification numbers, including sample media type, location number, and other pertinent descriptions were recorded on field sheets completed for each location and sample.

Chain of Custody (CoC) forms, detailing sample container, collection and possession information, were completed and accompanied each cooler shipment from the field to the laboratory. Date, time, sample identification, number of containers, analysis to be performed, and sampler/s in possession were recorded on each CoC. CoC records are included in Appendix D.

#### 3.4.3 **Quality Assurance Methods**

#### 3.4.3.1 Instrument Calibration

All field instruments that required a zeroing and/or a user calibration were appropriately calibrated prior to or at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards were performed at the beginning and periodically throughout each field day (if necessary / required) to verify equipment operation. Any calibration data was recorded in the field logbook. All calibration media (e.g. gas, liquid or otherwise) was properly stored and managed per manufacturer's recommendations and according to applicable PC Plant requirements.

### 3.4.3.2 Decontamination Procedures

Any non-disposable equipment was decontaminated prior to its initial use and after completing a particular sampling or logging task. Decontamination wash consisted of the following:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and
- > De-ionized water rinse.

> Drilling rigs, support vehicles, drill works, connection rods, augers and other large pieces of equipment would be decontaminated by power washing with a high-pressure steam cleaner only as described in Section 4 of the 2015 Project Work Plan (Cardno, April 2015).

No such decontamination of any equipment was necessary in the field during this quarterly groundwater sampling round.

### 3.5 Investigation Derived Waste

Investigation-derived waste (IDW) generated during this quarterly groundwater sampling event consisted of excess purge water produced during well pumping and general sampling waste debris (spent gloves, paper, etc.). All purge water was containerized into a Department of Transportation (DOT)-17H approved open head 55-gallon drum. A "common" purge water collection drum was initiated during the first quarterly sampling event in April, 2015. This drum was properly labeled with its media contents, date of generation, location of origin, and contents' owner. The drum was sealed with a fitted, gasketed lid and bolted band and placed on a pallet. Purge water from each subsequent sampling round is added to the "common" drum.

Approximately 5.5 gallons of purge water was generated during this quarterly sampling event. All purge water was placed in the "common" groundwater event drum, which is stored onsite during and between sampling rounds. To date approximately 24 gallons of purge water has been contained in this drum.

The purge water drum/pallet placement was approved by the PC Environmental / Safety Analyst – Project Manager. The storage location is secure and wholly within the PacifiCorp Chehalis property boundary. Additional IDW tasks, including testing, further staging, manifesting and disposal are being managed directly by PacifiCorp. No IDW was transported off of the site, nor manifested by CWS.

### 3.6 **Project Work Plan Discrepancies**

There were no significant or substantive changes, modifications, or revisions to the Project Work Plan (PWP) (Cardno, April 2015), nor discrepancies between the actual field tasks as performed and their description in the PWP. Methodologies as described in the PWP were followed and conducted and completed accordingly.

# 4 Analytical Results

This section summarizes the results of the groundwater sampling activities completed at the PacifiCorp Chehalis Plant on December 16<sup>th</sup>, 2015. Samples were analyzed for mineral oil using Northwest methods for total petroleum hydrocarbons – diesel extended range (NWTPH-Dx). These results are compared to the appropriate WA DoE MTCA Method A Cleanup Levels (WAC 173-340). The complete analytical report, including the CoC forms and electronic data deliverable table, are included in Appendix D.

### 4.1 Comparison of Project Results to Regulatory Guidance

Assessment of mineral oil in groundwater sample data results are compared to permissible values listed for WA DoE MTCA Method A Cleanup Levels for Groundwater (WAC 173-340-720). MTCA's definition of Mineral Oil means non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors measured using NWTPH-Dx. The MTCA Method A Groundwater Cleanup Level for Mineral Oil of **500 µg/L** is based on protection from noncarcinogenic effects during drinking water use. Additional PCB testing requirements listed under the MTCA groundwater section (173-340-720) do not apply to project sampling because PacifiCorp can demonstrate that: (1) The release originated from an electrical device that was manufactured after July 1, 1979; or (2) oil containing PCBs was never used in the equipment suspected as the source of the release; or (3) it can be documented that the oil released was recently tested and did not contain PCBs.

### 4.2 Groundwater Sampling Results

Five groundwater samples, along with one duplicate (duplicate from MW-5) were submitted to ARI Labs for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Residual Range Organics (RRO) / heavy fuel oil. DRO quantitation would be noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation would be noted on chromatograph peaks in the range from C16 to C34. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results would indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

There were no reportable detections of DRO/RRO or Mineral Oil at any of the project tested well locations during this quarterly groundwater sampling event. Groundwater sampling results are presented in Table 4.

| Sample ID | Parameter   | Detection Limit<br>µg/L | Reporting<br>Limit μg/L | Result Value<br>µg/L | Data<br>Qualifier |
|-----------|-------------|-------------------------|-------------------------|----------------------|-------------------|

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

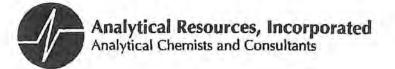

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

#### RE: Client Project: PacifiCorp GW Investigation ARI Job No.: ASW9

Dear Lenora:

Please find enclosed the original chain of custody record and the final results for the samples from the project referenced above. Six water samples were received on December 16, 2015. The samples were analyzed for NWTPH-Dx as requested.

There were no problems associated with these analyses.

A copy of these reports will remain on file at ARI. Should you have any questions or need additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Mark D. Harris Project Manager 206/695-6210 markh@arilabs.com

### Data Reporting Qualifiers Effective 12/31/13

### **Inorganic Data**

- U Indicates that the target analyte was not detected at the reported concentration
- \* Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but ≥ the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

### Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- \* Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Laboratory Quality Assurance Plan

Page 1 of 3

Version 14-003 12/31/13

Analytical Resources, Incorporated Analytical Chemists and Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drlft or minimum RRF).</p>
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (Dioxin/Furan analysis only)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (Dioxin/Furan analysis only)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (Dioxin/Furan analysis only)

Laboratory Quality Assurance Plan

W

 $(\cdot)$ 

i

Analytical Resources, Incorporated Analytical Chemists and Consultants

### **Geotechnical Data**

- A The total of all fines fractions. This flag is used to report total fines when only sleve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
  - Weight of sample in some pipette aliquots was below the level required for accurate weighting

### 1 Introduction

#### 1.1 **Purpose and Objective**

Clear Water Services (CWS) was contracted by KTA Associates, Inc. (KTA) to conduct a site investigation at PacifiCorp's Rocky Mountain Power (RMP) Chehalis, WA power plant. Site investigation activities focused on the assessment of potential impacts to subsurface soil and shallow groundwater within certain areas of the plant that were previously exposed to Mineral Oil releases in 2011 and 2013. These releases were due to malfunctions with the plant's Generator Step-up Unit (GSU)s #1 and #3. Mineral Oil is used as insulating fluid in these GSU transformers.

The primary objective of this project is to determine if any residual impacts from Mineral Oil releases exists in the subsurface soil and shallow groundwater at concentrations above Washington Department of Ecology's (WADOE) Model Toxics Control Act (MTCA) regulatory limits. Site investigation activities are being conducted under WA DoE's Voluntary Cleanup Program (VCP).

This project is divided into two main phases. The first phase included monitoring well installation, in conjunction with various sampling and support tasks. The outcome of soil boring / monitoring well installation activities and associated environmental sampling results are included within the *Monitoring Well Installation and Support Tasks Report (MWIR)* (Cardno, May 2015).

The second phase of this project involves groundwater monitoring, conducted on a quarterly basis. Previous monitoring events were completed in April, July and December of 2015. The current, and final scheduled, monitoring event was complete in March 2016. This Groundwater Monitoring Report (*GWMR*) details field methods, water level measurements, groundwater table elevations, flow direction assessment and sampling results for the forth quarterly field event. All field efforts, in support of this forth quarterly groundwater monitoring event, were conducted on 22 March, 2016.

#### 1.2 Scope of Work

To meet the above stated objectives, the scope of work for quarterly groundwater monitoring consisted of the following field activities:

- Coordination of pre- (field) mobilization tasks,
- Collection of static groundwater level measurements,
- Sampling of five groundwater monitoring wells,
- Handling of project collected environmental samples,

- Documentation of field activities,
- Containment of investigation derived waste (IDW), and
- Generation of an event-specific groundwater monitoring report.

Prominent site features and well locations are shown on Figure 1.

#### 1.3 Report Organization

This *GWMR* is organized into the following five sections:

- > Section 1.0 Introduction
- > Section 2.0 Site Background
- > Section 3.0 Field Efforts
- > Section 4.0 Analytical Results
- > Section 5.0 References

Discussions regarding the procedures and methods utilized for the groundwater monitoring tasks and subsequent results of the data collected are presented in the main text of this *GWMR*. Health & Safety Tailgate Forms, Monitoring Well Sampling and Water Quality Measurement Forms, Field Notebook entries, and the Analytical Report (along with the electronic data deliverable formatted for submission to WADoE's Environmental Information Management system) are presented as Appendices A through D, respectively.

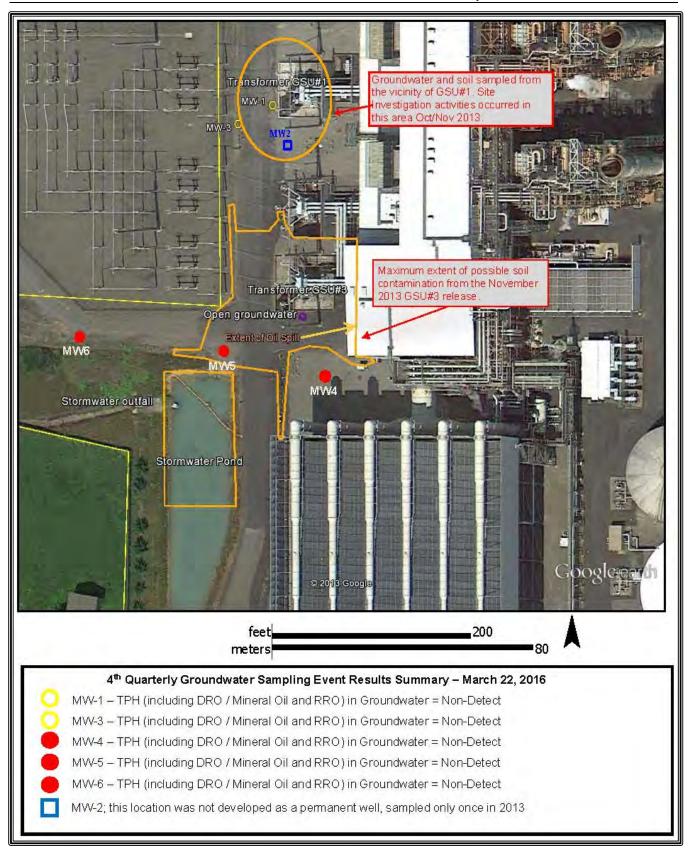

Figure 1. Site Map with Monitoring Well and Prominent Features

### 2 Site Background

#### 2.1 Site Description

Rocky Mountain Power owns and maintains a natural gas-fired combined cycle power plant, which produces 520-megawatts of electricity. The plant is located at 1813 Bishop Road, Chehalis, Washington, in the Chehalis River Valley.

The Chehalis River Valley is considered a rural area, with approximately 7,000 residents living in and around the city. The plant is located 3 miles south of town, which consists mostly of small parks, farms, small pockets of light industrial areas, and a few housing subdivisions.

#### 2.1.1 <u>Geology</u>

The overall soil-type distribution at the site consists of low permeability silt and clay layer underlain by 45 to 50 feet of water-bearing sand and gravel, underlain by a silt and clay aquitard. These soil-types are consistent with regional geologic mapping by Weigle and Foxworthy (1962) and a regional study for the Chehalis Generation facility (Dames and Moore 1994). These regional studies classify the upper 50 feet of soil in the area of the site as recent alluvium and glaciofluvial sediments. The aquitard found at approximately 50 feet bgs is widespread, is often described as blue-gray, clayey silt, and is reported to be more than 100 feet thick (Dames and Moore 1994).

#### 2.1.2 <u>Hydrogeology</u>

The groundwater flow direction beneath the site is assumed to travel south/southwest towards Bishop Road and Berwick Creek. Regional investigations conducted by others (Dames and Moore 1994) have categorized the shallow aquifer in the area as unconfined or semi-confined. However, the shallow aquifer appears to exhibit the characteristics of a confined or semiconfined system, primarily due to the low permeably silt cap immediately above the aquifer.

#### 2.2 Previous Mineral Oil Releases and Site Cleanup Efforts

Cowlitz Clean Sweep (CCS) completed a site cleanup (CCS 2011) at the RMP Chehalis Plant during the months of January through March, 2011. CCS removed floating product from the stormwater pond and ditch lines using oil booms, absorbent material, an oil skimmer and vacuum truck. The stormwater ditch lines were cleaned by removing impacted material down to the clay layer.

CCS sampled affected areas and ditches for analysis to determine the extent of oil contamination; additional soil and water sampling was conducted after cleanup.

The main excavation occurred at or near GSU-1, the first plant transformer that caught fire and subsequently released mineral oil to the surrounding areas. Impacted soil was removed to a depth of six inches below the static groundwater line using olfactory methods (i.e., visual).

During the excavation, free product was noted floating on top of the water and absorbent materials were deployed in the excavation area to remove the product. All excavated materials were loaded onto waiting dump trucks and taken to the Weyerhaeuser transfer station located in Longview, WA for disposal.

Once the excavations had been completed, the area around the GSU-1 transformer was backfilled with clean material and compacted to the required 95% compaction. All ditch lines were relined with clean gravel to prevent sediment loss and water quality issues.

Water collected during excavation activities completed near and around the transformer area was pumped to an on-site 1.7 million gallon diesel above ground storage tank (AST) and the AST containment area.

CCS removed 845 tons of rock and soil and 8,869 gallons of water from affected areas during excavation activities. CCS backfilled the excavations with 92 tons of 2 to 4 inch quarry spalls and 462 tons of 1 ¼" rock to help achieve the required 95% compaction standard.

Most recently, GSU-3 experienced a similar malfunction in late 2013 to the one that occurred at GSU-1 in early 2011. Consequently, this malfunction caused the release of mineral oil around the base of the transformer unit and impacted the surface areas adjacent to it, the roadway and ditches and the area around the southwest corner of the plant building. The management of the release of mineral oil at GSU-3 was approached by RMP and conducted by CCS in a similar fashion to the previous cleanup at GSU-1.

#### 2.3 Previous Site Investigations

A Site Investigation (SI) was completed at the RMP-Chehalis Plant on May 23<sup>rd</sup> through May 25<sup>th</sup>, 2011. The SI was conducted to determine the following:

- If groundwater had been impacted from the mineral oil spill;
- If the water contained in the large AST, which was collected during excavation activities, exceeded any regulatory levels, and;
- If surface water in the stormwater pond had been impacted from the mineral oil spill.

The following activities were completed during the 2011 SI:

- Six temporary monitoring wells were installed and sampled within the shallow water bearing zone;
- Two water samples were collected from the AST at varying depths;
- Two surface water samples were collected from the stormwater pond, and;
- Three surface soil samples were collected downgradient of the mineral oil spill.

The results of the 2011 SI are summarized as follows:

- One groundwater sample (GW-4) had a detection of Mineral Oil at 1100 μg/L, which exceeded the MTCA Method A Groundwater Cleanup Level of 500 μg/L;
- One AST water sample (TS2) had a detection of Mineral Oil at 440 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level;
- One surface water sample (SW1) had a detection of Mineral Oil at 360 µg/L, which did not exceed the MTCA Method A Groundwater Cleanup Level, and;
- One soil sample (SG1) had a detection of Mineral Oil at 160 mg/kg, which did not exceed the MTCA Method A Soil Cleanup Level of **4000 mg/Kg**.

Subsequent to the 2011 SI, a follow-up field investigation was undertaken in October and November of 2013. These follow-up tasks were conducted after a review of all field efforts and sampling results to date by WADOE VCP staff. The VCP stakeholders identified two hot spots near GSU#1. With concurrence from WADOE VCP staff, PacifiCorp and KTA agreed to investigate soil and groundwater at these two areas. This was undertaken to characterize the local groundwater flow to determine if the mineral oil released from GSU-1 had any longer-term impacts to the deeper subsurface soils, vadose zone and/or the local shallow groundwater from areas with previously identified concentrations of mineral oil above regulatory limits. The *Groundwater Investigation Report* (Cardno, 2014) presented data from this effort. Main investigative tasks and sampling results contained in this report are summarized below;

The following activities were completed during the 2013 SI:

- Drill, characterize and sample subsurface soil from 3 locations to ~30-feet below grade surface. Soil samples from the borings at SB-1 thru SB-3 were analyzed for mineral oil.
- Install permanent wells at two of the drilling locations, MW-1 and MW-3. Due to utility interferences, a well was not set at the location for MW-2. These activities took place on October 28 and 29, 2013.
- A (relative) survey of the monitoring well casing elevations was conducted to aid in the determination of groundwater flow direction.
- Groundwater was sampled from site wells MW-1 and MW-3. A one-time groundwater sample was collected at MW-2 during the extraction of the drill rods. These activities took place on November 1, 2013 – except for the MW-2 sample, which was collected earlier (10/29/2013).

The results of the 2013 SI are summarized as follows:

- One groundwater sample (MW-2) had a detection of Mineral Oil at 380 μg/L, which is below the MTCA Method A Groundwater Cleanup Level for Diesel Range Organics (DRO) – Mineral Oil of 500 μg/L.
- There were no detections of Mineral Oil in any of the subsurface soil samples.

Following the release of Mineral Oil from GSU#3 in November 2013 and the ensuing site cleanup efforts, RMP continued its environmental protection efforts in conjunction with their ongoing VCP actions. Through cooperative agreements between RMP and WADOE, a site investigation, similar to those previously implemented at the GSU#1 area, was implemented in the areas adjacent to and downgradient from GSU#3. Results of subsurface soil and electrical vault in-flow water sampling are presented in the *MWIR* (Cardno, May 2015). These SI efforts were undertaken on April 7-15, 2015.

The following activities were completed during the 2015 SI:

- Subsurface soil from 3 locations to ~30-feet below grade surface was characterized and sampled. Soil samples from the borings at SB-4 thru SB-6 were analyzed for Northwest Total Petroleum Hydrocarbon – Diesel range extended (NWTPH-Dx) / Mineral Oil.
- Permanent wells were installed at all three 2015 boring locations. These wells are MW-4, MW-5 and MW-6. The three new wells, along with the two previous wells (MW-1 and MW-3) were developed / re-developed. These activities took place on April 7 9, 2015.
- A (relative) elevation survey of the monitoring well casings was conducted to aid in the determination of groundwater flow direction. This was completed on April 15, 2015.
- A one-time sampling event was completed to test in-flow water within four deep electrical vaults adjacent to GSU's #1 and #3. Water samples from these vaults was submitted for NWTPH-Dx / Mineral Oil. These activities took place on April 7, 2015. Figure 2 shows the location of these electrical vaults at the site relative to the GSUs and other site features.

The Results presented in the 2015 *MWIR* are summarized as follows:

- Soil from a depth of 5' bgs collected at SB-5 had a detection of DRO at 6.7 mg/Kg, which is below the MTCA Method A Soil Cleanup Level of **4,000 mg/Kg**.
- Electrical vault in-flow water from EMHM003 had a detection of DRO at 120 µg/L, which is below the MTCA Method A Groundwater Cleanup Level of **500 µg/L**.
- Electrical vault in-flow water from EMHC002 and its Duplicate (DUP-vault) had detections of DRO, both at 110  $\mu$ g/L, which are below the MTCA Method A Groundwater Cleanup Level of **500 \mug/L**.
- Electrical vault in-flow water from EMHC001 had detections of DRO, Mineral Oil and Residual Range Organics (RRO) at 1900 µg/L, 1300 µg/L and 320 µg/L, respectively. DRO and Mineral Oil detections exceed the MTCA Method A Groundwater Cleanup Level, but are, comparatively, below the 10,000 µg/L Industrial Stormwater General Permit (ISGP) Stormwater Benchmark for TPH.

#### Groundwater Monitoring Report 4<sup>th</sup> Quarterly Event – March 2016 Rocky Mountain Power, Chehalis Plant

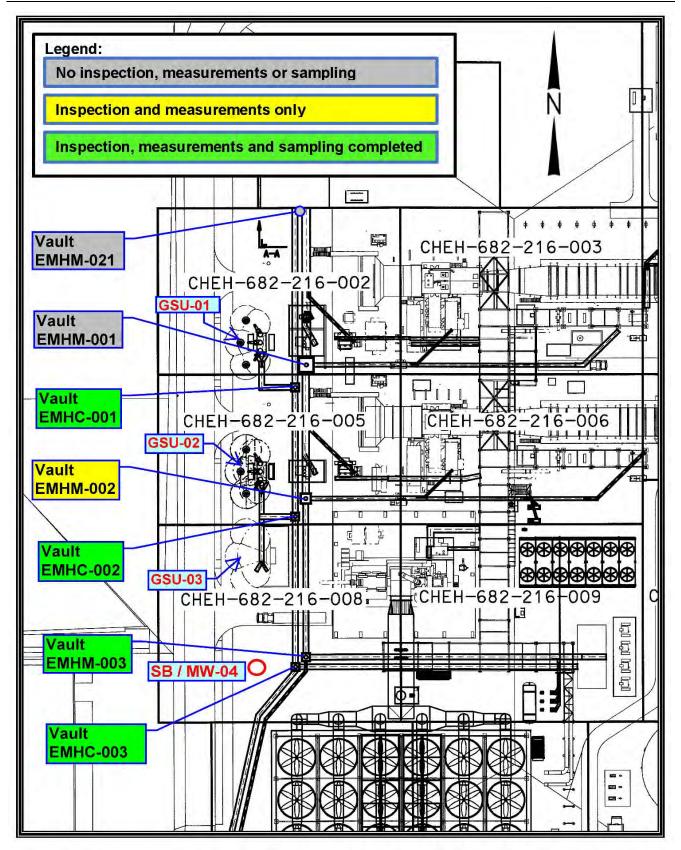

Figure 2. Electrical Vault / In-Flow Water Sampling Locations

## 3 Field Efforts

Section 3 details the field efforts that were employed during the March 2016 quarterly groundwater sampling event and support tasks. These tasks included pre-field mobilization planning, collection of static groundwater level measurements, sampling of five monitoring wells, handling of project collected environmental samples, documentation of field activities and containment of investigation-derived waste (IDW). Any discrepancies between the *Groundwater Investigation and Quarterly Monitoring Work Plan 2015/2016* (Cardno, April 2015) and the actual field methodologies utilized are also described in this section.

### 3.1 Pre-Field Mobilization Planning

The forth quarterly groundwater monitoring event was scheduled for and conducted on March 22, 2016. CWS coordinated the scheduling of this event with RMP and KTA staff to minimize any logistical impacts to plant operations and to the sampling event itself. The overall schedule had been discussed and approved during the planning phase and at the Kick-Off Meeting held on 13 March, 2015. Pre-field mobilization items included consideration of and preparation for health and safety concerns, scheduling staff, coordination with the analytical testing facility and reservation / ordering / procurement / rental of all necessary field sampling equipment, monitoring instruments, personal protective equipment, and field consumables.

Several days prior to initiation of groundwater sampling, CWS was in direct contact with the RMP Environmental / Safety Analyst and the KTA Project Manager to finalize event coordination, site access and to receive the latest health & safety and site condition reports. The laboratory was consulted during this period and an order was placed for the sampling containers, as well as other necessary laboratory supplies. CWS retrieved the containers and supplies directly from the laboratory during mobilization to the RMP site.

#### 3.1.1 <u>Health and Safety</u>

A Site Specific Health and Safety Plan was drafted for the groundwater sampling events and is included as an Appendix to the *Groundwater Investigation and Quarterly Monitoring Work Plan*, *2015/2016* (Cardno, April 2015). CWS adopted the appropriate sections of this plan. At a minimum this Health and Safety Plan provides emergency contact information, routes to the nearest medical and/or aid facilities, site specific work tasks and environmental /physical hazard information. Prior to the initiation of any field tasks, it is a mandatory requirement to conduct a Tailgate Safety Meeting. The purpose of the Tailgate Safety Meetings is to review any expected site specific hazards, general task hazards, current / changed site conditions, to receive a briefing from the RMP site representative, to discuss emergency procedures, and to review the daily work / task schedule. Such a Tailgate meeting was conducted on March 22, 2016, preceding the start of groundwater sampling tasks. A completed Health and Safety Tailgate Meeting Form is included in Appendix A.

#### 3.2 Groundwater Level Measurements and Flow Direction Assessment

Prior to sample collection, each monitoring well was opened and its expansion plug was removed. Ample time was allotted for each well to equilibrate to the current ambient air pressure. An electronic interface probe was used to check for the presence/thickness of any accumulated free-phase hydrocarbon product and to measure the distance from the top edge of the PVC well casing to the surface of the water table (static water level) within each monitoring well. No hydrocarbon product was detected (to a minimum thickness of 0.01') at any of the project wells, or was otherwise visually observed in the purge water, observation well or the collected samples.

The southwest corner of the GSU-1 containment wall was assigned an elevation of 100.00 feet above mean-sea level. A level survey was conducted to accurately determine the elevation of each monitoring well casing, using the assigned elevation of the GSU-1 containment wall corner as a benchmark. Water level measurements were subtracted from their well casing elevations to calculate (relative) elevation of the groundwater table beneath each well location. Site groundwater elevations were highest at MW-1 and lowest at MW-6, at 94.23 and 91.88 feet above mean-sea level (amsl), respectively. On average the water table was 0.69 feet higher than during the previous round of sampling, with the least difference of 0.23 feet (higher) noted at MW-3 and the greatest difference of 1.08 feet (higher) noted at MW-6. Groundwater gradient was 0.0077 ft/ft, or 0.77%. Table 1 lists the well casing elevations, depth to product, static water level measurements and groundwater elevations calculated for this quarterly event.

Groundwater elevation contours were constructed and the flow direction was assessed. As noted during previous sampling rounds, groundwater flow this round was noted to be east to west. A steepening gradient was noted toward the northern end and more even contour spacing was noted toward the southern end of the site. As seen in previous sampling rounds the groundwater table is deflected southwesterly, flowing towards a small stream basin offsite in the same direction. Figure 3 shows the generalized groundwater flow direction along with the elevation contours.

| Location                         | Top PVC Well<br>Casing<br>(ft amsl) | Depth to Product<br>(ft) | Static Water Level<br>Measurements (ft) | Groundwater<br>Elevation (ft amsl) |
|----------------------------------|-------------------------------------|--------------------------|-----------------------------------------|------------------------------------|
| SW corner GSU-1 containment wall | 100.00 <sup>1</sup>                 | NA                       | NA                                      | NA                                 |
| MW-1                             | 97.76                               | Not Detected             | 3.53                                    | 94.23                              |
| MW-3                             | 97.57                               | Not Detected             | 3.98                                    | 93.59                              |
| MW-4                             | 97.64                               | Not Detected             | 3.77                                    | 93.87                              |
| MW-5                             | 97.08                               | Not Detected             | 4.02                                    | 93.06                              |
| MW-6                             | 96.18                               | Not Detected             | 4.30                                    | 91.88                              |

#### Table 1. Water Level Measurements and Groundwater Elevations

<sup>1</sup>All elevations are relative, as they are referenced to the top of the SW corner of the GSU-1 containment wall. This reference location has been assigned an elevation of 100.00' amsl.

#### 3.3 Groundwater Sampling

Groundwater sampling events were scheduled for completion on a quarterly basis. This forth event was completed on March 22, 2016. Previous groundwater sampling events were conducted on (1) April 15<sup>th</sup>, (2) July 8<sup>th</sup>, and (3) December 16<sup>th</sup>, 2015. There are no additional groundwater sampling events scheduled. Groundwater sampling activities were conducted using U.S. Environmental Protection Agency Low-Flow Sampling Techniques (USEPA, 1996, Rev 2010) (where pumping rates are matched to achieve minimal drawdown of the water column during pumping) and WA Department of Ecology (WADOE, 2011) accepted methodology. Groundwater samples at the RMP-Chehalis Plant were collected and analyzed for mineral oil using the Northwest total petroleum hydrocarbons – diesel extended range (NWTPH-Dx) method. Monitoring well locations are presented on Figure 1.

Prior to sampling, all five site monitoring wells were properly and effectively developed / redeveloped on April 9, during the 2015 SI field event. All monitoring wells were allowed to settle and equilibrate for at least three days prior to initial sampling activities. Well construction and development details are included in the MWIR (Cardno, May 2015). Monitoring wells were not re-developed between or prior to quarterly sampling rounds.

A peristaltic pump, setup with dedicated platinum-cured Tygon® tubing, connected to dedicated, Teflon®-lined polyethylene tubing, was used to purge groundwater and to obtain samples at each well location. Monitoring wells were purged until water quality readings had stabilized or a maximum of three casing volumes had been removed. Water quality parameter measurements were recorded during sample purging (stabilization assessment) and included: specific conductivity, temperature, pH, dissolved oxygen (DO) and turbidity. A summary of the final water quality measurements collected prior to sampling are presented in Table 2.

| **Well ID           | Date /<br>Sample<br>Time | Average<br>Purge<br>Rate<br>(ml/min) | Total<br>Purge<br>Volume<br>(gal) | Temp.<br>(C°) | рН   | Sp. Cond<br>(µS/cm) | Turbidity<br>(NTU) | Dissolved<br>Oxygen<br>(mg/L) |
|---------------------|--------------------------|--------------------------------------|-----------------------------------|---------------|------|---------------------|--------------------|-------------------------------|

**Table 2 Summary of Water Quality Measurements** 

\*\*All wells are 2-inch diameter Sch40 PVC

<sup>a</sup>Duplicate sample was collected at MW-1

Samples were collected from either mid-screen depth or from the middle of the existing water column, depending on which of these two scenarios occurred at the time of sampling. Table 3 lists water sampling information; including parameters, testing methods and number of samples and duplicates. Sampling and water quality information collected at each well included average purge rate, water level, parameter measurements and cumulative volume of groundwater purged from well at each well volume interval. Detailed well measurement, purging and sampling information is contained on the Monitoring Well Sampling and Water Quality Measurement Forms, which are include in Appendix B.

| Sample Type                                 | Analytical  | Sample | Analytical | No. of  | No. of     |
|---------------------------------------------|-------------|--------|------------|---------|------------|
|                                             | Parameter   | Matrix | Method     | Samples | Duplicates |
| Quarterly<br>Groundwater<br>Sampling Events | Mineral Oil | Water  | NWTPH-Dx   | 5       | 1          |

#### Table 3. Groundwater Sample Collection Information

### 3.4 Sample Handling, Field Documentation and Quality Assurance

This section discussed field documentation and procedures used to handle and manage the environmental samples collected for laboratory analysis. Project quality assurance methods are also detailed.

#### 3.4.1 Field Documentation

A logbook was used to document sampling and other support procedures performed during field activities. More specifically, the Field Activities Logbook entries provide a record of specific sample locations and collection information, any subcontractor activities, noting their role(s), describing the major equipment used at each sampling location and providing noteworthy observations, description of problems, or incidents and their resolutions. Completed field forms, planning and safety documents and the Field Activities Logbook were all stored in a weather-proof file box, maintained on site, during all project work activities. Field Activity Logbook entries are included in Appendix C.

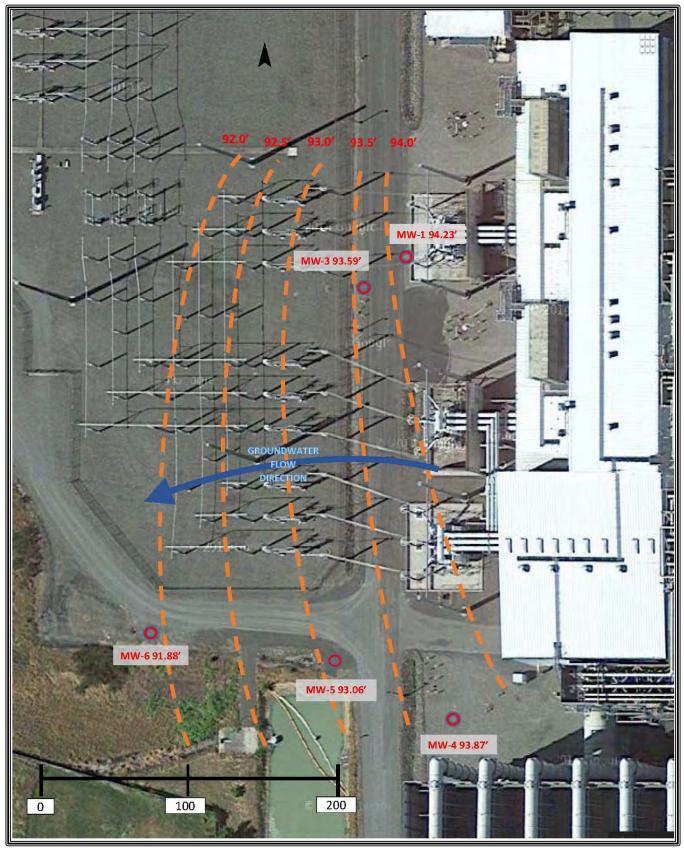

Figure 3. Groundwater Elevations and Flow Direction

#### 3.4.2 Sample Handling Procedures

Disposable nitrile gloves were used by personnel when collecting and handling of any samples. Gloves were changed frequently and in between each sample collection to avoid cross contamination. Samples were collected into certified clean, laboratory supplied containers, with pre-measured amounts of preservatives, as appropriate.

Once the samples were collected they were appropriately labeled and placed into an insulated cooler containing ice. This was done to keep the samples out of the direct sunlight and to maintain a temperature of as close to four degrees centigrade as possible. All project samples were hand-delivered to the contracted laboratory, Analytical Resources, Incorporated (ARI) laboratory in Tukwila, WA.

#### 3.4.2.1 Sample Identification, Labeling and Chain of Custody

Samples were identified by their location and corresponding date of collection. Any quality control samples (e.g. duplicates) were also properly denoted. Sample identification numbers, including sample media type, location number, and other pertinent descriptions were recorded on field sheets completed for each location and sample.

Chain of Custody (CoC) forms, detailing sample container, collection and possession information, were completed and accompanied each cooler shipment from the field to the laboratory. Date, time, sample identification, number of containers, analysis to be performed, and sampler/s in possession were recorded on each CoC. CoC records are included in Appendix D.

#### 3.4.3 **Quality Assurance Methods**

#### 3.4.3.1 Instrument Calibration

All field instruments that required a zeroing and/or a user calibration were appropriately calibrated prior to or at the start of each day's deployment per the instrument manufacturer's instructions. Calibration checks against standards were performed at the beginning and periodically throughout each field day (if necessary / required) to verify equipment operation. Any calibration data was recorded in the field logbook. All calibration media (e.g. gas, liquid or otherwise) was properly stored and managed per manufacturer's recommendations and according to applicable RMP Plant requirements.

#### 3.4.3.2 Decontamination Procedures

Non-disposable equipment (e.g. interface probe) was decontaminated prior to its initial use and after completing a particular sampling or logging task. Decontamination wash consisted of the following:

- > non-phosphate detergent (Alconox) and water wash;
- > tap water rinse; and

- > De-ionized water rinse.
- > Drilling rigs, support vehicles, drill works, connection rods, augers and other large pieces of equipment would be decontaminated by power washing with a high-pressure steam cleaner only as described in Section 4 of the 2015 Project Work Plan (Cardno, April 2015).

Decontamination of appropriate equipment was conducted in the field during this quarterly groundwater sampling round, as specified above.

#### 3.5 Investigation Derived Waste

Investigation-derived waste (IDW) generated during this quarterly groundwater sampling event consisted of excess purge water produced during well pumping, decontamination rinse, and general sampling waste debris (spent gloves, paper, etc.). All purge water was containerized into a Department of Transportation (DOT)-17H approved open head 55-gallon drum. A "common" purge water collection drum was initiated during the first quarterly sampling event in April, 2015. This drum was properly labeled with its media contents, date of generation, location of origin, and contents' owner. The drum was sealed with a solid lid, complete with fitted gasket, which was secured with a bolted band and placed onto a pallet. Purge water from each subsequent sampling round has been added to this "common" drum.

Approximately 9.5 gallons of purge water was generated during this quarterly sampling event. All purge water was placed into the "common" groundwater event drum, which is stored onsite during and between sampling rounds. To date approximately 34 gallons of purge water has been contained in this drum.

The purge water drum/pallet placement was approved by the RMP Environmental / Safety Analyst – Project Manager. The storage location is secure and wholly within the Rocky Mountain Power Chehalis – Plant property boundary. Additional IDW tasks, including testing, further staging, manifesting and disposal are being managed directly by RMP. No IDW was transported off of the site, nor manifested by CWS.

#### 3.6 Project Work Plan Discrepancies

No significant or substantive changes, modifications, or revisions to the Project Work Plan (PWP) (Cardno, April 2015) were instituted, nor were there any discrepancies between the actual field tasks as performed and their description in the PWP. Groundwater sampling, sample management and related event tasks, were conducted and completed in accordance with methodologies as described in the PWP.

## 4 Analytical Results

This section summarizes the results of the groundwater sampling activities completed at the RMP Chehalis Plant on March 22<sup>nd</sup>, 2016. Samples were analyzed for mineral oil using Northwest methods for total petroleum hydrocarbons – diesel extended range (NWTPH-Dx). These results are compared to the appropriate WA DoE MTCA Method A Cleanup Levels (WAC 173-340). The complete analytical report, including the CoC forms and electronic data deliverable summary table, are included in Appendices D-1 and D-2, respectively.

#### 4.1 Comparison of Project Results to Regulatory Guidance

Assessment of mineral oil in groundwater sample data results are compared to permissible values listed for WA DoE MTCA Method A Cleanup Levels for Groundwater (WAC 173-340-720). MTCA's definition of Mineral Oil means non-PCB mineral oil, typically used as an insulator and coolant in electrical devices such as transformers and capacitors measured using NWTPH-Dx. The MTCA Method A Groundwater Cleanup Level for Mineral Oil of **500 µg/L** is based on protection from noncarcinogenic effects during drinking water use. Additional PCB testing requirements listed under the MTCA groundwater section (173-340-720) do not apply to project sampling because RMP can demonstrate that: (1) The release originated from an electrical device that was manufactured after July 1, 1979; or (2) oil containing PCBs was never used in the equipment suspected as the source of the release; or (3) it can be documented that the oil released was recently tested and did not contain PCBs.

#### 4.2 Groundwater Sampling Results

Five groundwater samples, along with one duplicate (duplicate from MW-1) were submitted to ARI Labs for Mineral Oil analysis via NWTPH-Dx. Results are reported as Diesel Range Organics (DRO), Mineral Oil and Residual Range Organics (RRO) / heavy fuel oil / motor oil. DRO quantitation would be noted on chromatograph peaks in the range from C12 to C24. Mineral Oil quantitation would be noted on chromatograph peaks in the range from C16 to C34. RRO quantitation was noted on chromatograph peaks in the range from C24 to C38. Combined, the DRO/RRO results would indicate the total diesel range extended (Dx) identified in a particular sample. Mineral Oil, therefore, is a subset of the total DRO/RRO concentration.

There were no reportable detections of DRO/RRO or Mineral Oil at any of the project tested well locations, including field quality control samples (duplicates), during this quarterly groundwater sampling event. Groundwater sampling results are presented in Table 4.

| Sample ID | Parameter   | Detection Limit<br>µg/L | Reporting<br>Limit μg/L | Result Value<br>µg/L | Data<br>Qualifier |
|-----------|-------------|-------------------------|-------------------------|----------------------|-------------------|
| MW-1      | DRO         | 30                      | 100                     | <100                 | U                 |

RE: PacifiCorp GW Investigation

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

#### Analytical Resources Inc. TPH Quantitation Report

 Data file: 20160329.b/16032912.D
 ARI ID: 16C0025-05

 Method: 20160329.b/FID4TPH.m
 Client ID: MW-5

 Instrument: fid4a.i, ML
 Injection: 29-MAR-2016 14:59

 Report Date: 03/30/2016
 Dilution Factor: 1

 Macro: 15-MAR-2016
 Calibration Dates: Gas:24-FEB-2016 Diesel:15-MAR-2016 M.Oil:15-MAR-2016
