MEMORANDUM

TO: Tamara Cardona and Ron Timm, Washington Department of Ecology

FROM: Bill Haldeman/Brian O'Neal

CC: John Moshy, BMR-Dexter LLC

DATE: April 22, 2019

SUBJECT: Groundwater Data Summary, First Quarter 2019
American Linen Supply Co–Dexter Avenue Site
700 Dexter Avenue North, Seattle, Washington

PROJECT NO.: 1413.001.02

PES Environmental, Inc. ("PES") has prepared this technical memorandum on behalf of BMR-Dexter LLC ("BMRD") for the American Linen Supply Co–Dexter Avenue Site (the "Site") located at 700 Dexter Avenue North, Seattle, Washington. This memorandum documents the first quarter 2019 sampling of interim action performance monitoring wells at the 700 Dexter Avenue North property (the "Property"), including wells both on and outside of the Property. Consistent with the Final Interim Action Work Plan[1], PES conducted the following monitoring events during the quarter to document the chlorinated volatile organic compound ("CVOC") concentrations in groundwater and soil vapor during implementation of the interim action:

- The first quarterly monitoring event of 57 wells and three vapor probes after completion of the third and final *in situ* chemical oxidation ("ISCO") injection event in January 2019; and
- The monitoring of 20 wells, mainly on the Property, following the completion of the emulsified vegetable oil ("EVO") injection event in early March 2019.

This technical memorandum summarizes the procedures and results of the two monitoring events.

Groundwater Monitoring Procedures

PES collected groundwater samples from 57 monitoring wells between January 21 and February 5, 2019, including 8 Shallow Zone wells, 16 Intermediate A Zone wells, 17

[1] PES Environmental, Inc. 2018. *Final Interim Action Work Plan, American Linen Supply Co-Dexter Avenue Site, 700 Dexter Avenue North, Seattle, Washington.* Prepared for BMR-Dexter LLC. August.

Intermediate B Zone wells, and 16 Deep Zone wells.[2] Between March 11 and March 13, PES collected groundwater samples from 20 monitoring wells, including 3 Intermediate A Zone wells, 9 Intermediate B Zone wells, and 8 Deep Zone wells. One round of groundwater levels was measured in all available monitoring wells at the Site on March 14, 2019. Figures 1 and 2 show the well locations.

PES used an electronic water level probe to measure depth to groundwater in the wells, and either a peristaltic or bladder pump to purge and sample the wells. Wells were purged at pumping rates of 180 mL/min or less. One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from MW110, MW-142, and MW-163 in the first event, and from MW-136 in the second event. Two equipment rinsate blanks and seven trip blanks were collected in the first sampling event, and one equipment rinsate blank and two trip blanks were collected in the second sampling event. All samples were shipped to either Pace Analytical in Mount Juliet, Tennessee, or transported to Fremont Analytical in Seattle, Washington, for analysis of VOCs by Environmental Protection Agency ("EPA") Method 8260C. Groundwater samples from most wells near the Property were also analyzed for gasoline-range organics ("GRO") by Washington State Department of Ecology ("Ecology") Method NWTPH-Gx, and groundwater samples from a subset of wells across the Site were also analyzed for geochemical parameters as described in the Final Interim Action Work Plan. Groundwater sampling, sample analysis, and health and safety procedures were performed consistent with the Sampling and Analysis Plan, Quality Assurance/Quality Control Plan, and Health and Safety Plan provided in the Final Interim Action Work Plan.

Vapor Probe Sampling Procedures

PES collected soil vapor samples on February 6, 2019, from three soil vapor probes (SV01, SV02, and SV03) located on the east side of 8th Avenue North across from the Property (Figure 1). The soil vapor samples were collected in the vadose zone just above the groundwater capillary fringe, at depths ranging from 11.75 to 12.75 feet bgs, and analyzed for VOCs, including tetrachloroethene ("PCE"), trichloroethene ("TCE"), cis-1,2-dichloroethene ("cDCE"), trans-1,2-dichloroethene ("tDCE"), and vinyl chloride ("VC"). Soil vapor sampling, sample analysis, and health and safety procedures were performed consistent with the Sampling and Analysis Plan, Quality Assurance/Quality Control Plan, and Health and Safety Plan provided in the Final Interim Action Work Plan.

Results

Groundwater Elevations and Flow Directions. Table 1 provides the March 14, 2019, depth to groundwater measurements and calculated groundwater elevations. Depth to groundwater varied from 3.2 feet bgs in MW-149 to 39.8 feet bgs in MW-138, and groundwater elevations (relative to NAVD 88) ranged from 16.9 feet in MW-145 to 38.9 feet in R-MW5.

Figure 3 presents groundwater contours for the Shallow, Intermediate A, Intermediate B, and Deep Zones using data measured on March 14, 2019, over a year after shutdown of the 630 Westlake Avenue North groundwater extraction system. The groundwater flow direction in

[2] One additional well (MW112) that was scheduled to be sampled during the January/February event was sampled on December 21, 2018, due to January 2019 City of Seattle street use limitations in the Dexter Avenue North right of way. During this event, PES sampled 17 wells at the Property and 40 wells outside of the Property.

the Shallow and Intermediate A Zones was to the east-northeast, similar to March 2017 (a time of no known construction-related groundwater withdrawals in the area). Discounting the highly variable groundwater contours on the Property due to interim action activities (i.e., injection of ISCO reagents and EVO), the general groundwater flow direction in the Intermediate B Zone was also to the east-northeast. Similar to the March 2017 groundwater level events, the groundwater flow direction in the Deep Zone was westward to the west of 9th Avenue North, and eastward to the east of 9th Avenue North. Deep Zone pressure transducer data collected between March 2018 and March 2019 confirm the westward component of groundwater flow throughout a year with no known construction-related groundwater withdrawals in the area. In locations with co-located wells in different zones, the vertical gradient was generally downward (e.g., at the MW-142/MW-143 well pair). Comparing the March 2017 and March 2019 groundwater elevation contours for the Shallow, Intermediate A, and Deep Zones suggests that the interim action activities have not significantly affected groundwater flow in these zones. Groundwater elevation contours for the Intermediate B Zone were not prepared for March 2017, so a direct comparison between the March 2017 and March 2019 Intermediate B Zone events cannot be made.

Groundwater Analytical Results. Tables 2 through 4 provide the groundwater results for the first quarter of 2019, including the field parameter measurements, the analytical results for the detected VOCs and GRO, and the analytical results for the geochemical parameters, respectively. All sample results were reported to the method detection limit ("MDL") to provide VC detection limits below the VC screening level. PES has reviewed the January/February and March analytical reports to evaluate the laboratory's performance in meeting EPA's quality control criteria, and has added data qualifiers as necessary.

Only 8 of the 32 VOCs detected in groundwater were reported at concentrations above their respective screening levels (shown at the top of Table 3). The VOCs detected above their screening levels included benzene, 1,1-dichloroethene, cDCE, tDCE, 1,2-dichloropropane, PCE, TCE, and VC. Figures 4 through 7 depict the January/February 2019 PCE, TCE, cDCE, and VC results in the Shallow, Intermediate A, Intermediate B, and Deep Zones, respectively. The figures display both the data and the estimated areas of the Site where these constituents exceeded their respective screening levels.

GRO was also detected in groundwater samples at concentrations exceeding the screening level (Table 3); these were qualified, however, as a result of the data quality review. The laboratory indicated that the chromatograms for the GRO concentrations above the screening levels from five wells on the Property (MW-149, MW130, MW-135, MW-150, and MW-152) and three wells outside of the Property (MW113, MW-156, and MW-157) did not resemble the fuel standard, and that the results were likely due to the presence of CVOCs in the samples. None of the unqualified GRO results exceeded the GRO screening level.

Soil Vapor Analytical Results. Table 5 provides the analytical results for PCE, TCE, cDCE, tDCE, and VC, none of which were detected above the laboratory reporting limit in February 2019. These results are consistent with the September 2018 results.

Discussion of Groundwater Monitoring Results

The following presents an overview of the of the January/February and March 2019 groundwater results for both the Property and areas outside the Property.

Shallow Zone CVOCs. The Shallow Zone on the Property will be excavated and removed during the interim action and Property redevelopment, with the Shallow Zone immediately surrounding the Property dewatered during the subsurface construction phase of redevelopment. Consistent with the Final Interim Action Work Plan, shallow wells on the Property were not sampled in 2019. The Shallow Zone CVOC results for Property wells on Figure 4 are from the most recent sampling event prior to 2019. Shallow Zone CVOCs prior to 2019 were above the screening levels in a number of wells on the Property, with the highest concentrations in the wells on the southern half of the Property (wells F5, G12, J5, K8, and N7). The 2019 CVOC results for wells outside of the Property were near or below the screening levels, with generally neutral or downward CVOC trends.

Intermediate A Zone CVOCs. Figure 5 provides the January/February 2019 results for the Intermediate A Zone monitoring wells, including three monitoring wells on the Property (MW131, MW-149, and MW-151). One of the three Intermediate A Zone monitoring wells on the Property (MW131) continued to display decreasing CVOC concentrations in 2019, with PCE and TCE currently below the MDLs. The other two Intermediate A Zone monitoring wells on the Property (MW-149 and MW-151) showed the effects of the interim action injections, with increases in CVOC concentrations during the ISCO injections (reflecting desorption due to the ISCO activity) and decreases in PCE and TCE concentrations after EVO injection. EVO that has been injected in the Intermediate A Zone will continue to promote biodegradation for years into the future, the upper portion of the Intermediate A Zone will be excavated and removed during Property redevelopment, and Intermediate A Zone groundwater immediately outside of the Property will be pumped out during construction dewatering.

The 2019 PCE and TCE concentrations in Intermediate A Zone wells outside of the Property continued generally neutral or downward CVOC trends, with the exception of MW108, which continued the upward PCE and TCE concentration trends that started in 2016, prior to the start of the interim action.

As shown in Figure 5, the highest detections of CVOCs in Intermediate A Zone groundwater sampled in 2019 were in Property wells MW-149 (located near the former loading dock) and MW-151 (located near and south of the former western boiler room), in two wells located on the streets adjacent to the Property (MW-146 and MW-156), and two wells located in the alley between 8th and 9th Avenues North (MW108 and MW110). Monitoring wells MW115 (except for VC), MW116, and MW119 on 9th Avenue North and GEI-1 in the northwest corner of the 630 Westlake Avenue North property provide the lateral extent of the Intermediate A Zone CVOCs above the screening levels.

Intermediate B Zone CVOCs. Figure 6 provides the January/February 2019 results for the Intermediate B Zone monitoring wells, including eight monitoring wells on the Property (MW130, MW-132, MW-134, MW-135, MW-136, MW-139, MW-150, and MW-152). Three of the eight Intermediate B Zone monitoring wells on the Property (MW-134, MW-136, and MW-139) continued to display decreasing CVOC concentrations in 2019, with most constituents

below the MDLs, and only VC in MW-134 above the screening level. The other five Intermediate B Zone monitoring wells on the Property (MW130, MW-132, MW-135, MW-150, and MW-152) showed the effects of the interim action injections, with either significant decreases in CVOCs throughout the injection process (MW-132) or increases in CVOC concentrations during the ISCO injections (reflecting desorption due to the ISCO activity) followed by decreases in PCE and/or TCE concentrations after further ISCO or EVO injections (MW-135, MW-150, and MW-152). MW130 continued to show somewhat steady concentrations, but the well was not sampled in March 2019, so final conclusions about the well's trends after nearby EVO injections cannot be drawn. As in the Intermediate A Zone, EVO that has been injected in the Intermediate B Zone will continue to promote biodegradation for years into the future. Given the very low hydraulic conductivity of the zone, the Intermediate B Zone will not likely be influenced by construction dewatering.

The highest detections of CVOCs in Intermediate B Zone groundwater sampled in 2019 were in Property wells MW-135 and MW-150 (located near the former loading dock) and MW130 and MW-152 (located near and north of the former western boiler room), with decreasing concentrations in wells located to the south (MW-147) and northeast (MW-157) of the Property, and even lower concentrations in wells located further to the east of the Property (MW111, MW-143, and MW-145). Monitoring wells MW112 (west side of Dexter Avenue North), MW126 (alley east of the 800 Aloha Street parcel parking lot), and MW-148 (southeast of the Property) provide the lateral extent of the Intermediate B CVOCs above the screening levels. The low CVOC concentrations in the reconnaissance groundwater samples collected from B-213 (Dexter Avenue North) during drilling also provide the lateral extent of the Intermediate B CVOC plume.

Deep Zone CVOCs. Figure 7 provides the January/February 2019 results for the Deep Zone monitoring wells, including six wells on the Property (MW-133, MW-137, MW-141, MW-162, MW-163, and MW-164). Deep Zone monitoring wells MW-133, MW-137, and MW-141 on the Property continued to display decreasing or continued low CVOC concentrations in 2019, with most constituents below the screening levels or even the MDLs.

The 2019 PCE and TCE concentrations in Deep Zone wells outside of the Property continued generally neutral or downward CVOC trends.

As shown in Figure 7, the highest detections of CVOCs in deep groundwater sampled in 2019 were in MW-162 through MW-164 (all three recently installed at the Property and yet to stabilize) and in MW113 (located east of the Property). The CVOC concentrations in the MW-162, MW-163, and MW-164 groundwater samples were one to two orders of magnitude less than those in the nearest Treatment Zone C or D samples. The CVOC concentrations in MW-162 and MW-164 decreased significantly after the EVO injection event; for example, the PCE concentration in MW-162 decreased from 2,800 µg/L prior to EVO injection to 613 µg/L after EVO injection, and the PCE concentration in MW-164 decreased from 871 µg/L prior to EVO injection to 444 µg/L after EVO injection. The MW-162, MW-163, and MW-164 soil and groundwater CVOC results indicate that the presence of CVOCs in the MW-162, MW-163, and MW-164 groundwater samples is likely due to dissolved phase transport of CVOCs from a source present in zones above. CVOC concentrations in deep monitoring wells surrounding the Property (MW102 and MW124 near the northern Property boundary; MW104, MW-160, and MW-161

near the eastern Property boundary; MW-138 near the western Property boundary; and MW-140 near the southern Property boundary) were far lower than in MW-162, MW-163, and MW-164 on the Property (and often near or below the screening levels). MW102, MW105, MW106, MW122, MW123, MW124, MW-138, MW-140 (last sampled in April 2018), FMW-3D (last sampled in June 2017), and FMW-131 (last sampled in June 2017) provide the lateral extent of the deep CVOC plume.

Petroleum Hydrocarbons. The only petroleum-related VOC detected above the screening level on the Property was one detection of benzene just above the screening level in MW-135. Benzene was detected just above the screening level in only two wells outside of the Property, once in MW108 and twice in MW113. The benzene results in these two wells appear to be isolated relative to the results in other wells upgradient of these locations, and the MW108 and MW113 benzene results may indicate a source other than the former USTs at the Property. Based on these results, residual petroleum hydrocarbons in groundwater on and near the Property appear to be minimal.

The Next Monitoring Event

The next quarterly interim action performance monitoring event is scheduled for late April 2019. During the event, groundwater levels will be measured in all monitoring wells, and groundwater samples will be collected in 44 wells, including 8 Shallow Zone wells, 13 Intermediate A Zone wells, 10 Intermediate B Zone wells, and 13 Deep Zone wells. All samples will be analyzed for VOCs, and most samples will also be analyzed for GRO and geochemical parameters. Three vapor probes on the east side of 8th Avenue North will also be sampled, and the samples will be analyzed for VOCs.

Notes:

1. All groundwater sampling perfomed after 2016 conducted by PES Environmental, Inc.
2. – = not available
3. Detected results shown in bold, detections above the screening level highlighted in gray
4. dup = field duplicate sample
5. U = not detected at or above the laboratory method detection limit (MDL); detections above the MDL but below the laboratory reported detection limit (RDL) are qualified with a "J"
6. J = the identification of the analyte is acceptable; the reported value is an estimate
7. J+ = The result is an estimated quanitity, but the result may be biased high.
8. B = the same analyte is found in the associated blank
9. z = No/low level gasoline/petroleum detection; result is likely elevated due to high detections of CVOCs
10. GRO = gasoline range organics
11. Chloroethane is also known as ethyl chloride
12. cDCE = cis-1,2-dichloroethene
13. tDCE = trans-1,2-dichloroethene
14. Isopropylbenzene is also known as cumene
15. MEK = methyl ethyl ketone (2-Butanone)
16. MIBK = methyl isobutyl ketone (4-Methyl-2-penatone)
17. CFC-113 = 1,1,2-trichlorotrifluoroethane
18. PCE = perchloroethylene (tetrachloroethene)
19. TCE = trichloroethene
20. 1,2,4-TMB = 1,2,4-trimethylbenzene
21. 1,3,5-TMB = 1,3,5-trimethylbenzene
22. VC = vinyl chloride

SV02	SV02-020619	02/06/19	2.72	U	2.14	U	1.59	U	1.59	U	1.02	U
SV03	SV03-020619	02/06/19	2.72	U	2.14	U	1.59	U	1.59	U	1.02	U

Notes:

1. Laboratory analyses conducted by Pace Analytical of Mount Juliet, TN
2. VOCs analyzed by U.S. Environmental Protection Agency Method Modified TO-15 Low Level Analysis.
3. PCE = perchloroethylene (tetrachloroethene)
4. TCE = trichloroethene
5. cDCE = cis-1,2-dichloroethene
6. tDCE = trans-1,2-dichloroethene
7. VC = vinyl chloride
8. MTCA = Washington State Model Toxics Control Act
9. Detected results shown in bold, detections exceeding MTCA Method B sub-slab screening levels highlighted in gray
10. U = not detected at a concentration exceeding laboratory reporting limit
11. – = screening level not established

Explanation

- MW126 — Intermediate B Zone Monitoring Well
- Sanitary Sewer Main
- Storm Drain Main
- Combined Main
- King County Main
- Approximate Extent of PCE above 2.4 µg/L
- Approximate Extent of TCE above 1 µg/L
- Approximate Extent of cDCE above 16 µg/L
- Approximate Extent of VC above 0.2 µg/L
- All extents queried where uncertain

Notes:
Wells sampled in January and February 2019, except wells marked with an asterisk (sampled in June 2017), wells marked with two asterisks (sampled in second quarter 2018), and wells marked with three asterisks (sampled in December 2018)
Well screen elevations shown in parentheses
PCE = tetrachloroethene TCE = trichloroethene
cDCE = cis-1,2-dichloroethene VC = vinyl chloride
Concentrations reported in micrograms per liter (µg/L)
Concentrations above the screening level are shown in **bold**
< = not detected at or above the method detection limit (MDL)
J = the identification of the analyte is acceptable; the reported value is an estimate
+ = the reported value may be biased high

ID (Screen Interval)	
PCE	TCE
cDCE	VC
