<b>2.F.2 Release circumstances.</b> Describe the release circumstances. If you need to add more information, go to <u>2.F.2</u> in the additional information pages at the end of this form.
In the 1980's and early 1990's Sumner National Auto Parts rebuilt approximately 100 automobile engines per month in the machine shop. Part of the process included caustic spray cleaning the engines and parts prior to assembly. A caustic solution tank, which was stored adjacent to the interior east wall of the machine shop, overflowed in 1987 causing a spill of the solution to occur outside to the east of the exterior door of the building. The spill flowed onto a former concrete slab and soil-based surface adjacent to the slab during a heavy rainstorm. A shallow ditch was dug around the perimeter of the concrete slab to transport rainwater runoff east of the slab.
During this time period automobile engines and parts were routinely spray cleaned outside on top of a 16-foot long by 18.5-foot wide concrete slab that was formerly located adjacent to the east of an exterior door. A portion of the slab was covered with a metal roofed lean to. Rinsate from the spray cleaning process flowed onto the soil-based surface to the north, east, and south of the slab. Drums of oily liquids were also stored outside on the concrete slab.
A complaint was reported to ECOLOGY in November 1990 that 10 to 15 gallons of cleaning solvents, waste oils, metal sludge, caustic solutions, and antifreeze were dumped on the ground surface in the vicinity of the concrete slab east of the building.
