1.0 INTRODUCTION

Chronic toxicity tests were conducted using effluent samples collected from Birch Bay in January 2024. Chronic bioassays were conducted using *Americamysis bahia* (mysid shrimp) and *Atherinops affinis* (Pacific topsmelt). Testing was performed at Rainier Environmental located in Fife, Washington.

2.0 METHODS

2.1 Sample Collection and Transport

Birch Bay Water & Sewer personnel collected composite samples of effluent into LDPE cubitainers. Samples were packed in coolers containing ice and transported to Rainier Environmental. Appropriate chain-of-custody procedures were employed during collection and transport.

2.2 Sample Receipt

Upon arrival at Rainier Environmental, coolers were opened, samples inspected, and the contents verified against information on the chain-of-custody forms. Receipt temperature was measured and recorded on the chain-of-custody forms. Standard water quality parameters were measured and recorded on a sample check-in sheet (Appendix D). The samples were stored at 4°C in the dark until used for testing.

2.3 Test Methods

The chronic toxicity tests were conducted for mysid shrimp and topsmelt according to USEPA (2002) and USEPA (1995) procedures, respectively, and are summarized in Tables 1 and 2.

Results for the chronic toxicity tests are summarized in Table 4. The mysid shrimp and Pacific Topsmelt tests involved a 7-day static-renewal exposure to the effluent. The endpoints for these tests were survival and growth (evaluated on the basis of dry weight divided by initial count for biomass and final count for dry weight) at the end of the 7-day exposure. In the mysid shrimp test the highest concentration with no observed effect (NOEC) was 100 percent for survival, and 50 percent for dry weight and biomass. In the Pacific Topsmelt test the highest concentration with no observed effect (NOEC) was 100 percent for survival, dry weight and biomass. No statistically significant difference was detected in the CCEC of 0.77 percent sample for any endpoint of either test.

Individual statistical summaries for all tests and copies of the laboratory bench sheets, control QC plots, sample check-in sheets, and chain of custody forms are provided in Appendices A through E.

Table 4. Summary of results for the chronic toxicity tests.

Species	Endpoint	NOEC ^a (% effluent)	LOEC ^b (% effluent)
Mysid Shrimp	Survival	100	> 100
	Biomass	50	100
	Dry weight	50	100
Topsmelt	Survival	100	>100
	Biomass	100	>100
	Dry weight	100	>100

^a No Observed Effect Concentration, ^b Lowest Observed Effect Concentration

4.0 QA/QC

The samples were received in good condition and within the temperature range specified by WDOE (2016). The toxicity tests met all acceptability criteria for performance of control organisms. There were no deviations from the protocols and water quality parameters remained within the ranges specified in the corresponding test methods throughout the tests.

Results for the reference toxicant tests used to monitor laboratory performance and test organism sensitivity are summarized in Table 7. Reference toxicant test results fell within the acceptable range of mean ± two standard deviations of historical test results, indicating that the tests organisms were of an appropriate degree of sensitivity. The coefficients of variation (CV) for the tests are also shown in the table.

Table 5. Reference toxicant test results.
