EXECUTIVE SUMMARY

King County is required to perform sediment characterization following completion of combined sewer overflow (CSO) control projects as part of its National Pollutant Discharge Elimination System (NPDES) permit for the West Point Treatment Plant. Substantial completion of the North Beach Pump Station project, which controlled the North Beach CSO, occurred in spring of 2017. In accordance with the NPDES permit and King County's Post Construction Monitoring Plan, this report presents a description of the sampling and analysis methodologies and analytical results for the 2018 surface sediment quality characterization of North Beach Pump Station Inlet Overflow 048b.

King County collected sediment samples from six stations located near the Overflow 048b outlet on September 6, 2018. Samples were analyzed by the King County Environmental Laboratory for conventional parameters, trace metals, and organic compounds and the results were compared to Washington State Sediment Management Standards marine sediment quality standards (Washington Administrative Code 173-204-320). None of the sediment samples exceeded the marine sediment standards. Therefore, under the County's Sediment Management Plan, no further action is currently required for sediments at this overflow location.

This page intentionally left blank.

1.0 INTRODUCTION

This report presents results from the 2018 King County Combined Sewer Overflow (CSO) Sediment Quality Characterization for the North Beach Pump Station Inlet Overflow 048b. King County's West Point Treatment Plant National Pollutant Discharge Elimination System (NPDES) permit No. WA0029181, effective February 1, 2015, and issued by the Washington State Department of Ecology (Ecology), requires that the County perform sediment characterization following completion of CSO control projects. Pursuant to King County's Post Construction Monitoring Plan (PCMP; King County, 2012), sediment must be characterized via sampling or modeling methods after substantial completion of CSO projects. This report presents the results of the sediment sampling required under the NPDES permit and the PCMP.

1.1 Project Background

Substantial completion of the North Beach Pump Station project, which brought the North Beach CSO into control status, occurred in the spring of 2017. The North Beach Pump Station receives flows from the Loyal Heights, Crown Hill, and Greenwood areas of Seattle. Required sediment characterization of the North Beach Pump Station discharge point occurred in September 2018. Figure 1 shows the location of the North Beach Pump Station and associated sediment sampling locations.

King County previously collected sediment quality data from a wide range of its CSO discharge locations, both as part of past NPDES sediment monitoring requirements and during focused environmental studies. These sediment data were provided in King County's comprehensive sediment quality report (King County, 2009) as well as a recently updated version of this report (King County, 2018). Moreover, these data were collected and reviewed consistent with the Quality Assurance and Project Plan and programmatic Sediment Sampling and Analysis Plan (SAP) approved as part of the PCMP (Appendix H of King County, 2012).

The programmatic SAP for the PCMP only listed the North Beach Pump Station Wet Well Overflow 048a as requiring sampling when the North Beach Pump Station project controlled the North Beach CSO and triggered the PCMP process. When the County determined that a second overflow point at North Beach went to a separate overflow location, a sampling plan specific to the North Beach Pump Station Inlet Overflow 048b site was developed in accordance with the PCMP. The data quality objectives of the SAP were to collect data of sufficient quantity and quality in order to do the following:

- Measure the areal extent and spatial variations of sediment chemical concentrations in front of 10 King County CSO discharge points
- Evaluate these sediment chemical concentrations relative to the current marine sediment quality standards of Chapter 173-204 Washington Administrative Code (WAC)

- Provide data for populating, calibrating, and validating the near-field sediment recontamination model as part of the process to update King County's Sediment Management Plan
- Provide pre-construction, baseline, sediment quality data at four of the County's CSO facilities at which CSO control projects are currently underway

This sampling effort addresses the first two of the four objectives.

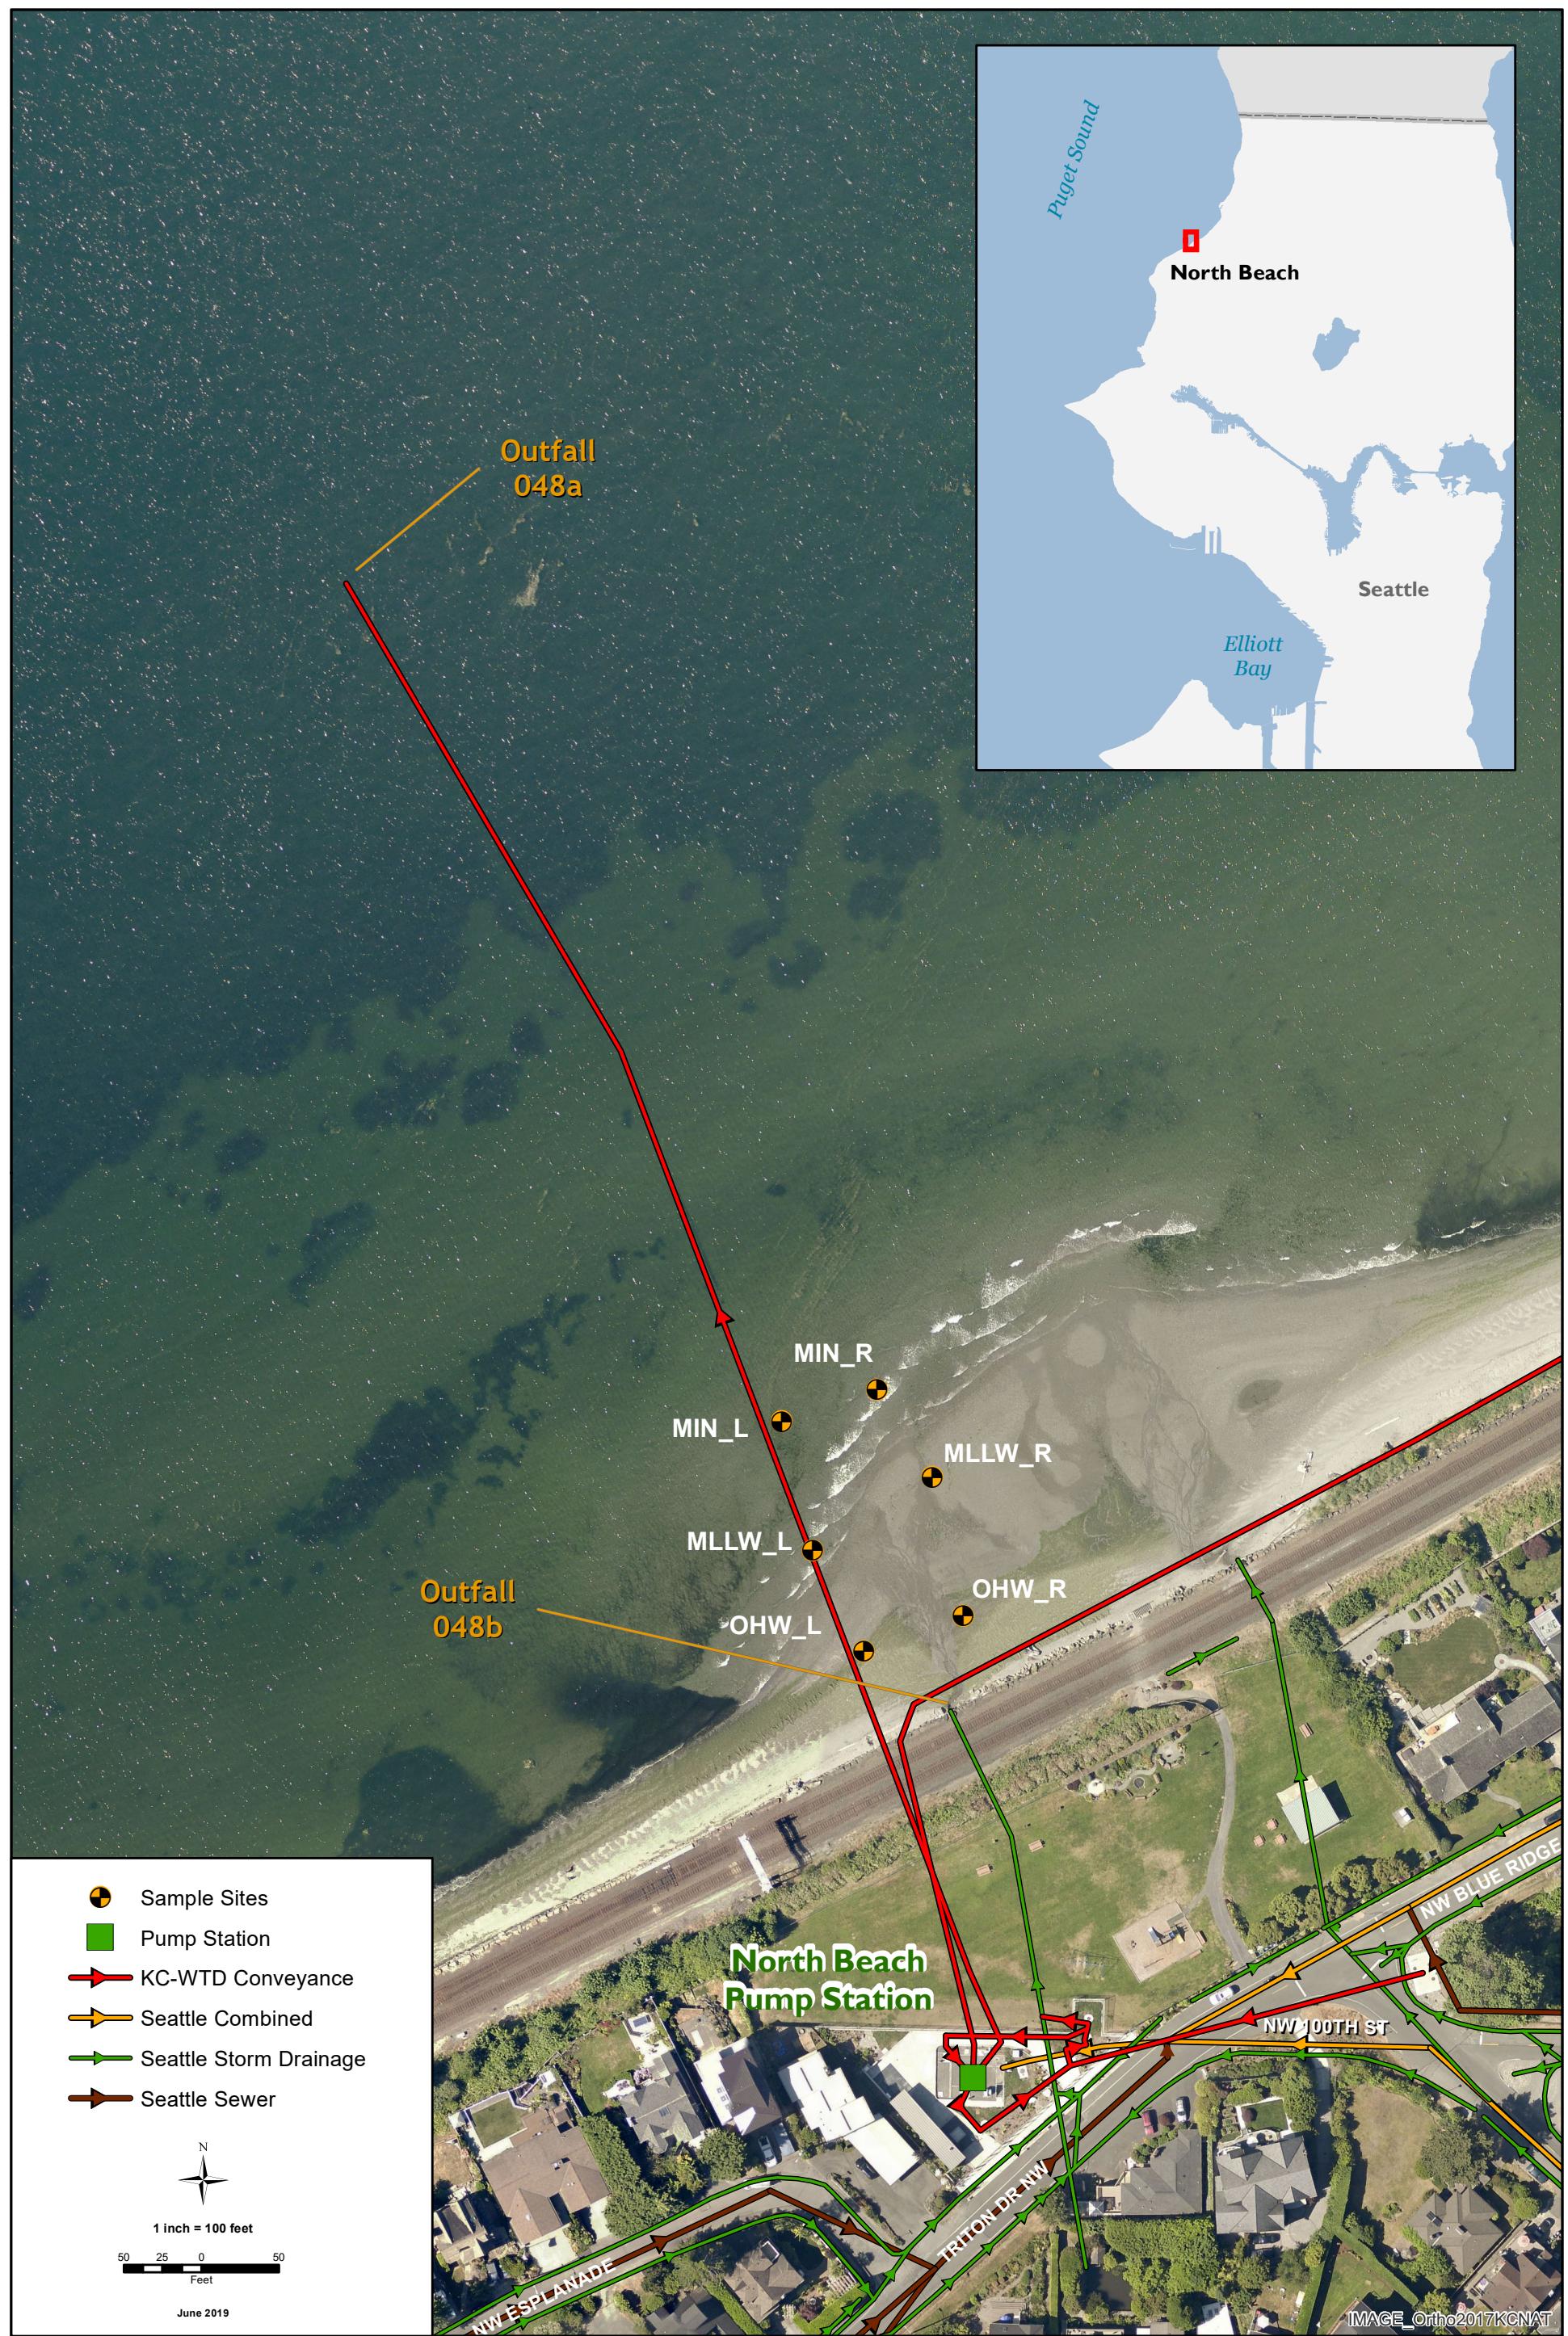

The PCMP requires site-specific SAP addendums to be developed for each CSO because CSOs discharge at varying volumes and depths and into varying flow regimes. Informed by preliminary sediment transport model projections, collection of six sediment samples at the North Beach Pump Station Inlet Overflow site was determined to be sufficient to provide data to meet the data quality objectives listed previously.

During development of the County's Sediment Management Plan Update, King County determined that the overflow at North Beach Pump Station Inlet Overflow 048b went to a second discharge location (King County, 2018). At the time, it was determined that the intertidal beach flow from this discharge was not appropriate for modeling the site conditions and that sampling would be required to characterize the sediment. Furthermore, the scaling analysis used in the PCMP to provide the optimal sampling station array was also not appropriate because it was designed for underwater discharges.

The discharge enters a small creek and storm drain basin that is released at the high-tide line of the beach, forming a classic alluvial fan (alluvial fans are deposited sediments built up as the stream channel moves across the fan surface over time). As a result, six sampling stations were spaced on a 60-foot grid along the axis of the alluvial fan from the ordinary high water mark to below mean lower low water to ensure sample collection within the deposition fan (see Figure 1 and Section 2 for station coordinates). The 60-foot spacing was slightly less than the spacing for the North Beach Pump Station Wet Well overflow in the PCMP (Appendix H of King County, 2012). Figure 1 and this rationale represent the site-specific SAP addendum, as no other changes to the programmatic SAP were needed.

1.2 Project Report and Associated Data Submittal

This report includes a description of both the sampling and analytical methodologies and a summary of the sediment chemistry analytical results. Appendices to the report include an update to laboratory detection limits methods and the sediment chemistry analytical results, and quality assurance/quality control (QA/QC) results. All project data referenced in this report will be submitted electronically to Ecology's Environmental Information Management System database.

2.0 SAMPLE COLLECTION

On September 6, 2018, sediment samples were collected from six stations located near the North Beach Pump Station Inlet Overflow 048b (Figure 1). Sample collection followed the protocols outlined in the *CSO Sediment Quality Characterization Sampling and Analysis Plan* (King County, 2011) and the programmatic SAP, with two exceptions. Samples were collected on foot at low tide using stainless-steel spoons and bowls rather than being collected from a research vessel using a grab sampler. Coordinate data representing the actual sediment sampling points were obtained using an Android phone global positioning system (GPS) rather than differential GPS.

Coordinate data were recorded in latitude/longitude format for each site, along with the time and tide height. All but one sample was collected within ± 3 meters of the prescribed location coordinates. One sampling location, NB_MLLW_L, was shifted south outside of the creek bed within a ± 6 -meter radius of the prescribed sampling location. Table 1 presents the target and actual sampling station coordinates by station locator name.

Table 1. Station coordinates by locator name for North Beach Pump Station Inlet Overflow 048b sediment sampling that occurred on September 6, 2018.

Locator	Sample Name	Sample Coordinates (ft.)*			
		Target		Actual	
		X	Y	X	Y

*State plane coordinates in North American Datum 1983 (NAD83) Washington State Plane North (4601)

All samples were collected from the top 10 centimeters of sediment. When sufficient sediment volume for all analyses was collected from a station, the sediment in the stainless-steel bowl was thoroughly homogenized. After homogenization, sediment aliquots were transferred to appropriate laboratory containers. Separate stainless-steel spoons and bowls were dedicated for each site, precluding the need for on-site decontamination of the sampling equipment.

Observations documented for the overall sampling event noted sampling occurred during a low tide that was ebbing, there was no precipitation, and no algal bloom was observed on the sediment surface at the time of sampling.

Sample jars were stored in ice-filled coolers from the time of collection until delivery to the King County Environmental Laboratory (KCEL) at the end of the sampling day. Samples were delivered under chain-of-custody and maintained as such throughout the analytical process. Samples for chemical analysis were stored frozen at -18°C by KCEL until analysis; particle size distribution samples were stored at 4°C .

3.0 SAMPLE ANALYSIS

Six marine sediment samples were submitted for analysis of conventional parameters, trace metals, and organic compounds in accordance with the programmatic SAP. The metals and organic compounds are those with Washington State marine sediment quality standards (WAC 173-204-320). Sediment chemistry analyses were performed following guidance recommended in the Puget Sound Protocols (PSEP 1986, 1997a, 1997b) and QA/QC practices were consistent with those outlined in Ecology's Sediment Cleanup User's Manual II (SCUM II) (Ecology, 2017). All analyses were performed by the KCEL.

Conventional parameter analyses included percent solids, particle-size distribution, and total organic carbon (TOC). Percent solids analysis was performed according to Standard Method 2540-G (APHA, 2011)—a gravimetric determination. Particle-size distribution analysis was performed according to American Society for Testing and Materials Method D422—a combination of sieve and hydrometer methodologies (ASTM, 2007). TOC analysis was performed following U.S. Environmental Protection Agency (EPA) SW-846 Method 9060—high-temperature combustion with infrared spectroscopy.

Metals analyses included arsenic, cadmium, chromium, copper, lead, mercury, silver, and zinc. Mercury was analyzed according to EPA SW-846 Method 7471B—cold vapor atomic absorption spectroscopy. The remaining metals were analyzed according to EPA SW-846 Methods 3050B/6010D—strong-acid digestion with inductively coupled plasma optical emission spectrometry.

Organics analyses included base/neutral/acid semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs) as Aroclors. SVOC analysis was performed according to EPA SW-846 Methods 3550B/8270D, which employed a mixture of 50:50 methylene chloride/acetone solvent extraction with sonication and analysis by gas chromatography/mass spectroscopy. PCB Aroclor analysis was performed according to EPA SW-846 Methods 3550B/8082A, which employed a mixture of 50:50 hexane/acetone solvent extraction with sonication and analysis by gas chromatography with electron capture detector and dual column confirmation.

4.0 DEVIATIONS FROM THE SAMPLING AND ANALYSIS PLAN

There were some deviations from the programmatic SAP. The deviations, which are listed below, did not adversely affect the quality of the data.

Field collection:

- Samples were not collected from a research vessel using a grab sampler, but rather were obtained on foot at low tide using stainless-steel spoons and bowls.
- One sampling location, NB_MLLW_L, was shifted south outside of the creek bed within a ±6-meter radius of the prescribed sampling location.
- Coordinate data representing the actual sediment sampling points were obtained using an Android phone GPS rather than a differential GPS instrument.

Analytical methods:

- EPA SW-846 methods have replaced the method detection limit with a lower limit of quantitation (LLOQ). The analyses for TOC, metals, and organic compounds all use detection limits based on the LLOQ (see Appendix A for additional details).
- The method reference for total metals changed from 6010C to 6010D.
- Eight compounds in the SVOC analysis list were analyzed using a modification of EPA method 8270D called “selected ion monitoring” to achieve a lower detection limit. The compounds are as follows:
 - 2,4-Dimethylphenol
 - Benzoic acid
 - Benzyl alcohol
 - Dimethyl phthalate
 - Hexachlorobenzene
 - Hexachlorobutadiene
 - N-Nitrosodiphenylamine
 - Pentachlorophenol

5.0 SEDIMENT CHEMISTRY ANALYTICAL RESULTS

This section presents analytical results for the 2018 North Beach Pump Station Inlet Overflow 048b sediment quality characterization. Appendix B presents a memorandum containing the complete sediment chemistry results and a summary of the analytical data quality, including laboratory QA/QC data.

Based on a review of the laboratory QA/QC data, no analytical results were rejected. A few SVOC results were qualified as estimated for the following reasons. All six benzyl alcohol results were qualified as estimated with potential low bias ("JG" flagged) because percent recovery and relative percent difference of this analyte were outside the lower and upper control limits in the matrix spike and matrix spike duplicate. All SVOC results detected below their respective LLOQs were flagged as estimated ("J" flagged). In addition, all silt and clay results were qualified as estimated because the relative standard deviation of laboratory triplicate samples was outside acceptable control limits. All qualifiers applied because of data quality issues are included in Table 2, as well as in the laboratory data report in Appendix B.

Samples were largely composed of sand and gravel and had low TOC (<0.5%).¹ Chromium, copper, and zinc were detected in all samples; lead was detected in four samples and cadmium in one sample. Benzoic acid and bis(2-ehtylhexyl) phthalate were detected in most samples and nine polycyclic aromatic hydrocarbon (PAH) compounds were detected in one sample. Most of the remaining SVOCs and all PCB Aroclors were not detected above the LLOQ at any of the sample stations. Detections and concentrations of most chemicals were highest overall at Station NB_OHW_R, which is closer to the discharge point (Table 2). However, detected concentrations of copper, lead, zinc, and benzoic acid were more evenly distributed across all sample sites.

Chemical concentrations detected in the Inlet Overflow 048b surface sediment samples were compared to Washington State Sediment Management Standards sediment cleanup objective (SCO)² and cleanup screening level (CSL) criteria based on protection of benthic communities (WAC 173-204-562). Sediment data for non-ionic organic compounds are generally normalized to organic carbon content for comparison to benthic chemical criteria. However, normalization to organic carbon can produce biased results when the organic carbon content of the sample is very low (Ecology, 1992). Ecology's SCUM II, *Guidance for Implementing the Cleanup Provisions of the Sediment Management Standards* (Ecology, 2017), outlines the use of apparent effects thresholds (AETs) when a sample's TOC content is less than 0.5% dry weight. Therefore, due to the low TOC concentrations (below 0.5% dry weight) of the Inlet Overflow 048b surface sediment samples, the non-

¹ See Appendix B for the particle size distribution data results.

² The benthic SCO is equivalent to the Washington State marine sediment quality standards (WAC 173-204-320).

ionic organic chemistry data were compared to the dry weight equivalents of the benthic SCOs and CSLs listed under the Marine Sediment AETs in Table 8-1 of SCUM II.

Table 2 presents a summary of the analytical results for the six samples and the applicable SCOs/CSLs; none of the sample concentrations exceeded the marine sediment standards. Therefore, sediments near the North Beach Pump Station Inlet Overflow 048b do not require any further actions under King County's Sediment Management Plan.

Appendix A

Lower Limit of Quantification Description

The terms, “method detection limit” (MDL) and “reporting detection limit” (RDL), were previously associated with analytical methods for total organic carbon (TOC), metals, and organic compounds in the programmatic Sediment Sampling and Analysis Plan (King County, 2011). The MDL is defined as the minimum concentration of a chemical constituent that can be detected, while the RDL is defined as the minimum concentration of a chemical constituent that can be reliably quantified.

U.S. Environmental Protection Agency (EPA) SW-846 methods have eliminated the concept of the MDL and have replaced it with a lower limit of quantitation (LLOQ). Details on how these quantitation limits are used to report SW-846 method analytical data by the King County Environmental Laboratory (KCEL) are described below.

The sensitivity of a particular analytical method is generally determined/defined by the reference method. The EPA reference methods used for this project belong mostly to the SW-846 compendium of analytical methods and require that sensitivity be defined as a single limit called the “lower limit of quantitation” or LLOQ. With the exception of Method 6010D (inductively coupled plasma [ICP] for metals), the LLOQ can be no lower than the lowest concentration on the calibration curve and must be verified according to the requirements in each reference method.

The LLOQ for ICP metals is verified for Method 6010D (ICP) with each run by analyzing a standard at the level of the LLOQ, which must recover within 80 to 120% of its true value (Appendix B). For trace metals (6010D, 7471B), TOC (9060C), and polychlorinated biphenyl methods (8082A), sample results may not be reported below the LLOQ and, therefore, the LLOQ value for each parameter is used as the MDL and RDL in the KCEL Laboratory Information Management System (LIMS).

Sample results for base/neutral/acid (BNA) semi-volatile organic compounds (Method 8270D) may be reported at concentrations below the LLOQ if the qualitative results for the parameter meet the requirements of the reference method. The LLOQs for BNA parameters will be reported in the LIMS RDL field, while the LIMS MDL column will be, at most, one-half of the LLOQ. The LIMS MDL may be lower than one-half of the LLOQ if the qualitative requirements of the method are fulfilled (defined as a low instrument standard that meets the qualitative requirements for the reference method). Therefore, the LIMS MDL values for BNA parameters represent the lowest qualitative instrument concentration for which a given compound can be identified.

Any BNA parameters reported below the LLOQ (LIMS RDL) will be flagged “<QL, J” because a result reported below the LLOQ (referred to as “QL” in LIMS) is an estimated value. For the tests based on non-SW-846 reference methods, sensitivity is defined as the MDL, which is calculated by the 40 CFR Part 136, Appendix B procedure. The value determined by this procedure may be increased to account for method variability, and will be reported in the LIMS MDL field. The LIMS RDL is calculated by multiplying the LIMS MDL by a factor between 2 and 10, depending on the parameter, and should be considered analogous to the practical quantitation limit.

SUBJECT: Report for Project 423368-210-4, CSO Characterization
North Beach Intertidal Sediments, Samples L70816-1- 6
Collected September 6, 2018

Attached is the comprehensive report for the intertidal sediment samples delivered to the laboratory on September 6, 2018. The samples were analyzed in the Trace Metals, Conventional, and Trace Organics units of the laboratory. QA/QC data summaries are included for your information. Comprehensive report #17627 was prepared and sent via e-mail on November 26, 2018.

Sample Collection:

All the samples were collected within ± 6 meters of the prescribed location coordinates. One location, L70816-3, NB_MLLW_L, was moved out of a creek but still fell within the acceptable sampling window.

Conventional:

Samples were analyzed for Total Solids, Particle Size Distribution, and Total Organic Carbon. All preparations and analyses were performed within the accepted holding time for each method. The data have passed all internal QA/QC checks for accuracy and completeness and may be used without qualification with the following exceptions.

The RSD (Relative Standard Deviation) for the Silt and Clay portions of the Particle Size Distribution analysis were outside the acceptance limits at 87 and 42% respectively. The values have been flagged with an “*” in the QC report. The results for the Silt and Clay portions of the QC sample, L70816-4, have been qualified with a “J” flag to indicate an estimated result. The method does not require reanalysis of the sample because these portions represent less than 10% of the overall sample mass.

Trace Metals:

Samples were analyzed for Total Mercury by CVAA and Total Metals by ICP. All preparations and analyses were performed within the accepted holding time for each method. The data have passed all internal QA/QC checks for accuracy and completeness and may be used without qualification with the following exception.

Standard Reference Material PACS3 (WG160102-7) was outside the acceptance limits of 80-120% for Cadmium (Cd) at 126% and Chromium (Cr) at 50%. Two LCS of known concentration (ERA Soil) were digested along with the samples to show that there were no systematic precision problems with the method. The recovery of both LCS were within lab control limits for all reported elements. All elements reported for PACS3 that are outside the 80-120% limits are qualified with an “**” on the QC Report. The certified values published for PACS3 were developed by different methods than the methods used by KCEL to analyze these samples. Insufficient data exists to control chart the applicable data to develop more appropriate control limits.

Trace Organics:

Samples were analyzed for Polychlorinated Biphenyls and Semi Volatile Organic compounds. All preparations and analyses were performed within the accepted holding time for each method. The data have passed all internal QA/QC checks for accuracy and completeness and may be used without qualification with the following exceptions.

The surrogates listed in the table below were outside the upper control limit in the indicated samples for Semi Volatile Organic analysis (WG160709). The values have been flagged with an “**” in the QC report. All other surrogate results were within control limits. Data was not qualified as more than one surrogate must be outside control limits for results to be flagged.

Surrogate:	2,4,6-Tri bromo phenol	2-Fluoro phenol	d5-Nitro benzene	d5-Phenol
(Lab Limits)	45--150	20--136	22--126	20--142
L70816-6	172 *	80	99	85
WG160709-7	170 *	70	77	69

The recovery of Benzyl Alcohol and Benzoic Acid were outside the lower control limit in the spike blank associated with Semi Volatile Organic – SIM analysis (WG160710). The results have been flagged with an “**” in the QC report.

The recovery and RPD (Relative Percent Difference) of Benzyl Alcohol were outside the lower and upper control limits in the matrix spike and matrix spike duplicate associated with Semi Volatile Organic – SIM analysis (WG160710). The results have been flagged with an “**” in the QC report. The sample results have been qualified with a “JG” flag to indicate possible low bias.

Sample results for Benzoic Acid were qualified with a “<QL,J” to indicate that the detected value was below the QL value but above ½ of the QL value and should be treated as an estimate.

The surrogates listed in the table below were outside the upper control limit in the indicated QC samples for Semi Volatile Organic - SIM analysis (WG160710). The values have been flagged with an “**” in the QC report. All other surrogate results were within control limits.

Surrogate:	2-Fluoro biphenyl	d14-Ter phenyl	d4-2-Chloro phenol
(Lab Limits)	30--150	30--150	30--150
WG160710-1	27 *	49	25 *
WG160710-2	92	156 *	71
WG160710-3	90	152 *	80

Additional comments:

Dry over the past few days. North winds 10-15 daily.

Specific observations that may affect results:

Algae Bloom Observed

Yes No

Type:

- Flecks
- Thin Film
- Thick Scum
- Small Clumps
- Filamentous Green Algae

	<input type="checkbox"/> Marine Location:
--	---

Equipment used for sampling: Stainless spoons, bowls.	Issues: None
	Specific settings:

Equipment used for field analysis: Android phone GPS.	Issues: None
	Specific settings:

Other observations: Access was through park. Needed WTD to let us in both sets of gates. Sample L70816-3 (NB_MLLW_L) had to be shifted out of creek. Still within 6 meters of prescribed locator.

³ Matrix Spike/Matrix Spike Duplicate (MS/MSD) Recoveries

⁴ MS/MSD Relative Percent Difference (RPD)

⁵ Sample/Lab Duplicate (LD) RPD

⁶ Laboratory Control Sample/Standard Reference Material (LCS/SRM) Recoveries

Certified values developed by a method other than that which was used for the analysis.

⁷ Internal Standard (ISTD) Recoveries

⁸ Elements over range:

⁹ Field Blank, Equipment Blank or Field/Lab Filter Blank Contamination.

¹⁰ Holding time exceeded by:

¹¹ Insufficient sample amount.

¹² Inappropriate storage, container, or preservation.

¹³ Other

Anomaly Description: *6) Standard Reference Material PACS3 (WG160102-7) was outside the acceptance limits of 80-120% for Cadmium (Cd) at 126% and Chromium (Cr) at 50%.*

IV. Type of Project Anomaly

- SAP/Work Plan specified MDLs not met.
- SAP/Work Plan specified QC frequency or QC type not met.
- SAP/Work Plan specified methodology not used.
- Sample exceeds regulatory and/or hazardous waste limits.

- Sample data results are unusual or inconsistent with expected results.
- Other

Anomaly Description:

V. Corrective Action Taken

- | | |
|---|--|
| <input type="checkbox"/> Sample(s) re-analyzed
<input checked="" type="checkbox"/> Sample(s) reported "AS IS"
<input type="checkbox"/> Exposure Deleted
<input checked="" type="checkbox"/> Data qualified with the following flags: *
<input type="checkbox"/> Other | <input type="checkbox"/> Sample(s) re-prepared and re-analyzed
<input type="checkbox"/> Post Digestion Spike(s) (PDS) performed
<input type="checkbox"/> Serial Dilution(s) (SD) performed |
|---|--|

Corrective Action Description: *6) Two LCS of known concentration (ERA Soil) were digested along with the samples to show that there were no systematic precision problems with the method. The recovery of both LCS were within lab control limits for all reported elements. All elements reported for PACS3 that are outside the 80-120% limits are qualified with an "*" on the Lab QC Report.*

VI. Potential Effects on Data Quality (explanation mandatory):

6) The certified values published for PACS3 were developed by different methods than the methods used by KCEL to analyze these samples. Insufficient data exists to control chart the applicable data to develop more appropriate control limits. We may not be able to quantify Cd and Cr within acceptance limits for this SRM.

¹⁰ Holding time exceeded by:

¹¹ Insufficient sample amount.

¹² Inappropriate storage, container or preservation.

Other

Anomaly Description: *The laboratory triplicate (LT) analysis for particle size distribution (PSD) on sample L70816-4 had a percent relative standard deviation (% RSD) of 87% for the Silt category and 42% for the Clay category, exceeding the 20% acceptance limits. The Silt category represented a small fraction (0 to 1.1%) of the overall sample mass associated with sample L70816-4. And the Clay category represented a small fraction (1.1 to 2.2%) of the overall sample mass associated with sample L70816-4. Variability due to the low contribution of these categories is the probable cause.*

IV. Type of Project Anomaly

- SAP/Work Plan specified MDLs not met.
- SAP/Work Plan specified QC frequency or QC type not met.
- SAP/Work Plan specified methodology not used.
- Sample exceeds regulatory and/or hazardous waste limits.
- Sample data results are unusual or inconsistent with expected results.
- Other

Anomaly Description:

V. Corrective Action Taken

- Sample(s) re-analyzed
- Sample(s) re-prepared and re-analyzed
- Sample(s) reported "AS IS"
- Data qualified with the following flags: *J,**
- Text added:
- Other

Corrective Action Description: *No reanalysis was performed because the individual Silt and Clay categories represented less than 10% of the overall sample mass. The Silt and Clay categories for sample L70816-4 and its associated matrix QC were each reported with the "J" qualifier to identify these data as estimated values based on the high category % RSD value for L70816-4LD (WG160275-1) and L70816-4LT (WG160275-2). The Silt and Clay categories for all samples were "J" qualified as they were the same consistency as sample L70816-4.*

VI. Potential Effects on Data Quality (explanation mandatory): *The Silt and Clay categories represented a relatively small fraction of the sample mass for the matrix QC sample included in this batch. The high % RSD associated with these categories for L70816-4 does not affect the quality of the data. Inherent variability at low levels can be expected in the method. In these instances, a high % RSD does not necessarily indicate poor precision or poor method performance. In the case of this sample, the QC data suggest that the Silt and Clay categories represent too small a fraction of the overall sample constituency to be considered appropriate for evaluation against a 20% control window.*

III. Type of Sample/Analytical Anomaly

- Values Outside of Control Limits:

- ¹ Blank Contamination
- ² SB/SBD Spike Recoveries
- ³ MS/MSD Spike Recoveries
- ⁴ LCS/SRM Recoveries
- ⁵ Initial Calibration
- ⁶ Performance Checks
- ⁷ ISTD %Differences

- ⁸ Surrogate Spike Recoveries
- ⁹ SB/SBD RPD
- ¹⁰ MS/MSD RPD
- ¹¹ Sample/LD RPD
- ¹² Continuing Calibration Checks
- ¹³ Tuning Criteria
- ¹⁴ Interferences in Sample Matrix

¹⁵ Holding time exceeded by:

¹⁶ Insufficient sample amount.

¹⁷ Inappropriate storage, container or preservation.

¹⁸ Other

Anomaly Description:

8. 2 of 72 surrogate spikes exceed QC Lab Limits.

November 27, 2018
16104_WG160709DAF

IV. Type of Project Anomaly

- SAP/Work Plan specified MDLs not met.
- SAP/Work Plan specified QC frequency or QC type not met.
- SAP/Work Plan specified methodology not used.
- Sample exceeds regulatory and/or hazardous waste limits.
- Sample data results are unusual or inconsistent with expected results.
- Other

Anomaly Description:

V. Corrective Action Taken

- Sample(s) re-analyzed
 - Sample(s) reported "AS IS"
 - Sample(s) Diluted
 - Data qualified with the following flags:
 - Other
- Sample(s) re-prepared and re-analyzed
 - Asterisk(s) applied to QC Report outlier(s)

Corrective Action Description:

8. The compounds were asterisked in the Lab QC Report.

VI. Potential Effects on Data Quality (mandatory):

8. Samples can be reported with no further qualification.

- | | |
|--|---|
| <input type="checkbox"/> Sample(s) re-analyzed | <input type="checkbox"/> Sample(s) re-prepared and re-analyzed |
| <input checked="" type="checkbox"/> Sample(s) reported "AS IS" | <input checked="" type="checkbox"/> Asterisk(s) applied to QC Report outlier(s) |
| <input type="checkbox"/> Sample(s) Diluted | |
| <input checked="" type="checkbox"/> Data qualified with the following flags: <i>JG, <QL,J</i> | |
| <input type="checkbox"/> Other | |

Corrective Action Description:

2. The compounds were asterisked on the Lab QC Report.

3. The compounds were asterisked on the Lab QC Report.

8. The compounds were asterisked in the Lab QC Report.

10. The compounds were asterisked in the Lab QC Report.

VI. Potential Effects on Data Quality (mandatory):

2,3. Due to low recoveries in the SB/MS/MSD, Benzyl Alcohol was flagged "JG".

8. Samples can be reported with no further qualification.

10. Samples can be reported with no further qualification.

Sample results qualified with a "<QL, J" flag indicate that the sample result was detectable but below the QL value for the sample.
