## 1.0 INTRODUCTION

PBS Engineering and Environmental Inc. (PBS) provided consulting services to Bellevue Gateway LLC (Client), in relation to remediation of contaminated soil removal from a former gasoline station located at 31 Bellevue Avenue, Bellevue, Washington (Site 1). This report details cleanup activity that took place on former King County parcels 1545600046 and 1545600041, these two parcels were combined in 2014 with five other parcels and are now part of King County parcel number 1545600005 (the Property).

This report is an appendix to the Cleanup Action (CA) report for the Venn at Main Development. Specific cleanup actions that pertain to Site 1 are presented here. Refer to the complete CA report for further information about this Site, including regional geology and water, Terrestrial Ecological Evaluation, neighboring properties, and other general characteristics of the Site.

Based on current characterization information, established cleanup levels, and points of compliance identified for Site 1, identified COCs are below Model Remedy cleanup levels. Site 1 qualifies for use of a Model Remedy established under WAC 173-340-360. Since risk(s) to human, terrestrial, and ecological receptors have been eliminated through cleanup action, we are requesting an opinion from Ecology for a No Further Action determination for Site 1 (ERTS # 667914).

## 2.0 SITE DESCRIPTION AND REGULATORY INFORMATION

Site 1 is part of the Venn at Main Development project (Property) located at 10360 Main Street, Bellevue, Washington (refer to Figure 1 - Site Vicinity Map, Figure 2 – Site Plan). The Gateway development includes the entire block with seven former parcels, bound by 1<sup>st</sup> Street NE, Main Street NE, Bellevue Avenue NE, and 103<sup>rd</sup> Avenue to the north, south, east, and west, respectively. Development plans required excavation ranging from 20 to 34 feet below ground surface (bgs), and included razing the existing buildings and construction of a new mixed-use building with sub-grade parking. The Site is centrally located in Bellevue with mainly commercial and residential uses.

Site 1 within the Property (“Texaco Parcel”) was developed by 1929 with a number of residential structures. A Texaco-branded service station with two retail gasoline pumps was constructed on the Site 1 in 1956, and equipped with one 1,000 gallon underground storage tank (UST), one 2,000 gallon UST, two 4,000 gallon USTs, and one 500 gallon UST.

The Texaco station (Site 1) was addressed as “31 104<sup>th</sup> Avenue Northeast” from at least 1959 until 1972. During that time period, the station was managed as “Wolfe Bros. Texaco”, “Ken and Bruce’s Texaco Service Gas Station”, “Bruce’s Texaco Service Gas Station”, and finally “Budget Texaco Station”. In 1972, the NE Parcel was converted into a “Budget Rent-A-Car” location. The site was listed as vacant in 1973 and 1974. From 1975 through 1985, the site was occupied by “Precision Tire & Wheel, Inc.” and “Automotive Tire Supply”. The site maintained a tire repair and supply store until 1989. In the early 1990’s, the building was converted into the “Orexii Greek Restaurant”, which continued to operate until being closed prior to the current development project that now incorporates the entire Property.

According to a 1989 subsurface investigation by others (Kennedy/Jenks/Chilton as cited by a 1989 Phase I report by AESI), three borings near the former USTs and a former hoist were advanced to depths of 13 to 16 feet, where petroleum hydrocarbons of unspecified types were detected. AESI's own 2006 subsurface investigation included six soil borings advanced to similar depths, and at similar locations. They reported that no concentrations of diesel, gasoline, or BTEX were detected. Two borings completed by PBS in 2011 were advanced to depths of approximately 20 feet near the former UST and product delivery lines and near the north property line. No petroleum products were detected in the samples that were collected by PBS.

### **3.0 INVESTIGATION SOIL SAMPLING, REMEDIAL EXCAVATION, AND RESULTS**

In September and October 2014, during excavation of the Site 1 for the Gateway development by Northwest Construction, soils were discovered with petroleum-like odors associated with the former gasoline station on four separate occasions: September 18, 23, 26, and on October 7, 2014. Each time PCS was encountered, PBS was called to the Site to assess the extent and degree of contamination associated with the discovery of petroleum contaminated soils (PCS), oversee excavation of PCS, classify the soil for proper disposal, and collect confirmation soil samples post PCS excavation. Refer to Figure 3 for soil sample locations and Table 1 for a summary of soil analytical results. Laboratory reports are included as Appendix I.

#### September 18, 2014

On September 18, 2014, Mr. Mike Bagley, PBS Geologist, was at the Site to oversee excavation of five exploratory test pits within the former Texaco parcel (Site 1) by Northwest Construction (NWC) in an effort to assess potential contamination associated with historical use of the parcel as a gas station. Five samples (T1 – T5) were obtained from those test pits and analyzed for indicator contaminants for gas stations, including gasoline and diesel-heavy oil range hydrocarbons (NWTPH-Gx and NWTPH-Dx), benzene, toluene, ethylbenzene, and total xylenes (BTEX), and MTCA 5 Metals (mercury, arsenic, cadmium, chromium, and lead). The test pits were generally advanced at the central portion of the parcel and were likely associated with former piping runs associated with the removed UST system.

Analytical results indicated concentrations of diesel, heavy oil, and gasoline present in soil represented by soil samples T1 through T5. The concentration of gasoline in soil sample T1 was 460mg/kg, above MTCA Method A standards. Based on field observations and analytical results, approximately 464 tons of impacted soils were exported for disposal as Category 3 PCS.

On September 22, 2016, confirmation samples TC-1 through TC-5 were obtained from soil left in place following the removal operation and analyzed for petroleum range hydrocarbons (NWTPH-Gx and NWTPH-Dx), and BTEX. Contaminants of concern were not detected above the reporting limits in soil samples TC-1 through TC-5.

### September 23, 2014

On September 23, 2014, NWC informed PBS that additional PCS had been encountered at the central portion of the Texaco parcel (Site 1). Mr. Bagley of PBS was called to the Site to oversee excavation of the PCS using visual and olfactory indications of soil contamination along with a PID. The PCS was discovered west of the suspect former piping runs and were most likely associated with the former UST system tank pit. The former USTs were not encountered during the excavation. Once the PCS was excavated it was stockpiled on-Site; five soil samples (TS-1 through TS-5) were obtained from the stockpile and analyzed for NWTPH-Gx, NWTPH-Dx, and BTEX.

Analytical results indicated contaminants of concern were below detection with the exception of a low concentration of heavy oil (50mg/kg) detected in soil sample TS-3 and gasoline (21mg/kg) detected in soil sample TS-5. Approximately 386 tons of impacted soil was exported from the Site for disposal as Category 2 PCS.

### September 26, 2014

On September 26, 2014, NWC informed PBS that additional PCS had been encountered toward the northeast corner of the Texaco parcel (Site 1). Mr. Bagley of PBS was called to the Site to oversee excavation of the PCS using visual and olfactory indications of soil contamination along with a PID. Once the PCS was excavated it was stockpiled on-Site; one composite sample (T-SP) was obtained from the stockpile and analyzed for NWTPH-Gx, NWTPH-Dx, BTEX, and lead.

Analytical results indicated diesel, heavy oil, and gasoline were detected at a concentration of 530mg/kg, 1600mg/kg, and 210mg/kg respectively. BTEX was not detected in the analyzed soil sample above detection limits. Lead was not detected above background concentrations above regional background concentrations (24mg/kg). On September 30, 2014, approximately 128 tons of impacted soil was exported from the Site 1 for disposal as Category 3 PCS.

### October 7, 2014

On October 7, 2014, NWC encountered additional PCS on the Site 1 (Site 1) located near the eastern excavation limits. PBS utilized visual and olfactory indications along with a PID to assess the extent and degree of contamination. PBS identified an area of potential contaminated soil that measured approximately 29 feet by 47 feet, and ranged in depth from approximately 11 to 19 feet bgs. The PCS is likely attributed to the former Texaco station's USTs, which would have been located at an elevation above the impacted soils. Soil sample T20 was collected to confirm the vertical depth where clean soil was present. Soil sample T20 was below detection for NWTPH-Gx, NWTPH-Dx, and BTEX. Based on the October 7, 2014 exploration activities a remedial excavation with approximate PCS removal quantities was planned for the Site.

PBS returned to the Site on October 13, 2014 to oversee excavation and proper disposal of the PCS identified on October 7, 2014. Approximately 1,967 tons (~58 truck loads) were transported to the Cemex facility as Category 2 PCS. Approximately 200 tons of Category 2 PCS was stockpiled

on-Site pending disposal when the construction schedule would allow. That staged soil was disposed on October 20, 2014 at the Cemex facility under the existing waste manifest.

#### 4.0 SAMPLE HANDLING

All soil samples were placed into laboratory provided glass jars and/or vials and stored on ice, under chain of custody documentation, until delivery to ALS Environmental's lab in Everett, Washington. Samples were analyzed using the regulated tanks required testing as specified in Chapter 173-340-900 - Table 830-1: *Required Testing for Petroleum Releases*.

#### 5.0 REMEDIAL EXCAVATION SUMMARY

Redevelopment plans required an excavation of the entire parcel as discussed in Section 2.0 of this report. Therefore, the remedial excavation locations, depths, and dates were guided by PBS field personnel using field indicators (e.g. sheen tests), PID readings, and the construction schedule. The *Contaminated Media Management Plan (CMMP)* prepared by PBS in May 2014 was followed as the guideline for the soil testing, removal and disposal actions during site development. Groundwater was not encountered during the site development excavation.

Approximately 2,553 tons of Category 2 and 593 tons of Category 3 petroleum contaminated soil (PCS) was removed and transported under permit by Northwest Construction for disposal at Cemex in Everett, Washington, a facility permitted to accept Categories 2 and 3 PCS. Soil disposal receipts are presented in Appendix II. The following table represents a summary of the remedial excavation quantities conducted for the Site:

Date	Cat 2 PCS (tons)	Cat 3 PCS (tons)
9/22/14	0	464.00
9/25/14	385.92	0
9/30/14	0	128.52
10/13/14	1,967.53	0
10/20/14	199.93	0
Total Quantity	2,553.38	592.52

On October 16, 2014, PBS inspected the remedial excavation extents and collected confirmation soil samples TW1-12 and TW1-14 from the exposed southeastern and southwestern excavation sidewall. Soil sample T20, along with field indicators, was utilized for confirmation that vertical extent of contamination had been removed. Analytical results from the confirmation soil samples indicated diesel, heavy oil, gasoline, and BTEX below laboratory reporting limits.

## 6.0 CONFIRMATION SAMPLE RESULTS

When indications that the PCS had been satisfactorily excavated, PBS was on-Site to collect samples to confirm removal of Site soils at the extent of excavation. Samples were analyzed using the regulated tanks required testing as specified in Chapter 173-340-900 - Table 830-1: *Required Testing for Petroleum Releases*. The laboratory was directed to hold any confirmation samples upon submittal with the expectation that additional analysis, in accordance with Table 830-1, would be conducted on those samples with indications of petroleum constituents above MTCA Method A. Since the confirmation investigation and sampling indicated the PCS was adequately removed, thus also demonstrating removal of the associated contaminants, additional analysis was not requested.

Below is a summary of confirmation soil samples for the Site. Contaminants of concern (COCs) at the Site include NWTPH-Gx, NWTPH-Dx, and BTEX. These COCs were detected in soil above MTCA Method A. Metals were previously analyzed with results at or below regional background concentrations. Therefore, metals are not considered a contaminant of concern at the Site. Groundwater was not encountered during Site activities.

North: Analytical results from confirmation soil samples TS-1 and TS-2, representing the northern extent of the remedial excavation, were below detection limits for contaminants of concern.

East and Bottom: Analytical results from confirmation soil samples TW2-12 and TW1-14, representing the eastern and vertical extent of the remedial excavation, were below detection limits for contaminants of concern.

South: Analytical results from confirmation soil samples TS-5, TC-4, and TC-5, representing the southern extent of the remedial excavation, were below detection limits for contaminants of concern with the exception of TS-5. TS-5 detected gasoline at a concentration of 21mg/kg; otherwise analytical results for the southern extent of the remedial excavation indicate contaminants of concern are not present at levels above detection limits.

West: Analytical results from confirmation soil sample TS-3, representing the western extent of the remedial excavation, detected heavy oil at the detection limit of 50mg/kg; otherwise analytical results for soil sample TS-3 indicate contaminants of concern are not present at levels above detection limits.

Bottom: Analytical results from confirmation soil sample T20, representing the vertical extent of excavation, was below detection limits for contaminants of concern.

Following receipt of the confirmation soil sample analytical results indicating Site soil was successfully removed to well below MTCA Method A cleanup levels, excavation continued as described in Section 2.0 for planned construction. The final subgrade consisted of a poured concrete surface garage level floor over the entire excavated area.

## 7.0 CONCLUSIONS AND RECOMMENDATIONS

Site 1 is characterized by a release of Gasoline, BTEX and Diesel range hydrocarbons to soil only, with no groundwater encountered. Cleanup action conducted at the Site included excavation and proper disposal of 3,146 tons of PCS associated with Site 1. Confirmation soil samples collected at the final excavation depth associated with the remedial excavation confirmed no Site soils remain above MTCA Method A Cleanup Levels. Based on current characterization information, established cleanup levels, and points of compliance identified for Site 1, identified COCs are below cleanup levels.

Using *Model Remedies for Sites with Petroleum Contaminated Soils*, Toxics Cleanup Program – Publication Number 15-09-043, September 2015 as a guide and current characterization information, Site 1 qualifies for use of a Model Remedy established under WAC 173-340-360. Per WAC 173-340-390, Ecology has identified circumstances that qualify a site for Soil Model remedy selection. The characteristics of Site 1 confirm with Ecology's identified qualifications: 1.) the only media affected is soil, 2.) contaminants are not present at Site 1 other than those typically associated with petroleum releases, 3.) Site 1 is exempt from a Terrestrial Ecological Evaluation under WAC 173-340-7491, and 4.) soil removal is the remedial action that has been used for cleanup. Therefore, a Feasibility Study (WAC 173-340-350(8)) or a Disproportionate Cost Analysis (WAC 173-340-360(3)) is not needed for Site 1.

Since risk(s) to human, terrestrial, and ecological receptors have been eliminated through excavation and removal of contaminated soil, a request for No Further Action determination for Site 1 (ERTS 667914) is being submitted for Ecology review.

## 8.0 LIMITATIONS

PBS has prepared this report for use by Gateway LLC and is not intended for use by others without the written consent of PBS. This study was limited to the tests, locations and depths as indicated to determine the absence or presence of certain contaminants. The site as a whole may have other contamination that was not characterized by this study. The findings and conclusions of this report are not scientific certainties, but rather probabilities based on professional judgment concerning the significance of the data gathered during the course of this investigation. PBS is not able to represent that the site or adjoining land contain no hazardous waste, oil or other latent conditions beyond that detected or observed by PBS.

Laboratory Reports and Chain-of-Custody

September 19, 2014

Mr. Tom Mergy  
PBS Environmental  
2517 Eastlake Ave. E., Suite 100  
Seattle, WA 98102

Dear Mr. Mergy,

On September 18th, 5 samples were received by our laboratory and assigned our laboratory project number EV14090115. The project was identified as your 41109.005. The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Carl Nott  
Operations Manager

September 23, 2014

Mr. Tom Mergy  
PBS Environmental  
2517 Eastlake Ave. E., Suite 100  
Seattle, WA 98102

Dear Mr. Mergy,

On September 22nd, 7 samples were received by our laboratory and assigned our laboratory project number EV14090132. The project was identified as your 41109.005 (former Texaco Site). The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Rick Bagan  
Laboratory Director

Dear Mr. Mergy,

On September 23rd, 5 samples were received by our laboratory and assigned our laboratory project number EV14090142. The project was identified as your 41109.005, Texaco Site. The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Rick Bagan  
Laboratory Director

Dear Mr. Mergy,

On October 8th, 2 samples were received by our laboratory and assigned our laboratory project number EV14100038. The project was identified as your 41109.005. The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Rick Bagan  
Laboratory Director
