Attention: Ms. Tamara Welty, LG, LHG

Subject: Source Investigation Summary Report
SE Parking Lot Plume
12th & Yesler Redevelopment Property
Seattle, Washington

Dear Ms. Welty:

As you are aware, ***Whitman Environmental Sciences (WES)***, has been conducting an investigation of the potential source areas of the groundwater plume of chlorinated solvents in the parking lot in the southeastern portion of the above referenced property. The attached report addresses the scope of work, methodology and findings of our investigation. It includes the laboratory reports of all soil and groundwater analyses conducted for this phase of work and includes supporting information from previously conducted drilling and sampling at the site and on adjacent properties that are relevant to this work.

WES has been pleased to have the opportunity to be of service in this matter. If you have any questions regarding the information contained in this report, or if I may be of any further assistance, please feel free to contact me.

Respectfully submitted,

Whitman Environmental Sciences

Daniel S. Whitman
Principal

EXECUTIVE SUMMARY

Whitman Environmental Sciences (WES) was has delineated a groundwater plume of vinyl chloride and related chlorinated solvents in the parking lot in the southeastern portion of the above referenced property. The plume appears to extend through the northern part of the SE parking lot from beneath the adjacent King County warehouse to the north. The purpose of this investigation is to identify the likely source area of the SE parking lot plume. In planning this investigation WES identified four potential areas where the plume may originate:

- The 118 12th Avenue tenant space, where prior tenants included a dry cleaner from about 1966 to 1972;
- An unidentified source beneath the King County warehouse related to past uses of that property;
- A former unidentified structure, incinerator or disposal area at the northern edge of the SE parking lot, or;
- An extended plume from the former Star Laundry facility at 160 12th Avenue, about 350 feet to the north.

Figure 1 shows the location of the subject site. Figure 2 illustrates the four areas and their relation to the SE parking lot plume. This study included drilling 14 additional borings, installing one additional monitoring well, two additional deep soil vapor probes, and obtaining 10 additional shallow soil samples in and around the site. The investigation focused on locations that would document conditions between these potential source areas and the SE parking lot plume. The purpose is to evaluate whether or not there are pathways for migration that would allow these potential source areas to contribute to the plume. The work was also coordinated with a complete set of quarterly groundwater sampling on all 19 previously exiting monitoring wells.

The findings of this study are summarized below:

- Six borings were drilled to the west of the warehouse. None of the investigation sampling from this area contained detectable concentrations of volatile organic compounds in any soil or groundwater sample. At the same time, monitoring well MW-14, an upgradient location from our investigation, contained vinyl chloride (0.66 ug/l) and cis-1,2-dichloroethene (C12DCE) at 1.3 ug/l. The investigative sampling, along with our prior investigations which support these findings, demonstrates there is no contaminant migration in groundwater toward or beneath the warehouse from this direction.

- A soil vapor sample adjacent to the west side of the warehouse did not contain tetrachloroethene (PCE) or any related daughter products except 1.4 ug/m^3 of vinyl chloride, below the deep soil gas screening level of 28 ug/m^3. The sample contained chloroform and bromodichloromethane above deep soil gas screening levels. These compounds are most commonly associated with municipal water supplies and are unrelated to PCE or its

breakdown products. This, along with our prior investigations which support these findings, demonstrates that conditions to the west of the warehouse have a different suite of compounds than observed over the SE parking lot plume. It further demonstrates that conditions to the west of the warehouse do not contribute to vapor intrusion into the warehouse structure.

- Four borings were drilled to the north of the warehouse. None of the investigation groundwater sampling from this area contained detectable concentrations of volatile organic compounds (VOCs) in any groundwater sample. The investigative sampling demonstrates there is no pathway for migration from the Star Laundry site toward or beneath the warehouse.

- Four borings were drilled to the south of the warehouse in the area of the suspected incinerator structure or disposal area. One was constructed as a permanent monitoring well (MW-15), to define the lower limits of groundwater contamination in the plume area. Ten shallow soil samples were also obtained to evaluate the extent of shallow PCE contaminated soils previously identified in boring WES-16.

  One groundwater sample from adjacent to the warehouse found elevated concentrations of PCE (33 ug/l), trichloroethene (TCE) (23ug/l), and vinyl chloride (0.23 ug/l), above MTCA Method A cleanup levels. That sample from WES-17 was obtained from within three feet of the south wall of the warehouse. Three other samples further away from the warehouse did not exceed Method A cleanup levels (WES-18), or did not contain any detectable VOCs (MW-15 and WES-19).

- One shallow soil sample from the borings south of the warehouse contained 0.13 mg/kg of PCE, with no other detected chlorinated compounds. The sample from WES-17 was from a depth of 1.5 feet below the surface, about the level of the footing of the adjacent warehouse. A deeper sample from 4.5 feet below the surface in WES-17 did not contain any detectable chlorinated VOCs. Borings WES-18, WES-19 and MW-15, further away from the wall of the warehouse, did not contain any detectable VOCs in shallow soil samples. A series of ten shallow soil samples (WES-20 through WES-29) were obtained in the area above the plume to evaluate the potential for surface spills in the parking lot. These samples did not find any other location with detectable chlorinated compounds in shallow soil.

- Groundwater samples were taken from 19 monitoring wells across the site as part of quarterly monitoring. The sampling found one well (MW-14) containing a detectable concentration of vinyl chloride (0.66 ug/l). The reported concentration exceeds the Model Toxics Control Act Method A groundwater cleanup criteria of 0.2 ug/l. Six of the samples contained detectable C12DCE at concentrations ranging from 1.1 to 3.3 ug/l, all below the applicable MTCA Method B standard formula value of 16 ug/l. Two samples contained TCE at 2.2 and 2.9 ug/l, below MTCA Method A cleanup criteria of 5 ug/l. The reported levels are lower and the distribution of chlorinated compounds is less than in prior sampling, which may reflect seasonal variations in water quality.

- Petroleum constituents were found in quarterly groundwater samples from monitoring wells MW-8, MW-9 and GEO B-8, all located in the northwestern corner of the subject property. Of these, only MW-9 exceeded MTCA groundwater cleanup criteria for any parameter. The

sample contained gasoline-range total petroleum hydrocarbons (TPH-G) at 3,900 ug/l, 9.5 ug/l of benzene and 1,100 ug/l of diesel-range TPH, which the laboratory flagged as not resembling the laboratory standard for diesel. This most likely reflects aged gasoline that extends into the diesel fraction of the test. The sample contained other petroleum-related volatile organic compounds, but at concentrations below applicable MTCA groundwater cleanup levels.

Based on the reported findings and our prior investigations of the site, this source investigation definitively excludes the areas to the west and north of the King County warehouse as potential sources or contributors to the plume in the SE parking lot. Sampling to the south of the King County warehouse found soil and groundwater contamination directly adjacent to the warehouse, but not at locations further south in the parking lot. Soil containing PCE has been identified at approximately the level of the warehouse footing. Groundwater adjacent to the wall of the warehouse is impacted with PCE, TCE, C12DCE and vinyl chloride.

Based on prior sampling throughout the SE parking lot there is a relatively limited plume that includes TCE, and a more widespread plume of vinyl chloride. The TCE distribution shows a distinct trend following the anticipated gradient of groundwater migration. The vinyl chloride plume reflects a wider distribution, suggesting the source area is located further north than the property boundary, in order to have spread to the degree found in our testing. The distribution of contaminants likely indicates a source of groundwater contamination beneath the King County warehouse.

The depth of contamination within the plume is bounded by deeper monitoring wells MW-1D and MW-15. Both of these wells are screened at depths underlying the plume and sampling has not found any detectable chlorinated compounds in any sample.

The extent of the plume is bounded to the east and southeast by on-site monitoring wells MW-1, MW-1D, MW-1S, MW-10 and MW-11. Off-site investigations conducted for Seattle Housing Authority (SHA) on the adjacent property to the east have sampled soil and groundwater for VOCs. Their investigations included analysis of seven soil and five groundwater samples that were located directly downgradient of the inferred extent of the vinyl chloride plume in the SE parking lot. None of these SHA sampling found any detectable VOCs in any samples. The finding bounds the easterly extent of the parking lot plume.

This summary is for introductory purposes only, and should be used only in conjunction with the full text of this report.

SE PARKING LOT PLUME
12TH & YESLER REDEVELOPMENT PROPERTY
104-124 12TH AVENUE & 1209 E. FIR STREET
SEATTLE, WASHINGTON 98122

1.0 INTRODUCTION

Whitman Environmental Sciences (WES) was retained by Mr. Michael Pollard of Centric Partners LLC to conduct an investigation to identify the likely source area of a plume of groundwater contaminated by chlorinated volatile organic compounds on the subject property. This work was conducted in response to comments received from the Washington Department of Ecology, which is reviewing a proposed cleanup to be conducted as part of redevelopment of the property.

This report summarizes the scope of work, methodology and findings of soil, groundwater and soil gas sampling conducted for this investigation. The investigation is one of several phases of assessment that have been completed at the property since 2017. Some pertinent site data from prior phases of work are incorporated into this assessment.

2.0 SITE DESCRIPTION

2.1 Location and Description

The subject property is located on the northeastern corner of the intersection of 12th Avenue and E. Yesler Way, in a mixed-use area in central Seattle, King County, Washington. The property and surrounding area are indicated in Figure 1, a Site Location Map.

The property consists of about 47,433 square feet of land extending the length of the block between Yesler and E. Fir Street, to the north. This investigation focused on the area surrounding an adjacent property occupied by a King County warehouse addressed 1215 E. Fir Street. Figure 2 shows the relative locations of the subject property and the warehouse.

2.2 Environmental Conditions

The subject site has been the subject of remedial investigations since at least 2016. The property has previously housed a service station with underground storage tanks, two auto repair operations, and a tenant space that housed both a screen printing shop and dry cleaner for part of its history.

WES' prior investigations have delineated a groundwater plume of vinyl chloride and related chlorinated solvents in the parking lot in the southeastern portion of the property. For identification in the redevelopment planning of the property, the area has been identified as the SE parking lot and the extent of contaminated groundwater has been identified as the SE parking lot plume. As shown in Figure 2, the plume appears to extend through the northern part of the SE parking lot from beneath the adjacent King County warehouse to the north. The purpose of this investigation has been to identify the likely source area of the SE parking lot plume.

The information collected about the site and surrounding area identified four potential areas that may contribute to the groundwater plume:

- The former tenant space at 118 12th Avenue on the subject property, where prior tenants included a dry cleaner from about 1966 to 1972;
- An unidentified source beneath the King County warehouse related to past uses of that property;
- A former structure or disposal area at the northern edge of the SE parking lot, or;
- An extended plume from the former Star Laundry facility at 160 12th Avenue, about 350 feet to the north.

Figure 2 illustrates the four areas and their relation to the SE parking lot plume. The available information about these potential sources was discussed in WES' workplan for this investigation, dated February 14, 2020 (WES, 2020).

2.2.1 118 12th Avenue Tenant Space Area

The 118 address is the northernmost tenant space in the 110 -118 12th Avenue building, a 1940 structure aligned along the western side of the redevelopment property. The area beneath the building and the open area to the east have been the subject of environmental investigations beginning in 2017 (WES, 2019). The closest point of the SE parking lot plume is about 125 feet to the southeast of the 118 12th Avenue area.

No soil samples from any of the borings in this area have contained detectable concentrations of any chlorinated compounds under analysis by EPA Method 8260. A reconnaissance groundwater sample from one hand augered boring evidenced vinyl chloride (1.9 ug/l), cis-1,2-dichloroethene (C12DCE) (5.3 ug/l), and trichloroethene (TCE) (1.6 ug/l), as well as several petroleum related volatile compounds that are attributable to the adjoining former service station to the north. MW-14 was constructed as a permanent monitoring well that has been sampled on two occasions prior to this investigation. Groundwater samples from MW-14 have detected vinyl chloride (0.25 to 0.66 ug/l) and C12DCE (1.8 to 2.3 ug/l), with no other detected compounds. Five other borings located between the former 118 12th Avenue tenant space and the SE parking lot plume (BN-1, BN-2, BN-3, BN-4 and WES-7) have not contained chlorinated volatile organic compounds (VOCs) in soil or groundwater samples.

Water level measurements in monitoring wells in and around this portion of the property indicate a generally south to southeastward gradient. The SE parking lot plume is not directly downgradient with respect to groundwater or contaminant migration. There are no utilities, trenches or known preferential flow paths that would allow cross-gradient migration of contaminants.

2.2.2 King County Warehouse Area

The King County warehouse was constructed in about 1954, replacing a small 1940s housing project. The structure was built on or very close to the property line that separates the subject property from the King County property. At the time of the warehouse construction, the SE parking lot was already in place as parking for an IGA grocery located in the lower level of the 104 12th Avenue building.

The building construction consists of tilt-up pre-cast concrete panels on narrow grade-beam foundations, with the roof supported by columns built on spread footings. Foundation plans

showing the building outline and typical footing construction are attached in Appendix C. The foundation plans do not show footing drains and the base of the building's footings are shallow, at elevations above groundwater level, which is typically five to seven feet below the surface along the northern edge of the SE Parking Lot. All utilities enter the building from the east side. The building or utility construction does not suggest a preferential flow path that would influence the direction of groundwater migration. There is likely to have been building maintenance and possibly equipment repair occurring in or on the warehouses. Activities related to the warehouse uses or construction may be potential sources of the chlorinated plume.

The row-houses that pre-dated the warehouse are also considered a potential source. Historical aerial photographs and Sanborn Fire Insurance Maps show long, narrow row-house buildings, one of which directly underlies the warehouse. At the time of a 1953 aerial photograph the homes had been removed in preparation for the warehouse construction, but the long narrow foundations and floor slabs were still in place and the photo shows a disturbed area at the southern end of the westernmost strip of slabs. The westernmost row-house and disturbed area are directly upgradient of the SE parking lot plume with respect to groundwater or contaminant migration. The warehouse area was considered a potential source of the plume due to historical uses or conditions and the location relative to the plume.

2.2.3 SE Parking Lot Area

The SE parking lot has been a parking lot since the early 1950s. Prior to that, the lot was unpaved and fenced off. Early tenants of the 104 12th Avenue building included auto repair, fertilizer manufacturing and a junk dealer. There is a potential that these early uses of the building resulted in impacts to the property that were later paved over to become the parking lot.

Another potential source in the parking lot was a structure shown in a 1955 photograph of the King County warehouse from historical Assessor's records (included in Appendix C). The structure could be a crude incinerator, located about 40 feet east of the southwestern corner of the warehouse. It should be noted that this structure pre-dates the former on-site dry cleaner at 118 12th Avenue, and the location would not have been readily accessible to that tenant. Solvent disposal in this area by the former cleaner is unlikely. Chlorinated solvents are not flammable, so it is unlikely for anyone to have attempted to dispose of them in an incinerator. This potential source is not likely related to any previously identified site activities.

This structure's location was investigated in 2019, with soil and groundwater samples from boring WES-16. A sample from one foot below the surface contained 0.12 mg/kg of tetrachloroethene (PCE), the only detected soil concentration of any chlorinated compound at any location on the entire property. The sample had a dark appearance and also contained elevated concentrations of cadmium (2.13 mg/kg), lead (883 mg/kg) and motor oil range petroleum hydrocarbons (1,200 mg/kg), suggesting this area may have been used for burning or other poorly controlled disposal. A groundwater sample contained a low concentration of 1.9 ug/l of C12DCE as the only detected chlorinated compound, but it represents the westernmost edge of the SE parking lot plume.

The area of this former structure was considered a potential source of the SE parking lot plume. The detected contaminants could also represent the southern edge of a source area beneath the King County warehouse.

2.2.4 Star Laundry Area 160 12th Avenue

The neighborhood surrounding the subject property has an extensive history of dry cleaning operations. Those include Star Laundry at 160 12th Avenue which operated to the north of the property as a laundry and dry cleaner from about 1928 to 1994. This potential source area is directly upgradient with respect to groundwater or contaminant migration. Although about 140 feet north of the King County property and about 350 feet north of the SE parking lot plume, the extremely high concentrations and the extended time the cleaner operated suggest that a contaminant plume could extend to that distance. It has been investigated since at least 2004, but no cleanup has been conducted. Five monitoring wells are at the Star Laundry property, all of which contained elevated concentrations of PCE. The highest concentrations were found in the area of a former sump in the southeastern corner of that building, where groundwater samples contained up to 16,000 ug/l of PCE and included C12DCE (4,700 ug/l), TCE (1,380 ug/l) and vinyl chloride (3.8 ug/l).

3.0 SCOPE OF WORK

To investigate these potential sources for the origin of the SE parking lot plume WES sampled soil and groundwater from fourteen additional borings located to the north, south and west of the King County warehouse. Figure 3 illustrates these new boring locations in context of prior site investigations. Six borings were drilled in the central part of the subject property along the western side of the King County warehouse, identified as borings BN-18 through BN-23. The borings were spaced about five feet from the warehouse wall, at approximately 15-foot intervals northward from the southwestern corner of the building. Four borings were drilled in the City of Seattle boulevard of E. Fir Street to the north of the warehouse, identified as borings BN-24 through BN-27. Four additional borings were drilled to the south of the warehouse, east, southeast and south of prior boring WES-16, designated WES-17 through WES-19 and MW-15. Boring MW-15 was constructed as a monitoring well for periodic sampling, screened at a depth to demonstrate the lower limits of the groundwater plume. Ten shallow soil samples were obtained from below the pavement, designated WES-20 through WES-29, in the area above the plume to evaluate the potential for surface spills to have occurred in the parking lot.

Two deep soil vapor probes were also installed along the west side of the building, identified as DSVP-3 and DSVP-4.

The work was coordinated with quarterly sampling of the 19 monitoring wells on the subject property.

3.1 Field Drilling and Sampling Procedures

WES subcontracted ESN Northwest, Inc. for all environmental field drilling in this investigation, except monitoring well MW-15 and shallow soil samples WES-20 through WES-22. These borings were drilled by Anderson Drilling LLC. Due to access constraints, borings BN-18 through BN-23 were drilled using a small tractor-mounted rig on February 28th, 2020. Borings BN-24 through BN-27 and WES-17 through WES-19 were conducted with a truck-mounted Geoprobe rig on March 3, 2020. Monitoring well MW-15 and WES-20 through WES-22 were drilled on March 26th, 2020. Shallow soil samples WES-23 through WES-29 were taken using hand auger on April 2, 2020.

Borings were drilled by direct-push methods, hydraulically driving a five-foot long sampler to obtain continuous soil samples throughout the drilled depth. Sample recovery was sometimes limited by loose or exceptionally dense soil conditions. The samplers were cleaned prior to each sampling

attempt and were equipped with new acetate liners which isolated the sample from contact with the body of the sampler. Boring BN-26 was drilled as a water sampling drive point only, since adjacent borings had consistent soil profiles showing no evidence of field detectable impacts. Details of the depths drilled, sample intervals and conditions encountered are noted on boring logs, included in Appendix A.

Borings were drilled to depths ranging from 15 to 25 feet below the ground surface. Except for MW-15, drilling extended to a depth that allowed sampling from the first encountered groundwater conditions. MW-15 was drilled through the first encountered groundwater and an underlying clayey stratum to a deeper seepage zone.

At the final depth of each boring, it was checked for standing water in the borehole. Groundwater seepage was encountered in all of the borings. Except for MW-15, a 1-inch diameter factory-slotted PVC well screen was installed as a temporary well to allow one-time reconnaissance groundwater sampling. The screen was purged to remove sediment using a peristaltic pump equipped with new polyethylene tubing. In most cases, recharge to the screen was sufficient to allow pumping until turbidity was reduced and relatively clear water could be obtained.

For monitoring well MW-15, after drilling and sampling to identify soil conditions, the driller moved over two feet and drove a 4-inch steel casing equipped with a sacrificial point to a depth of 25 feet, then installed a 5-foot long, 2-inch diameter PVC screen equipped with a mesh-wrapped pre-packed filter. The screen was then surrounded by an additional silica sand filter pack and the remaining borehole was grouted to seal off overlying water-bearing zones. The well was equipped with a flush monument installed in concrete at the ground surface. The well was allowed to stand undisturbed for five days prior to development and seven days prior to sampling.

Shallow soil samples were obtained using a jackhammer to break the asphalt pavement, then a post hole digger to clear base gravel from above the natural soil. Below that depth, a hand auger was used to extend the hole to a depth of three feet. Representative samples were taken from depths of 1.5 and 3 feet below the surface for potential laboratory testing.

During all drilling, representative portions of soil samples were placed in laboratory prepared containers, chilled and held under chain-of-custody following appropriate environmental sampling procedures. Soil samples intended for analysis of volatile organic compounds were placed in 40-ml septum sealed vials in accordance with EPA Method 5035A, chilled and held under chain-of-custody until delivered to the laboratory. Additional portions of all samples were held for field screening, potential laboratory testing and soil classification reference.

After drilling and sampling was completed the borings were sealed with bentonite and surficial asphalt patches were placed at the ground surface to match the surrounding surface in paved areas. Shallow soil sample locations were backfilled with the cuttings.

The deep soil vapor probes were completed at a depth of five feet below the surface, constructed with a 1" stainless steel porous filter surrounded by a silica sand pack, attached to teflon tubing extending to the ground surface. The remaining borehole was sealed with bentonite and the probes were allowed to stand for at least 48-hours before sampling vapors. A sample was obtained from DSVP-4 using a laboratory prepared 1-liter Summa canister attached to the tubing, following

appropriate leak check, purge and sample techniques. When attempting to sample DSVP-3, water was drawn into the tubing, indicating the porous filter was below groundwater level at that location. The probe could not be sampled for this investigation.

3.2 Quarterly Groundwater Monitoring

From February 24th to April 2nd, 2020, WES collected groundwater samples from 19 pre-existing monitoring wells and newly installed well MW-15. Water level measurements were taken relative to a measuring point on the top of well pipe that has the elevation established by a licensed surveyor. Sampling was conducted using peristaltic pumps with dedicated polyethylene tubing to purge and sample the wells. Where possible, sampled wells were purged of a minimum of three standing well volumes. Wells MW-3, MW-5, MW-12, MW-14 and MW-15 pump dry before that volume is reached and were allowed to recharge, then pumped again prior to sampling.

Field measurements of the groundwater temperature, pH and conductivity were taken as indicators of stability during pumping. During sampling, the pump flow rates are reduced to approximately 40 ml/minute to fill containers. Representative samples are placed in laboratory prepared vials and bottles appropriate for the planned analyses, chilled and held under chain-of-custody following appropriate environmental sampling procedures, until delivered to the laboratory.

3.3 Field Observations

During drilling, the samples were reviewed for soil classification purposes and any field detectable evidence of soil and groundwater contamination. There was no evidence of discoloration, petroleum or solvent odors, elevated PID measurements, sheens or staining at any of the borings. Shallow soils observed in the SE parking lot (borings WES-17 through WES-29 and MW-15) were fill, containing limited amounts of debris, including brick and glass, but no other field discernible evidence of impacts.

3.4 Laboratory Testing of Environmental Samples

For this investigation, at least one soil sample and the groundwater sample were selected from each on-site boring for laboratory analyses. No soil samples were selected from borings BN–24 through BN-27, north of the King County warehouse, as off-site locations removed from any planned cleanup or excavation, showing no field detectable indications of impacts.

All selected soil and groundwater samples were analyzed for a suite of 63 volatile organic compounds by EPA Method 8260. Selected soil samples were also analyzed for total petroleum hydrocarbons in the gasoline range by Method NWTPH-G and/or a list of five common regulated metals; arsenic, cadmium, chromium, lead and mercury (MTCA 5 Metals).

If initial soil analyses detect contaminants of concern, a deeper sample from that same boring was selected for additional analysis to evaluate the vertical extent. During this investigation only one additional sample, from boring WES-17 was selected for additional testing.

Groundwater samples from the quarterly monitoring round in existing monitoring wells were also analyzed for total petroleum hydrocarbons in the gasoline, diesel and motor oil ranges by methods NWTPH-G and NWTPH-D(x). One sample from monitoring well MW-1D was analyzed for total lead and arsenic.

The deep soil gas sample from DSVP-4 was analyzed by EPA Method TO-15 for a full list of volatile organic compounds.

The laboratory testing of soil and groundwater samples are summarized in Tables 1 and 2, respectively. Table 1 includes a summary of pertinent soil data from prior investigation borings in these portions of the site from our 2017 to 2019 investigations.

The laboratory testing of soil gas is summarized in Table 3, comparing the current sample results to that of two prior samples from other probes installed in the SE parking lot (DSVP-1 and DVSP-2).

A summary of 2017 to 2019 groundwater analyses from both reconnaissance samples and periodic sampling from monitoring wells is included as Table 4.

4.0 SOURCE INVESTIGATION RESULTS

4.1 Soil and Groundwater Conditions

As noted above, soil conditions consist of a layer of relatively unconsolidated fill containing organic material and debris, overlying brown to grayish brown clayey sand and gravel interpreted to be glacial till, or weathered, till-derived sediments. Where present, groundwater was encountered in sandier zones, including thinly layered interbeds in otherwise silty soil. Cross sections demonstrating the interpreted geologic stratification within the depths drilled are attached as Figures 4A and 4B. A cross section orientation plan is included as Figure 4. These figures include previous investigation data supplemented by the new information from this investigation. Table A-1 in Appendix A summarizes all site remedial investigation borings conducted on or around the property. The available bore logs are included.

Groundwater was encountered in sandier zones ranging from thin fine sand laminae within silt units to thicker water-bearing zones up to two and a half feet in thickness.

Water level measurements have been taken throughout this remedial investigation. Table 5 summarizes the top-of-pipe elevation for each well, the depth to groundwater and the groundwater elevation at each well during the current and prior monitoring events.

Current measurements show that groundwater ranges in depth from 1.65 to 14.62 feet below the top of pipe of the monitoring wells. The depths represent groundwater elevations within a range of 187.20 to 201.89 feet. There is a significant difference in water elevation from the highest elevations in the northwest to lowest levels in the southeast, indicating a relatively strong overall gradient of 0.03 to 0.04 foot/foot to the southeast across the site. Figure 5 shows the inferred contour of the groundwater surface and anticipated southeasterly direction of migration for measurements taken on March 17, 2020. The inferred direction and gradient of groundwater migration remains relatively consistent with prior measurement sets.

Water level measurements in the nested well set MW-1D and MW-1S demonstrate an upward vertical gradient ranging from 0.019 to 0.090 foot/foot, averaging 0.054 foot/foot over four sets of seasonal measurements. This suggests the lower water-bearing formation is under hydraulic pressure and is most likely isolated from the shallower water-bearing zones. This reduces the potential for shallow contaminants to reach underlying aquifers.

Monitoring well MW-15 was not yet installed at the date of this quarterly full set of water level measurements. Water level at the time of sampling was 7.12 feet below top of pipe, an elevation of 193.73 feet.

4.2 Soil Sample Analytical Results

Table 1 summarizes the soil samples selected for laboratory testing and the analytical results. Laboratory analytical reports are included in Appendix B. Laboratory analyses found no evidence of chlorinated volatile organic compounds in any of the soil samples from the six borings to the west of the King County warehouse (borings BN-18 through BN-23). These findings indicate there is no large scale source of contaminants in the vicinity of the 118 12th Avenue tenant space that could contribute to the SE parking lot plume. Five samples from these borings were also analyzed for the MTCA 5 Metals. None of the reported concentrations of any of the metals exceeded MTCA Method A cleanup levels. Total chromium was detected at concentrations ranging from 29.5 to 34.7 mg/kg, which exceeds the MTCA Method A cleanup level for chromium VI. However, there is no reason to suspect industrial operations that would utilize chromium VI, so the cleanup level of 2,000 mg/kg for chromium III would apply.

One shallow soil sample from boring WES-17, located to the south of the warehouse, identified 0.13 mg/kg of PCE, with no other detected chlorinated VOCs as degradation products. The sample, from a depth of 1.5 feet is at approximately the elevation of the warehouse footing and is located about seven feet east of a sample from similar depth in October 2019 boring WES-16. Deeper soil samples from WES-16 and WES-17 did not contain any detectable VOCs.

Based on this finding, WES conducted additional shallow soil sampling to evaluate whether or not surface spills in the parking lot were a potential source of the plume. Thirteen soil samples from borings WES-18 through WES-29 and MW-15 from a depth of 1.5 feet found no detectable volatile organic compounds.

This finding identified PCE contaminated soil within three feet of the warehouse, at footing level, with no detected concentrations at any other location in the SE parking lot. The finding suggests the detected contaminant is the southern extent of a source area beneath the warehouse.

Figure 6 illustrates the results of laboratory testing on soil samples from this investigation.

4.3 Groundwater Sample Analytical Results

Table 2 summarizes the groundwater samples of this source investigation and the quarterly sampling from prior monitoring wells. Figure 7 identifies the source investigation borings and 1st Quarter 2020 sampling of monitoring wells that detected chlorinated VOCs in groundwater.

Source Investigation Reconnaissance Samples

Laboratory analyses found no evidence of chlorinated volatile organic compounds in any of the reconnaissance samples from the six borings to the west (BN-18 through BN-23) or four borings to the north (BN-24 through BN-27) of the King County warehouse. These findings indicate there is no viable pathway for the potential sources from the west (118 12th Avenue) or north (Star Laundry) to contribute to the SE parking lot plume.

Groundwater in two borings south of the warehouse (WES-17 and WES-18) contained detectable chlorinated compounds. The sample from boring WES-17 found elevated concentrations of PCE

(33 ug/l), TCE (23ug/l), and vinyl chloride (0.23 ug/l), above MTCA Method A cleanup levels. Sample WES-17-GW was obtained from within three feet of the south wall of the warehouse. The sample from boring WES-18, about 15 feet south of the warehouse contained TCE (4.2 ug/l) and C12DCE (6.5 ug/l), which do not exceed Method A cleanup levels. Boring WES-19, located further to the southwest and the sample from MW-15, located to the southeast, found no detectable volatile organic compounds.

Quarterly Groundwater Samples from Monitoring Wells
Groundwater samples from the 19 pre-existing monitoring wells found concentrations of one or more chlorinated compounds in wells MW-5, MW-6, MW-11 and MW-14, GEO B-7 and GEO B-9. These six samples contained detectable C12DCE at concentrations ranging from 1.1 to 3.3 ug/l, all below the applicable MTCA Method B standard formula value of 16 ug/l.

Of the 19 wells, only MW-14 contained vinyl chloride, at a concentration of 0.66 ug/l, exceeding the MTCA Method A cleanup criteria of 0.2 ug/l. No other detected chlorinated compound in this or other wells exceeded MTCA Method A groundwater cleanup levels or Method B standard formula values. Two samples (MW-5 and GEO B-7) contained TCE at 2.2 and 2.9 ug/l, below MTCA Method A cleanup criteria of 5 ug/l. The sample from MW- 6 contained PCE at 1.1 ug/l. The reported levels are lower and the distribution of chlorinated compounds is less than in prior sampling, which may reflect seasonal variations in water quality. Time series plots demonstrating variations in concentrations are attached, for those wells that have detected contaminants in any sampling event.

Wells MW-5, MW-11 GEO B-7 and GEO B-9 are all within the area of the SE parking lot plume. The plume is typically bounded by monitoring wells MW-1, MW-1S, MW-1D, MW-11 and MW-10 to the east, MW-12 to the south, and MW-2 and GEO B-7 to the west. Additional information regarding conditions to the east of the plume is available from two investigations of the adjacent property for the Seattle Housing Authority.

A 2017 evaluation by Foster Wheeler AMEC drilled six borings for soil and groundwater testing in the parking lot to the west of the eastern King County warehouse. A 2019 report by PBS Environmental, Inc. drilled seven borings in and around the same building. The referenced reports are included in Appendix D.

The evaluations included analysis of eight groundwater samples for VOCs. Borings FIR-01, FIR-03, BH-03, BH-04 and BH-06 of those investigations were located directly downgradient of the inferred extent of the vinyl chloride plume in the SE parking lot. The boring locations are shown in Figure 3. None of the SHA sampling found any detectable VOCs in groundwater samples. The finding bounds the easterly extent of the parking lot plume.

Petroleum constituents were found in quarterly groundwater samples from monitoring wells MW-8, MW-9 and GEO B-8, all located in the northwestern corner of the subject property. Of these, only MW-9 exceeded MTCA groundwater cleanup criteria for any parameter. The sample contained gasoline-range total petroleum hydrocarbons (TPH-G) at 3,900 ug/l, 9.5 ug/l of benzene and 1,100 ug/l of diesel-range TPH, which the laboratory flagged as not resembling the laboratory standard for diesel. This most likely reflects aged gasoline that extends into the diesel fraction of the test. The sample contained other petroleum-related volatile organic compounds, but at concentrations below applicable MTCA groundwater cleanup levels.

A sample from monitoring well MW-1D was found to contain 10.3 ug/l of total arsenic. This result is most likely due to moderate turbidity in the sample, since this well is screened from a depth of 35 to 40 feet below the ground surface and any detected metals would likely be from natural sources. Additional arsenic testing will be conducted in future monitoring rounds with low-flow sampling to limit the amount of turbidity and dual analyses will be performed to compare total to dissolved concentrations.

4.4 Soil Gas Sample Analytical Results

The soil gas sample from DSVP-4, adjacent to the west side of the warehouse, contained 1.4 ug/m^3 of vinyl chloride as the only PCE-related chlorinated compound. The reported concentration is below Ecology's deep soil gas screening level of 28 ug/m^3. The sample contained a variety of other volatile compounds, mostly light-end petroleum constituents, none of which approach deep soil gas screening levels. This sample result demonstrates that soil gas is not migrating from the petroleum contaminated soil and groundwater areas on the former service station parcel toward or below the warehouse.

The sample contained chloroform (15 ug/m^3) and bromodichloromethane (8.5 ug/m^3), at levels above their respective deep soil gas screening levels. These compounds are most commonly associated with municipal water supplies and are unrelated to petroleum, PCE or its breakdown products. This most likely indicates a long history of leaking water lines in the vicinity of the site.

The reported detections are summarized in Table 3, along with two other deep soil gas samples taken in the area directly above the SE parking lot plume in October 2019. The most notable feature is the similarities of the suite of detected compounds between the samples over the plume (DSVP-1 and DSVP-2) versus the different composition of DSVP-4, from the west of the warehouse. DSVP-1 and DSVP-2 contained acetone, butane, carbon disulfide, C12DCE, heptane, hexane, methyl-ethyl-ketone, naphthalene and TCE at disproportionate levels to that found in DSVP-4. DSVP-4 contained chloroform, bromodichloromethane, cumene, dibromochloromethane, ethylbenzene, toluene, pentane, xylenes and trimethylbenzenes, disproportional to that found in the other two samples. It further demonstrates that conditions to the west of the warehouse are not a likely source of the SE parking lot plume, or contribute to vapor intrusion into the warehouse structure.

5.0 FINDINGS AND CONCLUSIONS

Based on the reported findings and our prior investigations of the site, this source investigation definitively excludes the areas to the west and north of the King County warehouse as potential sources or contributors to the plume in the SE parking lot. Sampling to the south of the King County warehouse found soil and groundwater contamination directly adjacent to the warehouse, but not at locations further south in the parking lot. Soil containing PCE has been identified at approximately the level of the warehouse footing. Groundwater adjacent to the wall of the warehouse is impacted with PCE, TCE, C12DCE and vinyl chloride.

Figure 7 notes the boring and monitoring well locations where groundwater concentrations of chlorinated compounds and petroleum have been detected exceeding MTCA Method A cleanup levels in this current quarter and source investigation. The estimated typical extent of the vinyl chloride plume is also shown. A smaller plume within this area is defined by locations that have

identified TCE in one of more samples throughout the history of the investigations of this site. The TCE plume is relatively limited in extent compared to the more widespread plume of vinyl chloride. The TCE distribution shows a distinct trend following the anticipated gradient of groundwater migration. The vinyl chloride plume reflects a wider distribution, suggesting the source area is located further north than the property boundary, in order to have spread to the degree found in our testing. The distribution of contaminants indicates a source of groundwater contamination beneath the King County warehouse.

The extent of the plume is bounded by monitoring wells and reconnaissance groundwater sampling to the east, south and west. Investigation samples both on-site and on adjoining property to the east include soil and groundwater samples beyond the limits of the plume. Monitoring wells MW-1D and MW-15 demonstrate that contamination is relatively shallow and does not extent to lower water-bearing units.

6.0 CLOSURE

Whitman Environmental Sciences has been pleased to be of service in this matter. If you have any questions regarding the information contained in this report, or if we may be of any further assistance, please feel free to contact me.

Respectfully submitted,
Whitman Environmental Sciences

TABLE 1
Source Investigation Summary of Soil Sample Analytical Results
104 - 124 12th Avenue & 1209 E. Fir Street, Seattle, Washington

Table Notes:
ND (<XXX) - Parameter not detected at concentrations at or above the noted reporting limit.
NA - Sample not analyzed for the listed parameter.
Total Petroleum Hydrocarbons by Method NWTPH-HCID, or Gasoline Range Total Petroleum Hydrocarbons by Method NWTPH-G and Diesel and Motor Oil Range Total Petroleum Hydrocarbons by Method NWTPH-D(x).

[x] - Sample Chromatogram does not resemble fuel standard used for analysis. Most likely carry over from gasoline range hydrocarbons or organic material.
BTEX compounds by EPA Method 8021B, or as part of volatile organic analysis by EPA Method 8260C.
Volatile organic compounds by EPA Method 8260C for a list of 62 different volatile parameters. Detection limits vary.

MTCA Soil cleanup criteria per Chapter 173-340-740 WAC. Method A criteria presented where available. Otherwise, Method B standard formula values or concentrations protective of groundwater in vadose zone at 13 degrees C, per Ecology's Cleanup Levels and Risk Calculations (CLARC) database. Basis of cleanup criteria noted:

A - Method A listed
B - Method B Direct Contact
GWP - Groundwater Protection
NV - No published value

Sample results exceeding applicable cleanup criteria are noted in ***Bold Italic***.

Table Notes:
ND (<XXX) - Parameter not detected at concentrations at or above the noted reporting limit.
NA - Sample not analyzed for the listed parameter.
Gasoline Range Total Petroleum Hydrocarbons by Method NWTPH-G.
Diesel and Motor Oil Range Total Petroleum Hydrocarbons by Method NWTPH-D(x).
x - Indicates sample chromatogram does not resemble fuel standard used for analysis. Most likely carry over from gasoline range hydrocarbons, or non-petroleum organic matter.
BTEX compounds and other volatile organic compounds by EPA Method 8260C. All detected compounds summarized here. See laboratory report for full list of analyzed parameters.
Total Metals on unfiltered samples by EPA Method 6020B.

MTCA Groundwater cleanup criteria per Chapter 173-340-720 WAC. Method A criteria presented where available. Method B standard formula values shown where no Method A criteria available. Method B standard formula values from Dept. of Ecology Cleanup Levels and Risk Calculation (CLARC) database. NV indicates no value available from CLARC.
A - Method A listed
B - Method B Direct Contact
NV - No published value

Sample results exceeding applicable cleanup criteria are noted in ***Bold Italic***.

TABLE 3
Summary of Deep Soil Vapor Sample Analytical Results
104 12th Avenue, Seattle, Washington

Detected Compounds (ug/m³) 78 Compounds Detectable by the Laboratory Method - Only detected compounds included here. See laboratory report for full list of analyzed parameters.	***Sample ID***			***Deep Soil Gas Screening Level (ug/m³)***

4-Ethyltoluene	ND (<6.9)	ND (<7.9)	38	NV

Table Notes:
Volatile organic compounds by EPA Method TO-15.
Table shows all detected compounds. See laboratory report for full analytical parameter list.

Screening levels from CLARC Database, January 2020.

[RST] TCE Residential Short-term screening level for sub-slab soil vapors from Ecology Implementation Memorandum No. 22, Vapor Intrusion (VI) Investigations and Short-term Trichloroethene (TCE) Toxicity, October 1, 2019. No deep soil screening level was developed for short-term exposures, so sub-slab screening levels may be applied.

NV- No Value. Screening level is not included in CLARC database for this parameter.

Sample results exceeding applicable screening levels are noted in ***Bold Italic***.

Table Notes:
ND (<XXX) - Parameter not detected at concentrations at or above the noted reporting limit.
NA - Sample not analyzed for the listed parameter.
Gasoline Range Total Petroleum Hydrocarbons by Method NWTPH-G.
Diesel and Motor Oil Range Total Petroleum Hydrocarbons by Method NWTPH-D(x).
[x] - Indicates sample chromatogram does not resemble fuel standard used for analysis. Most likely carry over from gasoline range hydrocarbons, or non-petroleum organic matter.
BTEX compounds and other volatile organic compounds by EPA Method 8260C. All detected compounds summarized here. See laboratory report for full list of analyzed parameters.
Total Lead on unfiltered samples by EPA Method 6020B.
Dissolved and total Iron and Manganese as general water parameters as part of clean-up feasability study. Analyses by EPA Method 6020B.

MTCA Groundwater cleanup criteria per Chapter 173-340-720 WAC. Method A criteria presented where available. Method B standard formula values shown where no Method A criteria available. Method B standard formula values from Dept. of Ecology Cleanup Levels and Risk Calculation (CLARC) database. NV indicates no value available from CLARC.

A - Method A listed
B - Method B Direct Contact
NV - No published value

Sample results exceeding applicable cleanup criteria are noted in ***Bold Italic***.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the results from the testing of material submitted on February 24, 2020 from the 12th+Yesler WES1591, F&BI 002341 project. There are 23 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on February 24, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th+Yesler WES1591, F&BI 002341 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
002341 -01	BN-18-GW
002341 -02	BN-19-GW
002341 -03	BN-20-GW
002341 -04	BN-21-GW
002341 -05	BN-22-GW
002341 -06	BN-23-GW
002341 -07	MW-9-GW
002341 -08	MW-14-GW
002341 -09	MW-8-GW
002341 -10	GEO-B8-GW

Several compounds in the 8260D laboratory control sample duplicate exceeded the acceptance criteria. The analytes were not detected in the samples, therefore the data were acceptable.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the results from the testing of material submitted on February 27, 2020 from the 12th + Yesler WES-1591, F&BI 002435 project. There are 25 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on February 27, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES-1591, F&BI 002435 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
002435 -01	BN-18-6.5'
002435 -02	BN-19-1.5'
002435 -03	BN-20-7'
002435 -04	BN-21-7'
002435 -05	BN-22-8'
002435 -06	BN-23-3'
002435 -07	BN-23-8'

A 6020B internal standard failed the acceptance criteria for the samples. The samples was diluted and reanalyzed with acceptable results. Both data sets were reported.

2-Butanone in the 8260D laboratory control sample failed the acceptance criteria. The data were flagged accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

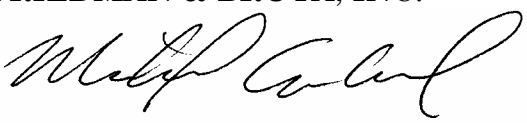
Dear Mr Whitman:

Included are the results from the testing of material submitted on February 27, 2020 from the 12th + Yesler WES-1591, F&BI 002438 project. There are 11 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on February 27, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES-1591, F&BI 002438 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
002438 -01	MW-10-GW
002438 -02	MW-1S-GW

All quality control requirements were acceptable.

Date of Report: 03/06/20
Date Received: 02/27/20
Project: 12th + Yesler WES-1591, F&BI 002438
Date Extracted: 03/05/20
Date Analyzed: 03/05/20

RESULTS FROM THE ANALYSIS OF WATER SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS GASOLINE USING METHOD NWTPH-Gx

Results Reported as ug/L (ppb)

Sample ID Laboratory ID	Gasoline Range	Surrogate (% Recovery) (Limit 51-134)
MW-10-GW 002438-01	<100	93
MW-1S-GW 002438-02	<100	92
Method Blank 00-394 MB	<100	98

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the results from the testing of material submitted on February 27, 2020 from the 12th + Yesler WES-1591, F&BI 002439 project. There are 8 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on February 27, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES-1591, F&BI 002439 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
002439 -01	DSVP-4

The TO-15 pentane concentration for sample DSVP-4 exceeded the calibration range. The data were flagged accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

March 11, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

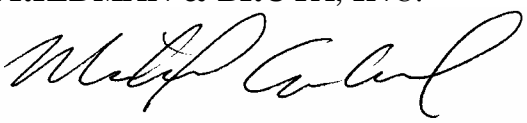
Dear Mr Whitman:

Included are the results from the testing of material submitted on March 3, 2020 from the 12th & Yesler WES 1591, F&BI 003025 project. There are 14 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 3, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th & Yesler WES 1591, F&BI 003025 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003025 -01	MW-1D-GW
003025 -02	MW-11-GW

All quality control requirements were acceptable.

Date of Report: 03/11/20
Date Received: 03/03/20
Project: 12th & Yesler WES 1591, F&BI 003025
Date Extracted: 03/06/20
Date Analyzed: 03/09/20

RESULTS FROM THE ANALYSIS OF WATER SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS GASOLINE USING METHOD NWTPH-Gx

Results Reported as ug/L (ppb)

Sample ID Laboratory ID	Gasoline Range	Surrogate (% Recovery) (Limit 50-150)
MW-1D-GW 003025-01	<100	89

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR TOTAL METALS USING EPA METHOD 6020B

Laboratory Code: 002447-01 (Matrix Spike)

Analyte	Reporting Units	Spike Level	Sample Result	Percent Recovery MS	Percent Recovery MSD	Acceptance Criteria	RPD (Limit 20)
Arsenic	ug/L (ppb)	10	1.79	89	87	75-125	2
Lead	ug/L (ppb)	10	<1	83	81	75-125	2

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Acceptance Criteria
Arsenic	ug/L (ppb)	10	100	80-120
Lead	ug/L (ppb)	10	96	80-120

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

March 13, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

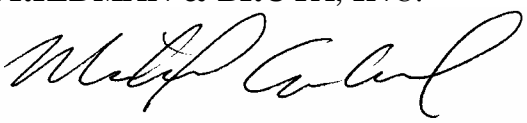
Dear Mr Whitman:

Included are the results from the testing of material submitted on March 5, 2020 from the 12th+Yesler WES-1591, F&BI 003094 project. There are 20 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 5, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th+Yesler WES-1591, F&BI 003094 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003094 -01	MW-1-GW
003094 -02	MW-5-GW
003094 -03	GEO-B7-GW
003094 -04	GEO-B9-GW
003094 -05	WES-17-GW
003094 -06	WES-18-GW
003094 -07	WES-19-GW
003094 -08	BN-24-GW
003094 -09	BN-25-GW
003094 -10	BN-26-GW
003094 -11	BN-27-GW

All quality control requirements were acceptable.

Date of Report: 03/13/20
Date Received: 03/05/20
Project: 12th+Yesler WES-1591, F&BI 003094
Date Extracted: 03/10/20
Date Analyzed: 03/10/20

RESULTS FROM THE ANALYSIS OF WATER SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS GASOLINE USING METHOD NWTPH-Gx

Results Reported as ug/L (ppb)

Sample ID Laboratory ID	Gasoline Range	Surrogate (% Recovery) (Limit 51-134)
MW-1-GW 003094-01	<100	96

1,2-Dibromo-3-chloropropane	ug/L (ppb)	50	106	104	57-141	2
1,2,4-Trichlorobenzene	ug/L (ppb)	50	104	103	72-130	1
Hexachlorobutadiene	ug/L (ppb)	50	98	97	53-141	1
Naphthalene	ug/L (ppb)	50	109	107	64-133	2
1,2,3-Trichlorobenzene	ug/L (ppb)	50	103	103	65-136	0

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

March 16, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

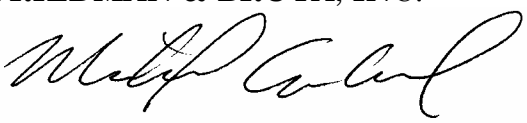
Dear Mr Whitman:

Included are the results from the testing of material submitted on March 6, 2020 from the 12th + Yesler WES-1591, F&BI 003136 project. There are 12 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 6, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES-1591, F&BI 003136 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003136 -01	WES-17-1.5'
003136 -02	WES-17-4'
003136 -03	WES-18-1'
003136 -04	WES-18-5.5'
003136 -05	WES-19-1.5'
003136 -06	WES-19-5'

The 8260D matrix spike and matrix spike duplicate failed the relative percent difference for several analytes. The analytes were not detected in the samples therefore the data were acceptable.

All other quality control requirements were acceptable.

Analysis For Total Metals By EPA Method 6020B

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the additional results from the testing of material submitted on March 6, 2020 from the 12th + Yesler WES-1591, F&BI 003136 project. There are 6 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 6, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES-1591, F&BI 003136 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003136 -01	WES-17-1.5'
003136 -02	WES-17-4'
003136 -03	WES-18-1'
003136 -04	WES-18-5.5'
003136 -05	WES-19-1.5'
003136 -06	WES-19-5'

All quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

March 23, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

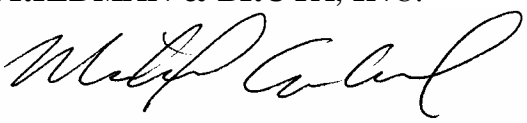
Dear Mr Whitman:

Included are the results from the testing of material submitted on March 17, 2020 from the 12th+Yesler WES-1591, F&BI 003283 project. There are 16 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 17, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th+Yesler WES-1591, F&BI 003283 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003283 -01	MW-2-GW
003283 -02	MW-3-GW
003283 -03	MW-4-GW
003283 -04	MW-6-GW
003283 -05	MW-7-GW
003283 -06	MW-12-GW
003283 -07	MW-13-GW

All quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included is the amended report from the testing of material submitted on March 26, 2020 from the 12th and Yesler WES-1591, F&BI 003433 project. The out of control result has been replaced with the reanalysis of MW15-1.5 and the additional result for MW15-5 has been included in the report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

April 1, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the results from the testing of material submitted on March 26, 2020 from the 12th and Yesler WES-1591, F&BI 003433 project. There are 14 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on March 26, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th and Yesler WES-1591, F&BI 003433 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
003433 -01	MW15-1.5
003433 -02	MW15-5
003433 -03	MW15-10
003433 -04	MW15-17
003433 -05	MW15-23
003433 -06	WES-20-1
003433 -07	WES-21-1
003433 -08	WES-21-2.5
003433 -09	WES-22-1
003433 -10	WES-22-5

Acetone was detected in the 8260D analysis of sample MW15-1.5. The data were flagged as due to laboratory contamination. In addition, the calibration standard failed the acceptance criteria for acetone. The data were flagged accordingly.

The 8260D matrix spike and matrix spike duplicate failed the relative percent difference for several compounds. In addition, several compounds in the laboratory control sample exceeded the acceptance criteria. The analytes were not detected in the sample, therefore the data were acceptable.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

April 6, 2020

Dan Whitman, Project Manager
Whitman Environmental Sciences
6812 16th Ave NE
Seattle, WA 98115

Dear Mr Whitman:

Included are the results from the testing of material submitted on April 2, 2020 from the 12th + Yesler WES 1591, F&BI 004031 project. There are 20 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on April 2, 2020 by Friedman & Bruya, Inc. from the Whitman Environmental Sciences 12th + Yesler WES 1591, F&BI 004031 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Whitman Environmental Sciences
004031 -01	MW-15-GW
004031 -02	WES-23-1.5'
004031 -03	WES-23-3'
004031 -04	WES-24-1.5'
004031 -05	WES-24-3'
004031 -06	WES-25-1.5'
004031 -07	WES-25-3'
004031 -08	WES-26-1.5'
004031 -09	WES-26-3'
004031 -10	WES-27-1.5'
004031 -11	WES-27-3'
004031 -12	WES-28-1.5'
004031 -13	WES-28-3'
004031 -14	WES-29-1.5'
004031 -15	WES-29-3'

The 8260D matrix spike and matrix spike duplicate failed the relative percent difference for several compounds. The analytes were not detected therefore the data were acceptable.

All other quality control requirements were acceptable.

1,2,3-Trichlorobenzene	ug/L (ppb)	50	89	94	74-122	5

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Section 1.0 Introduction

Conestoga-Rovers & Associates (CRA) prepared this report to document the fourth quarter 2014 groundwater monitoring activities performed at the former Star Laundry located at 160 12th Avenue, Seattle, Washington (Site, Figure 1).

Section 2.0 Findings

2.1 Monitoring Well Re-development

Blaine Tech Services, Inc. (Blaine) re-developed all Site monitoring wells MW-1A and MW-2 through MW-5 on October 16, 2014. Well re-development included surging and purging to remove sediment within the well casing and promote hydraulic conductivity. Blaine attempted to continue development until conditions (temperature, pH, conductivity, and turbidity) stabilized. However, turbidity did not drop below 1,000 Nephelometric Turbidity Units (NTUs) due to the insufficient groundwater in the wells. Blaine's field data sheets for well re-development are included in Appendix A.

2.2 Monitoring Well Gauging and Sampling

Blaine gauged and sampled Site monitoring wells MW-1A and MW-2 through MW-5 on October 21, 2014. The samples were collected without purging the wells due to the limited amount of groundwater present in the wells. The wells also dewatered during sample collection resulting in turbid groundwater samples. Field notes and observations from the sampling event are presented in Appendix B.

The groundwater samples were analyzed for the following.

- Total petroleum hydrocarbons (TPH) as gasoline (TPHg) by Method NWTPH-Gx
- TPH as diesel (TPHd) and TPH as heavy oil (TPHo) by Method NWTPH-Dx
- Volatile organic compounds (VOCs) by EPA Method 8260B
- Total and dissolved arsenic, cadmium, chromium, and lead by EPA Method 6020

Tabulated data are provided in Tables 1A and 1B, and the certified analytical reports are presented in Appendix C.

2.3 Groundwater Elevations and Flow Directions

The groundwater contour map for the fourth quarter of 2014 is presented as Figure 2. During the fourth quarter, groundwater elevations ranged from 36.63 feet relative to mean sea level (ft msl) measured in well MW-4 to 38.94 ft msl measured in well MW-1A. Current and prior sampling data are provided in Tables 1A and 1B. The groundwater flow direction beneath the Site was northeasterly at an estimated hydraulic gradient of 0.05.

2.3 Fourth Quarter 2014 Groundwater Concentrations

During the fourth quarter 2014, the following analyte concentrations exceeded the State of Washington Department of Ecology (Ecology) Model Toxics Control Act (MTCA) Method A cleanup levels.

- TPHg in well MW-5
- Trichloroethene (TCE) in well MW-1A and MW-5
- Tetrachloroethene (PCE) in well MW-1A, MW-2, MW-3, MW-4, and MW-5
- Cis-1,2-dichloroethene (cis 1,2-DCE) in well MW-1A and MW-5
- Vinyl chloride in well MW-1A
- Arsenic in well MW-2
- Lead in well MW-4

The TCE, PCE, and cis 1,2-DCE concentrations in groundwater were contoured and are shown on Figures 3 through 5, respectively.

Section 3.0 Discussion

The groundwater analytical data indicate that one or more of the VOCs and metal concentrations remain above MTCA Method A cleanup levels in all Site monitoring wells MW-1A, and MW-2 through MW-5. Among these, PCE were detected at concentrations above MTCA Method A cleanup levels in all Site monitoring wells. Concentrations of TCE and cis 1,2-DCE were detected at concentrations above MTCA Method A cleanup levels in two monitoring wells (MW-1A and MW-5). Concentrations of vinyl chloride, arsenic, and lead were detected at concentrations above MTCA Method A cleanup levels in one monitoring well each; MW-1A (vinyl chloride), MW-2 (arsenic), and MW-4 (lead). In addition, TPHg was detected at a concentration above the MTCA Method A cleanup level in well MW-5, indicating that there may have been a petroleum release in the vicinity of the sump.

These results indicated that PCE, TCE, and cis 1,2-DCE are major constituents of concern (COC) in groundwater. Monitoring well MW-5 contained the highest concentrations of these COCs: 11,000 micrograms per liter (µg/L) of PCE, 1,380 µg/L of TCE, and 485 µg/L of cis 1,2-DCE. Monitoring well MW-5 is located adjacent to the former sump at the southeast corner of the Site, which may be the source of the VOC plume. Monitoring well MW-1A is located approximately 25 feet west of MW-5, which contained concentrations of PCE, TCE, and cis 1,2-DCE lower than MW-5, but still above MTCA Method A cleanup levels, indicating the VOC plume had migrated to the west.

PCE concentrations were detected above MTCA Method A cleanup levels in all Site monitoring wells indicating that the VOC groundwater plume is not fully delineated. Additional investigation is warranted to define the plume. In addition, the current monitoring well network consists entirely or 1" diameter pre-pack monitoring wells, which produce very little groundwater and may not be representative of in-situ groundwater conditions. Additional and/or replacement monitoring wells may be warranted in order to obtain more representative data.

Additional recommendations for evaluating data gaps will be proposed under separate cover.

RE: Project: 062224-03 Former Star Laundry
Pace Project No.: 10286313

Dear Brian Peters:
Enclosed are the analytical results for sample(s) received by the laboratory on October 23, 2014. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: 062224-03 Former Star Laundry
Pace Project No.: 10286313

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: GCSV/14415

[1]	A matrix spike/matrix spike duplicate/sample duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

B	Analyte was detected in the associated method blank.
CL	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased low.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MS	Analyte recovery in the matrix spike was outside QC limits for one or more of the constituent analytes used in the calculated result.

RECOMMENDATION

No Further Action (Check appropriate box below):		**LIST on Confirmed and Suspected Contaminated Sites List**: ☒
Release or threatened release does not pose a threat	☐	
No release or threatened release	☐	
Refer to program/agency (Name: _____)	☐	
Independent Cleanup Action Completed (contamination removed)	☐	

COMPLAINT (Brief Summary of ERTS Complaint):
A groundwater monitoring report shows concentrations of PCE, TCE, cis-1,2-Dichloroethane and vinyl chloride above the MTCA Method A cleanup levels for groundwater. Levels for PCE and TCE are also above the groundwater screening levels for vapor intrusion evaluation (per the draft Guidance for Evaluating Vapor Intrusion, 2009).

CURRENT SITE STATUS (Brief Summary of why Site is recommended for Listing or NFA):
Site is described in the King County property database as a music studio, however, no description is included with the submitted monitoring report. PCE concentrations in all five monitoring wells sampled were above the MTCA Method A cleanup level. TCE concentrations exceeded the cleanup levels in two of the wells. Concentrations for PCE ranged from 11.5 to 11,000 ug/L; for TCE from 33.9 to 1380 ug/L. Vinyl chloride and cis-1,2-Dichloroethene also exceeded cleanup levels in some of the wells. No information on additional work at the site is included with the monitoring report.

Investigator: T. Cardona	Date Submitted: May 4, 2015

OBSERVATIONS

Description (If site visit made, please be sure to include the following: site observations, site features and cover, chronology of events, sources/past practices likely responsible for contamination, presence of water supply wells and other potential exposure pathways, etc.):

Documents reviewed:

Conestoga- Rovers and Associates (CRA) , Groundwater Monitoring Report Fourth Quarter 2014, January 2015.

Summary:

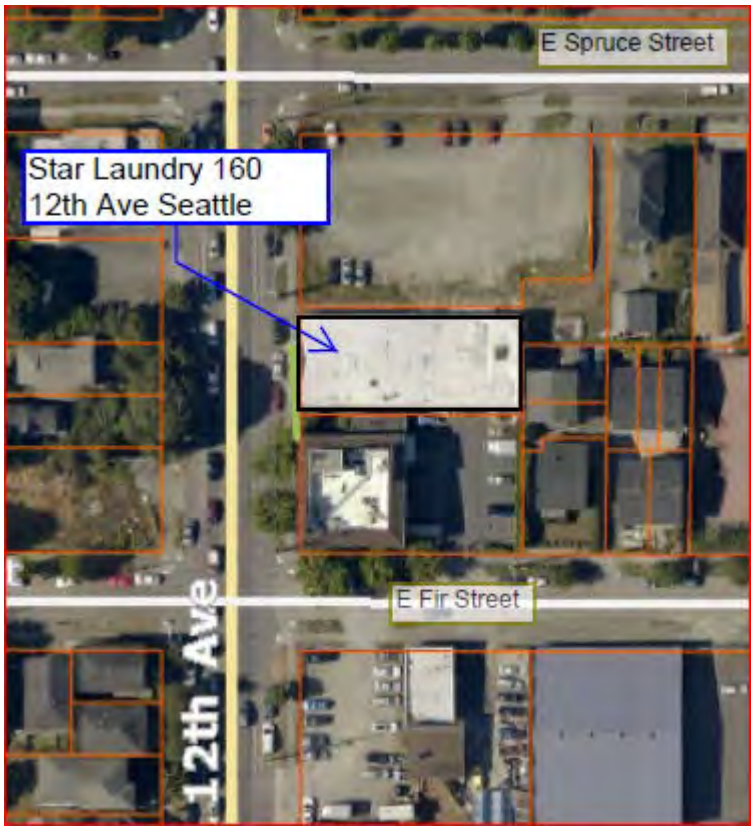
CRA submitted a groundwater monitoring report for a former laundry property that appears to be currently used as a music studio. Samples were collected from five existing monitoring wells and analyzed for VOC's and hydrocarbons. Concentrations of chlorinated solvents including PCE, TCE, cis-1,2-Dichloroethane, and vinyl chloride exceeded the MTCA cleanup levels in some of the wells. All wells contained PCE above cleanup levels.

Concentrations of PCE and TCE are high enough to be a vapor intrusion concern since they exceed the screening levels for vapor intrusion evaluation.

Additional information is needed to evaluate the site further. It seems like the wells have been installed for several years and that there was a groundwater sampling event conducted in 2004. These results were included in the table in the submitted report.

A site contaminated with chlorinated solvents is also located immediately north of this property. However, groundwater flow direction is listed as northwest to southeast for the other site and southeast to northwest at this site. Further information is needed to verify groundwater flow direction.

Update: Site owner contacted Ecology on 5/6/2015. He indicated he purchased the property without knowledge of the contamination. He has a report he was able to obtain from an adjacent property and is willing to share with Ecology when he gets back into town.



(fill in contaminant matrix below with appropriate status choice from the key below the table)

CONTAMINANT GROUP	CONTAMINANT	*SOIL*	*GROUNDWATER*	*SURFACE WATER*	*AIR*	*BEDROCK*	DESCRIPTION
Non-Halogenated Organics	Phenolic Compounds						Compounds containing phenols (Examples: phenol; 4-methylphenol; 2-methylphenol)
	Non-Halogenated Solvents						Organic solvents, typically volatile or semi-volatile, not containing any halogens. To determine if a product has halogens, search HSDB (http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB) and look at the Chemical/Physical Properties, and Molecular Formula. If there is not a Cl, I, Br, F in the formula, it's not halogenated. (Examples: acetone, benzene, toluene, xylenes, methyl ethyl ketone, ethyl acetate, methanol, ethanol, isopropranol, formic acid, acetic acid, stoddard solvent, Naptha). *Use this when TEX contaminants are present independently of gasoline.*
	Polynuclear Aromatic Hydrocarbons (PAH)						Hydrocarbons composed of two or more benzene rings.
	Tributyltin						The main active ingredients in biocides used to control a broad spectrum of organisms. Found in antifouling marine paint, antifungal action in textiles and industrial water systems. (Examples: Tributyltin; monobutyltin; dibutyltin)
	Methyl tertiary-butyl ether						MTBE is a volatile oxygen-containing organic compound that was formerly used as a gasoline additive to promote complete combustion and help reduce air pollution.
	Benzene						Benzene
	Other Non-Halogenated Organics						TEX
	Petroleum Diesel						Petroleum Diesel
	Petroleum Gasoline						Petroleum Gasoline
	Petroleum Other						Oil range organics
Halogenated Organics (see notes at bottom)	PBDE						Polybrominated di-phenyl ether
	Other Halogenated Organics						Other organic compounds with halogens (chlorine, fluorine, bromine, iodine). search HSDB (http://toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB) and look at the Chemical/Physical Properties, and Molecular Formula. If there is a Cl, I, Br, F in the formula, it is halogenated. (Examples: Hexachlorobutadiene; hexachlorobenzene; pentachlorophenol)
	Halogenated solvents		C				PCE, chloroform, EDB, EDC, MTBE
	Polychlorinated Biphenyls (PCB)						Any of a family of industrial compounds produced by chlorination of biphenyl, noted primarily as an environmental pollutant that accumulates in animal tissue with resultant pathogenic and teratogenic effects
	Dioxin/dibenzofuran compounds (see notes at bottom)						A family of more than 70 compounds of chlorinated dioxins or furans. (Examples: Dioxin; Furan; Dioxin TEQ; PCDD; PCDF; TCDD; TCDF; OCDD; OCDF). *Do not use for 'dibenzofuran', which is a non-chlorinated compound that is detected using the semivolatile organics analysis 8270*
Metals	Metals - Other						Cr, Se, Ag, Ba, Cd
	Lead						Lead
	Mercury						Mercury
	Arsenic						Arsenic
Pesticides	Non-halogenated pesticides						Pesticides without halogens (Examples: parathion, malathion, diazinon, phosmet, carbaryl (sevin), fenoxycarb, aldicarb)
	Halogenated pesticides						Pesticides with halogens (Examples: DDT; DDE; Chlordane; Heptachlor; alpha-beta and delta BHC; Aldrin; Endosulfan, dieldrin, endrin)

CONTAMINANT GROUP	CONTAMINANT	*SOIL*	*GROUNDWATER*	*SURFACE WATER*	*AIR*	*BEDROCK*	DESCRIPTION
Other Contaminants	Radioactive Wastes						Wastes that emit more than background levels of radiation.
	Conventional Contaminants, Organic						Unspecified organic matter that imposes an oxygen demand during its decomposition (Example: Total Organic Carbon)
	Conventional Contaminants, Inorganic						Non-metallic inorganic substances or indicator parameters that may indicate the existence of contamination if present at unusual levels (Examples: Sulfides, ammonia)
	Asbestos						All forms of Asbestos. Asbestos fibers have been used in products such as building materials, friction products and heat-resistant materials.
	Other Deleterious Substances						Other contaminants or substances that cause subtle or unexpected harm to sediments (Examples: Wood debris; garbage (e.g., dumped in sediments))
	Benthic Failures						Failures of the benthic analysis standards from the Sediment Management Standards.
	Bioassay Failures						For sediments, a failure to meet bioassay criteria from the Sediment Management Standards. For soils, a failure to meet TEE bioassay criteria for plant, animal or soil biota toxicity.
Reactive Wastes	Unexploded Ordinance						Weapons that failed to detonate or discarded shells containing volatile material.
	Other Reactive Wastes						Other Reactive Wastes (Examples: phosphorous, lithium metal, sodium metal)
	Corrosive Wastes						Corrosive wastes are acidic or alkaline (basic) wastes that can readily corrode or dissolve materials they come into contact with. Wastes that are highly corrosive as defined by the Dangerous Waste Regulation (WAC 173-303-090(6)). (Examples: Hydrochloric acid; sulfuric acid; caustic soda)

Status choices for contaminants	
Contaminant Status	**Definition**
B - Below Cleanup Levels (Confirmed)	The contaminant was tested and found to be below cleanup levels. (Generally, we would not enter each and every contaminant that was tested; for example if an SVOC analysis was done we would not enter each SVOC with a status of "below". We would use this for contaminants that were believed likely to be present but were found to be below standards when tested
S - Suspected	The contaminant is suspected to be present; based on some knowledge about the history of the site, knowledge of regional contaminants, or based on other contaminants known to be present
C - Confirmed Above Cleanup Levels	The contaminant is confirmed to be present above any cleanup level. For example - above MTCA method A, B, or C; above Sediment Quality Standards; or above a presumed site-specific cleanup level (such as human health criteria for a sediment contaminant).
RA - Remediated - Above	The contaminant was remediated, but remains on site above the cleanup standards (for example - capped area).
RB - Remediated - Below	The contaminant was remediated, and no area of the site contains this contaminant above cleanup standards (for example - complete removal of contaminated soils).

Halogenated chemicals and solvents: Any chemical compound with chloro, bromo, iodo or fluoro is halogenated; those with eight or fewer carbons are generally solvents (e.g. halogenated methane, ethane, propane, butane, pentane, hexane, heptane or octane) and may also be used for or registered as pesticides or fumigants. Most are dangerous wastes, either listed or categorical. Organic compounds with more carbons are almost always halogenated pesticides or a contaminant or derivitive. Referral to the HSDB is recommended you are unfamiliar with a chemical name or compound, as it contains useful information about synonyms, uses, trade names, waste codes, and other regulatory information about most toxic or potentially toxic chemicals.

Dibenzodioxins and dibenzofurans are normalized to a combined equivalent toxicity based on 2,3,7,8-tetrachloro-p-dibenzodioxin as set out in Ch. 173-340-708(8)(d) and in the Evaluating the Toxicity and Assessing the Carcinogenic Risk of Environmental Mixtures using Toxicity Equivalency Factors Focus Sheet (https://fortress.wa.gov/ecy/clarc/FocusSheets/tef.pdf). Results may be reported as individual compounds and isomers (usually lab results), or as a toxic equivalency value (reports).

FOR ECOLOGY II REVIEWER USE ONLY (For Listing Sites):

How did the Site come to be known: ☐ **Site Discovery (received a report):** _____ (Date Report Received)
☐ **ERTS Complaint**
☐ **Other (please explain):** _____

Does an Early Notice Letter need to be sent: ☐ Yes ☐ No
If *No*, please explain why: _____

NAICS Code (if known): _____
Otherwise, briefly explain how property is/was used (i.e., gas station, dry cleaner, paint shop, vacant land, etc.):
_____

Site Unit(s) to be created (Unit Type): ☐ Upland (includes VCP & LUST) ☐ Sediment
If multiple Units needed, please explain why: _____

Cleanup Process Type (for the Unit): ☐ No Process ☐ Independent Action
☐ Voluntary Cleanup Program ☐ Ecology-supervised or conducted
☐ Federal-supervised or conducted

Site Status: ☐ Awaiting Cleanup ☐ Construction Complete – Performance Monitoring
☐ Cleanup Started ☐ Cleanup Complete – Active O&M/Monitoring
☐ No Further Action Required

Please attach to this report a copy of the tax parcel/ownership information for each parcel associated with the site, as well as a parcel map illustrating the parcel boundary and location.

Site Hazard Assessment
Worksheet 1
Summary Score Sheet

Star Laundry

Address:	160 12th Ave, Seattle, WA 98122		
County:	King	Tax Parcel:	392740-0005
Cleanup Site ID:	12676	Latitude:	47.603096
Facility Site ID:	979	Longitude:	-122.316265

This site was assessed for the August 2015 update of the Hazardous Sites List.

Property Description

The former Star Laundry Property is located at 160 12th Avenue in Seattle, WA. The property is 0.24 acres in size and is in a mixed use area. It is located at Parcel 392740-0005. The site is paved with a structure that occupies the 7,416 square feet, or about 70% of the property.

The property began operating as a laundry facility when the building was constructed in approximately 1920. Dry cleaning activities were only conducted for a one year period between 1986 and 1988. The original building was remodeled to serve as a music/ rehearsal studio in 2013.

Site Ownership

From	To	Owner/Operator	Activity
12/12/2008	present	Hamed "Ted" Saedi	Remodeled as a music studio
		City foreclosed property	
10/6/2004	Sometime prior to 12/12/2008	Victoria's properties USA	Unknown

In 2004 the property was sold by Star Laundry. The new owner had several Notices of Violation with the City and the property was foreclosed and sold in auction by King County to the current owner. The current owner remodeled the property as a music/rehearsal studio and leased it.

Property History

On December 2002 eight borings were advanced at locations near the known underground storage tank, a suspected underground storage tank (UST) and the former dry cleaning machine. Total gasoline petroleum hydrocarbons (TPHg) were detected at concentrations of up to 1500 mg/kg at a depth of 12-16 feet below ground surface (bgs). Tetrachloroethylene (PCE) was detected at a concentration of 5,800 ug/kg at a depth of 0-4 ft bgs near the dry cleaning machine. Groundwater samples were not collected at this time.

In 2004 a Supplemental Subsurface Assessment was completed for Windermere Real Estate. This assessment was as a follow up to a Phase I and Phase II conducted at the site in 2002 and 2003, respectively, that identified potential environmental concerns related to an out-of-service dry cleaning machine inside the laundry, two abandoned USTs on the north side of the building and petroleum and solvent contaminated soils beneath the property.

Seven borings and one hand auger boring were advanced to assess subsurface soil and groundwater. No petroleum hydrocarbons were detected during this assessment. Volatile organic compounds (cis-1,2 dichloroethylene [cis-1,2-DCE], trichloroethene [TCE] and PCE) were detected in 7 of the 9 soil samples collected at depths between 8 – 12 feet below ground surface, which is also the depth at which groundwater was encountered. Concentrations of cis-1,2-DCE ranged up to 2,200 ug/kg, TCE ranged up to 1,900 ug/kg and PCE ranged up to 270,000 ug/kg. This investigation indicated that VOC impacted soils were present in the area near the former dry cleaning unit.

Ground water was also sampled at this time from 5 installed wells. An additional two ground water samples were collected from the bottom of the soil borings. The highest concentrations of VOC's detected were cis-1,2-DCE at 4,700 ug/L, vinyl chloride at 3.8ug/L, TCE at 1,500 ug/L and PCE at 16,000 ug/L.

The soil encountered during this investigation was typically silty sand and sandy silt. Peat, wood, debris, clay and gravel layers were also encountered in the borings . Ground water was encountered at depths between 7 and 14 feet bgs. Groundwater elevation data indicated that shallow groundwater flow is to the southeast, consistent with the topography.

In 2014 the property owner hired Conestoga Rovers and Associates to re-sample the existing monitoring wells. Concentrations in the wells are listed below as well as soil concentrations from previous samples.

Petroleum and BTEX Concentrations in Soil

Sample	Depth (feet)	TPH g (mg/kg)	TPH d (mg/kg)	TPH oil (mg/kg)	BTEX (ug/kg)
MTCA Method A		100	2,000	2,000	
P1-S3 (December 2002)	8-12	--	2900	--	NA
P1-S4	12-15	--	160	--	NA

P-9 / February 2004	--	--	7.4	9	81

NA = not analyzed

-- = below detection

Current Site Conditions

Based on the sampling conducted in 2014, contamination remains in the ground water above the cleanup levels. Because no cleanup has been reported, it is assumed that contamination also remains in the soil.

The estimated volume of impacted soil is unknown, however the contamination is assumed to have resulted from leaks and spills from the dry cleaning unit. An estimate of less than 200 gallons has been assumed.

No containment measures are assumed at the site. As a conservative measure it is assumed that the spills occurred directly into the ground.

Geology

Soil boring logs indicate that most of the site is covered by a layer of silty sand beneath the asphalt to depths of 15 (or the bottom of the soil boring) .

Ground Water

Groundwater was encountered at depths between 7 and 14 feet below ground surface. The direction of flow was established during the 2014 sampling event as to the northeast. However, the distribution of the groundwater contamination suggests a northwest flow.

A search within the Department of Ecology's Water Resources Map indicates that there are nearby wells within two miles of the site. Ten of the wells are listed for irrigation purposes and one domestic.

Drinking water in the area is provided by Seattle Public Utilities.

Surface Water

The nearest surface water body is the Puget Sound approximately a mile to the West.

Surrounding Population

The location of the site is an area with a mixed commercial and residential uses. Adjacent properties include a church to the north, a townhouse and duplex to the east, an office building to the south and 160th Avenue to the west. Residential properties are located across 160th Avenue to the West.

There is a park, Horiuchi Park, located approximately 550 feet west of the Site and an Elementary School at less than 1,000 feet south of the Site. A homeless shelter is located about 300 feet southwest of the Site. A Juvenile Detention Center is located about 200 feet north of the site.

Ecological Setting

Most of the property is covered by the building. Nearby properties are mostly covered with asphalt and limited areas are available as potential wildlife habitat.

Horiuchi Park is located 550 feet west of the site.

Special Considerations for Scoring

The detection of very high concentrations of chlorinated solvents in the soils suggests the presence of free product underneath the building. High concentrations of chlorinated solvents in groundwater underneath the building also represent a concern for vapor intrusion. The indoor air exposure pathway may be significant to the tenants in the building and/or downgradient properties.

Of particular concern is exposure to high levels of trichloroethene in the indoor air for pregnant women. Short-term exposure (less than 21 days) to trichloroethylene in indoor air from vapor intrusion has the potential to cause serious heart defects in the developing

fetus. The damage can occur early in pregnancy, possibly before the pregnancy is recognized, and can be caused by relatively low TCE concentrations, similar to those associated with other critical cancer and noncancer effects that are produced after long-term (many years) exposure.

Route Score Summary

Route	Human Health	Environment
Surface Water	NA	
Air	97	10
Groundwater	38

Worksheet 2
Route Documentation

Site Name: Star Laundry
CSID: 12676
FSID: 979

1. SURFACE WATER ROUTE – NOT SCORED-

2. AIR ROUTE

Substances Used for Scoring:
PCE, TCE, cis-1,2 DCE, 1,1,2-TCE, Vinyl Chloride and gasoline

Basis for Selection of Substances:
Substances that are volatile and have highest toxicity

Management Units for Scoring:
Soil and groundwater

Basis for Selection of Management Units
Management units were selected based on where the contamination has been identified that can contribute to the air exposure pathway.

3. GROUND WATER ROUTE

Substances Used for Scoring:
PCE, TCE, cis-1,2 DCE, 1,1,2-TCE, Vinyl Chloride and gasoline

Basis for Selection of Substances
Substances with highest toxicity present in groundwater

Management Units for Scoring
Soil and groundwater

Basis for Selection of Management Units
Management unit was selected based on where the contamination has been identified that can migrate to groundwater and also based on actual groundwater results.

PHASE II ENVIRONMENTAL SITE ASSESSMENT
1215 East Fir Street
Seattle, Washington

1.0 INTRODUCTION AND BACKGROUND

This Phase II Environmental Site Assessment (ESA) summarizes the results of a soil and groundwater investigation performed at the King County-owned property at 1215 East Fir Street in Seattle, Washington (the site) on June 14, 2017 Figure 1). Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) was retained by the Seattle Housing Authority (SHA) to determine whether soil or groundwater at the site are affected by constituent of concern associated with historic releases of petroleum and potentially other constituents from either on-site or off-site sources. Amec Foster Wheeler understands that SHA intends to develop the property for residential use after the pending property transaction is complete.

A Phase I ESA was conducted in May 2017 by SoundEarth Strategies, Inc., and no recognized environmental conditions were reported for the site. However, the Phase I ESA indicated that a former gas station, three former dry cleaners, and an existing car maintenance and body work business were located within 250 feet of the site, to the north, west, and northwest. There were also four groundwater monitoring wells installed on the adjacent Seattle Curtain Company property to the west of the site.

2.0 METHODOLOGY

To determine whether off-site contamination has affected the site, soil borings and groundwater sampling locations were selected in a north-south transect along the west side of the current building to capture possible movement onto the site from the north, northwest and west. Boring locations are shown on Figure 2.

We understand that the redevelopment plans require the upper 12 feet of soil to be excavated and disposed of off site. While we were not able to complete borings inside the existing structure, the results of the soil samples should provide a preliminary indication as to whether there are affected soils or groundwater on site. Sections 2.1 through 2.4 describe the work that was performed during the ESA.

2.1 UTILITY AND SUBSURFACE LOCATING

Amec Foster Wheeler staff met Applied Professional Services, Inc. (APS) on site on June 7, 2017. The purpose of the utility survey was to ensure that drilling did not disrupt or damage underground utilities during completion of the borings. APS performed underground utility location services using electromagnetic survey methods.

The utility clearance was helpful in determining the alignment of electrical conduits from the north property boundary to a transformer station located in the middle of the site. In addition, water service and probable locations of gas and additional electrical lines were identified.

2.2 DRILLING

Amec Foster Wheeler staff met Cascade Drilling, Inc. (Cascade Drilling) on site on June 14, 2017. Cascade Drilling advanced a total of six soil borings using a Geoprobe 6600 truck-mounted direct-push drill rig. Locations of the borings are shown on Figure 2. Soil samples were collected from all six borings and groundwater was collected from three of the borings.

Depth to groundwater ranged from approximately 12 to 18 feet below ground surface (bgs) during drilling, except for once instance of perched water near 10 feet bgs. The ground surface is higher at the north end of the property than the south. Borings FIR-01 through FIR-04 were advanced to 15 feet bgs, FIR-05 was advanced to 20 feet bgs, and FIR-06 (the northernmost boring) was advanced to 25 feet bgs.

2.3 SAMPLE COLLECTION AND FIELD INDICATIONS OF CONTAMINATION

Soil samples were collected within the zone where soil transitioned from moist to saturated, which is where total petroleum hydrocarbons (TPH) would be concentrated, if present. Following collection of discrete soil ampules for analysis of volatile organic compounds (VOCs) and TPH-gasoline range hydrocarbons (TPH-G), approximately 3 to 4 inches of soil from the same interval were composited for analyses of TPH-diesel range hydrocarbons (TPH-D), TPH-motor oil range hydrocarbons (TPH-MO), and Resource Conservation and Recovery Act (RCRA) 8 Total Metals. A photoionization detector (PID) was used to screen soils for VOCs from each borehole upon opening of the acetate sample liner and to record headspace readings. Headspace readings were collected by placing a small amount of soil in a plastic bag, sealing it, and waiting for 5 to 10 minutes. The headspace of the plastic bag was then tested using the PID. No contamination was identified based on PID field screening. Sample depths are presented in Table 1. All samples collected and PID readings are shown on the boring logs (Appendix A). None of the soil samples had observable signs of

contamination, such as discoloration or odor. All soil borings were logged in the field by an Amec Foster Wheeler geologist. Boring logs were reviewed by a senior hydrogeologist

2.4 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (soil cuttings contained in two 16-gallon drums, and one other drum for decontamination water) were securely stored on the southwest area of the parking lot. Disposal is being arranged now that the soil results are known.

3.0 SOIL AND GROUNDWATER ANALYTICAL RESULTS

Figure 2 shows the locations of the soil borings. Table 1 lists analytes detected above the reporting limit in the soil samples and Table 2 lists analytes detected above the reporting limit in the groundwater samples. These tables show all detected analytes, even those below the Washington State Department of Ecology (Ecology) Model Toxics Control Act (MTCA) Method A cleanup levels, because prospective construction debris landfills have various acceptance criteria in the range that is between the detection limit and below Method A cleanup levels. Tables B-1 and Table B-2 in Appendix B lists the complete soil and groundwater sample analytical results, and the laboratory results are included as Appendix C.

Soil sample results that were above the MTCA Method A cleanup levels are as follows:

- A soil sample collected from FIR-02 collected from 13 feet bgs contained 3,700 milligrams per kilogram (mg/kg) of TPH-MO, above the MTCA Method A cleanup level of 2,000 mg/kg.

The source of the motor oil in the FIR-02 soil sample is unknown. Since the FIR-02 soil sample was collected at the capillary fringe, there is a possibility that the TPH-MO detected in the sample may be attributable to an off-site source. No other soil results were above the laboratory reporting limits or MTCA Method A cleanup levels.

Groundwater sample results that were above the MTCA Method A cleanup levels are as follows:

- Arsenic was detected at 22.4 micrograms per liter (µg/L) in FIR-01, at 11.8 µg/L in FIR-02 and 126 µg/L in FIR-06 groundwater samples, above the MTCA Method A cleanup level of 5 µg/L.
- Chromium was detected at 1,850 µg/L in the groundwater sample from FIR-06, above the MTCA Method A cleanup level of 50 µg/L.
- Lead was detected at 1,680 µg/L in groundwater sample FIR-06, above the MTCA Method A cleanup level of 15 µg/L.

The FIR-06 groundwater sample was a grab sample collected from 18 to 22 feet in depth. The lead and chromium results for the FIR-06 groundwater sample are unusual, since the concentrations are much higher than background. There are no on-site historic practices that would appear to be responsible for the presence of these metals.

It should be noted that a combined sewer is located within the vacated Mosler Avenue, which is now the alley between the buildings on the site. This combined sewer drains properties to the northwest, including the auto body business at the corner of 12th Avenue and East Fir Street. Leakage from the combined sewer or releases from a neighboring property may have contributed to the metals in groundwater at the FIR-06 location. According to the Phase I ESA, the adjoining property to the west (TD Auto Body) was listed on Ecology's Confirmed and Suspected Contaminated Sites list for lead and petroleum hydrocarbons in soil above cleanup levels.

4.0 SUMMARY AND RECOMMENDATIONS

As based on our discussions with the SHA regarding redevelopment, a single story basement (approximately 12 feet in depth) is anticipated to be constructed. Because the surface elevation of the site varies from north to south by 7–8 feet, it is unclear if the 12-foot depth is a median depth. The affected soils at FIR-02 may be encountered at a depth of 13 feet. We expect the extent of soil affected by TPH-MO to be limited in volume.

If the affected soils surrounding FIR-02 are excavated, it may be difficult to distinguish the presence of TPH-O based solely on field observations. Observable contamination was not seen during completion of the FIR-02 boring. Confirmation samples should be collected at the time of excavation and analyzed with a rapid turnaround time so that the standby time for the excavator is minimized. Costs for transport and disposal of affected soil will depend on the location of the disposal facility.

Prior to the investigation, the depth to water was assumed to be 8–12 feet, based on review of drillers' logs in the immediate vicinity of the site. However, the depth to groundwater was 12 feet at the southern end of the property and approximately 18 feet at the north end of the property. Therefore, the currently proposed depth of excavation for the basement may not require dewatering, based on the observed depths to groundwater during this investigation.

When SHA finalizes the design of the future redevelopment of the site, Amec Foster Wheeler can refine the conclusions regarding soil disposal and dewatering. SHA has expressed that they may prefer to get an opinion letter from Ecology under the Voluntary Cleanup Program. If SHA decides to excavate the soil at FIR-02, it may be possible to get a No Further Action opinion letter from Ecology

in regard to the soil. Review of the file records for TD Auto Body at Ecology's Northwest Regional office may provide additional information that may allow SHA to argue that the affected groundwater at FIR-06 is due to an off-site source.

If it is necessary to review Ecology's files to determine the potential source of the groundwater concentrations at location FIR-06, it may be desirable to see if records exist concerning Seattle Curtain Company's property. A cursory review of Ecology's website records did not indicate that this site has been reported to Ecology, despite the presence of monitoring wells in the parking lot.

5.0 LIMITATIONS

This report was prepared by Amec Foster Wheeler exclusively for the SHA. The quality of information, conclusions, and estimates contained herein is consistent with the level of effort involved in Amec Foster Wheeler services and based on (1) information available at the time of preparation, (2) Phase I ESA data provided to Amec Foster Wheeler by the SHA, and (3) the assumptions, conditions, and qualifications set forth in this report. Environmental impairment of a property may result from many activities, such as illegal or unreported dumping, or the spilling of hazardous wastes or materials. The presence of contaminants at a particular property may not always be apparent, and the completion of the Phase II ESA cannot provide a guarantee that hazardous wastes or materials do not exist, particularly because not all areas of the site could be accessed for investigation. The findings contained herein are relevant to the date of Amec Foster Wheeler's sampling activities and should not be relied upon to represent conditions at later dates. In the event that changes in the nature, usage, or layout of the property or nearby properties are made, the conclusions and recommendations contained in this report may not be valid. If additional information becomes available, it should be provided to Amec Foster Wheeler so the original conclusions and recommendations can be modified as necessary.

This Phase II ESA is intended to be used by the Client for the site located at 1215 East Fir Street in Seattle, Washington, only, subject to the terms and conditions of its contract with Amec Foster Wheeler. Any other use of, or reliance on, this report by any third party is at that party's sole risk. Amec Foster Wheeler has completed this work under the contract terms and conditions presented in Amec Foster Wheeler's Phase II ESA proposal dated April 20, 2017.

Silver	NE	1 U	1 U	1 U	1 U	1 U	1 U

Notes:
1. Data qualifiers are as follows:
   U = The analyte was not detected at the reporting limit indicated.
2. The cleanup level for gasoline range TPH is 100 mg/kg when benzene is not detected in the soil.
3. The cleanup level for chromium is trivalent chromium.

Crystal Thimsen, Project Manager
AMEC Foster Wheeler
One Union Square
600 University Street, Suite 600
Seattle, WA 98101

Dear Ms Thimsen:

Included are the results from the testing of material submitted on June 15, 2017 from the Fir Street, PO PS1718052G, F&BI 706250 project. There are 40 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on June 15, 2017 by Friedman & Bruya, Inc. from the AMEC Foster Wheeler Fir Street, PO PS1718052G, F&BI 706250 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	AMEC Foster Wheeler
706250 -01	FIR-01
706250 -02	FIR-01
706250 -03	FIR-02
706250 -04	FIR-03
706250 -05	FIR-03
706250 -06	FIR-04
706250 -07	FIR-05
706250 -08	FIR-06
706250 -09	FIR-06
706250 -10	Trip Blank

Selenium failed below the acceptance criteria in the 6020A matrix spike sample. The laboratory control samples met the acceptance criteria, therefore the data were due to sample matrix effect.

All quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The compound is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

1.0 INTRODUCTION

PBS Engineering and Environmental, Inc. (PBS) is pleased to submit this Subsurface Investigation Report to Big Village, LLLP and the Seattle Chinatown International District Preservation and Development Authority (SCIDpda) summarizing environmental subsurface investigation activities related to the planned redevelopment of King County Assessor's Parcel 8061000045 located at 1215 E Fir Street in Seattle, Washington (the Site/Property).

PBS understands that the single-story warehouse structure totaling approximately 40,000 square feet will be razed to give way to construction of a new residential housing development.

1.1 Site Description and Topography

The site is located in the northeast quarter of Section 5, Township 24 North, Range 4 East of the Willamette Base and Meridian (W.M.) (Figure 1). The site is currently developed with a single-story warehouse used for public records storage by King County Archives and Records Center. The site slopes to the southeast (Refer to Figure 2 for site layout).

2.0 REGIONAL GEOLOGY AND HYDROGEOLOGY

The Property is located in the Puget Lowland physiographic province of Washington. This province is a basin which is bordered to the east by the Cascade Mountains and to the west by the Olympic Mountains. The Puget Sound Basin was partially filled with thick accumulations of sand, gravel, and till by at least four separate periods of glaciation within the past two million years. Periods of glaciation were followed by lacustrine, alluvial, and marine deposition of clay, silt, sand, gravel, and peat.

According to the Geologic Map of Washington – Northwest Quadrant (Washington Division of Geology and Earth Resources, 2002), 1:250,000 scale, the site is underlain by Pleistocene-aged glacial drift deposited as an end or recessional moraine.

The closest surface water to the site is Elliott Bay, an inlet of the greater Puget Sound, located approximately 1.1-miles to the west. Lake Washington is located 1.5-miles to the east of the Property.

3.0 BACKGROUND

In May 2017, SoundEarth Strategies, Inc. performed a Phase I Environmental Site Assessment (ESA) for the Property. No recognized environmental conditions were reported in the Phase I ESA, however, a former gas station, three former dry cleaners, and an existing car maintenance facility were located within 250 feet of the Property in the upgradient direction with respect to groundwater flow.

A Phase II ESA was performed for the Property by Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec) in July 2017. During the Phase II ESA, the following contaminants were discovered in Site soil and/or groundwater in exceedance of cleanup levels:

- Total Petroleum Hydrocarbons (TPH) in the motor oil range (TPH-MO) were detected in soil near the western property boundary at a concentration in exceedance of the Washington State Department of Ecology's (Ecology's) Method A Cleanup Levels for unrestricted land use (Cleanup Levels, see section 7). The soil sample in which TPH-MO was detected was collected from within the capillary fringe. Thus, there is a possibility that the TPH-MO may be attributable to an offsite source.

- Metals (arsenic, chromium, and lead) concentrations were reported in exceedance of cleanup levels in groundwater in the northwest corner of the Property. Additionally, arsenic was detected in groundwater in exceedance of cleanup levels in various locations along the western property boundary.

In addition to the soil and groundwater contamination described above, Amec noted the following environmental concerns associated with the Property:

- At the time the Amec Phase II report was issued, files relating to environmental concerns at the adjacent TD Auto Body and Seattle Curtain Manufacturing Co. properties located at 1209 E Fir Street and 104 12th Ave, respectively, were not available on Ecology's online database. The report noted that review of records for adjacent properties may provide additional information suggesting that impacted groundwater at the Property is a result of an offsite source.
- A combined sewer is located within the vacated Mosler Avenue, which is now the alley between the Property and west adjacent properties. The combined sewer drains properties to the northwest, including several current and former auto body shops and dry cleaners. Leakage from the sewer in combination with releases at nearby properties may have contributed to groundwater contamination at the Property.
- The Phase II report noted that the Phase I ESA for the Property reported that the TD Auto Body site was listed on Ecology's Confirmed and Suspected Contaminated Sites list for lead and petroleum hydrocarbons in soil above cleanup levels.

4.0 REGULATORY FILE REVIEW

Since the issuance of the 2017 Phase II ESA report and the scoping of this investigation, documents relating to the environmental investigation and cleanup of the TD Autobody and Seattle Curtain Manufacturing Co. properties were uploaded to Ecology's online database. PBS reviewed the associated database listing (Facility Site ID: 2501, Cleanup Site ID: 2666) which provides information for 104 -124 12th Avenue (including the Seattle Curtain Manufacturing Co. Site as well as a former dry cleaner) and 1209 E Fir Street (TD Auto Body). For the purposes of this report, the four parcels, King County parcel numbers 8061000005, 8061000015, 8061000025 and 8061000035, associated with the TD Autobody Cleanup Site listing will be referred to as the west adjacent properties.

The following environmental concerns at the west adjacent properties were noted as possible contributing factors to Site environmental concerns:

- Tetrachloroethene (PCE), trichloroethene (TCE), and vinyl chloride (VC) concentrations were detected in groundwater in exceedance of cleanup levels near the property boundary between the Property and the west adjacent properties. PCE is a common dry-cleaning solvent. TCE and VC are degradational products of PCE.
- Total petroleum hydrocarbons in the gasoline, diesel, and motor oil ranges have been detected in exceedance of cleanup levels in groundwater throughout the west adjacent properties.
- Benzene was detected in groundwater in the northwest portion of the west adjacent properties in exceedance of cleanup levels.
- Naphthalene, bromodichloromethane, and chloroform were detected in sub-slab soil vapor samples in exceedance of Cleanup Levels in the southwest corner of the west adjacent properties. No other portions of the west adjacent properties were evaluated for sub-slab soil vapors.
- Lead was detected in soil in exceedance of the cleanup level in one location on the west adjacent properties. Groundwater samples collected at the west adjacent properties were not analyzed for metals.

5.0 SITE INVESTIGATION

The subsurface investigation was completed to delineate the extent of known contamination in soil and groundwater at the Property and to evaluate the possibility of migration of offsite contaminants in groundwater onto the Property from west adjacent properties.

5.1 Drilling Investigation

Prior to beginning the drilling investigation, PBS filed a public utility notification request. On July 3, 2019, PBS supervised a private utility locating company, Applied Professional Services of North Bend, WA, while they conducted borehole clearance for subsurface obstructions.

The drilling and sampling program included the advancement of seven soil borings (BH-01 through BH-07) for collection of soil samples and grab groundwater samples. Soil borings were advanced on July 23 and 24, 2019 by Holt Services of Edgewood, Washington under the direction of a PBS geologist. The borings were completed with a track mounted direct-push drilling rig. Six of the seven soil borings were located indoors within the warehouse that occupied the property at the time of the investigation. Due to limited access to certain locations, a small track rig was mobilized on the second day of drilling to facilitate drilling in the limited access locations. The small track rig was unable to reach the proposed depth of exploration due to drilling refusal.

The following table provides justification for selection of boring locations and proposed vs. achieved depths:

Boring ID	Proposed Depth (feet bgs)	Achieved Depth (feet bgs)	Temporary Well Construction	Groundwater sample collected?	Objective
BH-01	20	20	Temporary well screened from 15-20 feet bgs	Yes	Delineate metals in groundwater in former boring FIR-06
BH-02					
BH-03	30	30	Temporary wells screened from 13-18 and 24-29 feet bgs	Yes	Investigate impacts to groundwater from combined sewer and west adjacent properties
BH-04	20	20	Temporary well screened from 15-20 feet bgs	Yes	Delineate motor oil in soil in former boring FIR-02
BH-05	20	7	None	No	Investigate eastern property boundary for environmental concerns and offsite impacts
BH-06	20	8	Expendable tip screened 16-20 feet bgs	Yes	Delineate motor oil in soil in former boring FIR-02
BH-07	20	12	None	No	

bgs – below ground surface (measured from top of slab within warehouse)

Soils from each boring were logged continuously, noting grain size, density, color, odor, and moisture. During the advancement of boreholes, soil was screened for volatiles using a hand-held photoionization detector (PID). PID readings were taken at one-foot intervals by partially filling a sealable plastic bag and taking headspace readings within the bag.

Refer to Figure 2: Site Plan for boring locations. Boring logs describing the subsurface lithology, sample depths, and PID readings are presented in Appendix A.

5.2 Groundwater Sampling

Groundwater was encountered in five out of seven on-site borings in sufficient volumes for sample collection. In borings in which the full depth of exploration was reached, temporary well screens were installed in the open boring for the collection of grab groundwater samples. Boring BH-03 was advanced to a depth of 18 feet below ground surface (bgs), a temporary well screen was installed from 13 to 18 feet bgs, and a shallow groundwater sample was collected. The temporary well screen was then removed, and boring BH-03 was advanced beyond the initial 18-foot depth to a total depth of 30 feet bgs. A new temporary well screen was installed in the boring from 25 to 30 feet bgs, and a deeper groundwater sample was collected. Groundwater samples were collected from BH-03 at multiple depths to target lighter than water contaminants (TPH) in the shallow water sample and typically heavier than water contaminants (VOCs) in the deeper water sample. An expendable tip was pushed beyond the depth of drilling refusal at BH-06 to facilitate the collection of groundwater samples. The expendable tip is a smaller diameter than the direct push drilling rods and can typically reach greater depths than those achieved with typical direct push drill tooling. Once the desired depth was achieved with the expendable tip, the smaller diameter rods were pulled up, exposing a temporary stainless-steel well screen allowing collection of a groundwater sample. An attempt to push an expendable tip was made at BH-05, however, refusal was encountered at the same depth of drilling refusal in boring BH-05.

Groundwater samples were collected using a peristaltic pump and dedicated disposable tubing from the temporary polyvinyl chloride (PVC) well screens placed in open borings and stainless-steel well screens exposed using the expendable tip technique.

5.3 Laboratory Analysis

Soil and groundwater samples were collected directly into laboratory-supplied containers, placed on ice in a cooler, and transported under chain-of-custody documentation. Samples were submitted on July 25, 2019 to Friedman and Bruya, Inc. in Seattle, WA, a State of Washington Department of Ecology (Ecology) accredited laboratory. Samples were submitted for the following analyses and analytical methods:

- Diesel range Total Petroleum Hydrocarbons (TPH-D) by method NWTPH-Dx
- Gasoline range Total Petroleum Hydrocarbons (TPH-G) by method NWTPH-Gx
- Volatile organic compounds (VOCs) by United States Environmental Protection Agency (EPA) method 8260
- Metals by EPA method 6010/6020

Additionally, one sample of artificial fill material was submitted for analysis of Polycyclic Aromatic Hydrocarbons (PAHs) by EPA Method 8270 SIM.

6.0 INVESTIGATION-DERIVED WASTES

Gloves, tubing, and other disposable field supplies were disposed of as municipal solid waste. Soil cuttings, purged groundwater, and decontamination water were placed in one 55-gallon drum, which is sealed, labeled, and stored on site pending disposal.

7.0 APPLICABLE REGULATIONS AND CLEANUP STANDARDS

Contaminated site assessment and cleanup is conducted in accordance with the substantive requirements of the Model Toxics Control Act (MTCA), Chapter 70.105D of the Revised Code of Washington (RCW) and its implementation regulations, Chapter 173-340 of the Washington Administrative Code (WAC).

Site assessment and cleanup (if applicable) has been and will continue to be performed under MTCA. This section summarizes the cleanup standards established for this site.

7.1 Soil and Groundwater Cleanup Standards

In accordance with MTCA, development of preliminary cleanup levels includes identifying potential exposure pathways for human and ecological impacts based on the planned land use. MTCA provides for three methods (Method A, B, or C) for establishing cleanup standards. Method A (unrestricted land use) is typically used as the default standard levels. Methods B and C are used when developing site-specific cleanup levels.

Considering the current land use and future land use as a multi-unit residential dwelling, MTCA Method A Cleanup Levels (Cleanup Levels) for unrestricted land use are adopted as screening levels at this time. Method A Cleanup Levels for soil and groundwater are presented in Tables 1 and 2, along with the contaminant concentrations.

8.0 FINDINGS

8.1 Groundwater Elevation

In the northwest portion of the Property, groundwater was first encountered between 14.5 to 17.5 feet bgs and stabilized at depths between 4.5 and 7 feet bgs. In the southwest portion of the Property, groundwater was first encountered at 15 feet bgs and stabilized at 10 feet bgs.

Depth to groundwater site-wide is estimated to be approximately 5 to 10 feet below the top of slab in the existing warehouse structure. Given the duration and sequence of the drilling investigation, sufficient time was not available to allow water levels to stabilize in all borings for simultaneous depth to water measurements. Therefore, detailed interpretation of groundwater elevations and flow direction cannot be made based on the findings of this investigation.

8.2 Soil Profile

A typical subsurface profile encountered on-site is presented below:

Typical Subsurface Profile

Classification	Description	Approximate Depth Range (feet bgs)
Asphalt/Concrete	Asphalt slab (exterior borings) Concrete slab (interior borings)	0.0 to 0.66
Sand and silt	Silty Sand / Sandy Silt with gravel (SM); brown; poorly graded clay, silt, sand and gravel mixture; brown to gray brown; medium dense; [Fill].	0.66 to 13
Sandy Silt	Saturated brown to yellow brown Silt (ML) with fine to medium sand; low plasticity.	13 to 30+

Graphic boring logs are provided in Appendix A.

8.3 Soil Analytical Results

TPH and VOC constituents were not detected in the soil samples with concentrations at or above laboratory reporting limits. Carcinogenic PAHs (cPAHs) and metals were detected in soil samples at concentrations below cleanup levels.

Soil analytical results are presented in Table 1. Toxicity equivalence calculations for cPAHs are presented in Appendix B. A copy of the laboratory reports and chain of custody documentation is included in Appendix C.

8.4 Groundwater Analytical Results

Arsenic was detected in groundwater samples from each location explored with concentrations exceeding Cleanup Levels in all locations explored. Lead and chromium were also detected in groundwater in exceedance of Cleanup Levels in two and three out of seven locations explored, respectively.

TPH-D was detected with a reported concentration below the Cleanup Level in the shallow groundwater sample collected from boring BH-03. BH-03 was located outside and adjacent to the western property boundary.

VOCs were not detected above laboratory reporting limits in groundwater samples with the following exception: chloromethane was detected in the groundwater sample collected from boring BH-04. No Cleanup Level has been established for this chemical.

Groundwater analytical results are presented in Table 2. A copy of the laboratory reports and chain of custody documentation is included in Appendix C.

9.0 CONCLUSIONS

9.1 Conclusions

A summary of the findings of the subsurface investigation are presented below:

Metals in Groundwater

Groundwater across the property contains levels of metals, namely arsenic, chromium, and lead, at concentrations in exceedance of Cleanup Levels. Past uses of the Property do not indicate an on-site source of these constituents. The metal concentrations are present site-wide, including in locations adjacent to the upgradient property boundaries, and are suspected to be the result of background or an offsite source. Given that groundwater in the area is not a current or proposed resource (for drinking water or otherwise), the metals in groundwater at the Property are not expected to impact the proposed land use.

Metals in groundwater are likely to present disposal restrictions or considerations for water generated as a result of construction dewatering at the Site.

Metals concentrations detected in groundwater samples from this investigation were significantly lower than those detected in the previous 2017 investigation conducted by Amec. This may be a result of decreasing concentrations over time, or due to the influence of sediment in previous grab groundwater samples creating a biased high concentration of total metals concentrations in groundwater.

VOCs

VOCs were not detected in the soil or groundwater samples collected during this investigation, with the exception of chloromethane. The sample locations included samples collected downgradient from locations with previously identified VOC contamination at the west adjacent properties. Chloromethane does not have an established Cleanup Level, and is not a common solvent used in dry-cleaning operations. The detection of chloromethane is not expected to impact regulatory compliance or proposed future land uses.

VOCs in groundwater do not appear to be migrating onto the Property at the time of this investigation. VOC plumes are known to impact the regional water table at several properties in the neighborhood, including the west adjacent properties and the 160 12th Avenue property located approximately 200 feet upgradient from the Property. VOCs have also been detected in exceedance of Cleanup Levels in sub-slab soil vapor samples collected at the west adjacent properties. Based on this information and the shallow depth to water on-site, PBS recommends consideration of a vapor intrusion evaluation and inclusion of a vapor barrier in future building design.

TPH-HO in Soil and Groundwater

TPH-HO was detected in boring FIR-02, located near the western portion of the property, in exceedance of the respective Cleanup Level during the 2017 investigation. TPH-HO was not detected in soil samples collected from borings surrounding FIR-02. Thus, the TPH-HO contamination in soil appears to be limited to a lateral extent of 50 feet or less.

TPH-HO in soil will likely require removal and offsite disposal during site grading and construction. The volume of TPH-HO impacted soil requiring removal from the Property is estimated to be less than 1,000 bank cubic yards based on the results of this investigation. TPH-HO was detected in the shallow groundwater sample collected from boring BH-03, albeit below the Cleanup Level. While remediation of

TPH-HO in groundwater is not required for regulatory compliance, the contaminant is likely to present disposal restrictions for water generated as a result of construction dewatering in the area.

10.0 LIMITATIONS

PBS has prepared this report for use by Big Village, LLLP and SCIDpda. This report is for the exclusive use of the client and is not to be relied upon by other parties. It is not to be photographed, photocopied, or similarly reproduced, in total or in part, without the expressed written consent of the client and PBS.

This study was limited to the tests, locations, and depths as indicated to determine the absence or presence of certain contaminants. The findings and conclusions of this report are not scientific certainties but, rather, are probabilities based on professional judgment concerning the significance of the data gathered during this investigation. PBS is not able to represent that the site or adjoining land contain no hazardous substances or other latent conditions beyond that detected or observed by PBS.

Sincerely,
PBS Engineering and Environmental Inc.

APPENDIX B

Toxicity Equivalence Calculations for cPAHs

Attachment B: Toxicity equivalence calculations for carcinogenic PAHs (cPAHs) in sample BH-05-02

It should be noted that the calculation of carcinogenic PAHs (cPAHs) must be performed in accordance with MTCA regulations to determine whether cPAH concentrations meet MTCA level A requirements. The calculation methodology is given in Washington Administrative Code (WAC) Section 173-340-708(8), and the Toxicity Equivalence Factors (TEFs) to be used in the calculations are given in MTCA Section 173-340-900 Table 708-2 which is reproduced below:

	Toxicity Equivalency Factor (TEF)	Concentration (mg/kg)	Benzo(a)pyrene Equivalent Concentration (mg/kg)
benzo(a)pyrene	1	0.025	0.025
benzo(a)anthracene	0.1	0.02	0.002
benzo(b)fluoranthene	0.1	0.027	0.0027
benzo(k)fluoranthene	0.1	0.011	0.0011
chrysene	0.01	0.027	0.00027
dibenz(a,h)anthracene	0.1	0.01	0.001
indeno(1,2,3-cd)pyrene	0.1	0.019	0.0019
		RESULT	0.03397
MTCA Method A Cleanup Level			0.1

mg/kg - milligrams per kilogram

Note: No carcinogenic PAHs were detected above laboratory reporting limits. Concentrations used represent laboratory reporting limit of non-detect result

James Welles, Project Manager
PBS Engineering and Environmental, Inc.
214 E. Galer St, Suite 300
Seattle, WA 98102

Dear Mr Welles:

Included are the results from the testing of material submitted on July 25, 2019 from the SCID 1215 E Fir St PO 41593.000, F&BI 907454 project. There are 65 ages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on July 25, 2019 by Friedman & Bruya, Inc. from the PBS Engineering and Environmental SCID 1215 E Fir St PO 41593.000, F&BI 907454 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	PBS Engineering and Environmental
907454 -01	BH-01-10
907454 -02	BH-01-W
907454 -03	BH-02-09
907454 -04	BH-02-W
907454 -05	BH-03-15
907454 -06	BH-03-WA
907454 -07	BH-04-15
907454 -08	BH-04-W
907454 -09	BH-05-02
907454 -10	BH-05-07
907454 -11	BH-06-05
907454 -12	BH-06-W
907454 -13	BH-07-12
907454 -14	BH-03-WB

A 6020A internal standard failed the acceptance criteria for the metals samples. In addition, barium exceeded the calibration range in the water samples. The samples were diluted and reanalyzed with acceptable results. Both data sets were reported.

Acetone in the 8260C water laboratory control sample failed the acceptance criteria. The data were flagged accordingly.

The 8260C soil calibration standard failed the acceptance criteria for dichlorofluoromethane. The data were flagged accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.
