**DATA GAP INVESTIGATION REPORT  
FRANK WEAR SITE  
YAKIMA, WASHINGTON**

## **1.0 INTRODUCTION**

Hart Crowser has prepared this Data Gap Investigation (DGI) Report for the former Frank Wear dry cleaner (site) in Yakima, Washington (Figure 1). All work was performed at the request of the Washington Department of Ecology (Ecology) under Task 3 of Work Assignment Number C110144W and Amendment 1.

### ***1.1 Purpose***

The purpose of this data gap investigation was to address data gaps with respect to delineating chlorinated volatile organic compound (cVOC) contamination in soil and groundwater at the site. The 2007 Feasibility Study for the site identified *in situ* bioremediation as the presumed preferred groundwater remedy (Hart Crowser 2007). In order to successfully execute this *in situ* bioremediation approach, shallow cVOC plume delineation and baseline bioremediation assessments were necessary to finalize a design. The specific objectives of this data gap investigation included the following:

- Shallow cVOC plume delineation;
- Deep groundwater zone contamination characterization; and
- Baseline bioremediation evaluation.

### ***1.2 Scope of Work***

To accomplish these objectives, we performed the data gap investigation activities in general accordance with the procedures presented in our January 20, 2012, Data Gap Investigation Technical Memorandum (Work Plan) (Hart Crowser 2012a) and the March 14, 2012, Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP)(Hart Crowser 2012c). The data gap investigation was completed from March through June 2012 and included the installation of eight exploratory borings with the collection of soil and groundwater samples; installation of seven new shallow and three new deep monitoring wells; and sampling of the new and existing monitoring wells (24 wells total).

### **1.3 Report Contents and Organization**

This report presents the results of the data gap investigation performed by Hart Crowser. A description of subsequent sections of this report with the topics discussed are as follows:

- Section 2.0: Site background and history including site description, geology and hydrogeology, historical operations and nature of contamination, previous environmental investigations, and interim cleanup actions.
- Section 3.0: Field activities and findings including preparatory activities, the Geoprobe® explorations, sonic drilling and explorations, monitoring well installations, groundwater monitoring, management of investigation-derived waste, and deviations from work plan.
- Section 4.0: Investigation results including groundwater elevations and flow directions, chemical analyses performed, chemical results, and bioremediation data assessment.
- Section 5.0: Comparison of chemical results to applicable cleanup levels includes soil and groundwater results comparisons.
- Section 6.0: Conclusions.
- Section 7.0: References.

### **1.4 Limitations**

Work performed by Hart Crowser for this project and the preparation of this report was conducted in accordance with generally accepted professional practices in the same or similar localities, related to the nature of the work accomplished at the time our services were performed. This report is for specific application to the referenced project and for the exclusive use of Washington Ecology. No other warranty, express or implied, is made.

## **2.0 BACKGROUND AND HISTORY**

Background project information including site description, geologic information, past site operations, and previous environmental investigation activities were based on documents and references provided by Ecology.

## **2.1 Site Location and Description**

The Site is located at 106 South 3rd Avenue, Yakima, Washington (Figure 1). The former Frank Wear property is now a vacant gravel lot zoned within the Central Business District. The property is bounded to the north by an asphalt parking lot, an alley and businesses to the west, a children's daycare facility to the south, and by South 3rd Avenue to the east (Figure 2).

## **2.2 Geology and Hydrogeology**

The site's shallow upper aquifer is unconfined and consists of unconsolidated alluvium, primarily coarse-grained sands, gravels, and cobbles with occasional interbedded lenses of clay and silt; and the Thorp Gravel, primarily highly weathered, poorly cemented, coarse sands and gravels. This alluvium extends from approximately 10 to 80 feet below ground surface (bgs) and is representative of the alluvium that blankets most of the Yakima Valley floor. Below this material is the Upper Ellensburg Formation, which consists of alluvial and volcanic mudslide deposits (lahar) that have been semi-consolidated. The Upper Ellensburg Formation overlies basalt bedrock (Columbia River Basalts) and interbedded Ellensburg Formation, and is present from 50 to 1,600 feet bgs. The upper member of the Upper Ellensburg Formation is the principle water source for the Ahtanum-Moxee Basin.

Site groundwater elevations fluctuate seasonally as a result of localized recharge created from irrigation canals. During the winter months (January through March), the shallow groundwater table at the site is typically present at approximately 20 to 25 feet bgs with flow direction toward the south. Irrigation ditches throughout the Yakima area are charged from late March through early October each year, raising the water table to between 12 to 18 feet bgs and changing the flow direction toward the east-southeast through the autumn months. Groundwater horizontal gradients at the site range from 0.008 foot/foot (winter) to 0.025 foot/foot (through autumn). Groundwater velocities within the alluvial aquifer have been estimated to be approximately 240 feet per year during the winter.

Two aquifers have been identified at the study site: a deep drinking water aquifer and a shallow water table aquifer. The interconnection between these aquifers has not been directly investigated. The aquifers are believed to be separated by a sequence of discontinuous, but thick and gradational low permeability layers.

### **2.3 Historical Operations and Nature of Contamination**

The Frank Wear site was a dry cleaning business from the early 1940s to 2000. The use of the site prior to 1940 is unknown. The business was owned and operated by the Frank Wear family from the early 1940s to 1980. The dry cleaning operations primarily used Stoddard solvent as the dry cleaning fluid. However, sometime during the 1970s, the business began using tetrachloroethene (PCE) as the dry cleaning solvent. Spent PCE from the dry cleaning operations was reclaimed using a distillation unit. Sludges or still bottoms from the reclamation process were reportedly deposited on the property for dust abatement. Overflow from the dry cleaning machine was also periodically discharged to a catch basin or overflow tray located outside the southwest corner of the building.

Occasionally, the catch basin would overflow, potentially causing spills of the PCE-contaminated liquids to the ground surface. Leaks and spills from the dry cleaning machines and associated equipment would have collected in floor drains and these floor drains may have carried PCE-contaminated wastewaters out to the west end of the building. In 1989, the owner reportedly removed a 500-gallon gasoline underground storage tank (UST) and a 1,000-gallon heating oil UST.

Based on releases, the Site has been identified as one source of chlorinated volatile organic compounds (cVOCs) within the broader Yakima Railroad Area (YRRA) plume.

### **2.4 Previous Environmental Investigations and Interim Cleanup Actions**

Ecology first inspected the site in 1985 due to complaints of sludges being disposed in the back parking lot. Subsequent site inspections by Ecology in 1987 and 1989 detected PCE in soil. Soil samples collected during the 1989 UST excavations contained PCE up to 10 milligrams per kilogram (mg/kg) at depths to 12 feet bgs.

A remedial investigation (RI) of the Site was performed during 1995. A 25-point soil vapor survey was completed on the site in January 1995, and PCE was detected in every sample ranging from 7 to 727 micrograms per liter of air. The dry cleaner building was still present during the soil vapor sampling (the building was demolished in 2000 and concrete floor removed in 2001), soil vapor sampling did not include areas under the building. These results suggested two main sources of the PCE; one beneath the northeast corner of the property near a plumbing access trench, and the other at the northwest corner of the former building near the former heating oil UST. However, because sampling did not

occur under the building, PCE sources within or around (or due north) of the building footprint are suspected to be more significant than those sources indicated by this soil vapor study.

During the RI, four shallow monitoring wells were installed and screened from 10 to 35 feet bgs. In September 1995, 610 tons of soil was excavated from 3 to 12 feet bgs from the former heating oil UST area with the extent based on confirmation soil sampling.

A five-well ozone sparging system intermittently operated during 1997 and 1998 with inconclusive results. In 2000, the Frank Wear building was demolished and in 2001, an additional 432 tons of soil were removed from within the building footprint. In 2005, four of the five original 4-inch diameter ozone sparging wells were converted to monitoring wells and five new additional 2-inch monitoring wells were installed at the site. Locations of the 14 monitoring wells installed prior to 2012 are presented on Figure 2.

## 3.0 FIELD ACTIVITIES AND FINDINGS

The field activities for the data gap investigation were completed from March through June 2012 and included the installation of eight exploratory borings with the collection of soil and groundwater samples; installation of seven new shallow and three new deep monitoring wells; and sampling of the new and existing monitoring wells (24 wells total). The exploratory borings were completed first for purposes of determining locations of the new monitoring wells. The discussion below summarizes the field activities and deviations from the Work Plan and SAP/QAPP.

### 3.1 *Preparatory Activities*

**Site Health and Safety Plan.** A site Health and Safety Plan (HASP) was prepared for the data gap investigation activities (Hart Crowser 2012b). The HASP was prepared in general accordance with WAC 173-340-810 and applicable federal Occupational Safety and Health Administration requirements. A draft HASP was previously submitted to Ecology prior to implementing the field work.

**Site Sampling and Analysis Plan/Quality Assurance Project Plan.** A site Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP) was prepared for the data gap investigation activities in general accordance with WAC 173-340-820 (Hart Crowser 2012c). The SAP/QAPP described proposed sampling locations, procedures, and analytical methods. The SAP/QAPP was submitted to Ecology prior to implementing the field work.

**Property Access.** Ecology arranged for site access and secured agreements with the affected property owners to allow the exploratory borings and monitoring well installations on their respective properties. Hart Crowser coordinated with the City of Yakima to obtain the Street Break Permits and Temporary Right of Way Closure Permits for the boring and well installations in the public right of ways.

**Underground Utility Location.** For each of the separate field efforts (Geoprobe® boring installations in March, sonic drilling exploratory borings in April, and monitoring well installations in June) Hart Crowser contacted the Washington utility notification service (Washington811) to locate underground utilities in the public right of ways. We also subcontracted with Utilities Plus, LLC, a local utility locating company, to locate the underground utilities on the private properties within the targeted work areas.

### **3.2 Geoprobe® Explorations (March 2012)**

The Work Plan identified up to 26 push probes that would be completed to a depth of 35 feet to further delineate the extent of the cVOC contamination in the subsurface soil and groundwater beyond the former Frank Wear property. These push probe explorations were to be installed using a track-mounted Geoprobe® drill rig. Cascade Drilling (Cascade) initiated the drill work on March 19, 2012. However, the subsurface conditions, consisting of mostly cobbles, proved too difficult for the Geoprobe® rig to complete the borings. Six different probe locations were attempted using the Geoprobe® rig. Multiple attempts were made at each of these locations to reach the desired 35-foot depth. The Geoprobe® rig could not advance further than 21 feet bgs before refusal was reached. Because the Geoprobe® rig could not drill down to the desired depths for soil and groundwater sample collection, no samples were collected for chemical analyses. In consultation with Ecology, it was determined that the Geoprobe® rig would not be able to complete the explorations as planned and this phase of field work was rescheduled for April 2012 using a sonic drill rig. Cascade Drilling demobilized from the site on March 20, 2012.

### **3.3 Sonic Drilling and Explorations (April 2012)**

Because the site subsurface conditions prevented completion of the soil borings using the Geoprobe® rig, a more robust drilling method using a sonic drill rig was used to complete the soil borings. In consultation with Ecology, the number of planned exploratory borings was reduced from 26 to 17 to compensate for the slower installation rates and higher costs by the sonic drilling methods compared to the Geoprobe® methods.

Cascade Drilling completed the soil exploratory borings from April 11 through 18, 2012, using a rotary-sonic drill rig. The rotary-sonic action of the drill rig allows it to slowly grind and break apart rocks in the subsurface. The drill rig utilizes a hollow auger casing that collects soils in the center of the casing as it penetrates the subsurface. The casing is occasionally pulled from the ground and the accumulated soil is collected into long plastic bags. This method is not optimal for recovering undisturbed soil samples, but this drilling method was necessary to penetrate the rocky subsurface.

The rotary-sonic drill rig was able to penetrate to the required depth of 35 feet bgs; however, the subsurface conditions caused the sonic drilling to proceed at a rate slower than anticipated. As a result, only eight of the planned 17 borings were completed due to cost concerns. The borings were completed in accordance with the applicable requirements of WAC Chapter 173-160. Logs of the completed borings are provided in Appendix A.

**Locations.** The locations of the eight completed borings are shown on Figure 2 (B-4, B-5, B-6, B-9, B-12, B-13, B-15, and B-16). These boring locations were targeted to assess the horizontal and vertical extent of the contamination in soil and groundwater. Locations were selected based on proximity to Frank Wear site, apparent groundwater flow direction, and previous soil and groundwater sampling results.

**Screening and Sampling.** Soil cuttings were collected continuously from each boring location for description by Hart Crowser field staff. The soil was also field screened for sheen and volatile vapors using a photoionization detector; both are indications of possible solvent contamination. Groundwater samples were collected from all of the eight completed locations. Soil samples were collected from five of the eight locations. Exploratory boring locations and associated analysis results are shown on Figure 5. Analytical results from the exploratory phase of work can also be found in Tables 1 and 2. Data from this phase of the investigation was compiled and used to determine the best location and construction of the new monitoring wells in the vicinity of the Frank Wear site.

Boring B-4, located cross-gradient and to the west of the site, was completed to a depth of 30 feet bgs. Soil was loose and dry, and consisted of mostly gravel and cobble with varying degrees of silty and sandy lenses. Groundwater was encountered at 22 feet bgs. A groundwater sample was collected to determine the extent of the plume to the west of the site where no previous data had been collected. No signs of contamination were observed by field screening methods during the drilling of this boring.

Borings B-5 and B-13 are located the furthest downgradient from the site. These locations were completed to a depth of 30 feet bgs. Soil was loose and dry, and consisted of mostly gravel and cobble with varying degrees of silty and sandy lenses. Groundwater samples were collected from these locations to determine the extent of downgradient contamination. Groundwater was encountered at about 26 and 23 feet bgs in B-5 and B-13, respectively. Soil in both locations became more dense and gray once the water table was reached. No signs of contamination were observed by field screening methods at either location during drilling.

Boring locations B-6, B-12, B-15, and B-16 are located downgradient of the site along West Walnut Street within the City of Yakima's right of way (Figure 2). These locations were chosen to determine the horizontal extent of the downgradient portion of the contaminant plume. Soil and groundwater samples were collected from each location and analyzed for chlorinated solvents. Soil encountered was generally loose and dry, and consisted of mostly gravel and cobble with varying degrees of silty and sandy lenses. Groundwater was encountered between 25 and 26 feet bgs at each location. No signs of contamination were observed by field screening methods at these locations during drilling.

Approximately 150 feet downgradient from the site within the known extent of the contaminant plume, boring B-9 was completed to a depth of 35 feet. This location was selected to provide information on the vertical extent of contamination in the soil. Three soil samples were collected and analyzed from varying depths during drilling activities. Groundwater was also collected and analyzed from the boring location. Soil encountered at this location was generally loose and dry, and consisted of mostly gravel and cobble with varying degrees of silty and sandy lenses. Groundwater was encountered at 28 feet bgs at this location. No signs of contamination were observed by field screening methods during the drilling of this boring.

**Decontamination Procedures.** Cascade Drilling used a specialized, self-contained decontamination trailer with a pressure washer and steam cleaner to clean the drilling equipment, such as drill rods and casing, prior to beginning each new boring. The investigation-derived waste (IDW) was contained and transferred to drums stored on the site.

Groundwater samples were collected from the borings using a stainless steel screen sampler attached to the drill rod and dedicated tubing. Hart Crowser field staff decontaminated the screen before the collection of each well sample. Cleaning procedures consisted of washing the well screen in a detergent

(Alconox®) solution, rinsing with tap water, and rinsing a second time with deionized water.

**Completion and Abandonment.** After sampling activities were completed, each boring was located by hand-measuring to fixed site features and was abandoned by filling the boring with granular bentonite and hydrating the bentonite with water.

### **3.4 Monitoring Well Installations**

Additional monitoring well installations were required to determine the extent of the contaminant plume originating from the Frank Wear property. Information gathered during the exploratory boring phase was used to determine the ten locations for monitoring well installations. Seven new shallow monitoring wells, completed to 35 feet bgs, and three new deep monitoring wells, completed to 90 feet bgs, were installed from May 29 through June 13, 2012, by Cascade Drilling using sonic drilling methods. Figure 2 shows the locations of the new monitoring wells.

**Locations.** The shallow well locations were selected for purposes of delineating the extent of the contamination in the shallow alluvial groundwater. Monitoring wells MW-20, MW-21, MW-22, MW-23, MW-24, and MW-25 were installed downgradient from the site (Figure 2). MW-16 was installed as an upgradient well. The current upgradient well, MW-5, has had detections of PCE that make it difficult to determine if it is a true upgradient well.

In addition to delineating the contaminant plume, some of the shallow wells may be converted to extraction or injection points as part of the groundwater recirculation system planned for the site.

The deep well locations were selected to determine if site contaminants have migrated vertically into the surficial aquifer, and measure the vertical hydraulic gradient. The deep well locations included an upgradient well (MW-17), a site well (MW-18), and a downgradient well (MW-19) (Figure 2).

**Construction.** The upgradient shallow well (MW-16) was constructed of 2-inch inside-diameter polyvinyl chloride (PVC) with a 5-foot length of 0.01-inch slot well screen placed from the bottom of the boring. The downgradient shallow wells are 4-inch diameter PVC with 10-foot lengths of 0.02-inch slot well screen, with the exception of MW-20 on the Central Washington Comprehensive Mental Health (CWCMH) facility which has a 5-foot well screen. The deep wells are all 2-inch diameter PVC, with a 5-foot length of 0.01-inch slot well screen.

All of the new wells have a bentonite seal placed from about 2 feet above the screen to within about 2 feet bgs. A concrete surface seal secures a flush-mounted, traffic-rated monument. A watertight locking cap and lock secures the wellhead, and bolts secure the monument cover. All monuments are permanently marked with well identification numbers. Monitoring well construction details are provided in Table 3. The monitoring well construction logs are provided in Appendix B.

**Development and Surveying.** After installation, each well was developed by Cascade Drilling by purging at least six casing volumes. Well development was completed on June 14, 2012. Elevations at the top of each well casing and monument and the locations of each well casing were surveyed by Hart Crowser field representatives using standard surveying equipment.

### **3.5 Groundwater Monitoring**

Hart Crowser collected groundwater samples from the 14 existing site monitoring wells on April 9 and 10, 2012. Additional groundwater samples were collected from the new monitoring wells after installation and development on June 15, 2012.

Groundwater monitoring consisted of measuring water levels, purging and sampling groundwater, and recording groundwater field parameters.

**Groundwater Level Measurements.** Water levels in the monitoring wells were measured for the purpose of determining groundwater elevations and gradients. The wells were opened, and the water levels allowed to equilibrate before measurements were taken. The depth to groundwater was measured to the nearest 0.01 foot using an electronic probe.

**Purging.** After the groundwater levels were measured, each well was purged using a peristaltic pump and low-flow sampling techniques. Purging was considered complete when the water quality parameters (i.e., pH, temperature, and conductivity) stabilized within 10 percent for three consecutive measurements. In addition to the water quality parameters mentioned above, the oxidation-reduction potential (ORP) and dissolved oxygen (DO) were measured during the purging process. Field parameters are listed in Table 6.

**Sampling.** Groundwater samples were obtained from the well immediately after purging using a peristaltic pump. Water quality data collected during the April and June 2012 sampling events are included in Table 4.

**Sample Handling and Storage.** Clean sample containers were provided by the analytical laboratory and were ready for sample collection, including preservatives, if necessary. Sample containers for VOC analysis were fully filled, leaving no headspace. A label was affixed to each sample container and marked with identifying information. Sample containers were immediately placed in a cooled ice chest upon collection. Samples were stored in a cooled environment until transported to the analytical laboratory. A chain of custody was maintained and documented at all times.

**Decontamination Procedures.** All groundwater samples were collected using dedicated equipment, so decontamination of equipment was not needed. A peristaltic pump was used with new tubing that was replaced between each sampling event.

### **3.6 Handling of Investigation-Derived Waste**

IDW consisted of soil from drilling activities, purge water, decontamination water, and personal protective equipment (PPE). PPE was disposed as solid waste. All other IDW was segregated by media and stored temporarily at the site in properly labeled U.S. Department of Transportation-approved 55-gallon drums. Each container was labeled with the project name, general contents, and date. Thirty-five drums of soil IDW and 24 drums of water IDW were generated during this work. Eight additional drums are on-site from previous work conducted at the site. IDW is currently located on the site awaiting transport to an off-site facility for proper disposal.

### **3.7 Deviations from the Work Plan**

During our field activities, we adhered to the Work Plan as closely as practicable; however, some changes were made as necessitated by field conditions. These changes, or deviations, are as follows.

- The Geoprobe® rig originally scoped for the investigation was unable to advance to the required depths of 35 feet due to harder than expected subsurface material. Cascade Drilling remobilized to the site with a sonic drill rig to complete the borings. Because of the slower installation rates and higher costs associated with using the sonic drilling rig compared to the Geoprobe® rig, the number of planned boring locations was reduced from 26 to 17. As the sonic drilling progressed at a slower pace than anticipated due to the subsurface material, the number of boring locations was further reduced to eight in an effort to control project costs and avoid further delays in the overall project schedule.

- The groundwater level in MW-2 was not measured in June 2012 because it was not accessible.

## 4.0 INVESTIGATION RESULTS

This sections discusses the results of the data gap investigation including interpretations of groundwater elevations and flow directions (Section 4.1); presentation of the chemical analysis performed (Section 4.2); chemical results (Section 4.3); and the bioremediation parameter evaluation (4.4).

### 4.1 *Groundwater Elevations and Flow Directions*

**Shallow Groundwater Flow Direction.** Water levels were measured in the 14 existing monitoring wells in April 2012. The elevations are shown in Table 5 and elevation contours shown on Figure 3. Elevations measured for this sampling event suggest a horizontal flow direction toward the south/southeast. Water levels were also measured from the 13 of the 14 existing wells and 10 of the new monitoring wells in June 2012. These elevations are provided in Table 5 and elevation contours for the shallow zone shown on Figure 4. Access to monitoring well MW-2 was temporarily blocked by a soil pile generated from the on-site vapor extraction system installation work, so the water level in this well was not measured.

Elevations measured in the shallow wells in June suggest a horizontal flow direction toward the southeast. The April and June flow directions are consistent with historic data that show seasonal fluctuations as a result of the localized recharge created from the irrigation canals. The charging of the irrigation ditches was initiated in mid April. The April groundwater south/southeast flow direction is consistent with the period at the beginning of the irrigation season. The June groundwater southeast flow direction is consistent with the continuous charging of the irrigation ditches. The higher elevations in the existing monitoring wells in the June monitoring event compared to the April event also indicate that groundwater recharge from the irrigation ditches is occurring.

**Deep Groundwater Flow Direction.** Groundwater elevations were also measured in the three deep monitoring wells in June. Elevation data for the deep wells are provided in Table 5. These data suggest groundwater flow in the deeper zone is toward the southeast.

**Vertical Gradients.** Comparing the elevation data for shallow/deep well pairs MW-16/MW-17, MW-10/MW-18, and MW-20/MW-19 shows that groundwater elevations in the shallow wells are higher than the deeper wells. This suggests a

downward gradient from the shallow to the deep zone groundwater. Calculated downward vertical gradients in these three well pairs ranged from 0.069 to 0.091 foot/foot.

## **4.2 Chemical Analyses Performed**

We analyzed samples collected during the above investigation to further assess the nature, extent, and magnitude of chemical constituents in subsurface soils and groundwater. Samples were submitted to TestAmerica Laboratories, Inc. (TA) in Tacoma, Washington, and Beaverton, Oregon (under subcontract to Hart Crowser), for chemical analysis. Methane, ethane, and ethene in groundwater were analyzed by Microseeps, Inc., in Pittsburg, Pennsylvania. A data quality assurance review is provided in Appendix C. Copies of the laboratory reports are included Appendix D.

Based on previous environmental site activities, the primary contaminants at the site are chlorinated solvents originating from past dry cleaning activities. As such, samples were analyzed for VOCs. Select groundwater samples were analyzed for bioremediation parameters including nitrate, sulfate, chloride, methane, ethane, ethene, iron, and total organic carbon (TOC).

**Soil Analyses.** Soil samples were collected during the exploratory drilling and monitoring well installation activities. Seven soil samples were selected from the exploratory boring locations. A total of fifteen soil samples were collected during the installation of monitoring wells.

Three soil samples were collected from varying depths at exploratory boring location B-9. Samples were analyzed for VOCs and TOC. One sample was collected from each boring: B-6, B-12, B-15, and B-16 at depths within the groundwater table, ranging between approximately 30 to 35 feet bgs. Samples were analyzed for VOCs only, with the exception of B-12 which was additionally analyzed for TOC.

A total of 15 soil samples were submitted for analysis during the construction of monitoring wells MW-17, MW-18, and MW-19. Six samples were collected from MW-17, with five samples collected from MW-18, and four from MW-19. Soil samples were analyzed for VOCs only.

Selection was made based on field indications of contamination and/or where contamination might be anticipated (e.g., similar depth as other samples with contamination, or at the groundwater table). Soil samples were analyzed for VOCs by EPA Method 8260B and TOC by Method 415.1/5310C.

Also, during the drilling of MW-21, petroleum odors and high PID readings were noted at depths of approximately 20 to 25 feet bgs. A sample was collected from a depth of approximately 21 feet and analyzed for total petroleum hydrocarbons by Method NWTPH HCID and VOCs by Method 8260B.

**Groundwater Analyses.** Groundwater samples from the exploratory borings and monitoring wells were analyzed for VOCs by EPA Method 8260B. Select locations were analyzed for the bioremediation parameters nitrate, sulfate, chloride, methane, ethane, ethene, iron, and TOC in addition to VOCs. Nitrate, sulfate, and chloride were analyzed by Method 300.0, methane, ethane, ethene by Method AM20GAX, iron by Method 6010B, and TOC by Method 415.1/5310C.

### **4.3 Chemical Results**

Chemical results for soil and groundwater samples from the exploratory boring and monitoring well installations and groundwater samples from the monitoring wells are discussed below. Soil results are presented in Table 1. Groundwater results are presented in Tables 2 and 4. Locations of the soil and groundwater samples with corresponding VOC concentrations are shown on Figures 5 and 6.

#### **4.3.1 Exploratory Borings**

**Soil Results.** Exploratory boring location B-9 is located downgradient from the site within the area of known contamination. Three soil samples were collected from B-9 at depths of 16, 22, and 34.5 feet bgs, and at these depths the analytical results showed concentrations of PCE at 36 micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ), 28  $\mu\text{g}/\text{kg}$ , and 64  $\mu\text{g}/\text{kg}$ , respectively. No other contaminants of concern were detected. The three B-9 samples were analyzed for total organic carbon (TOC), although TOC was not detected in any of the samples.

PCE was detected in two downgradient boring locations, B-6 and B-15, at concentrations of 27  $\mu\text{g}/\text{kg}$  and 18  $\mu\text{g}/\text{kg}$ , respectively, at approximately 30 feet bgs. PCE was not detected in samples collected from downgradient locations, B-12 and B-16. No other contaminants of concern were detected. The B-12 boring sample was additionally analyzed for TOC. TOC was not detected in this sample.

**Groundwater Results.** Groundwater was collected from the eight exploratory boring locations. PCE was the only contaminant of concern detected in groundwater samples. PCE was not detected in B-4, cross-gradient from the site. The remaining seven samples resulted in detections of PCE. Concentrations ranged from 2.9  $\mu\text{g}/\text{L}$  in B-16 to 83  $\mu\text{g}/\text{L}$  in B-9.

Temporary boring locations with corresponding VOC concentrations in the soil and groundwater are shown on Figure 5. Analytical results from the boring locations are provided in Tables 1 and 2.

### 4.3.2 Monitoring Wells

**Soil Results.** Soil samples were collected during the construction of the three deep monitoring wells. PCE was the only site contaminant of concern detected in the soil samples.

Upgradient from the site, PCE was detected in soil removed during the construction of MW-17 at a concentration of 24 µg/kg at a depth of 16.5 feet. At 26 feet bgs, the PCE concentration increased to 260 µg/kg. Analysis at 44 feet bgs indicated PCE decreased to 16 µg/kg. Soil samples were also collected at depths of 49, 55.5, and 90.5 feet bgs from MW-17. PCE was not detected in the deeper soil samples.

MW-18 was constructed as a deep well on the Frank Wear property. Five soil samples from this location were collected from varying depths. PCE was detected in the sample collected from 40.5 feet bgs at a concentration of 370 µg/kg. PCE was not detected in samples collected from 51.5, 61, 71, and 91 feet bgs.

Monitoring well MW-19 is located downgradient from the site within the area of known contamination. Soil samples from MW-19 were collected from depths of 39.5, 58.5, 76, and 93 feet bgs. PCE was detected at 61 µg/kg in the sample collected from 39.5 feet bgs. PCE was not detected in any of the deeper samples.

The soil sample collected from MW-21 at 21 feet bgs, where possible petroleum contamination was encountered during the well installation, contained sec-butylbenzene at 870 µg/kg; 1,2,4-trimethylbenzene at 570 µg/kg; and gasoline range hydrocarbons at 160 mg/kg.

**Groundwater Results.** The network of 25 on- and off-site monitoring wells were sampled for VOCs with select locations receiving additional bioremediation parameter analysis. Nitrate, sulfate, chloride, methane, ethane, ethene, iron, and TOC concentrations are used to determine the viability of an *in situ* bioremediation plan for the site. These results are discussed in the bioremediation data assessment section below (Section 4.4.). Analytical results from the sampling events are provided in Table 4. The sample locations with corresponding VOC concentrations are shown on Figure 6.

Shallow monitoring wells MW-5, MW-16, and the deep well MW-17 are located upgradient from the Frank Wear property. Directly west and cross-gradient from the site are the monitoring wells MW-6 and MW-7. Concentrations of PCE in shallow wells MW-5, MW-6, MW-7, and MW-16 ranged from 4.9 µg/L to 36 µg/L. PCE was the only contaminant of concern detected at these locations in the shallow aquifer. There were no detections of contaminants of concern in MW-17.

MW-1 and SPW-14 are located on the southeast corner of the property, east of the former Frank Wear building. Samples from these monitoring wells were collected and analyzed for VOCs. All contaminants of concern were at non-detect levels for this sampling event.

Monitoring wells MW-10, SPW-12, SPW-13, SPW-15, and the deep well MW-18 are located within the footprint and along the northern boundary of the former Frank Wear building. PCE concentrations in this region ranged from 380 µg/L to 2,300 µg/L in the shallow aquifer at wells MW-10, SPW-12, SPW-13 and SPW-15. In addition to PCE, SPW-12, SPW-13, and MW-10 samples contained concentrations of trichloroethene (TCE) and *cis*-1,2-dichloroethene (*cis*-DCE). TCE ranged from 1.0 µg/L in MW-10 to 21 µg/L in SPW-12. *Cis*-DCE ranged from 8.5 µg/L in SPW-13 to 70 µg/L in SPW-12. PCE was detected at a concentration of 1.2 µg/L in the deep aquifer (MW-18) with all other contaminants of concern at non-detect levels. Bioremediation parameter samples were collected and analyzed from MW-10 and MW-18.

Monitoring wells MW-2 and MW-8 are located on the Frank Wear property to the west of the former Frank Wear building. PCE concentrations of 16 µg/L and 260 µg/L were detected in MW-2 and MW-8, respectively. No other contaminants of concern were detected at these locations. MW-2 was selected to have bioremediation parameters analyzed during this sampling event.

Ten monitoring wells are located downgradient from the Frank Wear site. MW-19 is the only well in the deep aquifer downgradient from the site. There were no detections of any contaminants of concern in MW-19. PCE was detected in the remaining nine wells. Detected concentrations ranged from 6.5 µg/L in MW-25 to 2,700 µg/L in MW-9. Monitoring well samples MW-3 and MW-9 had detections of *cis*-DCE at concentrations of 1.2 µg/L and 3.2 µg/L, respectively. TCE was detected in MW-3 and MW-4 at concentrations of 1.5 µg/L and 1.3 µg/L, respectively. All other contaminants of concern in these wells were at non-detect levels.

## **4.4 Bioremediation Data Assessment**

Several parameters were monitored to assess baseline conditions around the site that are most directly related to natural attenuation and enhanced bioremediation. This assessment includes field parameters and groundwater samples collected to monitor the status of aquifer conditions, including geochemistry, electron acceptors, and bioremediation products. These results include: field parameters; electron donors (such as TOC); competing electron acceptors (such as nitrate and sulfate); and indicators of reductive biological products (total iron and methane); reductive dechlorination end products (ethene and ethane); and overall cVOC ratios.

### **4.4.1 Groundwater Field Parameters**

Field parameters can be very useful in interpreting and confirming geochemistry changes and electron acceptor availability. The data assessment in the following paragraphs describes each field parameter and how they contribute to an assessment of site conditions as they relate to bioremediation.

**pH.** Dechlorinating microbes prefer a pH of 6 to 8 for optimal growth and activity. By stimulating reductive dechlorination through the addition of electron donors, hydrochloric acid and organic acids are produced, potentially shifting values toward a pH of 6. Under natural attenuation conditions, lower levels of carbon fermentation can result in the accumulation of bicarbonate, shifting values toward a pH of 7.5 to 8.0. Excessive bicarbonate accumulation can interfere with the dechlorination process, and excessive aquifer acidity can mobilize metals.

Shallow groundwater pH around the site was typically around 7.0, suggesting very balanced conditions. Closer to the shallow source area, pH was 7.5 or higher in wells MW-9, MW-16, and MW-25. These wells are in general alignment, extending from approximately 100 feet northwest of the site property to 150 feet southeast of the property. Elevated pH values were also noted in deeper monitoring wells MW-17, MW-18, and MW-19. As discussed below, all of these wells (except MW-9) also had negative oxidation-reduction potential (ORP) values, suggesting the finite accumulation of bicarbonate due to the presence of electron donors.

**ORP.** Groundwater ORP can indicate the availability or lack of electrons in collected samples. Complete reductive dechlorination can typically be observed when ORP values fall below zero millivolts (mV). These conditions are suitable for creation of dissolved hydrogen gas, the primary electron donor for microbes (e.g., *dehalococcoides* sp.) responsible for complete dechlorination. Reductive

dechlorination operates most efficiently at an ORP between -130 to -300 mV. Coupled reductive dechlorination and oxidation of *cis*-DCE and VC to chloroacetic acids (one natural attenuation mechanism of cVOCs) can occur at ORPs between 0 to +100 mV.

Shallow monitoring wells MW-16, MW-23, MW-25 and all deeper monitoring wells had negative ORP values, ranging from -29 mV in MW-25 to -248 mV in MW-17. The deeper aquifer wells were the most reductive. As discussed in detail below, MW-23, MW-18, and MW-19 also had the highest detection of dechlorination end products ethene and ethane in groundwater. MW-16 and MW-25 samples were not analyzed for ethene and ethane. MW-16 had the lowest ORP in the shallow aquifer (-112 mV), consistent with the detection of petroleum constituents, including VOC electron donors benzene and isopropylbenzene. Most shallow monitoring had ORPs between +120 mV and +190 mV during this DGI though, consistent with the persistence of PCE and TCE without significant accumulation of *cis*-DCE or VC.

**Dissolved Oxygen.** Dissolved oxygen (DO) is one of the strongest natural electron acceptors in groundwater. Its presence inhibits the anaerobic reductive dechlorination processes as it is a preferred electron acceptor to PCE. While DO can be relatively high in the aquifer, discrete pockets of organic carbon can create localized anoxic conditions suitable for PCE and TCE dechlorination and subsequent mobilization of *cis*-DCE and VC. DO is suitable for oxidation of mobilized *cis*-DCE and VC to chloroacetic acids, and eventually, carbon dioxide and chloride in groundwater. A DO measurement of less than 1 mg/L suggests anoxic conditions have broadly established within an aquifer unit.

Consistent with ORP values between +120 mV and +190 mV, relatively high concentrations of dissolved oxygen were detected in the shallow aquifer. Lowest DO concentrations in shallow groundwater during the DGI were recorded in MW-16 (0.7 mg/L) and SPW-12 (4.6 mg/L). Again, these wells fall along the MW-16/MW-25 axis noted above, and the MW-16 DO value is consistent with the lowest ORP measured at the site. Depressed DO concentrations in SPW-12 are consistent with discrete anoxic pockets and the highest concentration of TCE and *cis*-DCE dechlorination products detected during the DGI. The deeper aquifer wells all had DO concentrations of 1.5 mg/L or less, consistent with the low measured ORP values and high ethene+ethane to PCE ratio, as discussed in Section 4.4.2 below.

**Conductivity.** Conductivity is a measure of groundwater's ability to carry an electrical current. Greater conductivity suggests a greater concentration of ions and charged molecules in groundwater. Reductive processes (e.g., dechlorination) releases ions like chloride, iron, manganese, and organic acids

into groundwater, increasing field-measured conductivity values. Conductivity during the DGI was common for shallow groundwater in oxidative aquifers, generally ranging from 0.15 to 0.30 millisiemens per centimeter (mS/cm). Slightly elevated conductivity was noted in shallow wells MW-3, MW-4, and MW-25. However, as discussed in Section 4.4.2 below, values in MW-3 and MW-4 are probably related to relatively high concentrations of chloride ions in groundwater and not reductive activity. Slightly elevated conductivity in MW-25 may be related to reductive activity based on ORP and/or elevated chloride, which was not analyzed.

#### 4.4.2 Groundwater Chemical Analyses

Groundwater samples were collected for laboratory analyses to evaluate both contaminant distribution, natural attenuation, and to estimate what level of electron donor will be required to promote enhanced reductive dechlorination. The data assessment in the following paragraphs describes each key parameter analyzed and how they confirm proper conditions and activity for reductive dechlorination. For organizational purposes, chemical analysis results are generally discussed in the order of oxidation state, with the most oxidized compounds discussed first (except for cVOCs).

**Nitrate.** Nitrate is considered a competing electron acceptor and at concentrations of more than 1.0 mg/L can inhibit the reductive dechlorination process. Nitrate can be a preferred electron acceptor to dechlorination, and rapid reductions in nitrate concentrations are typically observed when enhanced reductive dechlorination begins. In general, groundwater samples collected from shallow wells support the conclusion of an aerobic aquifer and oxidized geochemistry. The highest concentrations of nitrate at the site were detected in shallow wells MW-3 and MW-23. These wells are located along the same groundwater flow path southwest of the site property. The elevated nitrate in MW-23 is not consistent with measured ORP, suggesting localized infiltration of nitrogen-rich water in the MW-23 vicinity and subsequent oxidation of aquifer geochemistry.

**Total Iron.** Oxidized, ferric iron is commonly found in aquifers containing concentrations of DO and nitrate above 1.0 mg/L. The localized presence or addition of electron donors stimulates reductive activity, which converts low-mobility ferric iron to mobile ferrous iron. Even during redox recovery beyond areas of electron donor, ferric iron can persist as a colloid or suspended during groundwater purging. So elevated total iron concentrations in groundwater can be confirmation of reductive activity. The highest concentrations of total iron (up to 2.9 mg/L in MW-19) were detected in the deeper aquifer unit, consistent with more reductive conditions and low DO and nitrate concentrations.

In the shallow aquifer, total iron concentrations were low, consistent with the generally oxidized nature of groundwater in this zone. MW-22 contained the highest concentration of total iron in the shallow aquifer, consistent with its location downgradient of MW-23 (the second highest total iron concentration at 0.26 mg/L) and MW-3. As discussed above, ORP values and nitrate concentrations suggest redox recovery in MW-3 (less than 0.04 mg/L total iron). ORP values and nitrate concentrations drop again by the time groundwater reaches MW-22, consistent with the observed increase in total iron.

**Sulfate.** Sulfate is a competing electron acceptor to the process of complete reductive dechlorination. A concentration in excess of 20 mg/L may inhibit the process of complete reductive dechlorination. Additionally, declines in the aquifer sulfate concentration during enhanced reductive dechlorination confirm that strong reducing conditions conducive to vinyl chloride (VC) dechlorination to ethene have been achieved. Sulfate concentrations at the site were all naturally below 20 mg/L during the DGI, ranging between 8.1 mg/L to 15 mg/L. This data indicates that sulfate will not be a significant inhibitor of complete dechlorination.

**Methane.** The presence of methane indicates a highly reduced environment containing elevated concentrations of dissolved hydrogen gas. An environment rich in hydrogen gas allows methanogenic bacteria to form methane from carbon dioxide to yield energy. This is the same environment preferred for rapid, complete reduction of cVOCs. These two processes competitively consume available hydrogen generated from organic carbon fermentation. Concentrations of methane greater than 0.50 mg/L suggest an environment suitable for the rapid conversion of cVOCs to ethene and ethane. Concentrations of methane less than 6.0 µg/L are considered the most efficient use of electron donor during enhanced reductive bioremediation.

Some microbes use dissolved oxygen to oxidize methane to carbon dioxide. The enzymes responsible for this process (e.g., methane monooxygenase) can also convert TCE, *cis*-DCE, *trans*-DCE, and VC to chloroacetic acids via co-metabolism. Co-metabolism will not reduce dissolved concentrations of PCE due to steric hindrance by the four chloride atoms. Co-metabolism, unlike reductive dechlorination, does not typically generate intermediates reported through the 8260 analysis, making direct co-metabolism assessment difficult without more advanced analysis.

Consistent with lower ORP values, DO, and nitrate, the deeper aquifer had the highest detections of methane, up to 0.012 mg/L in MW-18. As discussed below, MW-18 also had the highest concentrations of ethene and ethane in analyzed samples. The low levels of methane detected in analyzed shallow aquifer samples, along with the availability of DO, suggest that co-metabolic

natural attenuation is likely occurring. Overall, groundwater methane concentrations at the site support the conclusion of sporadic and discrete zones of strong reducing conditions.

**cVOCs.** This cVOC discussion only pertains to groundwater data in the context of bioremediation and natural attenuation. Particularly useful is the presence of dechlorination products *cis*-DCE and VC and the ratio of dechlorination products to PCE and TCE. Because of the generally oxidative nature of the aquifer in the site vicinity, TCE may also be considered as a significant dechlorination product under natural conditions. At sites undergoing enhanced reductive dechlorination, TCE is typically considered comparable to PCE due to very rapid rate of the first dechlorination step.

Dechlorination intermediate *cis*-DCE was only detected in shallow wells MW-3, MW-9, MW-10, SPW-12, and SPW-13. No *cis*-DCE was detected in deeper aquifer wells. Additionally, VC was not detected in any wells during the DGI. As discussed above, this pattern of cVOC detections supports the conclusion that reductive dechlorination is only occurring in discrete pockets of the aquifer and aerobic oxidation of *cis*-DCE and VC is likely occurring. Using the simplistic groundwater ratio of PCE to total cVOC, greatest dechlorination is evident in MW-3 (approximately 0.75) with relatively low rates of dechlorination in SPW-12 and SPW-13, at 0.96 and 0.97, respectively. As discussed in the TOC section below, these ratios are consistent with organic carbon-limited natural attenuation. During enhanced reductive bioremediation, ratios can rapidly drop to 0.001 or lower.

**Ethene and Ethane.** Ethene and ethane are the final degradation products of the reductive dechlorination process (PCE to TCE to *cis*-DCE or *trans*-DCE to VC to ethene to ethane). Detection of ethene and/or ethane molecules typically confirm that the process of complete cVOC dechlorination is occurring at the site. Additionally, higher ethane to ethene ratios typically indicate that little bio-available cVOC remain since ethene hydrogenation does yields little energy for the microbe as they consume electron donors. During enhanced reductive dechlorination, the molar (concentration of molecules) balance of cVOCs versus ethene+ethane commonly ranges around five percent due to various processes that convert these end products into other compounds.

As noted above, the highest concentrations of ethene and ethane were detected in deeper aquifer wells, consistent with geochemical and competing electron acceptor data. The highest concentrations were noted in MW-18, at 2.1 and 4.7 µg/L, respectively. On a molar concentration basis, the ethene+ethane concentration in MW-18 is over 30-times the concentration of PCE. This

suggests a strong natural attenuation front is present at depth, likely inhibiting movement of shallower cVOC into the deeper aquifer in the site vicinity.

In the shallow aquifer, both ethene and ethane were detected in almost every sample analyzed. The highest ethene+ethane concentration was detected in MW-23, consistent with lower ORP and higher conductivity values. While present at very low concentrations, the detected ethene+ethane molar concentration is still approximately 1.3 times the PCE molar concentration, indicating reductive natural attenuation is occurring in the well vicinity. Similar conditions may be present in MW-16 and MW-25.

**TOC.** Total organic carbon (TOC) is one measure of electron donor availability. Dissolved TOC in groundwater is one method for assessing appropriate electron donor loading during enhanced reductive dechlorination treatment. When the source of detected TOC is low-solubility donors (e.g., native humic compounds, oil/petroleum), then concentrations of 20 mg/L or more are typically recommended to stimulate robust, complete dechlorination. When TOC is due to added high-solubility donors (e.g., sugars, lactates), dissolved TOC above 200 mg/L is commonly recommended.

Based on the above data, it is evident that low-solubility TOC is fueling the observed dechlorination. Based on the concentration of TOC in both shallow and deeper aquifer units (all less than 10 percent of the recommended loading), the rate of cVOC degradation is electron donor limited. The addition of more electron donor would likely improve dechlorination rates.

**Chloride.** Chloride is a byproduct of cVOCs degradation through both reductive and oxidative processes. Concentrations of chloride in the shallow aquifer ranged as high as 160 mg/L (MW-4) and 7.9 mg/L (MW-18) in the deeper aquifer. Aggressive, enhanced reductive bioremediation of PCE is unlikely to result in chloride concentration changes of more than 100 mg/L unless PCE free-product is present. The elevated chloride is likely due to the periodic use of chloride-containing de-icer. As a result, we cannot derive any conclusion from the chloride data, and future chloride data is not likely to be useful.

## 5.0 COMPARISON OF CHEMICAL RESULTS TO APPLICABLE CLEANUP LEVELS

Detected constituents in soil and groundwater were screened against the applicable MTCA Method B Cleanup Levels (CUL). These cleanup levels were provided by Ecology for development of the feasibility study for the site and are summarized in Table 7.

## **5.1 Soil Results Comparison**

Table 1 provides a summary of the analytical results for soils analyzed during the exploratory boring work and new monitoring well installations. Screening of these data show that concentrations of PCE exceeded the CUL of 19.6 µg/kg in boring B-6 at a depth of 29.5 feet bgs, B-9 to 34.5 feet bgs, MW-17 to 26 feet bgs, MW-18 to 40.5 feet bgs, and MW-19 to 39.5 feet bgs. No other detected constituents in the soil samples analyzed exceeded the applicable CUL.

## **5.2 Groundwater Results Comparison**

**Push Probe Groundwater Detections.** Table 2 provides a summary of the analytical results for groundwater samples collected from the exploratory borings during April. These results were compared to the MTCA Method B groundwater CULs. Groundwater samples collected from borings B-5, B-9, B-12, B-13, and B-15 exceeded the CUL for PCE of 5.0 µg/L.

**Monitoring Well Detections.** Groundwater monitoring results from the April and June 2012 monitoring events are provided in Table 4. These results were compared to the MTCA Method B groundwater CULs. Groundwater samples collected from all of the shallow monitoring wells with the exception of MW-6 and SPW-14 exceeded the CUL for PCE of 5.0 µg/L. Concentrations of TCE in SPW-12 also exceeded the CUL of 3.98 µg/L. No other detected constituents in the shallow groundwater samples analyzed exceeded the applicable CULs.

None of the detected analytes in the deep monitoring well samples exceeded applicable MTCA Method B CULs.

## **6.0 CONCLUSIONS**

The data gap investigation was completed from April through June 2012 to obtain data and delineate the extent of contamination on and off the former Frank Wear site. The data were evaluated to further our understanding of the current conditions of the site. Our conclusions are summarized below.

- Field observations and sampling of soil during the soil exploratory borings and monitoring well installations suggest PCE migration to depths between 40 and 60 feet at and near the site. This migration is indicated by PCE detections to depths of 40 feet bgs on the site in MW-18, to depths of 60 feet to the south of the site at MW-19, and at depths of 30 feet at downgradient locations, B-6 and B-15.

- Results of the groundwater monitoring for shallow wells indicate the horizontal extent of the PCE contamination extends from the site to the downgradient wells MW-24 and MW-21. The highest detected PCE concentration in groundwater was at MW-9, located off-site to the south of the site near the Children's Daycare Center, indicating that the PCE mass may have shifted to the south from the previous high-concentration areas around MW-10. MW-4 also had high concentrations of PCE, possibly indicating mass migration.
- With the exception of the MW-6 and SPW-14 wells, groundwater samples from all of the site shallow monitoring wells exceeded the MTCA Method B CUL for PCE of 5.0 µg/L.
- PCE was detected in the on-site deep well MW-18, suggesting vertical migration at depth. However, PCE was not detected in the downgradient deep well MW-19, indicating off-site migration in the deeper zone does not appear to be occurring.
- The bioremediation data assessment indicates shallow groundwater is generally oxidative and the deeper zone more reductive, which can act as a barrier to downward migration.
- There is evidence of complete dechlorination occurring in the shallow groundwater with only simple electron donor availability as the limiting factor. This indicates that an enhanced *in situ* bioremediation remedy using reductive processes can be effective in achieving complete dechlorination.
- The proposed groundwater remedy using enhanced *in situ* bioremediation with a recirculation system to deliver amendment is still appropriate for the Frank Wear site. It appears the most effective operation of a recirculation system may be during periods of high water during the irrigation season to more effectively target the contaminants that are vertically distributed throughout the soil matrix and shallow aquifer.

- = Not analyzed for or not available.

Shading indicate the analyte exceeded an applicable MTCA Method B cleanup level.

^ = Continued calibration verification recovered above the upper control limit. Analyte non-detect status deemed appropriate.

EXPLORATION LOGS**

# Key to Exploration Logs

## Sample Description

Classification of soils in this report is based on visual field and laboratory observations which include density/consistency, moisture condition, grain size, and plasticity estimates and should not be construed to imply field nor laboratory testing unless presented herein. Visual-manual classification methods of ASTM D 2488 were used as an identification guide.

### Density/Consistency

Soil density/consistency in borings is related primarily to the Standard Penetration Resistance. Soil density/consistency in test pits and probes is estimated based on visual observation and is presented parenthetically on the logs.

SAND or GRAVEL Density	Standard Penetration Resistance (N) in Blows/Foot	SILT or CLAY Consistency	Standard Penetration Resistance (N) in Blows/Foot
Very loose	0 to 4	Very soft	0 to 2
Loose	4 to 10	Soft	2 to 4
Medium dense	10 to 30	Medium stiff	4 to 8
Dense	30 to 50	Stiff	8 to 15
Very dense	>50	Very stiff	15 to 30
		Hard	>30

### Moisture

Dry	Little perceptible moisture
Damp	Some perceptible moisture, likely below optimum
Moist	Likely near optimum moisture content
Wet	Much perceptible moisture, likely above optimum

### Sampling Test Symbols

<input checked="" type="checkbox"/> Split Spoon		Cuttings		Core Run
<input checked="" type="checkbox"/> Push Probe		Grab (Jar)

**APPENDIX C**  
**DATA QUALITY ASSURANCE REVIEW**

## **APPENDIX C**

### **QUALITY ASSURANCE REVIEW**

This appendix documents the results of a quality assurance (QA) review of the analytical data for samples collected for site investigation activities. TestAmerica Laboratories, Inc. (TA) of Tacoma, Washington, and Microseeps, Inc. of Pittsburgh, Pennsylvania, performed the soil and groundwater chemical analyses under subcontract to Hart Crowser. A copy of the analytical laboratory report is included in this appendix.

The QA review included examination and validation of the laboratories' summary reports, including:

- Analytical methods;
- Detection limits;
- Sample holding times;
- Custody records;
- Surrogates, spikes, and blanks;
- Initial and continuing calibration verification; and
- Field and laboratory duplicates.

The QA review did not include a review of raw data.

## **1.0 ANALYTICAL METHODS AND DETECTION LIMITS**

### ***1.1 Chemical Analyses on Soil***

Soil samples were analyzed for VOCs by Environmental Protection Agency (EPA) Method 8260B and TOC by Method 415.1/5310C.

### ***1.2 Chemical Analyses on Groundwater***

Groundwater samples from the temporary borings and monitoring wells were analyzed for VOCs by EPA Method 8260B. Bioremediation parameters were analyzed on select samples. Nitrate, sulfate, and chloride were analyzed by Method 300.0, methane, ethane, ethene by Method AM20GAX, Iron by Method 6010B, and TOC by Method 415.1/5310C.

### **1.3 Detection Limits**

Detection limits are set by the laboratory and are based on instrumentation abilities, sample matrix, and suggested detection limits by the EPA or the Department of Ecology (Ecology). Detection limits were generally consistent with industry standards and below promulgated regulatory standards.

## **2.0 DATA QUALITY ASSURANCE**

Data quality is indicated by assessing their completeness, representativeness, accuracy, precision, and comparability. An evaluation of the data follows.

### **2.1 Completeness**

Completeness is defined as the percentage of measurements made that are judged to be valid. The completeness goal is essentially that a sufficient amount of valid data be generated to meet the objectives of the investigation (i.e., assess soil and groundwater conditions and human health risk). Eight laboratory reports were received and are included in Appendix D. The data completeness for the samples is 100 percent for all requested analyses.

### **2.2 Representativeness**

Representativeness is a measure of how closely the results reflect the actual concentration of the parameters in the medium sampled. It is not possible to measure this directly, so representativeness is controlled and ensured by using standard protocols for sample handling and custody, analyzing samples within prescribed holding times, and analyzing blank samples.

**Sample Handling and Custody.** We collected samples in general accordance with industry standards. This included requirements for collection, containers, labeling, packaging, shipping, and storage. Compliance with these procedures is documented on chain of custody forms. Copies of chain of custody forms are included with the laboratory reports.

**Holding Times.** Collection dates for all samples submitted are documented on the chain of custody forms. Collection and analysis dates are indicated in the laboratory reports. Holding times required by EPA CLP protocols were met for all applicable soil analyses. Groundwater had the following samples analyzed outside the required holding times; B-4, MW-2, MW-3, MW-16, MW-17, MW-22, MW-23, and MW-23 Dup. Reasons for the exceedances included; insufficient preservative reducing the acceptable hold times, laboratory case load

preventing on-time analysis, and sample dilutions performed outside the acceptable hold times. Holding time requirements on all other groundwater samples were met.

## 2.3 Accuracy

**Surrogates.** In a surrogate analysis, a known amount of a compound similar to the constituent of interest is added to a sample and measured. The surrogate analysis assesses the accuracy of a chemical measurement by comparing the measured value to the actual spiked value. Up to four surrogates are added to each sample. Surrogate recoveries were within control limits, with the exception of MW-24. Trifluorotoluene was detected outside the upper control limit. The laboratory states, "Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed."

**Matrix Spike Samples.** Matrix spike analyses are performed on samples submitted to the laboratory that are of the same matrix as the actual sample. It is spiked with known levels of the constituents of interest. These analyses are used to assess the potential for matrix interference with recovery or detection of the constituents of interest and the accuracy of the determination. The spiked sample results are compared to the expected result (i.e., sample concentration plus spike amount) and are reported as percent recovery. All matrix spike analyses were within control limits, with the exception of the matrix spike sample associated with the MW-17 soil samples. The matrix spike acceptable control limits were exceeded by numerous analytes. The matrix spike results were compared to the associated laboratory control samples and shown to be biased high. Since sample results were not detected for the analytes in question, the data was deemed usable.

**Laboratory Control Samples.** The laboratory also analyzed a laboratory control sample (LCS) to assess the accuracy of the analytical equipment. The sample is prepared from the analyte-free matrix, which is then spiked with known levels of the constituents of interest (i.e., a standard). The concentrations are measured, and the results are compared to the known spiked levels. This comparison is expressed as percent recovery. The percent recoveries of LCS samples were within control limits, with the exception of the LCS associated with the MW-17 soil samples. 1,2-dichloropropane exceeded the upper control limit and is biased high. Since soil results from the batch did not detect 1,2-dichloropropane the data was deemed usable.

## **2.4 Precision**

**Field Duplicates.** For field duplicates, a second sample is collected in the field in conjunction with the original and both are submitted for analysis. The duplicate is then prepared along with the original. It is analyzed and compared to the first sample to assess the precision of the analytical method and the potential variability of the sample matrix. Three duplicate groundwater samples were collected by filling an additional set of sample containers. Original and duplicate samples were analyzed for VOCs.

Field duplicate results are compared to the initial results to assess variability in the sample matrix and bias due to sampling procedures. This comparison is normally expressed by the relative percent difference (RPD) between the original and duplicate samples. RPDs up to 50 percent are considered to be acceptable. RPDs for tetrachloroethene (PCE) detected in both the original and duplicate samples were 2 percent for the three sets of samples. These results indicate that the field duplicate data are acceptable.

**Laboratory Duplicates.** A laboratory duplicate is a second laboratory sample taken from a submitted sample. The duplicate is then prepared along with the original. It is analyzed and compared to the first to assess the precision of the analytical method and the potential variability of the sample matrix. This comparison is reported as the RPD. For the laboratory duplicates, RPDs were acceptable.

**Matrix Spike Duplicates.** A second matrix spike sample (a.k.a., the matrix spike duplicate) is prepared as above and analyzed. This is compared to the initial matrix spike to assess the precision of the analytical method (i.e., RPD). For this method, both a percent recovery and an RPD are reported. Matrix spike duplicates were performed only for VOC analyses. Percent recoveries and RPDs were within control limits, with the exception of the matrix spike duplicate sample associated with the MW-17 soil samples. The matrix spike duplicate acceptable control limits were exceeded by numerous analytes. The matrix spike duplicate results were compared to the associated laboratory control samples and shown to be biased high. Since sample results were not detected for the analytes in question, the data was deemed usable.

**LCS Duplicates.** A duplicate is a second analysis of an LCS. The duplicate is then prepared along with the original. It is analyzed and compared to the first to assess the precision of the analytical method and the potential variability of the sample matrix. For this method, both a percent recovery and an RPD are reported. QC results were within control limits, with the exception of the LCS duplicate associated with the MW-17 soil samples. 1,2-dichloropropane

exceeded the upper control limit and is biased high. Since soil results from the batch did not detect 1,2-dichloropropane the data was deemed usable.

## ***2.5 Comparability***

All samples were analyzed in accordance with accepted methods of the EPA or Ecology. Because similar or the same methods were used, the quality of the data collected are consistent for all data sets and are, therefore, comparable.

## Case Narrative

Client: Hart Crowser, Inc.  
Project/Site: Yakima/Frank Ware

TestAmerica Job ID: 580-32318-1

### Job ID: 580-32318-1

Laboratory: TestAmerica Seattle

#### Narrative

##### Receipt

The samples were received on 4/11/2012 9:50 AM; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 4.70 C.

##### GC/MS VOA - Method 8260B

Samples MW-5 (580-32318-6), MW-6 (580-32318-7) and SPW-14 (580-32318-14) were reanalyzed in analytical batch 580-109817 for the target compound Tetrachloroethene due to the potential for carry over contamination of said compound in the original analyses.

No other analytical or quality issues were noted.

##### Metals

No analytical or quality issues were noted.

##### General Chemistry - Method 300.0

The following samples required a dilution which was performed outside of the analytical holding time: MW - 2 (580-32318-2), MW - 3 (580-32318-3).

No other analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Yakima/Frank Ware

TestAmerica Job ID: 580-32318-1

### Qualifiers

#### General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
干	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Login Sample Receipt Checklist

Client: Hart Crowser, Inc.

Job Number: 580-32318-1

**Login Number:** 32318

**List Source:** TestAmerica Seattle

**List Number:** 1

**Creator:** Blankinship, Tom

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## Case Narrative

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear

TestAmerica Job ID: 580-32383-1

### Job ID: 580-32383-1

Laboratory: TestAmerica Seattle

#### Narrative

#### Job Narrative 580-32383-1

#### Receipt

The samples were received on 4/17/2012 10:30 AM; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 3.10 C.

Except: The following samples were received with headspace in the sample vial greater than 1/4": B-4 and B-13. The methanol vial for sample B-6/5-1 contains less than 10 grams of soil. The VOA vials received for the following samples contain a large amount of sediment: B-4, B-5, B-6 and B-13.

#### GC/MS VOA - Method(s) 8260B:

The following sample(s) submitted for volatiles analysis was received with insufficient preservation (pH >2): B-4 (580-32383-1). The following sample was analyzed outside of analytical holding time due to being analyzed outside of the seven day hold time for unpreserved samples: B-4 (580-32383-1).

The following sample was received with headspace in the sample vial: B-4 (580-32383-1). The approximate size of the headspace bubble was 10 mm and has been recorded in the batch record.

No other analytical or quality issues were noted.

#### General Chemistry

No analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear

TestAmerica Job ID: 580-32383-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

✓	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

**Login Number:** 32383

**List Source:** TestAmerica Seattle

**List Number:** 1

**Creator:** Riley, Nicole

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	See NCM.
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	False	See NCM. Headspace larger than 1/4" in one or more vials.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

### Job ID: 580-32427-1

Laboratory: TestAmerica Seattle

#### Narrative

##### Receipt

The samples were received on 4/19/2012 10:20 AM; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 0.30 C.

The following samples were submitted for analysis; however, they were not listed on the Chain-of-Custody (COC): B-16 Dup (580-32427-11), R. Blank 2 (580-32427-12) Three voa vials were received labeled B-16 Dup with a date and time of 4/17/12 09:55 that were not indicated on the COC. Also three voa vials labeled R. Blank 2 (4/18/12 09:35) were received but not mentioned on the COC. Both samples were written in on the COC of custody according to their labels and logged in.

The majority of the VOA vials from the following aqueous samples had large amounts of sediment in them: B-9 (580-32427-7), B-12 (580-32427-8), B-15 (580-32427-9), B-16 (580-32427-10), B-16 Dup (580-32427-11).

The following samples were received with headspace in the sample vial: all three vials of sample B-9 (580-32427-7) and two out of three of the vials containing sample B-12 (580-32427-8).

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): B-12/S-1 (580-32427-4). The container label lists the sample as B-12. The COC lists the soil sample as B-12/S-1. The time and date on the label for this sample as well as the matrix match the COC so the sample was logged in and labeled according to the COC.

The container label for sample B-9/S-2 did not match the information listed on the Chain-of-Custody (COC): B-9/S-2 (580-32427-2). All three container labels for this sample list a time of 12:50. The COC lists a time of 12:53. Sample times were logged in according to the information provided on the COC.

The container labels for sample B-16/S-1 do not match the information listed on the Chain-of-Custody (COC): B-16/S-1 (580-32427-6). The container labels list a time of 9:40. The COC lists a time of 9:20. Samples were logged in according to the information provided on the COC.

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): B-12/S-1 (580-32427-4). The container label for the MeOH VOA vial does not list a time. The COC lists a time of 16:40 for this sample. The vial was labeled according to the information provided on the COC.

##### GC/MS VOA - Method 8260B

The following sample was received with headspace in the sample vial: B-9 (580-32427-7). The approximate size of the headspace bubble was 14mm and has been recorded in the batch record.

The following sample submitted for volatiles analysis was received with insufficient preservation (pH >2): B-9 (580-32427-7).

Per SW846 Chapter 4, section 4.1.2, samples that contain analytes that are subject to biological degradation prior to analysis need to be preserved. Samples where aromatic hydrocarbons are target analytes, which are most subject to biological degradation, need to be preserved, unless they are to be analyzed immediately on-site, even if other VOA compound classes are present. Sample B-9 (580-32427-7) was received with insufficient preservation and all aromatic compounds have been flagged "H" due to the requirement outlined above.

No other analytical or quality issues were noted.

##### Metals

No analytical or quality issues were noted.

##### General Chemistry

No analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Frank Ware

TestAmerica Job ID: 580-32427-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

✓	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Login Sample Receipt Checklist

Client: Hart Crowser, Inc.

Job Number: 580-32427-1

**Login Number:** 32427

**List Source:** TestAmerica Seattle

**List Number:** 1

**Creator:** Riley, Nicole

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	False	See NCM. Received extra samples not listed on COC.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	False	See NCM. Headspace larger than 1/4".
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Ecology Frank Wear

TestAmerica Job ID: 250-3800-1  
SDG: 17800-23

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

✓	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Login Sample Receipt Checklist

Client: Hart Crowser, Inc.

Job Number: 250-3800-1

SDG Number: 17800-23

**Login Number: 3800**

**List Source: TestAmerica Portland**

**List Number: 1**

**Creator: Svabik-Seror, Philip**

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

## Case Narrative

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear

TestAmerica Job ID: 580-33374-1

**Job ID: 580-33374-1**

**Laboratory: TestAmerica Seattle**

### Narrative

#### Receipt

The samples were received on 6/8/2012 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.3° C.

#### GC/MS VOA - Method 8260B

The method blank for batch 113214 contained Methylene Chloride above the reporting limit (RL). This analyte is a known common laboratory contaminant and was detected at a concentration less than five times the RL; therefore, re-extraction and/or re-analysis of samples was not performed. The associated data have been flagged as appropriate and reported.

No other analytical or quality issues were noted.

#### General Chemistry

No analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear

TestAmerica Job ID: 580-33374-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

✓	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Login Sample Receipt Checklist

Client: Hart Crowser, Inc.

Job Number: 580-33374-1

**Login Number:** 33374

**List Source:** TestAmerica Seattle

**List Number:** 1

**Creator:** Riley, Nicole

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	Preservation labels on samples match COC
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

## Case Narrative

Client: Hart Crowser, Inc.  
Project/Site: Yakima/Frank Ware

TestAmerica Job ID: 580-33318-1

### Job ID: 580-33318-1

Laboratory: TestAmerica Seattle

#### Narrative

##### Receipt

The samples were received on 6/7/2012 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.7° C.

##### GC/MS VOA - Method(s) 8260B:

The continuing calibration verification (CCV) for 1,1-Dichloroethene and Chloroform associated with batch 580-113072 recovered above the upper control limit. As these compounds were also CCC's, all target compounds were evaluated to +/-20%D calibration criteria. Several other target compounds recovered above +20%D. As all samples associated with this CCV were non-detects for the affected analytes, the affected compounds have been flagged as appropriate "^" and the data reported.

The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch 580-113072 exceeded control limits for the following analyte: 1,2-Dichloropropane. This analyte was biased high in the LCS and LCSD and was not detected in the associated samples; therefore, the data have been reported.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 580-113072 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria as discussed in ncm#53357.

No other analytical or quality issues were noted.

#### General Chemistry

No analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Yakima/Frank Ware

TestAmerica Job ID: 580-33318-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
*	LCS or LCSD exceeds the control limits
F	MS or MSD exceeds the control limits

#### General Chemistry

Qualifier	Qualifier Description
F	Duplicate RPD exceeds the control limit

### Glossary

#### Abbreviation

**These commonly used abbreviations may or may not be present in this report.**

☒	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

# Client Sample Results

## Login Sample Receipt Checklist

Client: Hart Crowser, Inc.

Job Number: 580-33318-1

**Login Number:** 33318

**List Source:** TestAmerica Seattle

**List Number:** 1

**Creator:** Blankinship, Tom

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## Case Narrative

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear/Yakima, WA

TestAmerica Job ID: 580-33472-1

### Job ID: 580-33472-1

#### Laboratory: TestAmerica Seattle

##### Narrative

##### Receipt

The samples were received on 6/15/2012 1:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 5.9° C and 6.0° C.

##### GC/MS VOA - Method 8260

Every attempt was made to analyze the samples within holding time, however due to capacity issues at the time of sample receipt the following samples were analyzed two days outside of analytical holding time: MW-16 (580-33472-1) and MW-17 (580-33472-2).

The following sample(s) required a dilution for Tetrachloroethene which was performed outside of the analytical holding time: MW-22 (580-33472-7), MW-23 (580-33472-8) and MW-23 DUP (580-33472-9).

Trifluorotoluene surrogate recovery for the following sample(s) was outside the upper control limits: MW-24 (580-33472-10). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

##### Metals

No analytical or quality issues were noted.

##### General Chemistry - Method 300.0

The following samples required a dilution which was performed outside of the analytical holding time: MW-22 (580-33472-7), MW-23 (580-33472-8).

No other analytical or quality issues were noted.

## Definitions/Glossary

Client: Hart Crowser, Inc.  
Project/Site: Frank Wear/Yakima, WA

TestAmerica Job ID: 580-33472-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
X	Surrogate is outside control limits

#### General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

✓	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

**List Number:** 1

**Creator:** Riley, Nicole

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

**RE: FRANK WEAR / 17800-23/ TASK 3**

*Microseeps Workorder: 5608*

Dear Jill Kiernan:

Enclosed are the analytical results for sample(s) received by the laboratory on Tuesday, June 19, 2012. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

A handwritten signature in black ink that reads "Julianne C. Sproull". To the right of the signature is a small circle containing the number "13" and the date "6/28/12".

Julianne Sproull 06/28/2012
