

Zoetic Research

The aquaculture industry in Washington state has proven to be a total failure from the perspective of ecosystem management and conservation of native species. The latest proposal to use "native" steelhead means that genetically-modified "domesticated" individuals will, with 100% certainty, escape at some point in time. These inevitable escapees will contaminate native endangered runs of unique steelhead strains and threaten their survival. Steelhead have already been suffering from a reduction in genetic diversity and this will only accelerate the problem.

While the threat of domesticated strains of native fish escaping and damaging endangered runs of steelhead is a new threat, the old problems of high fecal bacteria pollution and low-oxygen benthic zones remains. Worse still, aquaculture fish pens are proven reservoirs of deadly disease and parasites that quickly jump to wild fry, smolt, and adults that pass too close to the pens.

Apart from the glaring biological problems, players such as Cooke Aquaculture have proven to be bad faith actors. They have a long history of failing to perform basic maintenance and preventing escapee. They should be prohibited from participating in any aquaculture activities in Washington state.

Aquacare Environment Inc

We support Cooke Aquaculture Pacific in their application to convert the sea cage sites to Steelhead grow-out. We know CAP to be a conscientious and environmentally sensitive operator with a very qualified and dedicated team of Washingtonians to operate the farms.

Re: Comments on Ecology Draft Permit Modifications for Cooke Aquaculture Pacific

Dear Ms. Niewolny:

This letter is in full support of the request by Cooke Aquaculture Pacific (Cooke) to modify its existing permits to allow the company to switch the species it is cultivating from Atlantic salmon (*Salmo salar*) to triploid rainbow trout, also known as steelhead, (*Oncorhynchus mykiss*).

I am the sole owner and Chair of ProFish International Inc., a Washington State corporation which was founded in 1983. Our principal involvement has been in the Bering Sea pollock fishery. In 2008 we expanded our involvement in the seafood industry with the formation of a tilapia farm in Peten, Guatemala. Our grow-out operations are conducted in cages situated in a large lake, Lago Izabal. We have successfully operated in full compliance with environmental permit requirements required by the Ministerio de Ambiente y Recursos Naturales (MARN).

I am a certified fisheries biologist who was employed by NOAA for fifteen years prior to entering the seafood business. I also have served 9 years on the North Pacific Fishery Management Council, six of which as Vice Chair.

It is noteworthy that following a full review of public comments and statements by leading scientists in response to the posting of Cooke's request for its permit modifications, the Department has concluded that *little or no difference exists in feed utilization and nutrient waste production between Atlantic salmon and rainbow trout/steelhead*. Considering that both species are Salmonids and have strikingly similar nutritional needs and metabolic processes, it would be surprising if a contrary conclusion were reached. Certainly, the conclusion of *little or no difference* fully supports the species change requested by Cooke.

In looking to the future, it should be noted that there currently is considerable research being conducted by feed companies and those raising fish in cages and elsewhere directed at improving feed conversion rates (FCRs) and further reducing metabolic and excrement waste. This research is being driven by efforts to improve the economics of aquaculture operations themselves, but also in response by aquaculture companies themselves to be good stewards of our environment and produce nutritious protein for an expanding world population. Cooke has been a leader in these efforts for which we can expect continued improvements in feed utilization and waste reduction.

It is truly unfortunate that we still see opposition to aquaculture operations in Puget Sound from those who do not want to see them in our waters under any conditions. This opposition is largely based on false information, hearsay and untruths devoid of sound science and objective reasoning. The development of aquaculture in Washington state is vital to our food security and public health. Denying the development of aquaculture in Puget Sound only hurts our regional economy, particularly in rural areas, and our native tribes that are trying to develop responsible aquaculture operations to support their communities and replace salmon production lost over the years.

In conclusion it is quite apparent that the scientific literature clearly demonstrates the remarkable similarities of Atlantic salmon and rainbow trout/steelhead in feed digestion, growth and excretion of excess feed nutrients. Therefore, on the basis of these important metrics the request by Cooke Aquaculture Pacific to modify its existing permits to allow the company to switch the species it is cultivating from Atlantic salmon to triploid rainbow trout/steelhead should be approved.

Thank you.

Sincerely,

A handwritten signature in blue ink, appearing to read "Walter Pereyra".

Comments to Washington Department of Ecology (ECY)

Draft NPDES Permits for Cooke Aquaculture Marine Sites

October 26, 2020

Jim Parsons, General Manager

Cooke Aquaculture Pacific, LLC (CAP)

Dear Ms. Niewolny,

Thank you for the opportunity to comment on the draft NPDES permits for our facilities. Please accept the following comments as supplemental to those submitted to you recently by Mr. Kevin Bright, Permit Coordinator for our operations.

By the time these permits will be issued, should ECY approve them, over a year will have passed since we first notified ECY of our interest in a simple modification to culture an animal in our operations that is raised and released into public and private waters throughout the state of Washington by a variety of private, governmental and tribal entities. When coupled with the year spent obtaining permission from the Department of Fish and Wildlife to do so, we are now faced with a nearly untenable situation. As an entity we chose to follow the guidance given us by the State Legislature and cease the rearing of Atlantic salmon in Puget Sound, even though we would still legally be able to do so until the expiration of our leases in 2022. The farming of aquatic animals in the locations for which the draft NPDES permits are being considered has occurred for over three decades under an assortment of owners. Previous ownership, a Chicago-based venture capital company, had unfortunately allowed the marine farm infrastructure to fall into disrepair.

In 2016, Cooke Aquaculture Pacific purchased the farms, retained all its workforce, and began investing to modernize the operations. In the short year between asset purchase and the unfortunate Cypress Island facility collapse, new containment nets were purchased and installed at each facility, state-of-the-art feeding equipment guided by visualization of underwater fish activity was installed at the Clam Bay and Hope Island facilities, and the legal processes for facility (cage) replacements were initiated. These improvements alone were accomplished with investments of millions of dollars and planned investments of much more.

Cooke Aquaculture Pacific is staffed, managed, and operated by local Washington residents who pay taxes, purchase goods and services, and contribute to the local and state economy. Many of these folks have been part of the operations here for many years, and care deeply about local food production and the local marine jobs that it provides. The direct and indirect employment income and supply chain spinoffs generated from these operations contributes to the social and economic benefit of the communities in which we operate in many ways.

It must be noted that this community commitment is the operational standard that CAP's parent company, Cooke Aquaculture Inc. strives for as a global seafood leader working to help build vibrant working waterfronts. Cooke's commitment to sustainability, science-based marine practices, and forward-thinking innovation has afforded them many certifications and recognition in recent years.

In September of this year, Cooke was selected by SeafoodSource.com as one of the Top 25 Seafood Suppliers in North America for Sustainability & Conservation (<https://www.seafoodsource.com/news/environment-sustainability/the-top-25-seafood-sustainability-conservation>). All divisions within the Cooke family of companies have mandated sustainability, environmental and biodiversity policies enshrined within their operating and reporting practices.

Many of the assertions regarding the so-called “negative impacts of farm operations” that are being made by various individuals and groups are completely false and are unsupported by science. In the previous comment period I have provided ECY with summaries and complete references of recent science regarding discharge characteristics from cage operations and I thank you for considering them in your finding that there are no significant differences in discharge characteristics between Atlantic salmon and rainbow trout. We have worked transparently with ECY to also change operational aspects of our activities and will continue to do so to make certain that our operations perform to the highest standards.

Many commentators inaccurately state that the culture of aquatic animals in open-water marine environments is no longer a water-dependent use given advancements in upland and indoor finfish farming facilities. What needs to be understood here is that both upland and indoor systems depend not only on water but also on having sufficient energy to pump this water and space on which to do so.

While the Recirculating Aquaculture System (RAS) technology has indeed advanced over the past few decades, it is important to point out that CAP already operates a state-of-the-art Danish-designed RAS facility near Rochester, WA, that supplies juvenile animals for our marine operations.

In fact, the production cycle is such that our fish spend half of their lives in this RAS environment due to the security, environment, and control that it provides. This facility has a production capacity of approximately 90 metric tonnes of production with 95% or greater water reuse, and we are extremely proud of its success and positive impact to our operations. If, however, we were to expand this to produce the equivalent tonnage of harvest-size fish produced by our in-water farms, we would quickly exhaust the aquifer water supply even at this high rate of re-use, and we would consume massive amounts of electrical energy, thereby greatly expanding our carbon footprint and the ecological impact of our operations.

We at CAP, like other companies are doing, will continue to adapt and implement new RAS improvements as they develop; however, recent research is showing that this technology is not yet the panacea espoused by its proponents and will indeed cause its own set of problems related to land use, loss of biodiversity, and exacerbation of climate change. We would welcome the opportunity to host a visit to our Rochester site so that you might view the realities of RAS production and better understand its opportunities and limits.

The Bainbridge Island City Council recently affirmed that it “supports local, sustainable food production and acknowledges that sustainable, well managed net pen operations can safely produce local affordable seafood into the future, and that there is a place for farmed fish in the mosaic of sustainable local food choices in our community in the future”. This is indeed consistent with countries around the world who have recognized that many wild capture fishery stocks are at risk due to overfishing and farmed seafood is the answer for local healthy, sustainable food. In fact, the United Nations Food and Agricultural Organization is placing a major emphasis on aquaculture in an effort to solve world hunger.

Indeed, if the pandemic has taught us anything, it is that we as a nation can no longer rely on imports of any food items to sustain our people. Seafood has been consistently shown to be vitally important for human health. Currently, the US imports ~90% of the seafood it consumes. Over half of that is produced through aquaculture in countries that are much less regulated than our own.

With the understanding that all food production has some form of environmental impact, we owe it to ourselves to seek the truth on the real impacts of our protein production systems. No longer is it sustainable to make acquiring food “someone else’s problem” by ignoring where and how our food is produced. We owe it to ourselves to work together to find solutions to production and environmental hurdles.

The remaining comments are targeted primarily at sections in the draft permits that could be viewed as ambiguous. As you may well understand, given the litigious nature of environmental NGO’s it is important that specific requirements are well laid-out and easily understandable by all.

S. 3. A. 1 (and elsewhere) states that reporting will occur for a variety of parameters, including “..., percentage of nitrogen in feed, ..., feed conversion rates, ...”. Nitrogen in fish feed is a product of the amount of protein in the feed. Modern feed manufacturing requires that protein sources vary by time, amounts, and composition based upon a large number of external and economic factors. If ECY hopes to estimate the amount of elemental nitrogen being excreted from the cage rearing systems a simple arithmetic calculation of nitrogen percentage in the feed and food conversion efficiency will not provide an accurate estimate. Protein utilization and conversion efficiency of various feed ingredients will vary from feed batch to feed batch and is only estimated by understanding the digestibility of the various sources of protein, usually through in vitro analytical processes (see “Application of in vitro digestibility methods in aquaculture: Constraints and perspectives.” Moyano, F. J., et al. 2015. Reviews in Aquaculture, 7: 223-242. doi:[10.1111/raq.12065](https://doi.org/10.1111/raq.12065)). Over a given month (reporting period) several manufacturers and batches of feed within manufacturers may possibly be utilized. While feed manufacturers utilized by CAP generally conduct analyses of digestibility on ingredients, they may or may not be available for each specific batch and we may only have the “minimum guaranteed level of protein” to inform our report. We ask that ECY specify how they plan to use this data so that we can work with ECY, our manufacturers and our staff to better provide the information that will serve its intended purpose.

S3.G. Reporting Permit Violations. Several instances under this section are ambiguous. For example, under the requirements for 24-hour notification it is stated that CAP must report, “Any noncompliance that may endanger health or the environment, unless previously reported under immediate reporting requirements.”. However, no explanation is given on what must be reported “immediately”, only what action CAP must take immediately (reporting is not mentioned). We ask that this be clarified.

S. 8. B. 13. Notification of Unusual Events. This section remains ambiguous. As an example, the circumstances leading to the low water position of one support pontoon at the Orchard Rocks- South facility lead to the development of this section. However, the definition provided in this section, “An unusual event can create or lead to an increased potential for accidental fish escapement, structural failure of the net pen array, or spill” (**please note: the definition is somewhat different in S9**), was clearly never the case in this instance. The only containment nets that held fish at the facility were on the far end of the cage system, which was supported by five other pontoon systems that had normal buoyancy. Moorings were sound (which was why the system dipped) and there was never any danger

of accidental fish escapement, structural failure of the net pen array, or spill. Company records show that the condition had been noted the previous week, was determined to not be a hazard to fish escapement or structural integrity by staff, and was scheduled to be further analyzed early that coming week, confirmed by DNR in subsequent review. It was only upon a frantic reaction to the situation by well-meaning but ill-informed visitors to nearby houses and subsequent reporting to news media that this situation even became an issue. Further clarification of the definition of an Unusual Event is needed to prevent accusations of non-reporting, particularly since it is a condition within the discharge permit.

On behalf of our farm employees throughout the State and contracted processing workers based in Seattle, along with our many suppliers, buyers, and consumers of our products we request that the modifications we seek to the NPDES permits should be granted. We believe that the scientific literature, combined with the track record of CAP's NPDES performance and demonstrated willingness to work with ECY to constantly improve our operations speaks loudly and, we hope, convincingly toward that end.

Respectfully submitted this 26th day of October, 2020.

No Net-Pens of any kind in Washington State!

Net-Pens are not environmentally friendly, even ones with Native species being raised.

If we want more Salmon, manage the populations better. Reduce/cut the quota, close more fisheries for longer periods of time or indefinitely until the populations are restored to much higher, truer sustainability levels.

Encourage people to eat less Salmon, so we HAVE more Salmon.

Joseph Jauquet

The first three items in your revisions above address escape, and the remaining three address pollution and net maintenance. This implicitly acknowledges the major problems you and Cooke expect from the so-called revised plans. Thus, one or more of those events is certain if Cooke gets it's permits. The fact of sterilized steelhead is just a slick end-run around the Legislature's short-sighted bill.

I am strongly opposed to any net pens by any entity for any specie(s) anywhere in WA waters, including the San Juans and the open Straits. I am completely disappointed with WDFW (a former employer) and DOE for not understanding the spirit of the law and rejecting the net pen application forthwith.

Thank you for your consideration,
J. Jauquet

Scott Morrison

I am concerned for water quality and fish diseases. Caged cultured fish are susceptible to many different fish diseases and parasites, and my concerns are for wild fish, during all of their life stages, that may swim near these structures, could get infected. Also, and cultured fish that get out could also infect our wild fish. How will this be addressed?

Ryan Viers

Raising net pen Steelhead anywhere in the Pacific Northwest is an absolute disaster waiting to happen. Raising net pen Steelhead outside of the Skagit River watershed should have been shoot down long before it got to this stage.

The Skagit River was once a fabled Salmon and Steelhead river. Now it is a fraction of what it once used to be. There are many reasons of why the Skagit River saw declines of Salmon and Steelhead. That is not the point, the point is that there is, and has been, an active move to conserve these fish in this river (and others in the Puget Sound). There was a full on cancellation of Steelhead fishing season for a decade, that has only re-opened twice in the last 3 season, and one of those openings was a partial opening. The reason, to let wild Steelhead recover and repopulate.

Now lets rewind a couple years when Cooke had a net pen failure that saw tens of thousands of Atlantic Salmon (which are non-native to the Pacific Ocean and it's watersheds) swimming freely in the Sound and making their way up the Skagit River, as far as Rockport. A failure which by the way, Cooke tried to initially blame on big tides caused by an eclipse. Nice job on stepping up and taking ownership. Ultimately, if net pens with farmed Steelhead are allowed in Puget Sound outside of the Skagit River...it will fail, at some point. And, when it does fail all of those farmed Steelhead will do exactly what the Atlantic Salmon did, find a river to swim up. When that happens the farmed Steelhead will try to spawn with wild Steelhead. Maybe the farmed Steelhead are all sterile, that's what we are told anyway. But, how do we really know? A failure like this from a company that we already know tries to deflect responsibility could undo years, decades, of recovery of the fish that made the Skagit River known world wide.

Having farmed Steelhead on my plate is not a compelling enough argument to put a net pen, any net pens, in Puget Sound outside of the Skagit River. The state of Washington should not even be considering this. What should be considered is eliminating net pens altogether in Puget Sound, removing dams and hatcheries, and letting the fabled wild Salmon and Steelhead that made the Pacific Northwest what is, recover.

Jean Thompson

I have continued concerns that Cooke Aquaculture can be relied upon to comply with the requirements of the permits they seek. It was non-compliance that led to the collapse of the Cypress Island pens and release of Atlantic Salmon, which we witnessed first hand from our home here in Anacortes.

Additionally, I am not convinced there is a way to conduct aquaculture that does not pollute/harm the seabed below and the surrounding waters. Excess feed and concentrations of fish poo pile up on the seabed and smother all naturally occurring living organisms.

Thirdly, I have seen multiple documentaries showing how fish farms attract an over population of sea lice. Whereby sea lice occur naturally, these concentrations attach to the smolt of wild fish runs in the area in numbers so great that they kill them before they reach the open sea, thereby reducing the survival rates of our wild fish runs.

Aqua culture is a threat to our wild fish runs and should not be allowed for anyone, anywhere.

L Wayne

Washington is the only state on the Pacific coast that permits these facilities. At the beginning of 2020, Canadian Prime Minister Trudeau announced plans to transition all open-water industrial aquaculture in British Columbia to land-based facilities by 2025.

Many of these farmed fish would still be capable of interbreeding & exchanging pathogens & parasites with endangered wild Puget Sound steelhead. With this permit Cooke will be able to exploit a loophole in the legislative phaseout by raising steelhead rather than Atlantic salmon. Our state government needs legislation to get rid of any type of net pens! Our ocean, sea life, and the public's healthy consumption of fish is at risk.

William Bryden

The methods allowed by the permits are dated and do not reflect "best available technology to reduce impacts and wastage". Zero discharge land based RAS is available and must now be the new standard by which pollution acceptance is measured. Spill-over and spill-back of contagions (viruses, bacteria, parasites, and fungi) has driven the economic shift of investment money to RAS. Cooke, holding a large market share of net pen production in N.A. has refused such changes due, in part, to their inevitable loss of market share if they retrofit to RAS land based tech. The permits, as they are written, fail to prevent or monitor impacts to wild resources impacted by the mega pollution resulting from open net pen use. History and the weight of scientific evidence has shown this, has it not? Using current technology, monitoring impacts from open net pen effluent (which unnaturally amplifies contagions) is impossible. In fact, new to science contagions are found constantly and increased virulence is the order of the day in these unnatural unmoving populations of naturally migrating and predator strengthened anadromous fish. With all due respect, please do your jobs and stand up against this ecocidal use of our marine ecosystems and the ecocidal transference of expense from Cooke bottom line to our shared environment.

PS I have an ecology degree and more than 10 years experience watch-dogging this method of protein reduction for profit. I have reviewed and testified during discharge permit applications in Maine and throughout Atlantic Canada as an expert witness. I have also been involved in numerous law-suits that I initiated and reviewed ALL of the open net pen EPR and EIS's filed in Atlantic Canada since 2012. In fact, most of them were triggered due to my work on this issue.

I can go on and on about predatory migration disruption and attraction, contagion amplification and increased virulence, a lack of effective monitoring, escapes and genetic introgression (triploidy is not 100%), effects of triploidy on salmonid health and predator preference/attraction, impacts from escapes, antibiotic/neurotoxin use/abuse and illegal toxin use by Cooke (multiple convictions), sea lice, cleaner fish abuse and disease/escapes/morts, coastal nutrification, etc All of which is avoided by RAS systems with zero effluent (eg the license-able tech offered by Sustainable Blue in NS Canada, and Superior Salmon in Wisconsin)

But will you even listen....will your grandchildren ever eat an economical wild salmon due to their abundance?

Be better than the managers before you....the ones that allowed and facilitated our current mess. If you chose to ignore my warnings and pleas...at least fin mark or pitt tag every fish, allow eNGO over-sight for disease and lice monitoring, and set limits on lice and drug/toxin use, increase escape/disease/parasite monitoring and reporting...do it better and Cooke too will shift to land based....for the money.

Mike Brinkley

I am strongly against any kind of aquaculture in the sound. Feeding the fish depletes natural food sources and the waste products and disease from crowded net pens pollutes everything around the pens. Passing wild fish are adversely affected. the only kind of fish farming that is acceptable is in land pools. Even then I would personally never buy a farmed fish.

NO NET PENS!!!!

Andrew Stevenson

Lipstick on a pig. You continue to dance around the edges of the problems, instead of addressing them directly. Your statement that "the change from Atlantic salmon to steelhead is not likely to change the effect to water quality" is demonstrably false with respect to pathogens, and presupposes that your original water quality determination is correct and supportable, which is not the case. Instead of trying to leverage off a false and inadequate original finding of dubious applicability I DEMAND you "begin at the beginning" and execute an entirely new NPDES permit investigation that specifically addresses steelhead and incorporates and accounts for all the new science that has evolved around net pens as a source and dispersal point for viruses, parasites, and other pathogens to native species. It is irresponsible in the extreme to allow cultivation of a native species in an environment that is proven to foster disease and parasites harmful to wild stocks.

NO NO NO!

Katherine Marshall

No! Please do not approve this reckless plan. Cooke Aquaculture has demonstrated its unreliability, its past failure to follow rules it has agreed to, its inability to keep its own operations from despoiling Puget Sound. I spend big parts of the year on the Sound, and it is my fervent hope that it becomes a cleaner home for its native species. Thank you

Gerard Stromberg

Do not allow fish farming in our inland waters; Support salmon & steelhead hatchery programs.

William Fitzsimmons

If the truth is told you have a foreign corporation that wants to exploit a local resource for profit without knowing whether or not the presence of their facilities will have a deleterious effect on a cherished and valued environment. Cooke Aquaculture has already proven they are not to be trusted with the operation and maintenance of their facilities. How long is it going to take the state of Washington to recognize the obvious. We do not need net pens. We need a healthy Puget Sound.

Jeff Waldron

This is still garbage. It is a permit to allow pollution from feed and fish feces. Reporting and monitoring does nothing to prevent the release of fish into a fragile environment. If Washington state cared about protecting natural resources such as salmon and orca no fish farms would be allowed. Revising a permit so they can raise native fish is a joke. This is still a dangerous operation. Easier to continue to limit salmon seasons and enforce closures while allowing private enterprises to utilize public resources to make a buck. Way to go Inslee minions or is that morons

Eleanor Mattice

Please do NOT allow fish farming in the Puget Sound. Fish farms pose a danger to native fish stocks with infections that are easily passed from the farmed fish. Please help our native salmon/steelhead fish improve their numbers. This, in turn, will help the orca survive. Fish farms have caused a lot of problems around the world. I do not want fish farms polluting the waters of the Puget Sound.

Rob Schmaus

Please stop this!! If you had a house guest, and that house guest caused irreparable damage to your physical home, damage that could not be measured and who's repercussions will be felt for years, all because they directly defied you house rules, WHY WOULD YOU LET THIS HOUSE GUEST BACK INTO YOUR HOME?!?

It is absolutely ridiculous that This is even being considered...

These people have no respect of our waters, they have proven that. What has changed?

This is about money. Lobbyists and back door meetings. Don't let that sway you from doing what is so clearly right. STOP COOKE AQUACULTURE.

Renew the faith in our system and do what's right for our environment.

Bye Felicia!

Steve Salonen

I do NOT want to see Cooke's steelhead pens in Puget Sound. Their poor track record of safety and containment of farmed fish is sufficient reason to deny their request.

Melissa Belz

I'm opposed to any net pens in WA. There is always change of escape, contamination, and use of antibiotics in the fish. Make habitat not pens.

Thank you

Aileen Jeffries

The proposed continuation of net pens in the Puget Sound will have a detrimental effect to the marine ecosystem. The concentration of so many fish will promote fish disease, sea lice and contamination of the waters as well as many other negative effects. Aquaculture should be done on land where it will not affect the marine waters. Litigation has already made the point that this is not a public benefit.

Jon Steeves

I approve and encourage growth of the aquaculture industry anywhere in the country, including these projects submitted by cooke aquaculture. we as a nation import 85%-90% of all seafood consumed and to not have our own production secured as a nation is criminal. As we have seen throughout this covid crisis our reliance on other countries to meet our production demands can have serious implications. Aquaculture is scientifically proven to be sustainable and profitable and will help meet the need of increasing demand on locally sourced seafood. it creates good paying careers for people that would otherwise be left behind due to lack of skills or education and helps relieve the burden on the state.

Cooke though large in size has always operated in areas that often get forgotten or left behind, i suspect this will be no different and the areas of their operations will see an influx in demand to other local business and indirect spending by the business, its employees and other contractors and providers.

I fully support this growth industry and encourage governments country wide to get behind the industry to see it able to grow and become competitive with other nations.

christina conte

The Ft Ward fish pens are directly in our view and it's a shame that it's marred by them. I think our passage is much too narrow for the pens to be located here. They are a visual blight and the noise made by the operation is offensive. Not to mention that I don't trust Cooke after their 2018 spills.

Recently I complained to the DNR, Fish & Wildlife, the Bainbridge Police and Cooke about the 100-200 sea lions that were hauling out on their pens for approximately 2 months this summer. All they needed to do was install more fencing to create a barrier. First they lied in an email to me and said it would cost \$100K to fence the pens off. When several neighbors complained they installed simple fencing in 2 hours! But it took them months to respond and then act.

I'd like to see the passage returned to its indigenous state.

Mike Freeze

The use of all female sterile rainbow trout in Cooke's net pens is an excellent idea and should be permitted. This demonstrates Cooke Aquaculture's commitment to protecting the environment, while also providing much needed employment opportunities in this area of the state. As a producer of sterile triploid grass carp for over 35 years, I can attest that the use of non-reproducing fish can have tremendous ecological benefits and is a win-win for all sides involved. To not allow Cooke Aquaculture to use such environmentally safe fish is to ignore science completely.

Megan Taylor

I am sad to see state agencies wasting yet more time trying to gather public input, review a plan, or insure that plan is followed by Cooke Aquaculture through monitoring by WA State agencies. They have been a very poor and irresponsible tenant in WA State waters in the past and have lied about actions that they had taken or would be taking -- when they were caught. They should be prohibited from having any net pens or operations in WA State waters.

James Beck

I am very concerned about the waste produced by the massive number of fish raised and kept in net pens. There is no way for the massive amount of waste produced by the fish to be "flushed" out to sea, so it accumulates in the canals affecting water quality. I beg you not to allow more net pen permits.

Charles Ballard

Net pens are never acceptable in Puget Sound waters as they concentrate droppings into a small area of the water and therefore pollution is concentrated . Steelhead are protected and in very short supply and should never be sold because people will be lead to thinking they are now plentiful and could be buying poached wild fish.

Penelope Benz

There is no reason in the world why a for-profit company should be able to lease a section of Puget Sound that belongs to the Public. I find it very offensive that ANY company can profit from using our public waterways. It should also be known that there is a HUGE amount of sludge at the bottom of the pens on the bottom...after years and years of dumping fish food DAILY which we can smell at very low tides. There is no actual accountability for their negative impact on the environment or else we would see a clean-up effort from all of the damage caused over the years.

Any company wishing to grow fish should be required to purchase land and create their own fish pens- much like the Salmon Hatchery near Kingston.

Please DO NOT continue to allow this company or any other company to profit from using any part of Puget Sound!!

Neal Hoffberg

Cook Aquaculture nor any other artificial company should never be allowed to build new or maintain existing fish pens in the Puget Sound or other Northwest waters. Existing pens have already done irreparable damage to the environment and more importantly, native fish.

Terry Sullivan

Open water net pens for fish farming spread disease among wild fish, pollute the immediate environs, pose a threat to the genetic purity of local wild fish, and are not a solution to the environmental loss of local fish stocks. If we want to improve fish stocks, we will need address the systemic environmental causes of their decline. That will require human lifestyle change: something we are reluctant to do, but for this and many reasons, we **MUST DO!** We can't continue settling for half baked solutions that worsen the problem in the long run. Please make an honest long term decision on this and deny the permit on these facilities.

Jeffrey Norman

I am appalled that WSDOE would consider granting Cooke Aquaculture a permit to raise "Steelhead" in net pens. Steelhead are anadromous Rainbow Trout, *O. mykiss*. What distinguishes it from its fluvial and lake-bound brethren is the sea-going life-cycle, and the return from the salt to spawn in its natal waters. These captive trout cannot be called Steelhead. Labeling issues aside, you still have the same, terrible environmental consequences of net-pen-rearing of a non-native species, or at least a species raised in an unnatural manner. The same issues of pollution, disease, escape, and inter-mingling with wild stock exist, just as it has with Atlantic Salmon. Take a big hint from Alaska, Oregon and California: these nets do not belong in our waters. Shame on you for prioritizing revenue over the environment.

Matthew Steinwurtzel

I strongly disapprove of the decision to allow Cooke Aquaculture to farm native steelhead in Puget Sound. For one, Cooke has proven that their track record in aquaculture does not support a healthy Puget Sound ecosystem, and they have proven that they cannot adequately and safely manage their facilities.

Secondly, allowing Cooke Aquaculture to farm native steelhead works against a regional approach to restore our native populations of steelhead and other anadromous fish. With recent years of poor returns, this decision is incredibly concerning given how it will affect our wild fish.

I implore you to reject Cooke's permit and to focus on regional ecosystem-based solutions that will allow for the restoration of our prized fisheries.

Thank you for your time.

Katherine Scott

I'm appalled that this permit is even being considered.

Seriously?

Why would we trust Cooke Aquaculture now in view of their criminal past actions and the lies they told?

Mitigations may be made, good intentions may be promised, but pollution remains inevitable and when their freak fish escape again into our waters the damage will be done.

Wendy Feltham

I have heard that Cooke Aquaculture hopes to switch from raising non-native salmon to steelhead trout in Puget Sound. I am writing strongly opposed to permitting Cooke Aquaculture to raise any kind of fish in their net pens or any other pens. Despite the addition of requirements to (hopefully) stop fish from escaping, that cannot be guaranteed. Additionally, the inadvertent release of food, waste from the food, antibiotics, and decayed nets into the sea will only cause harm to the fragile ecosystem, including our native wild fish. Past practices by Cooke Aquaculture terrify me, as our top priority should be to protect our local waters and environment.

Ben Bauermeister

Cooke does not have a reputation of being a good actor in this field. Their pens have collapsed, their pollution above regulated levels, and their responsiveness slow and recalcitrant. I believe that their application should be denied based on past infractions.

Susan Alotrico

I do not support this project and neither can they prove it will be safe. Farmed invasive species are already in the Salish seas from failed net pens. How wild species will survive interacting with farmed species is not known and I don't believe it serves the native fish. I stand with the Wild Fish Conservancy, Center for Biological Diversity, Center for Food Safety and Friends of the Earth that argue allowing Cooke Aquaculture to raise steelhead in floating net pens would jeopardize the region's wild steelhead, salmon and endangered Southern Resident orca whales. I agree that "Puget Sound steelhead, including those from the Skagit River, have been listed as threatened under the federal Endangered Species Act since 2007." Furthermore, Cooke has a bad track record, "In August 2017, one of the company's farms near Cypress Island in Skagit County collapsed under the weight of debris the company neglected to clean off, and the majority of the 300,000 fish in that net pen escaped." ...these quotes take from The Columbian article:
<https://www.columbian.com/news/2020/feb/13/groups-sue-washington-wildlife-agency-over-steelhead-farms/>

I vote NO!

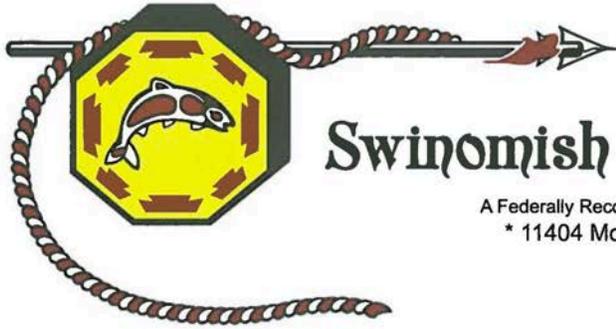

Austin Franklin

I fully support the Cooke Aquaculture NPDES permit modification to change the species being raised in net pens. I believe they are trying to do things the right way and are making their operations as transparent as possible. The DOE is providing oversight and will be closely monitoring Cooke's water quality reports. All water quality testing must also be done by a DOE approved laboratory. The community should allow Cooke the opportunity to prove net pen operations can be done in a sustainable and environmentally safe way.

Janet Alderton

I am dismayed that public comments opposing aquaculture of finfish in confined feeding operations in our marine waters do not appear to have any effect on whether such negatively impactful projects are allowed to go forward. I agree with all the comments submitted by the Swinomish Indian Tribal Community that oppose just such a concentrated feeding operation being carried out immediately off-shore of their land. I have attached their comments. It is clear to me that the proposed steelhead rearing operation could be more safely carried out on land -as proposed in the Swinomish comments. But this would not solve all the negative impacts, including the problem that such finfish concentrated rearing facilities will feed the steelhead food derived from smaller fish species in the marine food web. This disrupts the marine food chain for salmon and other threatened and endangered animals.

Must further legislation be adopted to specifically ban this new misguided proposal?

Re: Cooke Aquaculture Pacific, LLC NPDES permit modification application

Dear Director Watson:

Thank you for the opportunity to review the request for a NPDES permit modification submitted by Cooke Aquaculture Pacific, LLC (Cooke) for its proposal to rear domesticated native Rainbow trout/Steelhead at the Hope Island net pen facility. Cooke's proposal to rear 350,000 domesticated native Steelhead poses new and different risks than rearing non-native Atlantic salmon. After reviewing the NPDES application materials that Cooke submitted to the Department of Ecology (Ecology), we believe it is necessary for Ecology to engage in a new permit process that includes new SEPA threshold determination and a public hearing. We have a number of concerns with Cooke's NPDES permit application, about which we offer the following comments.

Introduction

The Swinomish Indian Tribal Community is a present-day successor in interest to the tribes and bands that signed the 1855 Treaty of Point Elliott ("Treaty") with the United States. One of the core rights reserved by the Treaty is the Tribe's right to fish in our adjudicated usual and accustomed fishing areas (U&As) in and around the Skagit River system, the Samish River system, and marine waters in northern Puget Sound. *United States v. Washington*, 459 F. Supp. 1020, 1049 (1975). The Swinomish Tribe and WDFW are co-managers of fisheries and fisheries

resources within western Washington and the Tribe's right to take fish under the Treaty of Point Elliott is a legally protected interest.

The Tribe's reservation is located on Fidalgo Island in northern Puget Sound, in Skagit County, Washington. The reservation's southern boundary is the north fork of the Skagit River, which is the only river in Washington that still supports six species of wild salmon. The DNR aquatic lands lease for Cooke's Hope Island net pen contains an official survey showing the lease area to be approximately 1,010-feet wide and 1,358- feet long, or approximately 31.5 acres. According to a January 2018 engineering inspection report of the Hope Island net pen facility, that structure is currently comprised of ten (10) 26-meter square net pen cages, as well as a feeding shack, walk ways and other infrastructure around the periphery of the facility. These cages were installed in September 2010, and have a lifespan of 10-15 years. The 2018 inspection report's Attachment A contains plans and drawings of the net pen structure showing that the net pen cages, facility, anchors and anchor lines expand across an area approximately 787- feet long 700-feet wide, or extending coverage over 12.65 acres.

Since time immemorial, the Tribe has lived, hunted, fished, and gathered in and around the Skagit River basin, the Samish River basin, and marine waters in northern Puget Sound. Anadromous fish, and particularly salmon, have played a central role in the Tribe's subsistence, economy, culture, spiritual life, and day-to-day existence. For thousands of years, our homeland contained no impediments to the Tribe's ability to fish and gather shellfish throughout our adjudicated U&As. Historically, much of the Swinomish Tribe's subsistence needs were met through fishing and shellfish gathering in and around the Skagit River basin, the Samish River basin, and marine waters in Skagit Bay. The Bay is historically and currently an important fishing place, both because it is where the mouth of the Skagit River meets Puget Sound, and because of its extremely close proximity to the Swinomish Reservation, making for ease of access by the Swinomish Tribe's fishing fleet. Tribal fishers have fished Skagit Bay and throughout the San Juans, for a variety of fish or shellfish species, including Chinook, coho, steelhead, halibut and Dungeness crab. Lone Tree Point on the Swinomish Reservation and directly across from the Hope Island net pen, has historically been a place for tribal members to gather in the summer, with the beach at Lone Tree Point serving as a fishing village with fishing shacks lining the beach with unimpeded views and access.

Tribal leaders want to ensure that their grandchildren and seven generations from now have the opportunity to fish in the same way that they have for decades and to restore the cultural import and use of Lone Tree Point. The Swinomish Tribe's Treaty Rights, and the cultural, historic and subsistence significance of Lone Tree Point depends, in large part, on salmon have clean waters that are free from chemicals or other introduced man-made substances.

Pursuant to WAC 173-220, no pollutants shall be discharged to any surface water of the state from a point source, except as authorized by an individual [NPDES] permit.¹ All discharges authorized by a NPDES permit shall be consistent with the terms and conditions of the permit.² Discharge of pollutants not expressly authorized by the NPDES permit is prohibited. The permit holder must report discharges and will be subject to CWA violations and penalties for discharges not covered under the permit.

Permits are issued for a fixed term not to exceed five years.³ During the five-year permit term, the facility's effluent discharge conditions may change from those conditions reported in the permit application and the permit holder must notify Ecology if significant changes occur constituent with 40 C.F.R. § 122.42(a). Any facility expansions, production increases or process modifications which would result in new or increased discharges of pollutants causing effluent limitations in the permit to be exceeded must be reported to the department by submission of a *new* application or supplement thereto; or, if such discharge does not violate effluent limitations specified in the permit, by submission to Ecology notice of such new or increased discharges of pollutants.⁴

Ecology's stated role is to consider how the proposed new species effects the discharges from the operation and what is required to protect water quality as a result. It is Ecology's duty to ensure that discharges will not endanger human health or the environment.⁵ It would be appropriate for Ecology to consider the availability of land-based, environment-controlled aquaculture systems and compare the water quality discharges from land-based aquaculture operations to the those proposed in Cooke's NPDES permit application. The reality is that the technology exists, and it is commercially viable, to grow fish in land-based, environmentally

¹ WAC 173-220-020.

² WAC 173-220-150(a).

³ WAC 173-220-180(1).

⁴ WAC 173-220-150(b).

⁵ WAC 173-220-150(d)(iv).

sustainable farms.⁶ As a result, *there is simply no reason to continue allowing concentrated animal feeding operations that emit hundreds of thousands of pounds of fish feces, fish food, dead fish, and antibiotic-laced food into ecologically sensitive marine areas and designated critical habitat – particularly at the mouth of the Skagit River.*

As you may know, Demographically Independent Populations (DIPs) of both Skagit River Steelhead and Chinook are listed under the Endangered Species Act. Cooke’s net pen proposal to rear 350,000 domesticated native Rainbow trout/Steelhead presents a host of new, potentially adverse water quality impacts. These potential adverse impacts include antibiotic treatments for diseases like Rainbow trout fry syndrome, which has no vaccine but is pervasive. Adverse impacts also include the potential for increased spilled fish food, which acts as chum for native wild fish, attracting predatorial pinnipeds and birds, caused by an overall higher number of individual fish in the net pen facility.

An additional important point to note at the outset is the age of Cooke’s Hope Island facility. According to DNR Aquatic Lands Net Pen Lease for Hope Island, Cooke’s net pen cages were replaced in 2010 and have “an average expected service life of approximately 15 years.”⁷ Given that the Hope Island net pen cages are entering the last one-third of their life expectancy, we believe it is necessary for Ecology to impose more stringent below-surface inspection requirements for this cage if a permit modification were granted. We address this concern in more detail in Section 2.B.

To protect water quality, human health and the environment from pollution emanating from Cooke’s Hope Island net pen facility, Ecology must analyze and address specific concerns including but not limited to the fact that Cooke has submitted an:

1. Incomplete and Deficient Pollution Prevention Plan, including Unaddressed Adverse Impacts on Water Quality and Ecosystem Health from Antibiotic Use.
2. Incomplete and Deficient Fish Escape Prevention Plan.
3. Incomplete and Deficient Fish Escape Response and Recapture Plan.

⁶ For example, AquaCare Environment is a company based in Bellingham, WA that “was established in 1987 dedicated to developing and marketing cost-effective equipment and systems for modern, intensive land-based fish farming.” www.aquacare.com

⁷ DNR Aquatic Lands Net Pen Lease 20-B12356, Exhibit B, p. 2.

Additionally, we believe that, given Cooke's history of Clean Water Act and NPDES permit violations, including –

- the 2017 catastrophic net pen collapse at Cypress Island that released over 200,000 non-native Atlantic salmon,
- the summary judgment ruling against Cooke on April 26, 2019 for Clean Water Act and NPDES permit violations, and
- the Orchard Rocks net pen facility partial sinking incident in late October 2019,

that Ecology must take Cooke's history of permit violations into account as it considers how to handle this application.

Specifically, Cooke has lost any benefit of the doubt that it may have once enjoyed due to its failures to follow basic procedural safeguards in prior NPDES permits. The stakes could not be higher for protecting water quality in Skagit Bay, and a worst-case scenario analysis for ESA-listed Steelhead and Chinook must be included in Ecology's water pollution calculus. Given these concerns and the new information in Cooke's NPDES permit application as highlighted below, we believe that Ecology should engage in its own SEPA analysis under RCW ch. 43.21c.

Ecology should engage in its own SEPA analysis because (1) Cooke's Pollution Prevention Plan is incomplete and deficient, (2) Cooke's Fish Escape Prevention Plan is incomplete and deficient, and given Cooke's history of non-compliance should have more accountability measures, (3) Cooke's Fish Recovery and Recapture Plan is incomplete and deficient, and (4) New Tier II analysis should be required in accordance to Washington's Antidegradation Policy.

The new information contained in Cooke's NPDES permit application materials was not included as part of Department of Fish & Wildlife's (WDFW) SEPA analysis. In order for Ecology to perform its duty to ensure that discharges will not endanger human health or the environment, it must take a thorough analysis of Cooke's application and should engage in its own SEPA analysis to determine if the NPDES modification without a new threshold determination. Some of the new and/or deficient information provided by Cooke in its NPDES permit application materials includes, but is not limited to, the following.

1. Incomplete and Deficient Pollution Prevention Plan

A Permittee is required to develop and implement a pollution prevention plan under WAC 173-221A-110(4)(c).⁸ The plan must contain operating, spill prevention, spill response, solid waste, and stormwater discharge practices to prevent or minimize the release of pollutants from the facility to the waters of the state.⁹ A Permittee is required to submit the plan within six months of permit issuance, and review the plan at least annually. If changes occur, the permittee must update the plan and inform Ecology.

The pollution prevention plan must address how solid and biological wastes are collected, stored, and ultimately disposed of at an upland facility. Solid wastes of concern for marine salmon net pens include fish mortalities under normal operations, fish mortalities due to a fish kill involving more than five percent of the fish, blood and waste from harvesting operations, and sanitary waste and operational debris.

The draft pollution prevention plan submitted by Cooke in the 2020 application does not address changes in procedure related to raising native domesticated trout/steelhead. Therefore, it is likely the pollution prevention plan does not take into consideration any differences involved in native steelhead versus Atlantic salmon. The permit modification application states that Cooke is in the process of updating the pollution prevention plan, spill prevention control and response plan, and fish escape prevention plans, which will be submitted to Ecology and WDFW. None of the drafts mention steelhead or address differences in steelhead versus Atlantic salmon, and Ecology should not grant the permit until it closely examines the differences.

A. Increased Numbers of Fish Equals More Fish Food, Antibiotics and Fish Feces

Cooke states that growth projections for the triploid steelhead stock and the smaller targeted average harvest size may shorten the saltwater growth cycle by several months in comparison to Atlantic salmon. Yet when comparing the 2020 NPDES permit modification application to the 2017 NPDES permit application, the pounds of fish and pounds of food is estimated to be the same or greater in the 2020 application compared to the 2017 application. If steelhead are harvested at a smaller size than that of Atlantic salmon, then to achieve the same poundage rate, more fish would need to be in the net pen. If that is true, then more feed and antibiotics will be required. This, in turn, will result in more discharge of fish feces. Given harvest size for steelhead is different from that of Atlantic salmon, Ecology should expect

⁸ The Permittee is also required to review, update, and maintain a fish escape prevention plan and a Fish Escape Reporting and Response Plan in compliance with WAC 220-370.

⁹ WAC 173-221A-110(4)(c)(i).

discharges to be greater for raising steelhead versus Atlantic salmon and therefore should take this into consideration when evaluating the permit modification application.

The information provided by Cooke about fish feed consumption rates and the amount of excess feed spilling out of the net pen facility is indeterminate. Section 4 of the pollution prevention plan states that:

4. "... The feeding strategies prioritize the minimization of uneaten food, thus minimizing the amount of food that falls through the cages and onto the ocean floor below. Cooke has developed Feeding Strategies to provide standards for the initial startup feeding of new smolts when they arrive on site, the size of the feed pellets, the duration time of the feeding process and the types of feed diets. As the fish grow, the Site Managers will adjust the feeding schedules ..."

This language is well-intentioned but insufficient for purposes of a NPDES permit. Cooke provided an estimate of the monthly fish feed at maximum production.¹⁰ It should be required to provide an estimate of the amount of feed that is uneaten. This uneaten fish food that falls through the net pen into surrounding waters is a recurring discharge that also serves as chum to attract native fish, as well as predatorial birds and pinnipeds. Until Ecology establishes with reasonable certainty the amount of fish feed released from the net pen facility, it cannot perform an adequate assessment of the adverse impacts to water quality, human health and the environment.

Further, there is no mention in Cooke's application materials about the differing feed conversion rates between domesticated Atlantic salmon and rainbow trout. Generally speaking, science has shown Atlantic salmon to be generally more efficient at converting feed to biomass than trout, the latter being more variable in feed conversion rates and more susceptible to environmental controls (temperature and salinity) on growth.¹¹ As such, more feed is likely to be needed for trout/steelhead, which would produce more waste into the marine environment. Even though this issue is not addressed in the NPDES permit modification application Ecology should consider how the new species would increase the level of discharges.

¹⁰ Cooke January 2020 NPDES permit application, p. 9.

B. Antibiotic Harms to Aquatic Life and Human Health

Ecology determined discharges may contain chemicals of concern for human health, specifically federally-approved antibiotics for fish.¹² Antibiotics have the potential to create antibiotic resistant bacteria in the sediment, and that resistance could be transmitted to human bacteria. Antibiotics are widely found in surface waters across the country,¹³ and they cause known, antimicrobial-related adverse effects on both wildlife and human health at the pollution levels currently found in our waterways.

1. Harm to Aquatic Wildlife

In a recent nationwide study of stream sites, maximum antibiotics concentrations ranged from 12 nanograms per liter up to 1.8 micrograms per liter (parts per billion), with many sites hosting multiple antibiotics.¹⁴ Concentrations of just 0.5 micrograms per liter have been shown to change aquatic microbial communities.¹⁵ One risk of these microbial changes is that the antibiotics suppress beneficial bacteria in the water, thereby harming aquatic organisms that rely on healthy levels of “good” bacteria.¹⁶

Furthermore, the presence of antibiotics in the water has led to increases in the growth of antibiotic resistant bacteria in surface waters. Studies have found that aquatic organisms also contain these antibiotic resistant bacteria. For example, studies of orcas in the Salish Sea have found antibiotic resistant bacteria in orca blow (respiratory exhalation) and feces.¹⁷ In the orca feces study, 100% of samples showed resistance to at least one antibiotic, and over 70% of samples showed resistance to multiple antibiotics.¹⁸

There is a commonly occurring disease in farmed rainbow trout at the fry, fingerling and juvenile life stages requiring the use of anti-biotics because there is no vaccine.¹⁹ *Flavobacterium*

psychrophilum is the causative agent of Rainbow Trout Fry Syndrome (RTFS).²⁰ Both living and dead fish can be a source for the bacterium but “dead fish show a higher rate of bacterial release into the surrounding water.”²¹ The principal infection control measure is to administer the antibiotic florfenicol, which is one of the three anti-biotics listed for use by Cooke.²²

Despite the legal framework of Washington’s water pollution control laws, dilution of point source pollution emanating from a marine-based concentrated animal feeding operation is still seen as the solution to pollution, regardless of the impacts on known ESA-listed fish. Ecology must consider a worst-case scenario for the use of antibiotic medicated feed and extra-precautions taken to find diseased fish, treat diseased fish, and regularly dispose of dead fish.

2. *Harm to Human Health*

Aside from potential concerns about humans consuming low levels of antibiotics in their drinking water, aquatic antibiotic pollution poses the most substantial health threat to humans because it increases the rate of antibiotic resistance. At least two million people are infected with antibiotic-resistant bacteria in the U.S. each year, and 23,000 of those individuals die from the infection.²³ Studies have linked pharmaceutical water pollution to the growth of antibiotic resistance, including a recent EPA study which found that current antibiotic levels in water could inhibit some naturally occurring and potentially beneficial bacteria and trigger some antibiotic resistance.²⁴ One example of this link is provided by the common antibiotic ciprofloxacin, a drug that was recently found at about a quarter of studied stream sites across the country at concentrations up to 400 nanograms per liter.²⁵ Ciprofloxacin has been found to select for resistant bacteria at levels of only 100 nanograms per liter (parts per trillion) – well below the levels actually found in the recent nationwide stream site study.²⁶ Therefore, studies have already demonstrated that the current levels of aquatic antibiotic pollution are contributing to increasing levels of antimicrobial resistance.

²⁶ *Id.*

3. *Bioaccumulation of Pharmaceuticals*

Pharmaceuticals have a high potential to bioaccumulate through the aquatic food chain, with corresponding adverse impacts for aquatic and non-aquatic species alike. Even non-aquatic species that eat fish or insects can be harmed by the bioaccumulation of pharmaceutical pollution in water.

The concern that scientists have been underestimating levels of contamination in fish was reinforced in a more recent study of 150 contaminants of emerging concern in three estuaries in Puget Sound, two of which receive effluent from waste water treatment plants (WWTPs).²⁷ The study analyzed the levels of these emerging contaminants (including pharmaceuticals) found in wastewater effluent, estuarine water, and two species of fish: Pacific Staghorn Sculpin and juvenile Chinook.²⁸ The fish in this study had higher levels of contamination than would be expected based solely on the levels of contamination present in the estuarine waters, suggesting there were either upriver sources of contamination in addition to the wastewater effluent or bioaccumulation impacts through the food web, or both.²⁹ Additionally, the authors noted that there is a larger potential for bioaccumulation in water with a higher than neutral pH, such as marine waters.³⁰ In all, forty-two contaminants were found in fish tissues, including nine contaminants which were absent from both the wastewater effluent and estuarine water samples.³¹ Importantly, juvenile Chinook had significantly higher levels of contamination than the Pacific Staghorn Sculpin, perhaps because of their high rates of ingestion and gill ventilation.³² Therefore, some species such as Chinook may be especially vulnerable to pharmaceutical bioaccumulation. This variability in bioaccumulation rates between species, as well as the variability in bioaccumulation rates between specific contaminants, underscores the need to protect aquatic wildlife from foodweb magnification of pharmaceutical pollution.

In sum, bioaccumulation is likely occurring from the existing discharges and with the anticipated increase in fish and feed involved in raising steelhead bioaccumulation is likely to increase. The true amount of pharmaceutical pollution in Puget Sound is relatively unknown, and during a time when disease is causing a national pandemic, Ecology should be extra cautious

when evaluating increased discharges of antibiotics under Cooke’s NPDES permit modification application.

C. New Fish Mortality Information

Cooke’s pollution prevention plan includes new quantitative fish mortality information that was not provided by Cooke to WDFW in its SEPA materials. It is unclear whether this significant new information is based on Atlantic salmon mortality. The new fish mortality information includes the following.

- a) Expected average monthly fish mortality at the Hope Island net pen is 5,000 pounds of fish biomass, or 0.17% of the total 2,800,000 lbs of annual fish biomass that Cooke expects to rear at Hope Island.
- b) These dead fish are collected three times per week by divers, except in the event of adverse weather conditions, and disposed of in landfills or compost facilities.
 - It is unclear from Cooke’s application what happens when divers are not able to retrieve the dead fish – if are they left to decay at the bottom of the net pen, what is the maximum threshold for this type of pollution discharge?
- c) Divers make what amounts to an educated guess by noting the “presumed cause of death” in their weekly reports as to the cause of the fish mortality, yet no specimens are required to be sent to a lab facility for testing.
 - Is this what Cooke considers as having a “licensed veterinarian monitor the health of fish stocks raised at the facilities” as referenced in the plan’s section 5.2?
 - Why are these fish not regularly tested at a lab for diseases, pathogens and parasites?
 - What exact training to staff have to diagnose the cause of death for several thousand pounds of fish mortality each week?
- d) The WA Department of Health (DOH) is only notified when a “large mortality event” occurs, defined as 5% mortality (140,000 pounds of fish biomass) in a one-week period. This is 28-times more than the “average” expected weekly mortality rate, but there is no information or explanation provided for why DOH notification is not required until an event of such magnitude occurs.

- Stated another way, why does an event that is 5- or 10-times the normal mortality not require DOH notification?
- Is a lower threshold for DOH engagement appropriate given the potential for disease in a net pen to infect native wild Steelhead?
- What is the plan for handling a medium-sized or large mortality event when inclement weather prevents divers from retrieving the dead fish?
- There do not appear to be notice requirements to the Tribes – why not?

- e) With respect to section 5.2, it is unclear from the plan under exactly what circumstances Cooke would engage a licensed veterinarian. Section 5.2 reads:
A licensed veterinarian monitors the health of the fish stocks raised at the facilities. The veterinarian is used to identify the type of pathogen causing disease and the effective course of management to control the pathogen.

The claim that a licensed veterinarian “monitors the health of fish stocks” is contradicted by other statements in Cooke’s permit application. If Cooke is not required to regularly test the weekly batches of dead fish, then it seems that a veterinarian is not “monitoring” the health of the fish stock, particularly if a veterinarian does not engage until a massive fish mortality event. All indications are that it is up to technicians with completely unknown or unquantified technical training to make judgment calls about fish mortality. If veterinarians actually do “monitor” the health of fish stocks at a net pen facility, what specifically does this entail, how often do they consult with local staff, what tests are run and under what circumstances?

- f) With respect to section 5.3, the words in Section 5.3 are phrased more as a goal rather than permit conditions. It fails to state specific steps that Cooke will take to ensure the minimization of medicated feed into the environment. Section 5.3 reads:

5.3 Site Managers are responsible for the administration and keeping records of disease control chemicals used at the facilities. Site Managers work closely with the attending veterinarian to ensure that medicated feed is administered appropriately and used in a manner that minimizes the discharge of uneaten medicated feed into the environment.

Ecology needs to include some measure of quantification to direct this, rather than granting Cooke this vague, discretionary decision-making authority. Why aren't there additional requirements imposed to protect water quality from medicated feed, like an additional net, or pumping out each net pen cage of fish to treat them on land? The prevalence of antibiotics and potential adverse impacts to native wild Steelhead must be taken seriously. These are basic questions that are not answered in Cooke's pollution prevent plan and for which we request an in-depth analysis as part of SEPA review and/or a full permit modification process.

2. Fish Escape Prevention Plan

This plan is dated January 27, 2020, was not included with Cooke's permit application to WDFW, and as submitted is incomplete and deficient. Cooke's escape prevention plan must be reviewed in the context of Cooke's previous Clean Water Act and NPDES violations.

A. Cooke is Not a Trustworthy Permit Operator

Any NPDES permit can be revoked or modified in whole or in part during its terms for: violation of any term or condition of the permit; obtaining a permit by misrepresentation or failure to disclose fully all relevant facts; a change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge; or a determination that the permit activity endangers human health of the environment, or contributes to water quality standard violation.³³ The department shall modify or revoke permits only after public notice and opportunity for public hearing in those instances where changes are proposed which lessen the stringency of effluent limitations.³⁴

The state agency report on the investigation into Cooke's August 19, 2017 catastrophic net pen failure is damning. The report highlights outright lies and misinformation that Cooke told state agency officials and tribal governments. The 2018 investigation report found, among other things, that:

- The "probable cause of both the July incident and the August failure was the failure of Cooke to adequately clean the nets containing the fish."³⁵

³³ WAC 173-220-150(1)(d); WAC 172-220-190.

³⁴ WAC 173-220-190(3).

³⁵ 2017 Cypress Island Atlantic Salmon Net Pen Failure: An Investigation and Review. WA Departments of Ecology, Fish & Wildlife, and Natural Resources. January 30, 2018. P. 6.

- “Cooke did not provide accurate and complete information to the state about the July incident. Consequently, the state agencies did not investigate further.”³⁶
- “In August and September, Cooke reported harvesting/extracting 145,000 fish from the collapsed net pen. The Panel (of state agency investigators) concluded that Cooke could only have extracted 42,000 to 62,000 fish, 43% of what Cooke reported.”³⁷
- “The Panel estimates that between 243,000 and 263,000 fish actually escaped. Previous estimates, based on Cooke’s reports, put that number at 160,000 fish.”³⁸
- “Of the escaped fish, 57,000 have been caught (recovered). Between 186,000 and 206,000 Atlantic salmon remain unaccounted for.”³⁹
- “Cooke removed the surface portions of the net pen by September 24. Although Cooke stated by letter that it had removed all debris from the bottom of Deepwater Bay, an inspection by DNR on October 27 showed that substantial debris remained. DNR required further cleanup that lasted into January 2018.”⁴⁰

On October 20, 2019, there was an incident at Cooke’s Rich Passage net pen facility where a corner of the facility became partially submerged as a result of Cooke’s inaction. Cooke failed to adhere to regulatory provisions in its fish escape prevention plan that were specifically enacted in response to Cooke’s net pen failure in 2017. While the investigation was ongoing, Ecology issued a letter dated October 25, 2019 that directed Cooke to review the provisions of its escape plan, and in particular, pointed out “that one technology to minimize fish escapement is the routine repair and maintenance of cage structures and mooring equipment, individual actions of which you (Cooke) outlined in the plan. From the lesson learned in the boat collision at Clam Bay in November 2018, Cooke was expected to use the Emergency and “Unusual Events” Call Down List to phone agency staff of an unusual event.”

Apparently neither of these things occurred as they were supposed to. In the end, no action was taken against Cooke despite the determination that the Cooke’s Orchard Rocks

³⁶ Id. At p. 8.

³⁷ Id.

³⁸ Id.

³⁹ Id.

⁴⁰ Id.

facility did experience an “unusual event”⁴¹ and that there was significant repair work needed to fix two of the net pen facility pontoons that keep the cages and structure afloat.⁴² The reality is, Cooke waited and watched the Orchard Rocks facility slowly sink for multiple days before it took any action, and when it did act, it sent emails rather than making a simple phone call.

From the Swinomish Tribe’s perspective, it is clear that Cooke has lost the confidence of the public to be a trustworthy steward of our marine waters. Most of the new regulations enacted in 2018 by state legislature rely on unbiased self-reporting. Ecology needs to consider Cooke’s continued failure to comply with permit conditions in assessing whether Cooke will actually implement the permit conditions it may impose. Because Cooke has shown repeatedly that it is not capable of being a trustworthy, reliable net pen operator, the presumption on this critical question should go against the applicant. More than a listing of permit conditions is needed. Ecology must also assess whether Cooke should be granted the privilege of operating in Washington’s waters. An unbiased review of the track record supports denial on that basis alone.

B. Deficient Notification Provisions

Cooke’s draft escape prevention plan relies on a deficient threshold for notification to state agencies and tribal governments, and there are no procedures listed for monitoring the implementation of the plan components as required in WAC 220-370-110 (1)(e). The “Responding to Structural Integrity Emergencies” of Cooke’s escape prevention plan states in Section 2.1 that:

Cooke facility staff who observe an actual or potential structural integrity issue that poses an imminent risk of structural collapse and the release of fish into the environment shall implement the following procedure:

This section sets out the threshold for when Cooke’s staff must invoke the internal chain of emergency calls and then calls to state agencies and tribal governments, but the threshold is far too high. It is unacceptable to allow Cooke - particularly given the recent partial sinking of the net pens at Cooke’s Orchard Rocks facility – to make a unilateral judgment call about when and whether it believes there is an “imminent risk of structural collapse” before invoking the

⁴¹ October 2019 Unusual Event Summary, Orchard Rocks South, Rich Passage Atlantic Salmon Farm Operated by Cooke Aquaculture Pacific, Version 10/301/19.

⁴² Assessment of Orchard Rocks SE pontoon repair, DSA, by Colin Wilson, Peng, Nov. 21, 2019.

notification provisions of the Prevention Plan. Cooke's judgment cannot be relied upon or trusted.

The specific trigger for invoking notification to state agencies – Ecology, WDFW and DNR – should be much lower; in order to meet Ecology's duty to protect water quality and prevent ecological harm, Cooke cannot be trusted to self-regulate any longer. There is simply no basis for that given its past behavior. There must be unequivocal language that would require Cooke staff to initiate emergency notification procedures at the outset of any potential emergency or unusual situation, regardless of whether Cooke believes it poses an imminent risk of structural collapse. This is particularly important in light of Cooke's failure to follow procedures last October with the Orchard Rocks net pen incident, as documented by Ecology in its October 25, 2019 letter.

C. Net Pen Life Expectancy

As noted above, the DNR lease clearly states that the existing net pen cages were replaced in late summer 2010, and that they have a life expectancy of approximately 15 years. Section 9.4 of the plan contains an error by stating that Cooke's "cage systems may have a life of 20 years" when the facts do not support that statement. Given age [10 years] and life expectancy of net pen cages [10-15 years] more frequent below surface inspections should occur for the entire mooring system, marine engineering inspection, and ultrasonic surveys if in fact Cooke is ultimately granted a new or modified NPDES permit. More frequent inspections are especially important and necessary considering Cooke's 2017 and 2019 net pen failures. Cooke's failure to increase monitoring inspections given the life expectancy is another example of the plan's deficiency.

3. Fish Escape Reporting and Recapture Plan

Cooke's Recapture Plan, dated January 27, 2020, was not included with Cooke's permit application to WDFW and is an incomplete and deficient plan as submitted. It contains multiple sections that raise concerns, including fish recapture procedures that purport to rely extensively on tribal fishermen and tribal fishing vessels despite a complete lack of communication from Cooke on this matter.

The recapture procedures in Cooke's recapture plan apparently conflict with statutory requirements. WAC 220-37-120 unequivocally states, "[i]t is the responsibility of aquatic farmers to report an escape of marine finfish and to attempt to recapture escaped fish." However, Cooke's recapture plan grants Cooke's Emergency Management Team full discretion regarding

the order in which it proceeds to secure the net pen site, all the while feral fish are escaping.

Section 4.1 on the recapture procedures states that:

4.1 Recapture Procedures In the event of a catastrophic structural failure of the equipment, securing the net pen structure may be necessary in order make the site safe for employees and subsequent fish recapture actions. The safety of Cooke employees and contractors takes priority over fish recapture. This determination is made at the discretion of Cooke EMT.

While the safety of human life is undoubtedly a priority, securing the net pen should happen *simultaneously* with the emergency notification and recovery of feral fish, not afterward, and not at the discretion of Cooke.

Section 4.1 goes on to state that:

The next priority is to determine and attempt to correct the cause of the accidental fish release by repairing the breach or implementing some form of secondary containment, if possible.

Cooke EMT maintains an Emergency Work Vessel Contact List. The contact list is provided in Appendix B. The Permit Coordinator will update this list annually. The operators of emergency work vessels will keep Cooke apprised of changes in personnel or contact information.

This last provision is problematic both procedurally and substantively. Cooke should be required to keep a list of willing vessel owners who have agreed ahead of time to be on call to come under contract at a pre-arranged and agreed upon rate and terms. In the event of another net pen failure, there is no time for contract negotiations. Further, Cooke should not be allowed to require work vessels to have to update their information to Cooke – this responsibility should rest solely with Cooke.

Section 4.1 Recapture Procedures continue as follows:

Upon receiving authorization from WDFW, the Cooke EMT will commence recovery of escaped fish through one or more of the following actions:

- a. Deploying Cooke skiffs and seine nets to recapture escaped fish.
- b. Contacting the Northwest Indians Fishery Commission and nearby tribal Natural Resource managers to help facilitate the recapture of escaped fish.
- c. Contacting and engaging the services of local vessels of opportunity to facilitate the recapture escaped fish.

We believe it would be imperative that Cooke engage in all three of those actions simultaneously, and that WDFW, Ecology, DNR and the affected tribal governments work together in making these decisions. Cooke should have no discretion in making these types of important decisions that would impact fishery resources.

Section 4.2 addresses recapture vessels, gear, and methods, and includes that:

Cooke will work with nearby tribes to review appropriate fisheries and gear types and identify the key natural resource contacts in the areas near each of the marine net pen farming locations. The tribal contact list is presented in Section 2.

This is a huge assumption on the part of Cooke. In essence, they are relying on tribal fishery expertise, boats and gear, yet have not approached anyone at the Swinomish Tribe about this potential. Thus, we are a cornerstone of Cooke's recapture plan yet they do not believe it is important to start by asking whether and how we may want to engage with them in these efforts.

Section 4.2.2 discusses potential contractor equipment, yet contains a fundamental error.

Commercial fishing contractors can employ the following methods of capturing and removing fish:

1. Purse seining - These vessels allow the nets to be gathered and the captured fish to be pumped onto a harvest vessel using the vacuum pump.
2. Gill netting – These vessels capture fish by encircling them with nets that the fish become tangled in. This method is effective if the fish are within the size range that gill-net vessels target. Target fish size for most gillnets is between three pounds and 15 pounds.

According to Swinomish Tribe fishermen, only gill netting, and not purse seining, would work to try and recover escaped fish in Skagit Bay. This further highlights Cooke's failure to work with nearby tribes to review appropriate fisheries and gear types, although it claims that it will.

Section 7.1 discusses the reliance upon a Unified Command system in the event of an emergency. We find the provisions in this plan particularly inadequate and believe this plan is fundamentally flawed and incomplete. Cooke must ensure that Swinomish Tribe representatives are included in the Unified Command system as an equal partner and decision maker.

Finally, we respectfully request that Ecology refrains from issuing the NPDES permit for Hope Island unless and until Cooke has initiated, and has reached agreement with all parties on, the requirement in the January 21, 2020 WDFW permit to develop a "no-recovery option" for escaped fish with numerous state agencies, tribes and NOAA. The WDFW permit requirement states:

"3. It is conceivable that an attempt to recover fish after an escape event might negatively affect native Pacific salmonids more than no attempt to recover fish. Cooke is required to work with WDFW, Ecology, DNR, affected treaty tribes, and NOAA to include a no-recovery option in the 2021 Fish Escape Prevention, Response, and Reporting Plan, to be

finalized December 2020. This option should include when, where, and under what conditions a recovery effort should not be attempted. A no-recovery option would be triggered by the state, in consultation with co-managers and federal agencies for the purpose of protecting native Pacific salmonids.”

We believe it is incumbent upon Ecology to require that Cooke initiate this process and reach agreement with all appropriate state and federal agencies and tribal governments on the “no-recovery option” *prior to* any steelhead being placed in the Hope Island net pen.

4. New Tier II Analysis Required

The Clean Water Act requires that water quality standards protect existing designated uses by establishing the maximum level of pollutants allowed in surface water. Washington requires extra protections for water that is already cleaner than the standards. The Washington State Antidegradation Policy⁴³ functions to restore and maintain the highest possible quality of the surface waters of Washington. The policy applies to human activities that are likely to have an impact on the water quality of the surface water.⁴⁴

The Policy applies three tiers of protection for surface waters of the state and the proposed facilities are under Tier I. Tier I requires dischargers maintain and protect existing and designated uses.⁴⁵ Ecology must not allow any degradation that will interfere with, or become injurious to, existing or designated uses, except as provided for in chapter 173-201A WAC. Tier II review is required when a physical expansion of the facility (production or wastewater system expansions with a potential to allow an increase the volume of wastewater or the amount of pollution) or activity. New or expanded actions that are expected to cause a measurable change in the quality of the water may not be allowed unless the department determines that the lowering of water quality is necessary and in the overriding public interest.⁴⁶

In 2017 Ecology made a determination that Tier II analysis was not required because the receiving water quality constituents had not been demonstrated to be higher than the criterion designated by state water quality standards. Now that Cooke is planning to raise an increased number of fish, which is likely to lead to an increase in discharge, Ecology should make a new

⁴³ WAC 173-201A-300 - 173-201A-330.

⁴⁴ *Id.*

⁴⁵ WAC 173-201A-310.

⁴⁶ WAC 173-201A-320(1).

determination as to whether Tier II analysis is required to protect existing and designated uses of the receiving water.

Conclusion

For the foregoing reasons, we believe that Ecology should perform its own SEPA analysis to ensure the health and safety of Washington state waters and people. In doing so, Ecology must take into full account Cooke's pattern of violations of the Clean Water Act and requirements of its NPDES permits.

Thank you for your consideration of our comments and concerns. We look forward to our government-to-government consultation with you on Thursday, June 11th.

Sincerely,

A handwritten signature in black ink that reads "Amy Trainer". The signature is fluid and cursive, with a long horizontal flourish extending to the right.

Amy Trainer, Environmental Policy Director
Swinomish Indian Tribal Community

John Pauli

I do not support raising of hatchery steelhead in net pens in Puget Sound in any capacity. Cooke Aquaculture and any other fish farming companies should be banned from Puget Sound permanently.

John Pauli,

President

4MSigma Corp. (VOSB--Wash St. Certified)

Cage: 0BC31

Keith Shimizu

It's stunning that Ecology is even considering permitting an operation with the history of Cooke!
Ecology and Cooke are another environmental accident waiting to happen while it allows disease and parasites to impact native marine life.

Jeff Redburn

NO NO NO....We don't need another accidental release for the fish to go up the green and everywhere else. Generate money some other way.

Laura G Medbury

I do not believe it is in the best interest of our waters or resident orcas regardless of pen raised finfish species. Discharges from pens such as fish feces, uneaten fish food, disease control chemicals milled into fish feed, biofouling organisms displaced from routine net cleaning, and escaped fish benefit no one except those who are making money on this process. We do not want penned fish farms in our waters! We oppose any fish farming especially from a company that has failed to show good stewardship of our waters.

Erik Kingfisher

I was pleased to finally see a moratorium on net pen aquaculture in Puget Sound after the 2017 incident, and I disagree with the effort to continue with net pen aquaculture, even with native species. The water quality and disease threat to the ecosystem and wild salmonids is abundantly clear, and the benefits of these net pens is not proportional to the impact they have on the public values of clean water and healthy functioning marine systems. Please reject this permit application based on the clear science that demonstrates the pollution from this kind of farming in our public waters.

Richard Ereth

I absolutely do not support ANY permit to culture Steelhead Trout in ANY LOCATION in the marine waters of the Salish Sea. PERIOD.

Paul Buehrens

The benefits here accrue largely to Cooke, and the risks accrue to the environment, and may be largely externalized to the taxpayers. There are better ways. We should be focussed on improving the environment for ALL species, not adding another risk.

Greg Abel

I have no problem with what is proposed providing it applies to all others raising fish in net pens including the state. If that is not the case I would deem your conditions unreasonable and unfair. What applies to one must apply to all.

Elizabeth Sawyer

It is unacceptable that after seeing the amount of disease and parasites affecting our wild fish that come from allowing open-net fish farms - regardless of the species - that this department would even consider opening another one. It flies in the face of science, it flies in the face of conservation, and it flies in the face of public goodwill. You are tasked with ensuring our ecosystems remain healthy, and you would risk increased sea lice infections in our already critically endangered salmon runs? Unacceptable. Deny the permits. To do otherwise is to be blind to your very mission as a department.

SARAH HANSON

I am opposed to all permits for Cooke Aquaculture in Puget Sound.

Phil Gere

Please, no net pens in Puget Sound.

Danny Beatty

Once again, I am writing in opposition of any specie change for the Puget Sound Net Pens. In fact, I am in favor of eliminating now. Past operation by Cooke Aquiculture caused a reduction (Example - Cypress Island) in the number of net pens. It also brought needed attention to the problems of net pens and set an end date to their operation. Many Wild Salmon and Steelhead river stocks are already in fragile condition. It seems unfathomable that some sort of lab developed and unnatural form of steelhead be allowed near the mouth of the Skagit River. What in the world is our Department of Ecology "scientists" thinking? Certainly not in favor of Wild Fish.

Patrick Townsend

It is shocking that Cooke would be considered for yet another net pen operation in Puget Sound following the ecological disaster they created previously. It is also shocking that WDFW and ECY would be considering another net pen operation in Puget Sound given the global trend away from these types of operations. Many countries are now banning these operations due to the negative environmental impacts. This is from Denmark:

"Saying that Denmark's coastal and inland waters have become "overloaded" with nitrogen, the country's current environment minister Lea Wermelin, recently announced that licensed fish farms will be only for land-based operations."

Reference:

<https://www.rastechmagazine.com/ireland-fisheries-chief-sees-trend-towards-onshore-fish-farms/>

Even traditional Northern European net pen operators are now moving to onshore operations to avoid the environmental impacts:

<https://salmonbusiness.com/these-are-the-leading-land-based-salmon-farms-in-the-world-right-now/>

The future for net pen and shellfish aquaculture is clearly with onshore, land-based operations. Just one facility currently in development in Florida will meet more than half the demand for salmon in the US. Washington State is in danger of becoming the dumping ground for unsustainable aquaculture operations with negative effects on our native fish populations and on our Southern Resident Killer Whale populations.

Just say No to all net pen operations in Puget Sound.

lance magnuson

Dear Ladies and Gentlemen,

I'm am unclear why we are being asked once again for comments on Cooke's change to steelhead. The evidence is clear from past performance that Cooke is incapable of successfully maintaining a farm salmonid site.

The failure of Cooke's Cypress Island farm site was based upon lack of maintenance, the inability to invest in vital infrastructure and lack of humility. Cooke's excuse was strong tides caused by the solar eclipse - really?

Changing to another salmonid (steelhead) does nothing to indicate a change in corporate culture. While the fish may be all female triploids, based upon pen density, the risk of disease is greater. If and when the fish escape (and they will escape), there is risk of these fish intermingling with native stocks and spreading disease. This is an unacceptable risk.

Cooke hides behind the Jamestown S'Klallam Tribe, using their First Nation's status as a smokescreen of corporate responsibility. Cooke is intentionally using the natives to gain sympathy for this cause. Do not fall for this ruse.

I am unable to forgive Cooke for their unmitigated disaster at Cypress Island. Cooke is a hugely profitable Canadian company, with a long history in Canada. If they want this business with steelhead to succeed, move it to Canada. The Canadians seem to be more tolerant of corporate irresponsibility.

Sincerely,

Lance Magnuson

Keith Drynan

The modifications to these permits show a progressive approach by DOE to working with a professional aquaculture company and implementing workable guidelines to ensure a high standard of operations and protection of the environment in which they operate.

After the collapse of the pens and subsequent escape of significant numbers of non native salmon in 2017 the most vocal opposition to the operation was based on the species being raised.

The move to a sterile version of a native species should be accepted as environmentally sensitive and progressive move to local high quality food production via sustainable aquaculture, providing local employment and support of other local businesses.

Shannon O'Sullivan

Are you kidding me, When are you people going to put the people and fish of this state before money. Keep the poison out of Puget sound.

Ken Wood

Cooke Aquaculture has long since proven it's utter disregard for the law and it's utter incapacity to follow regulations. There is NO WAY to raise ANY fish in a pen without concentrating pollutants and spreading parasites to wild fish. NO. JUST. NO. No pens, no permits, no Cooke Aquaculture! REVOKE the permit!

Anonymous Anonymous

I feel that there would be no difference in the environmental impact if Cooke was allowed to farm steelhead. Cooke should be allowed to move forward.

Annie McIntyre

Please do not allow Cooke Aquaculture Pacific to lease any further areas in the Salish Sea. Cooke Aquaculture Pacific has proven themselves to be horrible stewards of their own fish pens and the environment surrounding those pens in the leases that they have held in the past. In 2017 a ten-cage net-pen rearing 305,000 salmon off Cypress Island in northern Puget Sound collapsed. They lied about the reason it happened. They seem to scoff at regulations and the laws that govern them. They have consistently had sick fish and have sickened wild fish as well as polluted the sea beds under and around their pens with the fall out of the feed and drugs they have given to their fish. This unnatural habitat fosters disease which can not be contained in their pens. To consider leasing them any areas on the PNW coast, let alone in the Salish Sea would compound the issues and disasters that they have been directly linked with. When examined their fish pens and fish have been environmentally disastrous, and have led directly to the decline of our wild salmon. They do not deserve another chance to pollute and disrupt our fragile ecosystem. Please say no to Cooke Aquaculture Pacific.

Patrick Baumann

Cooke Aquaculture Pacific has proven again and again that they are poor stewards of the Salish Sea. In the past, when breaches have occurred, their only response was a litany of excuses. Before any new permit is granted, please verify new processes are in place to protect our sea. Based on history alone though, I recommend rejecting the permit request.

STEVE KNUTZEN

When Cooke lost all those salmon, due to lack of maintenance and incompetence, they lied to the state and public on a daily basis for months. They have no right to be in business in our state, as they will no doubt continue to lie , break the rules, and break the laws. They have not changed their nature. Deny them.

Larry Jones

The oceans can no longer support the fishing needed to provide Food for the amount of people in this world. Aquaculture is the future whether people like it or not. The last thing this state should be doing is getting rid of more jobs

CULP 2020

SEND COMMON SENSE TO OLYMPIA

RECALL

KSHAMA SAWANT

Duffy MCKENZIE

NO! NO! NO! Your industry has already proven itself incapable of securely containing your disease ridden faux food. Your industry is single handedly the greatest detriment to our wild salmon populations. Your permits should be revoked outright! The Atlantic salmon you currently raise have been proven unable to survive and reproduce in the wild here. I DO NOT TRUST YOU WILL ONLY HAVE STERILE FEMALE STEELHEAD! Viable fish and males will certainly slip thru the cracks into the tanks. Posing yet another threat to our wild fish populations. Your use of antibiotics in your cesspools of filth, riddled with sea lice and abhorrent living conditions are appalling and ought be illegal. Your abuse and pollution of our waters should be illegal! Take your industry on to land and quit destroying our natural habitat!

Anyone who is interested, please watch the documentary Salmon Confidential. It is free on YouTube.

https://youtu.be/ftCQ2IA_Zss

Jeremy Maldonado

This should not be allowed.

Kristine Holm

Will the permit explain how the level of PCBs in the fish feed will be assessed and reduced as required by state regulations concerning PCBs in products? How will PCB assessment and treatment in feed be addressed as part of the AKART requirement? I don't see any reference to impacts on water quality from PCBs in feed, waste, wastewater discharge or in fish as a discharge. This issue needs to be part of any AKaRt analysis for feed waste or related discharges.

Jacob Manning

Please do not allow these people to keep polluting our waters. Cooke is in the business of disease introduction. Raising Steelhead is worse than Atlantic Salmon as our native Steelhead are on a path to extinction.

Owen Fairbank

The track record of Cooke Aquaculture and other firms shows that disease from the concentrations of fish spreads to wild populations, and also that no net pens can reliably contain fish 100% of the time. These unavoidable consequences mean that salt-water net pens are detrimental to the surrounding environment and native species.

The responsible solution is to require all net pens to be situated on land with comprehensive treatment of the circulating water before it is returned to the ocean.

Is not the role of the Department of Ecology to protect the environment and ecology of the natural world? Is that not more important to us and future generations than short-term corporate profit for a few individuals?

Thank you for your consideration of the people and wildlife of Washington and the world.

Cindi McNabb

This is a horrific idea. Cooke aquaculture has proven they do not maintain their nets. The tragedy that befell our native fish at their hands is shameful. The oceans do not belong to them and NO PERMIT SHOULD BE GIVEN to them for steelhead

John Corso

Generally, I support aquaculture as a means of reducing the harvest of wild fish and especially endangered and threatened species. However, I am concerned about the threat of disease and parasites in farmed stock infecting wild fish especially threatened and wild species like steelhead. Please ensure that there is a strong clause in the permits requiring recurring testing of farmed steelhead for all known infectious diseases -including bacterial, fungal, and viral - and parasites. Further, please incorporate the cost of testing into the cost of the permits and require an independent business to collect and analyze samples and publicly report the results. If Cooke can demonstrate that it can raise disease and parasite-free steelhead, please consider rewarding them with a renewed permit. However, if testing reveals that Cooke is unable to keep its stock free of infectious disease and parasites in any one of its pens, the permits must strongly and clearly state that they must immediately remove all steelhead from all of their pens to reduce the likelihood of the disease and/or parasite infecting threatened and endangered wild steelhead. Finally, if Cooke demonstrates that it is unable to keep its stock free of disease and parasites, the permit must clearly and strongly state that all of the pens must be shutdown and Cooke must present their plan for controlling the disease and/or parasites for public review, comment and approval before they are permitted to restock the pens.

Thank you for considering my concerns and suggestions.

John Corso

Nick Falls

To whom it may concern. This company should never be permitted to raise farmed non-native fish in the first place. Now they swing money in front of politicians and officials to keep they're profits up and pockets stuffed. They care not of our fragile eco system they helped destroy by neglecting the nets. Changing the type of fish won't change the company's way of operating. They caused irreparable damage to our sea with the release of thousands of Atlantic salmon. They knew about the torn nets but wouldn't fix the issue. If you allow them to continue it only proves my point that our government doesn't care about us or the environment. The only thing that matters to them is the money.

Cynthia Livingston

Cooke Aquaculture should be denied any permits to operate fish farms. Their negligence that led to the net breach and release of Atlantic salmon will likely be causing harm to our ecosystem for decades to come, in ways we may never understand. They have proven their incompetency. I suggest their corporate charter be revoked, their assets seized, and put toward remediation for the harm caused. It is pure folly to allow them to continue to operate.

Allan Holmes

The problem here is that for at least the last 30 YEARS we've been living here Cooke Aquaculture has promised and promised, but seldom, if ever, performed. It's time to end the charade. They've never been good neighbors for the 33 years we've lived here so there's no reason to believe they will change their mushroom theory business plan which amounts to "keep 'em in the dark and feed 'em a bunch of shit". Excuse my language, but enough is enough and we feel powerless. PLEASE shut down this operation asap and let them return to Canada with their business venture and leave us alone. Thank you.... Allan Holmes

Ruth LeBrun

I STRONGLY DO NOT SUPPORT any further operations by Cooke Aquaculture in Washington State waters. No further permits, no further changes in their operations, nothing. They have proven quite clearly that they are unable to manage net pens or have any consideration for the environment. Our waters are fragile. Our native fish are decreasing constantly. The Orca whales are gravely endangered. How much longer are we going to despoil our land and water for private gain? Think about PUBLIC gain! We need waters that are unspoiled, for all citizens to enjoy and appreciate. We are talking about the public trust here, land and seas.

No further Aquaculture - Cooke or other companies.

Thank you for your consideration.

Ruth LeBrun, Anacortes WA

BRIAN COWAN

Hi

I am writing to express my opposition to net pens operating in Washington State. The irresponsible management of the pens by Cooke should not be rewarded with more opportunities to adversely impact our ecosystem. There is too much at stake for our wild salmon and steelhead. Please remove the pens and do not allow any more. Help us avert a future disaster.

Brett Wedeking

Do not issue new permits or modify existing permits for any fish farming in WA marine waters. Raising sterile rainbow trout is not any better than Atlantic salmon. They present the same problems with waste and pollution and sea lice that negatively affect surrounding waterways and the wild species that live there, including ESA listed species.

I am a fishing guide on Puget Sound and I see first hand the lack of fish that live near the Orchard Rocks pens. Bluntly, the fishing always sucks near those pens.

Rainbow trout present the same escape risks, and possibly worse, than Atlantic Salmon. Escapes are unavoidable and when fish escape they compete for food and space with wild species, again some of which are ESA listed. These pens must be in violation of both the ESA and Clean Water Act.

There is no guarantee that all these fish will be sterile. When those fish escape they can migrate up local rivers and interbreed with ESA listed, wild steelhead and dilute genetic diversity, contributing to further declines in survivability of wild steelhead.

The net pens are not worth it. The science is clear, it all points to net pens as bad for wild species and bad for people. WA is the last state or province on the West Coast to allow marine fish farming. All marine net pens need to be banned in this state as soon as possible.

Philip Forve

I am a private citizen who wants to go on record opposing these fish pens and any extension of the leases currently in force. We need to protect our natural environment and not destroy it with industrial fish farming methods. We are blessed in the PNW with great abundance. Let's not repeat the environmentally damaging mistakes of the recent past.

Peggy Most

Cooke has a terrible track record leading me to assume they care little for the environment of Puget Sound. How will they address the sea lice which are prevalent on pen fish? Those lice move freely from the pens to wild species.

Keep net pens out of Puget Sound altogether.

Lynda Cole

Why would the DOE and WDFW set themselves up for a class action suit by issuing a permit for pen raised fish? Why would you sell out the State by allowing the desecration of Puget Sound? Why are you selling out the salmon fishery of Washington state and hundreds of it's fishermen who have fished for many generations? What doesn't the DOE understand about PCB's, viruses, parasites, bacteria, fungi and toxins? Does this not define your job description? Do you really want to be a part of the destruction of Puget Sound? What gives the DOE the right to lease public waters to a proven deceitful, polluting, non-compliant, foreign company. What is the payoff?

There are many ways to enhance not only water quality, quality of life and salmon production. Look to Alaska's fish production and how much revenue it produces. The West Coast of the USA has the potential to feed a lot of the world. Why should we ever have to import fish?

Please be honest about the destruction of Puget Sound, it's natural stock, and water quality. What would issuing this permit make better? The revenue received is tantamount to prostitution. Who will pay for the clean-up??? the tax payers of Washington State. Who will pay when it's all gone? Most criminals get thrown in jail.

Cornelis Bakker

I applaud the aquaculture company rearing native steelhead instead of Atlantic salmon. I consider this a good use of the 4 areas and an appropriate response to the net pen collapse.

Katherine Kirchhofer

Under no circumstance should we be opening another fish farm in Washington state. Beyond the violation of treaty right as stated in the Boldt decision, this can cause increased disease rates, decrease genetic diversity for fish best suited for the net pen life, and harm our wild salmon populations. As a naturalist that works on the water I beg that you halt this project and support dam removals, and modeling after the Alaskan fisheries. Do not do this. This is almost as bad as the Pear Point fish farm idea. Cooke aquaculture should be ashamed of themselves after the harm they have already done! Move along and support wild salmon instead!

Polly Derr

Farmed fish lack the nutritional value and flavor of naturally grown fish in the wild. They also have a much higher fat content than normal. It is certainly not advisable to put farm pens anywhere there is an even remote chance that the farmed fish or their nutrients could infiltrate our fish grown naturally in local rivers or the Salish Sea anywhere! To experience another "oops" could change our sea life forever!

Sarah Kuh

Aquaculture provides a safe and sustainable food source as well as many living wage jobs. This change is minimal, and I believe Cooke should be able to move forward.

Cathleen Burns

Please deny permits for more Cooke aquaculture! We already know the disasterous results of their last attempt to make \$ at the expense of our environment. No matter the supposed safeguards required, more disasters are bound to occur. This is a detriment to our waters, to our fish and ultimately ourselves. People need to stop buying fish. There are plenty of other options for food. We have exhausted this resource and this attempt to make more will have dreadful, unintended consequences. Please deny more aquaculture experiments at our expense.

Janet Marx

Has Ecology ever conducted a survey of the sea floor (benthic layer, micro sea life, forage fish populations, etc.) prior to installation of a net pen operation and then conducted a follow-up survey four or five years later to determine changes to the water quality and sea-life health?

If not, how can you approve an open net pen permit?

Jamie Kitson

I believe there should be no permits issued for net pen fish farms in the Puget sound or any of the interconnected waterways. The threat of disease and interference with migration of endangered Pacific salmon and steelhead is too great. These populations must be recovered. There is no need for farm raised steelhead in the Puget sound.

Duane Edwards

I am against all farm raised fish but especially Atlantic salmon

John Dentler
8920 Franklin Avenue
Gig Harbor, WA 98332

Laurie Niewolny, Water Quality Program
Washington State Department of Ecology
PO Box 47600, Olympia, WA 98504

Dear Ms. Niewolny

I am writing in support of the issuance by the Department of Ecology (DOE) of final NPDES permits for the rearing of steelhead (*O. mykiss*) in net pens by Cooke Aquaculture at all four sites (Clam Bay, Fort Ward and Orchard Rocks (all in Rich Passage) and Hope Island in Skagit County).

I have been involved in fisheries science, research, policy, and law since the late 1970s. During that time, I have worked for state, federal and multi-jurisdictional agencies as well as in private industry in fisheries and aquaculture. I have worked in North and South America in these endeavors and I am knowledgeable regarding the practices of the salmon and trout aquaculture industry. I support efforts to ensure a sustainable environment in the Puget Sound area and throughout Washington. I support efforts to ensure that efforts are made to preserve and sustain wild salmon stocks. I also support efforts to support sustainable aquaculture in Washington and efforts to produce healthy seafood whether through wild capture fisheries or aquaculture – whether finfish, shellfish, or marine and aquatic plants.

As noted by the DOE -- the public should keep in mind that the draft NPDES permits involve a proposal to rear *sterile* native steelhead in *substitution for* Atlantic salmon previously reared at these sites. From an environmental perspective there is, to my knowledge, no evidence that this change will result in any substantive change in feed quality or quantity that will be used or effluent quality or quantity from the baseline condition – which was through the rearing of Atlantic salmon. Moreover, on an absolute basis the issuance of the revised NPDES permits will, in my view have no probable significant adverse effect on the environment.

The trout proposed to be reared will be sourced from Troutlodge, a trout egg production company located in Bonney Lake, Washington. I am now retired but I previously worked at Troutlodge hatcheries from 2007 through 2018. I thus have knowledge of Troutlodge procedures and practices. The sterile eggs produced by Troutlodge are made using organic measures, (pressure) to create triploid eggs. The resulting batches of eggs are virtually 100 percent sterile (greater than 99.5% sterile) based on years of testing results at Washington State University. Further, trout at Troutlodge have been domesticated and bred over many decades for hatchery production and in the event any trout should escape from the net pens, these trout will not fare well in the wild environment. They will likely be caught by anglers, seals, sea lions, or orcas or die from starvations as they are very unlikely to identify and capture wild prey items.

Moreover, the broodstock at Troutlodge is subject to a robust fish health and biosecurity program. Each year thousands of samples are taken and analyzed for a suite of pathogens and parasites. The analyses are conducted independently at the Washington Animal Disease Diagnosis Laboratory (WADDL) at Washington State University. The samples and preparations thereof are supervised by a USDA-approved veterinarian. If WADDL identifies any reportable pathogen, those results must be reported to the U.S.D.A. Animal Plant Health Inspection Service (APHIS) and Washington Department of Fish and

Wildlife (WDFW). Fortunately, the biosecurity and fish health program at Troutlodge has been instrumental in preventing the introduction of aquatic animal pathogens at Troutlodge. Based on the sampling and diagnostic results at WADDL and the facility inspections conducted by APHIS itself, APHIS has been able to certify that the eggs Troutlodge complies with the pathogen-free standards and criteria of the World Organization for Animal Health pathogen standards and that Troutlodge meets the requirements set out by WDFW.

The United States and the State of Washington have robust environmental laws and regulations that are rigorously enforced. Moreover, many private aquaculture companies such as Troutlodge and Cooke Aquaculture and others aquaculture companies meet additional environmental performance requirements through independent private entities -- GLOBALGAP, Global Aquaculture Alliance BAP, and others. These organizations establish best practices and standards for environmental sustainability as well as labor and community/social practices. To be awarded certification, companies must undergo third party independent audits to demonstrate adherence to applicable laws, rules, and standards. Both Troutlodge and Cooke Aquaculture have met either or both GLOBALGAP and BAP certification.

Moreover, for a number of other reasons, enumerated below, DOE should support aquaculture in all its forms, whether finfish, shellfish, kelp or seaweed and whether at-sea, in the shoreline, whether on land in traditional flow through operations or recirculating aquaculture systems.

1) WORLD POPULATION GROWTH AND THE LAND WATER AND FOOD GAP:

Currently, the world's human population is about 7.5 Billion. Already, land-based agriculture uses 75% of the world's developed land. Land-based agriculture uses 70% of the world's freshwater resources. By the year 2050, the U.N. estimates the world human population will reach 9.8 Billion and they are will have a higher life expectancy. See World Resource Institute ¹.

Planet Earth is sometimes referred to the "Blue Planet" and it would be more aptly named, Planet Water. Over 70% of the earth's surface is covered by water, more specifically, salt water. Of our planet's water, by volume, 97.5% is seawater and only 2.5% is freshwater and of that freshwater only 1% of that water is easily accessible. Of the 30% of the land surface on our earth, only 11 % is arable and capable of growing crops. As our population grows, less land per unit population is available for food production.

A significant and critical worldwide food and land gap is growing. We will need to increase by food calories by 56% and protein production will need to increase by 70% to meet this gap. To do this with land-based agriculture, an additional 2.3 million square miles (roughly equivalent to 74% of the contiguous U.S.) of agriculture land is needed. Clearly, we cannot manufacture new agricultural lands. However, we can take advantage of our oceans and brackish water -- right here in Washington State -- to grow healthy seafood. The growing land, freshwater and food gap is a fundamental reason why the DOE should approve the four draft NPDES permits under consideration.

2) CLIMATE CHANGE -- GLOBAL WARMING AND SEA LEVELS ARE RISING

The land, water and food gap referenced above will only worsen due to global warming. The Intergovernmental Panel on Climate Change (IPCC), the World Resource Institute and U.N. FAO have

¹ <https://www.un.org/development/desa/en/news/population/world-population-prospects-2017.html>

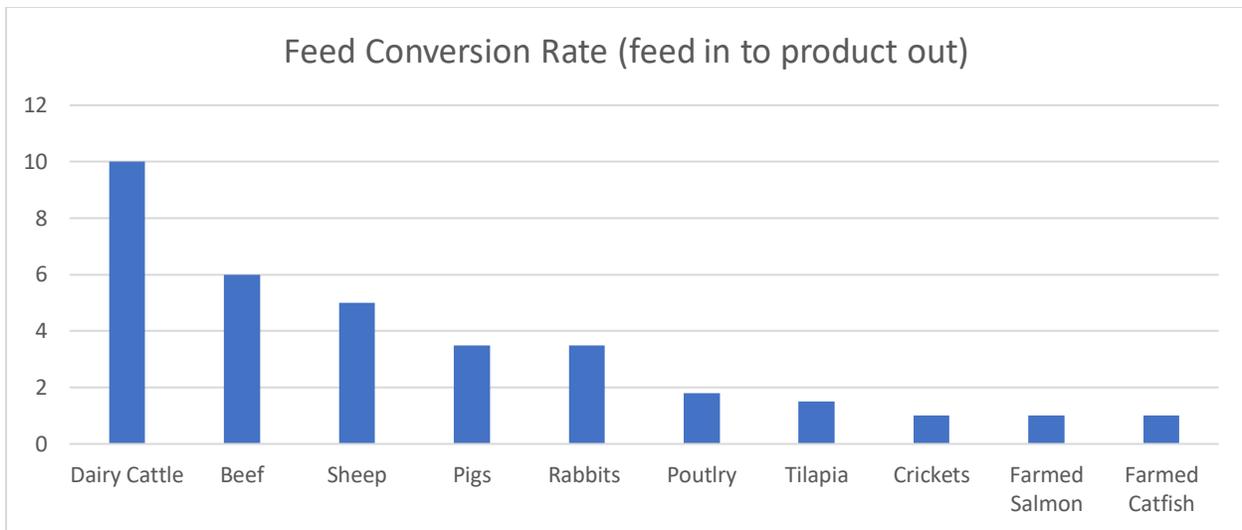

documented that the worldwide food crisis will continue to grow, not only because of population growth, but for several other reasons. These other factors include climate change, rising sea levels, salt water intrusion, extremes in rainfall and temperature, snow, wind, floods, intense heat waves and droughts, colossal forest fires, more and stronger hurricanes and generally less freshwater where it is needed. For example, a sea level rise of only three feet is expected to destroy 40% of the Mekong Delta, Vietnam's rice basket. In terms of temperatures, five of the warmest years recorded from 1880 to 2019 all occurred after 2015 and nine out of ten of the warmest years ever recorded occurred since 2005. Global warming is widely expected to adversely affect land-based agriculture. In view of global warming and anticipated effects on agriculture, Washington State needs a State aquaculture plan. Further, in view of the anticipated effects of global warming on land-based food production, DOE should approve the four draft NPDES permits under consideration.

3) ENVIRONMENTAL FOOTPRINT OF AQUACULTURE IS RELATIVELY LOW

It is widely acknowledged that human-caused Greenhouse Gases (GHGs) are responsible for global warming. However, the global appetite for reducing GHGs is quite low. In part, this stems from our dependence on fossil fuels and because the lag time from GHG emissions and their effects on the environment are on the scale of a century. This makes the politics of reducing GHG emissions very difficult.

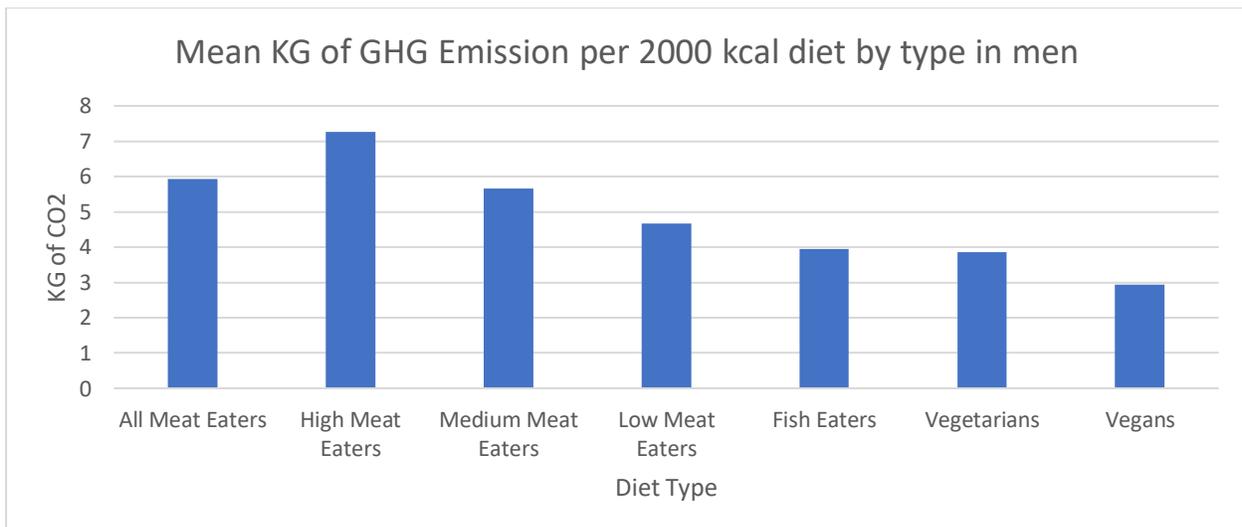

However, we know that various types of activities do result in GHG emissions. All food production systems result in environmental impacts including GHG emissions. Traditional land-based agriculture accounts for about 12 percent of methane emissions, a potent GHG.

Fortunately, aquaculture is the most efficient form of animal protein production. Aquaculture is environmentally efficient for several reasons but primarily because fish and shellfish are ectotherms -- they do not spend energy to maintain a constant body temperature (like most mammals). Secondly fish and shellfish do not fight gravity. Fish are neutrally buoyant and movement in the water column is almost effortless and most shellfish, through most of the life cycle, are sessile, affixing themselves to once place and staying there. Because these animals do not fight gravity, they either do not have an internal bony support structure or have a very small one. For this reason, the edible portion of fish is very high -- say 70%-80% for trout and salmon as opposed to only 40% for cattle. Moreover, the feed conversion efficiency in fish is very high relative to other forms of animal protein production.

Aquaculture and finfish aquaculture in particular require very little water consumption. For example, to grow 1 kilogram (2.2 lbs) of salmon requires about 900 liters (240 gallons) of water whereas 1 kg of beef requires 15,000 liters (4,000 gallons) of water.

The graph below shows that consumers who eat fish produce much lower carbon emissions on a dietary basis than say, meat eaters.²

Aquaculture is also spatially efficient. Because fish and shellfish can be grown throughout the water column, a very small surface footprint is needed to produce large numbers of finfish or shellfish.

Moreover, if fish are produced locally, either in the wild or via aquaculture, then the carbon and environmental footprint of that production is even lower, as the fuel cost and emissions produced when transporting seafood from local areas to local markets is much lower than importing such products from, for example, Norway, Chile or China.

² Data summary Scarborough et al. 2014

The State of Washington is committed to reducing GHG emissions and combating global warming – as it should be. Consequently, DOE should support aquaculture as the most efficient means of producing animal protein and having a low environmental and carbon footprint – particularly when we raise the seafood products are produced right here in Puget Sound. For this reason, DOE should approve all four of the finfish aquaculture draft NPDES permits.

4) U.S. CONSUMERS SHOULD EAT MORE SEAFOOD

Seafood is high in protein which is critical for our body composition and the building of muscle, bone, cartilage, other tissues. This protein comes from amino acids, nine of which are considered “essential” amino acids. All plants lack at least 1 amino acid. However, by eating a balanced diet of vegetable matter, sufficient protein can be obtained. In addition to being high in protein, seafood is high in vitamins A, B12, and D; and seafood is comprised of many micronutrients like iron; zinc; magnesium; phosphorous; and potassium. Seafood, particular oily fishes, like salmon and trout, are high in Omega-3 fatty acids, (e.g., eicosapentanoic acid and docosahexaenoic acid) and these nutrients are critical for fetal development, heart health, cognitive performance, etc.

Salmon and trout reared via aquaculture are also be high in carotenoids, which give them the red color of the flesh. These carotenoids (astaxanthins), are the same natural compound that causes leaves to turn red and yellow in the fall. The astaxanthins are also an antioxidant and are found in most health food stores as an antioxidant intended directly for human consumption. The astaxanthins are typically harvested from algae and added to the fish feed and is naturally taken up by the fish. In short, the astaxanthins are good for the fish and good for humans.

Many epidemiological and nutrition studies have shown that eating finfish produces many health benefits. Among them are the following:

- a) 84,000 premature deaths could be avoided if more seafood was eaten in the U.S.
<https://hms.harvard.edu/news/burden-calculated-preventable-causes-death>
- b) Increased cognitive scores, reduced ADD hyperactivity disorder, better academic performance in children whose mothers at between 4 oz and 12 oz of seafood per week during pregnancy. Almost all of the studies on seafood consumption during pregnancy and lactation reported beneficial outcomes for children, including five that found that compared to children of mothers who ate none, those whose mothers ate more than 12 ounces of seafood a week had significantly higher verbal I.Q. scores. In children, the benefits of eating seafood were apparent as early as 14 months. The studies variously found that seafood eaters had lower risk of attention deficit hyperactivity disorder, better school grades, and higher I.Q. by as much as 9.5 points compared with their peers who ate no fish. The highest intakes — more than 8 to 12 ounces a week — were associated with the greatest benefits.
[https://www.plefa.com/article/S0952-3278\(19\)30192-9/fulltext](https://www.plefa.com/article/S0952-3278(19)30192-9/fulltext) Relationships between seafood consumption during pregnancy and childhood and neurocognitive development: two systematic reviews. Hibbeln, CAPT Joseph R. et al. (Journal of) Prostaglandins, Leukotrienes and Essential Fatty Acids, Volume 0, Issue 0, 2019. [https://www.plefa.com/article/S0952-3278\(19\)30192-9/fulltext](https://www.plefa.com/article/S0952-3278(19)30192-9/fulltext) see also <https://www.nytimes.com/2019/10/30/well/eat/children-pregnant-women-eat-fish-seafood-brain-smarter.html> We conducted two systematic reviews, evaluating the relationship between seafood consumption in pregnancies and in childhood on neurocognitive development using methodologies detailed by the Dietary Guidelines for

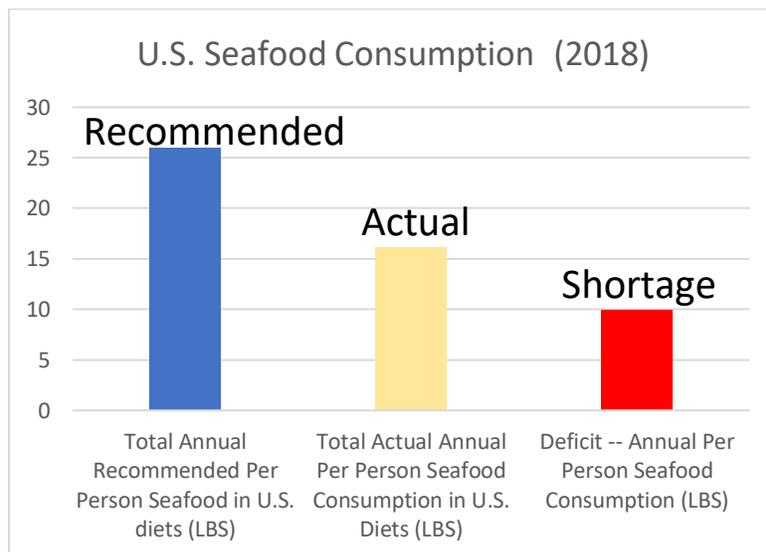

Americans Scientific Advisory Committee 2020-2025. •This evaluation of seafood inherently integrates any adverse effects from neurotoxicants, if any, and benefits to neurocognition from omega-3 fats, as well as other nutrients critical to optimal neurological development. •No adverse effects of seafood consumption on neurocognition were found in 44 publications reporting on 102,944 mother-offspring pairs and 25,031 children. •Benefits to neurocognitive development began at the lowest amounts of seafood consumed in pregnancy (~4 oz/wk) and up to >100 oz/wk, with benefits to age appropriate measures of neurocognitive development including an average increase of 7.7 IQ points. •Consumption of >4 oz/wk and likely >12 oz/wk of seafood during childhood had beneficial associations with neurocognitive outcomes. •A clear understanding of the effects of seafood consumption on neurocognition can have significant public health implication

- c) Reduced incidence of heart attack and strokes (40,000 men in study had 15% lower risk of heart disease by eating one serving of seafood per week) L Diouise et al. Fish consumption, omega-3 fatty acids and risk of heart failure: a meta-analysis J. Clinical Nutrition (Dec. 2012). An analysis of 20 studies involving hundreds of thousands of participants indicates that eating approximately one to two 3-ounce servings of fatty fish a week—salmon, herring, mackerel, anchovies, or sardines—reduces the risk of dying from heart disease by 36 percent. Mozaffarian D, Rimm EB. Fish intake, contaminants, and human health: evaluating the risks and the benefits. JAMA. 2006; 296:1885-99. <https://www.hsph.harvard.edu/nutritionsource/fish/#1>
- d) Fish contains nutrients crucial during neural development. Omega-3 fatty acids are essential for growth and development. The omega-3 fat docosahexaenoic acid (DHA) is especially important for brain and eye development. changes in brain concentrations of DHA are positively associated with changes in cognitive or behavioral performance. “Is docosahexaenoic acid, an n-3 long-chain polyunsaturated fatty acid, required for development of normal brain function? An overview of evidence from cognitive and behavioral tests in humans and animals”. J.C. McCann and B.N. Ames Am J. Clin. Nutr. Aug 2005. Caution for some fish species high on food chain due to mercury.
- e) Increase seafood consumption slows rate of mental decline. Many studies suggest that people who eat fish have slow rates of age-related mental decline. Fish consumption and cognitive decline with age in a large community study M.C. Morris et al. Arch Neurol. Dec 2006. And they have more gray matter – the brains functional tissue. “Weekly consumption of baked or broiled fish was positively associated with gray matter volumes in the hippocampus, precuneus, posterior cingulate, and orbital frontal cortex even after adjusting for covariates. These results did not change when including omega-3 fatty acid estimates in the analysis”. Regular fish consumption and age-related brain gray matter loss. C.A. Raji, et al. Am. J. Prev. Med. Oct. 2014.
- f) Less depression in those who regularly eat fish Omega-3 Fatty Acids and Depression: Omega-3 Fatty Acids and Depression: Scientific Evidence and Biological Mechanisms. G. Grosso et al. March 2014 Oxidative Medicine and Cellular Longevity. Also improves treatment results when antidepressive medicines used.
- g) Reduced risk of autoimmune diseases, like Type 1 Diabetes; T1D occurs when immune system attacks cells in beta cells Pancreas. Several studies link Ω 3 or fish oil with reduced risk to T1D in children and autoimmune diabetes in adults. L.C. Stene et al. Use of cod liver oil during first year of life is associated with lower risk of childhood-onset type 1 diabetes: a large, population

based, case-control study. *Am J Nutrition*. Dec. 2003; J.E. Lofvenborg et al. Fatty fish consumption and risk of latent autoimmune diabetes in adults. *Nutrition & Diabetes* Oct. 4(10) 2014

- h) Seafood consumption may help prevent asthma in children. Studies show that regular fish consumption is linked to a 24% lower risk of asthma in children. Y. Huan, X. Pengcheng, and H Ka. Fish and Fish Oil Intake in Relations to Risk of Asthma: A Systematic Review and Meta-Analysis. *PLoS* 2013 (8)11. Other studies generally show, even in adults, that vegetable oils substituted for marine oils in the diet increases the risk of asthma by 67%. Shahieda et al. **Relationship between Serum Omega-3 Fatty Acid and Asthma Endpoints.** *International Journal of Environmental Research and Public Health*, 2018; 16 (1).
- i) Fish and related Ω 3 fatty acid consumption may protect adults from age-related macular degeneration and vision impairment and blindness. Regular fish consumption can decrease risk of AMD in women by 42% - 53%. Dietary ω -3 Fatty Acid and Fish Intake and Incident Age-related Macular Degeneration in Women. Christen, W et al. *Arch Ophthalmol*. 2011 Jul; 129(7) 921-929. Further eating oily fish at least once per week compared with less than once per week was associated with a halving of the odds of AMD. Oily fish consumption, dietary docosahexaenoic acid and eicosapentaenoic acid intakes, and associations with neovascular age-related macular degeneration. C. Augood, et al. *Am J Clin Nutr* Aug 2008 88(2) 398-406.

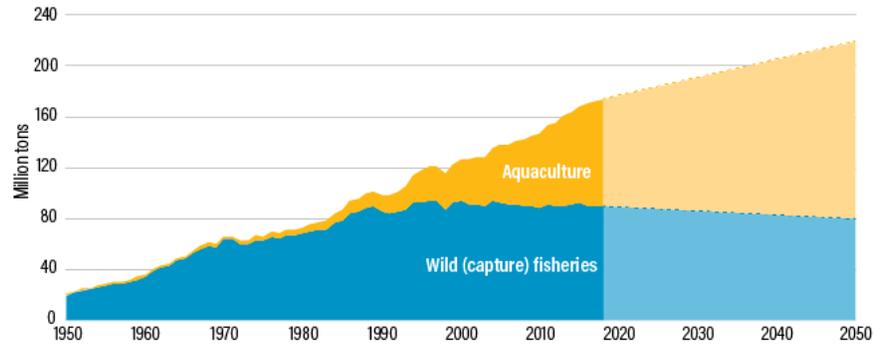

The U.S. Department of Agriculture (USDA), based on nutrition and epidemiological studies like those cited above, recommends that consumers should eat two 4-ounce seafood meals per week. The USDA weekly seafood consumption recommendation equates to about 26 pounds of seafood per year. However, U.S. consumer eat only about 16 pounds per capita (2016) so the per capita seafood consumption needs to increase by about 10 pounds. The graph below reflects the USDA seafood consumption recommendation vs. actual consumption and the shortage of seafood consumption.

However, there is not enough wild seafood to meet this need. Data collected by the UN FAO show that most wild fisheries are completely exploited, with some of these fisheries over-exploited. On the other hand, aquaculture is growing everywhere at very high rates -- except the United States. The graph below shows that on a worldwide basis, aquaculture accounts for half of all seafood produced

worldwide and, in the future, we need more aquaculture to meet the worldwide nutritional demand for seafood.

Aquaculture must increase to meet global demand for fish

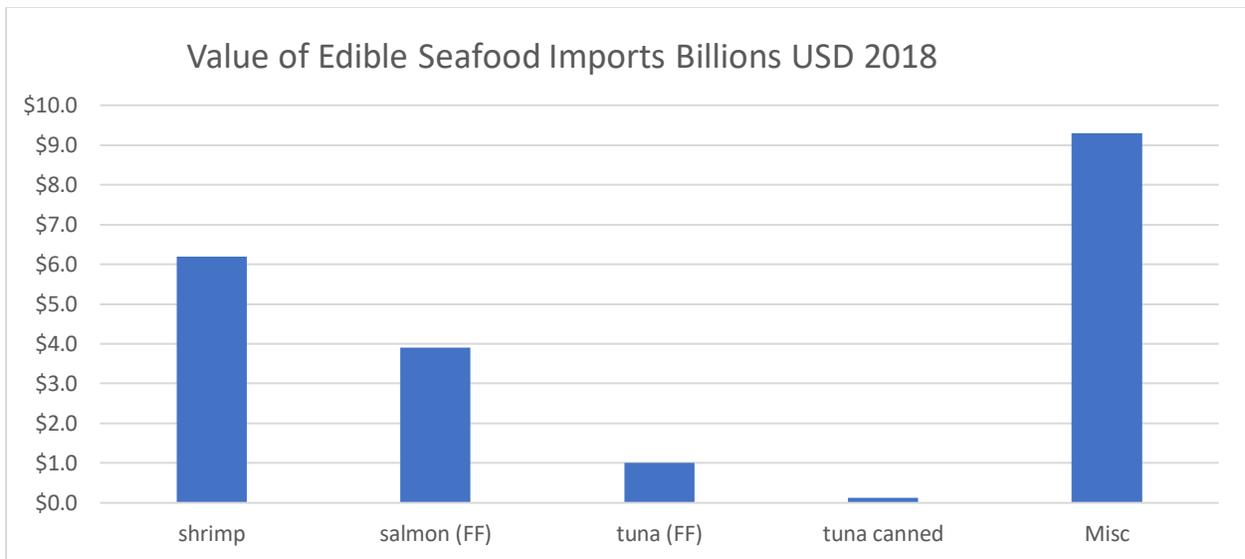

Sources: Historical data, 1950–2016: FAO (2017b) and FAO (2018).
 Projections to 2050: Calculated at WRI; assumes 10 percent reduction in wild fish catch from 2010 levels by 2050, linear growth of aquaculture production of 2 Mt per year between 2010 and 2050.

To increase U.S. consumption of seafood to meet U.S.D.A. standards, seafood must be more accessible and affordable to those of modest means. To achieve this goal and facilitate making the U.S. population healthier through seafood consumption, DOE should approve all four of the finfish aquaculture draft NPDES permits.

5) U.S. IMPORTATION OF SEAFOOD AND THE RELATIONSHIP TO JOBS IN RURAL AREAS

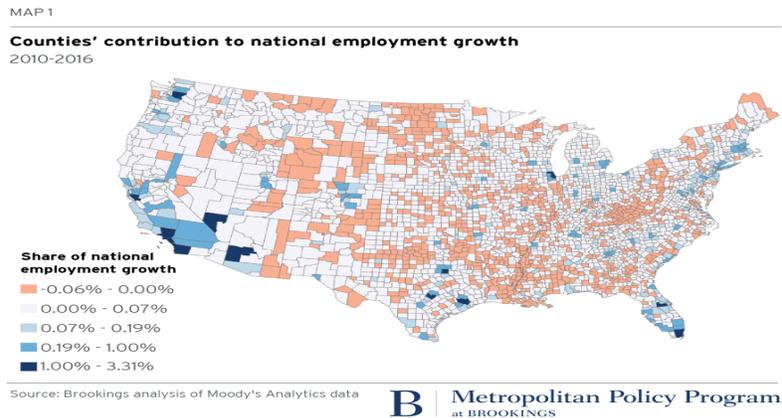

According to data supplied by NOAA, the U.S. imported nearly \$4 billion worth of salmon in 2018.

While importation of seafood is currently very much needed, the U.S. and Washington State in particular, have the know-how, the desire, the resources, and the workers ready and willing to raise seafood. Consequently, reliance on the importation of salmon to meet our needs represents a forgone

opportunity. Aquaculture is typically carried out in rural areas where family wage jobs are rare and even rarer in the CV-19 environment. If salmon aquaculture were to be actively promoted in Washington, hundreds if not thousands of new and good-paying jobs could be created where they are desperately needed – in our rural counties.

While much pre-CV-19 job growth occurred in Seattle and Redmond corridor, Washington had virtually no job growth in the rural areas such as Clallam County. Moreover, Tribal Governments have been hard hit by the lack of jobs and opportunities to make good on federally guaranteed Treaty rights to harvest fish and shellfish in their usual and accustomed areas. The graph below demonstrates the lack of job growth in rural areas.

If the DOE is interested in improving the health of Washington's residents and U.S. consumers, and helping Tribal communities, then it should support sustainable aquaculture and DOE should approve all four of the finfish aquaculture draft NPDES permits.

6) CONCLUSION

In conclusion, for the reasons set out above, the DOE should approve each of the four revised NPDES permits at four locations to allow Cooke Aquaculture to raise all-female, sterile rainbow trout.

Sincerely,

John Dentler

John Forster

I have worked in the the aquaculture industry and related research activities since 1965, including 31 years in Washington State where participated in several different aquaculture activities, including management of the salmon farm in Port Angeles Harbor from 1984-1994 and as part owner and president of Columbia River Fish Farms from 1995-2003.

I believe Cooke Aquaculture's plan to switch production to sterile Steelhead Trout in its Washington farms makes good sense. If approved it will keep alive an industry in Washington that started in the 1970's and has grown worldwide so that fresh farmed salmon and trout are now readily available year round to most U.S. consumers. During this time the industry worldwide has innovated and made great improvements in its practices and the design and operation of the equipment used.

Cooke Aquaculture is a global leader in the salmonid farming industry and Washington State is fortunate to have such a company willing to invest in and develop the salmonid farming industry there. In the years ahead there is no doubt that the salmonid farming industry will continue to innovate and grow and with Cooke Aquaculture as it's leading producer the State is in a good position to benefit from this growth.

Martine Springer

The aquaculture industry in Washington state has proven to be a total failure from the perspective of ecosystem management and conservation of native species. The latest proposal to use "native" steelhead means that genetically-modified "domesticated" individuals will, with 100% certainty, escape at some point in time. These inevitable escapees will contaminate native endangered runs of unique steelhead strains and threaten their survival. Steelhead have already been suffering from a reduction in genetic diversity and this will only accelerate the problem.

While the threat of domesticated strains of native fish escaping and damaging endangered runs of steelhead is a new threat, the old problems of high fecal bacteria pollution and low-oxygen benthic zones remains. Worse still, aquaculture fish pens are proven reservoirs of deadly disease and parasites that quickly jump to wild fry, smolt, and adults that pass too close to the pens.

Apart from the glaring biological problems, players such as Cooke Aquaculture have proven to be bad faith actors. They have a long history of failing to perform basic maintenance and preventing escapee. They should be prohibited from participating in any aquaculture activities in Washington state.

Caroline Armon

Please do not permit Cooke Aquaculture Pacific to raise steelhead or any fish in Washington State waters,

based on their previous neglect, deception, WDFW statement

"After scientific review, WDFW determined that raising steelhead trout in the existing net-pen facilities would carry similar or less risk than raising Atlantic salmon.", and that these nets are in our public waters.

Washington State Department of Ecology are caretakers of our public waters and lands, our representatives, and the majority of we public do not support our waters being used and decimated for corporate profit.

I support, WSDE please also support

Wild Fish Conservancy seeking to restore the sites to their natural states and to restore full access for public use. As Executive Director Kurt Beardslee said "Leasing these lands for the purpose of restoring Puget Sound is consistent with the will of the public and will provide broad cultural, social, and economic benefits for all citizens while restoring direct access to 130 acres of public waters for the first time in over thirty years.

Buying the rights to the sites and removing the pens would, cost-to-benefit-wise, be one of the best restoration projects in 30 years."

Sincerely,

Caroline Armon

Marine Ecology Educator

Field Research

Lauralee Carbone

Friends don't let friend buy/eat farmed fish. Polluting. Can effect wild fish. Just say no and do the right thing.

Doug Simms

I fully support Cooke Aquaculture Pacific's move to produce triploid steelhead at all their marine sites.

As we have endured covid 19 over the past several months, the importance for locally produced foods from both land and sea has become more apparent than ever. Also, considering the underwhelming footprint it takes to produce 10,000 metric tonnes of sustainable locally grown healthy protein in Washington waters and the local jobs it provides makes this a no brainer.

Andrew Wynne

To whom it may concern:

We tend to hear about loopholes when they involve money (loopholes in tax codes, energy permits, and land).

Now fish

Steelhead vs Salmon. This loophole is the only reason we are still having this conversation. This is not what the voters want (the city of Bainbridge Island as recent as October 14, 2020 City Council Meeting is publically supporting other uses for the location). **THIS IS NOT WHAT THE PEOPLE WANT.** Except for the people and organization who benefit - which is a foreign corporation!

Jobs will be created with the proposed land use from Wild Fish Conservancy plan which will support the cleanup and resulting dock use.

The current jobs at the facility are skilled workers (welders, divers) who have the skills to find employment at other facilities. This is not about losing work.

This is about stopping a foreign corporation from exposing a loophole.

Stop this permit, and stop this loophole.

Laurie Sander

Fish farms do not contribute to the health and well being of Puget Sound and its wildlife. With all the stresses already on our oceans from increased population, acidification and other climate-related changes, the last thing we need is a fish farm with the known potential to further degrade water quality and jeopardize already federally-listed species like salmon and Orcas.

Cooke Aquaculture has a documented history of lying: they lied about the number of fish that escaped in 2017, they didn't report diseases in the escaped fish, and it is in their interest to continue lying about the health of any fish in the future. We can't afford to give them another chance to injure Washington's waters and wildlife.

Whether the farmed fish are fertile or infertile, Atlantic or native, the risk of any adverse effects on wild fish and the environment is too high.

Thank you for considering this layperson's opinion.

Jayni Detrick

As the closest neighbor to Cooke Aquaculture Pacific, the latest owner of the fish farming operation on Rich Passage, Bainbridge Island, we have witnessed their (and past owners) farming of Atlantic salmon in an artificial environment for 25 years. Although there are many reasons why fish farming in the Puget Sound should not be allowed, water quality is the most important. We see the pollution that occurs from the fish feed, full of questionable ingredients such as antibiotics, artificial coloring, vitamins, etc. It is a wasteland on the sea floor under the fish pens. It doesn't matter what type of fish that are being farmed artificially in fishnets, as they all will need to be fed polluting fish food! Although I am a free market, pro business and farming, citizen, fish farming businesses don't belong in our Puget Sound waters.
Thank you.

Isa Werny

It is time we stop all fish farms. Cook does not have a good record. They are not even a Washington company.

Kent Hoium

Raising Steelhead in Puget Sound will provide local seafood without harvesting the wild fish stocks which other wildlife depends on. It will also provide employment and tax revenue to the local economy. The only difference in the environmental impact of raising Steelhead vs. Atlantic Salmon will be that the "non-native species" issue will be removed.

I support the approval of the Permits allowing Steelhead to be raised here in Washington.

Martha Hall

I'm sorry that our legislature did not just ban in-water fish farms in Puget Sound in 2018. I'm sorry WDFW is issuing a permit to Cooke to raise native fish in Puget Sound at 4 sites, one near me, Hope Island. Many negative impacts have not changed because Cooke changed to a native species such as water pollution and the possibility of diseased fish and use of antibiotics because this is "factory farming" at its worse because the farmed fish will be sharing the same waters as our wild fish and some of our most important waters in Puget Sound.

I listened to the oral comments from a person who said humans must have a source of fish. He also said now and in the future more of the fish will come from "fish farms" rather than from wild salmon. I disagree with both of his statements. Humans do not have to eat fish. That's a choice. There are many other sources of protein, and far safer sources that have not been pumped full of antibiotics as they are produced. If farmed fish are not available, all fish would come from wild sources and this would be far better for the Salish Sea. It would honor our pledge to lead in protecting the Salish Sea by banning fish farms. We can then hope Canada will do this too. As our human population grows and our the Salish Sea suffers from the impacts of climate change more and more, humans will need to make some hard choices, like change our eating habits so we eat far less meat and fish. As we see more of the negative impacts of our over-use of antibiotics when producing meat and fish we will need to take them out of food production. Factory farms are not safe for the animals that must live in them until they were killed and eaten, "harvested" and their products are not safe for humans and our pets.

The pollution caused by the fish food, fish feces and antibiotics coming from pens that use the waters of the Salish Sea is just plain unacceptable to many of us who have worked hard to reduce and stop pollution. We are working hard to try to protect our declining populations of salmon and resident orcas. It seems like our state agencies should be doing the same.

Allowing factory farms, fish farms, to operate in the waters of the Salish Sea is extraordinarily short-sighted. Everything inside of the nets on these fish farms may get out including diseases, feces, antibiotics, and fish food. These create point-source pollution and the Department of Ecology is going to issue permits for this! This is shocking after all of the efforts of the people of WA State to clean-up the Salish Sea. Our cities are spending millions on wastewater treatment. We are checking our outfalls. Boats must store sewage. Farmers are being told to fence off riparian areas to keep livestock feces out of streams that flow into the Salish Sea. We've spent millions trying to "save our salmon" through dozens of efforts. Why, when our state agencies move ahead to give permits for fish farms that we do not need to have in WA State. The fish farms generate a few jobs, very few. Profits go to Cooke, not the people of WA State. We just get the pollution!

As to the so-called stricter pollution standards, I find the self-reporting by Cooke on various items like the monthly reports on fish food consumption and monitoring for escaped farmed fish totally unacceptable. Cooke clearly demonstrated that a third-party is needed to oversee all of its operation on at least a weekly basis if not daily. Cooke has a long history of not reporting and properly dealing with diseases in fish in its pens. It tried to avoid responsibility for the collapse of the net pen near my home and lied to us saying it was caused by unusual circumstances. Escapes have not been

reported. Why does the Dept. of Ecology think Cooke will operate any differently in the future? Who believes Cooke will closely monitor and report escaped fish or food consumption or use of antibiotics or anything else?

Sustainable agriculture, in the water and on land, should be our goal. Factory farming in the Salish Sea or the Skagit Valley farmland is not sustainable. It is also not humane to the poor animals, the fish, who live their lives crammed into over-crowded pens and fed antibiotics to keep them artificially healthy. This should not be part of our vision for the future in the State of WA. We don't have to have fish farms in our state. We'll be able to get enough protein without fish farms. I'm very disappointed in our legislature for not banning all fish farms and I'm disappointed in my three state agencies who have lined up to issue permits to Cooke for factory farming in the Salish Sea.

Dan Swecker

As a retired state Senator and former fish farmer, I fully understand the risks and impacts of a commercial net pen operation the environment and native stocks. In addition to our freshwater operation in Rochester, WA,. my company also applied and received a permit to raise fish in saltwater in Case Inlet near Hartstine Island in South Puget Sound.

During my tenure in the Senate, I also served on the Natural Resources Committee for 18 years, and am very familiar not only with the status of stocks in Puget Sound, but also the various impacts on them as well as the potential for threats that might cause a deleterious effect on them.

While it has been shown beyond a doubt that Atlantics cannot and do not breed with native Pacific salmon stocks, the decision by Cooke Aquaculture to switch to sterile, all-female, triploid, Rainbow Trout/Steelhead is the very best option for eliminating any possible impact on the environment or native stocks. Should any of these fish escape, they will not reproduce because they are sterile. In fact the Washington Department of Fish and Wildlife routinely stocks these same fish in freshwater lakes throughout the state.

The preference for these fish is that they grow faster than other fish (considered an advantage by sportsmen). In addition, they will not reproduce and compete with native stocks. The state uses the same process as the private sector to create triploid fish that they routinely introduce in bodies of water though out the state. There are no chemicals used to do this. Instead, at fertilization, the eggs are subjected to high pressure for a few minutes which causes them to retain three sets of chromosomes. This results in the eggs that produce only sterile fish.

With regard to disease, these stocks are certified disease-free prior to entry in saltwater. The only possible disease- transfer that might occur would be from wild fish to the commercial stocks in the net pens. If such a transfer should occur, the problem would be detected right away and appropriate action would be taken to resolve it. This would result in no additional risk to native stocks.

In my 18-year experience as a legislator, I saw no legitimate statewide policy or priority that these fish being used for commercial aquaculture would impact. Some public policies would be greatly enhanced. One of those is the need for jobs in our rural communities. In the recent past, commercial net pen aquaculture has provided up to 400 jobs at any one time. The economic viability of some of these communities is heavily dependent on commercial aquaculture.

It has been suggested that the areas occupied by the net pens would be better utilized for recreational access. It is important to remember that most of rural Puget Sound is available for this purpose. Very little of the land is set aside to use for aquaculture. Around the world other countries and making huge efforts to expand aquaculture. It is now producing most of the seafood that we consume. It is critical that our country participate and remain competitive in the international marketplace.

I would like to make a strong recommendation that this application be approved for the good of rural communities, our natural resources and the state as a whole. Let's stop importing these products from other countries and produce them ourselves.

Sincerely,
Dan Swecker
Senator, retired

Craig Clark

I am in complete favor of going forward in allowing Cooke Aquaculture to farm steelhead in our local waters.

We need seafood, jobs, tax revenues, economic activity, and to food produce more of our food locally, rather than rely on importing it from overseas. This company has proven themselves to be responsible, reliable, and good neighbors.

Support Mariculture

I am in support of the modifications Ecology has made to the draft NPDES permits for the Cooke Aquaculture operations. Cooke's transition to growing native species will be good for creating a sustainable seafood source that can be locally grown and well regulated in Washington state. We need to use scientific research and evidence based facts as we navigate towards a more sustainable future.

Ecology has put forward multiple safeguards and environmental reporting requirements that will help further minimize risk, potential impacts and maintain water quality conditions around these types of farm sites. Aquatic farms need clean, healthy water to grow healthy fish. This is true for aquatic farms just as much as it is true that land farms require the maintenance of healthy soil to raise healthy crops. To my knowledge, the fish farms have been growing fish in them for over 30 years in Puget Sound. If there was negative impacts to the surrounding water or sediments, it is doubtful they would be able to continue growing fish in these same locations. The different companies that have operated the farms over this time have all made their mistakes or had accidents happen. Fish farming is not an easy industry. It is fishing and farming combined. Both require you to work in and with Mother Nature and as anybody that fishes or farms already knows, she can be a harsh teacher at times. Like anything we humans do, we learn from our mistakes and try to do things better the next time. In my opinion, Cooke needs to be given a chance to try to do things better. Transitioning to sterile steelhead native trout is a step in the right direction.

- Seafood production will need to increase to provide more food for the expected increased human growth in the human population that is forecasted to occur in the next 30 years. The United Nation global demographic data shows an increase of 2 billion additional people will inhabit the planet by the year 2050. Most of this population growth is expected to occur in areas that are already poor in protein resources and/ or rely primarily on natural seafood resources that are being stretched to capacity already.
- Fishery experts agree that significant increases in the U.S. and global capture fisheries are generally unlikely to occur because most currently utilized capture fisheries have been at their maximum sustainable yield for the past 30 years or longer. Increasing, and most importantly, securing global food production resources will become even more important over the next several decades.
- Wild capture fisheries for most of the traditional northwest fish species are in decline or are currently at their maximum harvestable yields to sustain the species.
- Tribal and commercial fisheries in Washington, Oregon and California do not exist at anywhere near their historic levels. By working on the water and working with fish, aquaculture can provide locally produced seafood, employment opportunities, and help to maintain this region's cultural connection to producing food from the sea.
- There is scientific agreement that increasing mariculture (ocean farming) will have less environmental impact than a proportional increase in terrestrial food production systems. There is a finite amount of freshwater available for an increase in terrestrial agriculture and most suitable

growing areas have fully exploited freshwater resources.

- Mariculture, done correctly and responsibly, can be a sustainable resource for seafood and become a resource to help supplement salmon enhancement, recovery operations and possibly even Orca recovery.

- WDNR and the other state agencies have refocused their regulations and helped to make the necessary corrections that will guide the marine net pen industry to more environmentally sound and sustainable practices. Strict regulations continue to make Washington's aquaculture operations part of the long term, sustainable solution to increasing seafood for human consumption.

- If we want to eat it, we better learn how to grow it.

Chris Long

Net pens open to the ocean have been shown in recent research studies in BC to have negative impacts on wild salmon and steelhead. BC is removing their pens by 2025 based on this science. WA should not ignore it and jeopardize our few remaining wild salmon and steelhead. A pen near the mouth of the Skagit is an especially bad idea. Just say no!

Also, from an economic perspective, net pens exploit our natural resources to benefit only a few people who own the company. Healthy fish populations are far more beneficial to the state's overall economy, since sport fishers spend hundreds of dollars a trip at local businesses. Don't risk killing the golden goose.

Kristin Balmet

Let's work to restore NATIVE species to their natural habitats. Perhaps muscle farming would be a safer and cleaner possibility for fish farming. Thank you for all your Time and hard work.

Corinne Asher

Cooke Aquaculture has already displayed their negligence and incompetence. Please do not give them or any other Net Pen company the opportunity to endanger native fish/marine populations and pollute the water. We must do everything to guard the safety of our waters and native fish populations, or we will NO LONGER have them!!!!!!!!!!!!

Harriet Holmgren

I think all permits should be provisional given Cook's history of not ensuring that the fish cannot escape. Even though these fish are native they are not the same as the wild fish (DNA may be the same but the environment/life experience is not - epigenetics has effects). Cook's should have to prove they can follow through with what they say they are doing for the next 5 years.

Lyn Kerschen

No steelhead! Cooke has had their chance at responsible farming and blew it. Studies have increasingly shown that fish raised in open water pens can have significant negative impacts on wild salmon populations and the environment. The practice usually sees tens of thousands or even hundreds of thousands of fish raised in close proximity to each other, where they can exchange diseases and parasites like sea lice. I strongly opposed to Cooke's permits. L. Kerschen

anonymous anonymous

This request is ONLY for a modification to the species being raised. The proposed change to raise native, sterile, steelhead trout is very reasonable, and I support this modification and the continuation of our local aquaculture industry.

Cyndy Holtz

Please see uploaded file.

Ecology should not authorize Cooke Aquaculture's modified NPDES permits for the following reasons:

1. WDFW issued a Mitigated Determination of Nonsignificance and granted Cooke permits for operating steelhead farms. The WDFW decision was challenged in court and a decision on whether to require WDFW to prepare a full EIS is pending. Ecology should not make any decisions on Cooke's NPDES permits until the court has issued its decision. If the court requires a full EIS, Ecology should not make any decisions regarding the NPDES permit until a full EIS has been prepared and vetted.
2. The SEPA determination issued by WDFW in January 2020 requires Cooke to prepare a steelhead marking plan, and a "no-recovery response" plan in the event of farm fish escapes. Additionally, Cooke is planning to replace some net pens at its Orchard Rocks location, but no plans or engineering data on the new structures have been provided. Ecology should delay its NPDES decisions until it has received and reviewed the imminent submission of additional information about Cooke's proposed operations.
3. Following the 2017 Cypress Island net pen collapse, a Washington court ruled that Cooke had violated the terms of its permits in a variety of egregious ways. Ecology should not take action on the NPDES permit until it has assurance that Cooke's emergency response plans and protocols will address the inadequacies that resulted in the Cypress Island collapse.
4. Ecology's review for issuing a modified NPDES permit to Cooke should be based specifically on whether Cooke's proposed operations will meet the state's goals, as stated in HB 2957, to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish and wildlife," instead of concluding simply that the conditions of the current NPDES application are similar to those of past permits.
5. The NPDES review should thoroughly evaluate existing data on the Cooke operations' effluents from industrial products, medicines, feed, fish waste, and dead and rotting fish. Evaluating only the difference between water quality impacts of salmon net pen operations, and those of steelhead, is inadequate and irresponsible.
6. The NPDES review should evaluate the genetic risks of the proposed steelhead farms to naturally spawning steelhead populations. The existing permit addresses genetic impacts of non-native Atlantic salmon.
7. Ecology should not issue NPDES permits until Cooke has requested and received agreement from all local, state, federal and tribal governments. At its regular meeting of October 13, 2020, the Bainbridge Island City Council unanimously voted to send to their consent agenda for adoption on October 27, 2020 [Resolution #2020-18](#), supporting Wild Fish Conservancy's application to lease the aquatic lands currently occupied by Cooke Aquaculture in Rich Passage, for the purpose of restoration and public benefit. Issuing an NPDES permit to Cooke for its Rich Passage operations would rebuke the Bainbridge Island City Council's aspiration for the restoration of Rich Passage.

Douglas Love

What may have been a good idea 30 years ago is no longer a good idea. Because farming salmon and other fish in tanks on land is now a viable, commercially profitable alternative to fish pens in open water, continuing to permit the farming of fish in Puget Sound and the Strait of Juan de Fuca no longer makes sense. The pollution caused by the pens (fish waste, uneaten food pellets), as well as the potential to spread viruses, other diseases and parasites to wild fish populations, creates too big a cost to the environment and citizens living in the Puget Sound region that outweighs any economic benefit to the state in lease payments or taxes or to citizens working at the farms. The risks of continued farming are amplified by Cooke's history of ignoring legal requirements and operating their farming activities in a negligent manner. Their reckless disregard for safety was shown by the 2017 release of hundreds of thousands of fish near Cypress Island, their failure through 2017 to keep their pens within their leased area in Port Angeles, and their failure in 2019 to notice a hole in a pontoon for one of their pens off Orchard Rocks in Rich Passage which caused a portion of the pen to dangerously sink and required Bainbridge Island residents to contact the U.S. Coast Guard to investigate.

If Cooke's modification request is granted, the State should not allow Cooke to continue farming fish of any type past 2022, with 2023 and 2024 used by them to remove the pens, remove or close facilities, and monitor environmental conditions in the area.

Helen Frances Glass

I fully support the denial of NPDES permit modifications and any further attempts to support Net Pen Fishing in our public waters. As many neighbors and citizens have already spoken so eloquently on the subject in the comments already received, I will voice my agreement with them, Senator Rolfe and the Bainbridge Island City Council.

When I first moved to the Fort Ward neighborhood in 2018, I was astonished to see that our Rich Passage waters were home to Orchard Rocks "Conservation Area" and Fort Ward Underwater Park "marine protected area". How then, could this fish farm exist right next to them?

And when observing the view from Google Earth, I was even more alarmed to see the clouds of waste and feces being transported directly to these sights by our strong incoming/high tides. For a population who seems committed to the "conservation" message and makes such efforts to pick up pet waste, spend a bit extra on green cleaning, laundry and gardening products, earnest about what goes down a storm drain and mortified by the thought of a sewage treatment mishap, I was shocked to see that we could watch the flushing of this giant toilet full of untreated waste each and every day in front of our own eyes.

It seemed so farcical at the time. What do we want to support and subsidize with our tax dollars?

I hope we will close the SEPA loop hole and end the Farce of thinking Net Pen Fishing and Conservation of our waters can ever be compatible.

Thank you for the opportunity to comment,

Frances Glass

Karen McDonell

Net pens cause discharges of effluent that flows down into Puget Sound and they must be shut down. I live on a shellfish farm in the lower Sound and we have had catastrophic clam die-offs in each of the last two years from discharges from fish pens and sewage treatment plants. These "so-called" nutrients have caused oxygen starvation and dead zones costing shellfish farmers enormous amounts of money from product loss.

Rachel Running

I am adamantly opposed to the permit modification that would allow Cooke to change species from Atlantic salmon to steelhead. It is unfathomable that Cooke's past practices with raising Atlantic salmon is not being considered. They have consistently pushed the limits in regards to being in compliance with environment standards. The only oversight of the Bainbridge Island net pens seems to come from the neighborhood, questioning what they are doing, calling them out on it and at times reporting them. Clearly the pens are in a state of disrepair. When one of the pontoons had a leak over several days the pen became lower and lower in the water. They were notified yet nothing was done until it was reported to the coastguard. By that time a corner was submerged. My family consistently picks up trash/debris from the beach that appears to come from the farm. We have had issues with noise from generators that are suppose to have noise abatement covers on them, pressure washing, and fish die off. We have witnessed seals and a sea lion in the pens eating fish. If they get in surely salmon are getting out. There were hundreds of sea lions residing on one set of pens for 8 months before any abatement was done.

Just last month they put old nets in an open dumpster for a weekend. It caused an unbearable stench throughout the neighborhood. After a complaint was made someone came and at least put a tarp over the dumpster. There have been multiple such instances. How can this company be trusted.

Their past practices must be considered when modifying any permit. What would make them take any more

care with this new endeavor, who will oversee this. Clearly they have not been good stewards in caring for the puget sound and a new species wouldn't change that.

The pending litigation needs to be resolved before the company is allowed to move forward on this.

Thank you

Rachel Running

Hello Washington Department of Ecology,

I am a Colorado School of Mines student who is doing a project over the Cooke Aquaculture crisis. I have been taking information from local tribes, Cooke's Website, Clam Bay permits, and local news sites. I have a couple questions about the solutions that I have come across that may have been proposed, where more information about some solutions that I may not know about, and some general questions about the situation.

The first question is about the switch from salmon to steelhead. Who did your department consult in order to come to this conclusion? Did you contact local tribes, and if so, which tribes? Did you take into account any of the tribes benefiting like that of the Jamestown Tribe, or did you look at the permits from a strictly environmental point of view?

You have a loose way for reporting numbers according to the "FACT SHEET FOR NPDES PERMIT WA0031526 COOKE AQUACULTURE PACIFIC, LLC CLAM BAY SALTWATER I", that is Cooke Aquaculture will be reporting the numbers directly to you, which can lead to possible fraud. Along with this, to the public Cooke doesn't have the best environmental track record. Why would they not want to report improper numbers?

So it seems that there would also be concerns over environmental degradation of the surrounding area when it comes to the fish waste. I have come across the proposal of using sea cucumbers to get around this hazard, as they are one of the most efficient bottom feeders you can use. Has your organization looked into this proposal, and do you think it is sustainable economically and environmentally?

Over the years since the accident, many foreign countries, especially Canada have taken notice of your response and solutions with the accident. Where do you see your organization playing a role on a global scale, or do you try to keep priorities only related to the problem at hand?

Finally, how under what criteria have you heavily leaned on to create solutions for this problem? Was it research, was it EPA regulations, or was it something second hand, such as Cooke Aquaculture research?

Thank you!

Stephen O'Brien

Ms. Laura Watson and the Washington State Department of Ecology,
Due to past malpractice and negligence Cooke Aquaculture should be denied a Pacific NPDES permit modification to raise steelhead.

I am vehemently opposed to the continuation of this project. The danger to other native salmonid species in Puget Sound through disease transmission, pollution due to the presense of the pens and the aforementioned poor maintenance by Cooke Aquaculture are proper grounds for denial of this permit. I as a Washington State resident and United States citizen do not think that we should allow Cooke, a company which has shown blatant disregard for native flora and fauna nationally and internationally, to operate any longer within Puget Sound or Washington State.

Maradel Gale

Puget Sound and the Salish Sea have had enough of industrial aquaculture, especially finfish netpens. These are loci of parasites, pesticides, fecal material and basically incompatible with the protection of our marine waters. Cooke Aquaculture should not be allowed to do anything in our waters. They have proven they are irresponsible and are not capable of managing their business to protect the public's waters and wild fisheries. I don't need to present any more information than has already been submitted to DOE by many others, both individuals and organizations. The facts are there. Deny any further permits for Cooke's operations and get them out of our waters!

To: Washington State Department of Ecology
From: Stephanie Ross, non-representational
Re: "Cooke Aquaculture Pacific NPDES permits modifications to raise steelhead"
Date: October 25, 2020

Commentator Stephanie Ross (hereafter "Commentator") attaches and incorporates in full the prior NPDES Comment on the Cooke Aquaculture Pacific (hereafter "Applicant") application for NPDES permits, mandatory pursuant to the laws of the United States, to operate Applicant's facilities while discharging pollutants into the waters of the United States. At this time, the NPDES authorization is delegated, as a matter of discretion, to the State of Washington Department of Ecology (hereafter "DOE"). This authorization, of course, can by law be removed from DOE if that unelected agency does not wholly comply with the intent and express laws of the United States, as well as the laws of the State of Washington and the financial responsibilities to the citizens/taxpayers.

As set forth in the attached Comment, "Governor Inslee's 2019-21 budget package includes over \$26 million in operating and \$300 million in capital investments for the Southern Resident orca recovery. Specifically, we will use these funds to address lack of prey, TOXIC CONTAMINANTS and vessel traffic issues." Comment at 2-3. Quoting Department of Ecology Focus on: Saving the Southern Resident Orca Financial Services_19-01-00. (emphasis added)

These toxic contaminants, as explicitly set forth, are a multitude of toxins and antibiotics, and expressly include "PCBs...THE MOST CARCINOGENIC." United States Environmental Protection Agency "Polychlorinated Biphenyls (PCBs)" (emphasis added)

Giving DOE the initial benefit of the doubt, it is assumed this agency intends to utilize this taxpayer money in full to do what was intended: protect the Southern Resident Orcas. The sole compliant legal option then, is invalidating the prior NPDES permits and denying the present applications.

Grant of the permits, however, would of course be proscribed by both the United States and State of Washington. 18 U.S.C. Ch. 47; RCW 42.20.

Moreover, the proposed "modifications" have no impact whatsoever on the multiple violations of governing and controlling laws of the United States, specifically, the Endangered Species Act and Clean Water Act.

Accordingly, Commentator submits this cover letter and the prior comment as incorporated by reference, in response to the Applicant's "permits modifications to raise steelhead."

Respectfully,

Stephanie Ross

COMMENT: NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT COOKE AQUACULTURE STEELHEAD

Submitted by Stephanie Ross Commentator¹

I. OVERVIEW

Cooke Aquaculture (hereafter “Applicant”) is a foreign, for profit entity, which seeks National Pollutant Discharge Elimination System (hereafter “NPDES”) permits to discharge pollutants in the waters of United States, and Washington State, from the Washington State Department of Ecology (hereafter “DOE”). These pollutants include a multitude of antibiotics and chemicals, listed and referenced infra. Not set forth by Applicant, but necessarily included, are the polychlorinated biphenyls (hereafter “PCBs”) which are conclusive, federal and state “Toxic Pollutants.” CFR 401.15.

Applicant “operates two freshwater hatcheries...the hatcheries raise and produce the juvenile fish that are eventually transferred to Cooke’s Puget Sound marine net pens for final cultivations and desire harvest size. Eyed all-female triploid Rainbow Trout/steelhead eggs would be supplied to the Cooke hatcheries from the Troutlodge hatchery...” Applicant NPDES application, attachment D at D-2.

DOE expressly underscores that PCBs are in the fish feed for hatcheries. “EPA and Ecology are not aware of a feasible way to reduce PCBs in fish feed for hatcheries.” Fact Sheet For The Upland Fin-Fish Hatching And Rearing General NPDES Permit at 20.

It is widely recognized that farmed fish “That are fed ground-up fish have been found to be higher in PCBs compared with wild caught...” Mayo Clinic 2020. The United States government informs that “the types of PCBs that tend to bioaccumulate in fish and other animals and bind to sediments happen to be the most carcinogenic.” United States Environmental Protection Agency “Polychlorinated Biphenyls (PCBs)” EPA.gov (emphasis added).

DOE was allocated and has received public funds to mitigate the presence and impact of toxic pollutants.

Ecology’s role in Southern Resident orca recovery

Ecology works to improve and protect water quality, water quantity, fish habitat, and reduce toxic contaminants....Governor Inslee’s 2019-21 budget package includes over \$26 million in operating and \$300 million in capital investments for Southern Resident orca

¹ Commentator is a multi-jurisdictional constitutional attorney. However, this Comment is not written in a representative capacity for any past or present clients. The Commentator’s submission is personal and solely her own.

recovery. Specifically, we will use these funds to address lack of prey, toxic contaminants, and vessel traffic issues.

Department of Ecology “Focus on: Saving the Southern Resident orca” Financial Services 19-01-00; See e.g. Washington Department of Ecology Budget and Program Overview 2019-2021

The DOE cannot take taxpayer funds to protect the Southern Resident Orcas and simultaneously issue permits to a foreign, for profit entity to discharge toxic and multiple chemical and antibiotic pollutants that impact human health and endangered species. It is manifest that existing and future NPDES permits are unjustifiable.

Further, the issuance of NPDES permits for Applicants fish farms in the endangered species critical habitat in the waters of the United States and Washington, is a wholesale violation of the Endangered Species Act of 1973 (hereafter “ESA”), 16 U.S.C. §1531 et seq as pertaining to the Southern Resident Orcas. Pursuant to the laws of the United States and the State of Washington, the only applicable remedy is denying issuance of any further NPDES permits for further aquaculture operations at Applicant's Washington State fish farms (hereafter "fish farms") and voiding the existing permits. These are not permissible pursuant to the laws of Washington State, the Clean Water Act 33 U.S.C. secs 1251 et seq (hereafter “CWA”) or to the ESA, Sections 9 and 10.²

II. BACKGROUND

Commercial fish farms have been present and operated in the State of Washington for several decades.³ In 2016, Applicant purchased these fish farms from Icicle Seafoods. In only three years, Applicant has been sanctioned for a number of violations including the collapse of the Cypress Island farm, pollution and risk-related mismanagement issues at the Port Angeles farm, water quality mismanagement issues at the Port Angeles Facility and water quality violations in the operations off of Bainbridge Island. As recently as October 2019, a portion of one Bainbridge Island net pen started to sink. Department of Ecology.

Massive escapes from the fish farms in Washington State are not limited to the Cypress Island collapse. In 1997, "an estimated 300,000 Atlantic salmon escaped from the net pens, then owned by Global Aquaculture." Anderson, Ross "Atlantic Salmon Escape into Sound from Pens," Seattle Times, Tuesday, June 15, 1999. Approximately two years later in 1999, the Bainbridge Island Rich Passage facility collapsed, "releasing about one hundred thousand non-native salmon

² In the United States, citizens have a constitutionally guaranteed right "to petition the government for a redress of grievances." United States Constitution, First Amendment. Accordingly, any and all threats or retaliation, filing of a lawsuit or threat to file a lawsuit for exercise of this right shall be addressed as a civil and/or criminal matter as may be appropriate.

³ Fish farms as referenced herein specifically excludes any and all First Nation owned and/or operated commercial fish facilities.

into Puget Sound." *Id.*; <http://us.whales.org/news/1999/06/farm-raised-salmon-escape-washington-pen>; "Rough Waters for Salmon Farms", Bainbridge Review, Saturday, July 8, 2000. Many of the Atlantic salmon from the 1999 escape made their way to the mill pond at the head of Port Blakely Harbor. Port Blakely has a wild native salmon tributary. ESA threatened and endangered species have been located in the Port Blakely area.

The Center for Food Safety has reported and documented the frequency and quantity of world-wide escaped fish farmed from 1996-2012. The number of incidents is more than 30, and totals a reported amount of 25,768,729 escaped fish.

Endangered Southern Resident Orcas

All of Applicant's fish farms are located in the federally designated habitat of the critically endangered Southern Resident Orcas. Designated Critical Habitat for Southern Resident Killer Whales, November 2006, NOAA Fisheries, Northwest Region.

The Southern Resident Orcas are faced with imminent extinction if immediate, wide scale actions are not taken to alleviate the threats to them in their marine environment. Accordingly, NOAA recently has identified the Southern Resident Orca as among those few species who will become extinct without urgent and comprehensive intervention. National Marine Fisheries Service, Recovering Threatened and Endangered Species Report to Congress (FY 2015-2016) (Nov. 30, 2017), <https://www.fisheries.noaa.gov/resource/document/recovering-threatened-and-endangered-species-report-congress-fy-2015-2016>.

The Governor of the State of Washington convened the Southern Resident Orca Task Force to address the looming extinction of the extraordinary Southern Resident Orca. The Task Force cited three threats, including lack of prey and toxic contaminants. The Executive Summary specifically states Southern Residents and their prey are exposed to an ever-increasing mixture of pollutants in the marine environment, particularly in the Salish Sea. "Many of the pollutants are poorly metabolized, persist in the environment and bioaccumulate and biomagnify in the food web. These toxins can reduce salmonid survival by making them more susceptible to disease, which in turn means less food is available to the Orcas. The toxic contaminants can also reduce immunity and cause reproductive disruption in Orcas." Southern Resident Orca Task Force, November 2018, 5-6.

The Governor's Task Force further explained the impact of contaminants on the Southern Resident Orcas:

Contaminants enter the Salish Sea through . . . direct water contamination . . . and invariably enter the food web . . . At the top of the food chain, these contaminants can accumulate in long lived, high level predators including the Southern Resident Orcas.

Id. at 31.

Toxic contaminants in the water irreparably affect starving as well as well-fed Southern Resident Orcas. As the Task Force instructed "Orcas with higher contaminant levels in their blubber also have higher levels circulating in their blood, even when they are well-fed." Id. at 31, citing NOAA Northwest Fisheries Science Center.

Fish Farm Pollutants

Species sought to be introduced by Applicant are themselves a pollutant in the critical habitat of the Southern Resident Orca. Any chance of escape of any number of fish exacerbates the threat to the survival of the Orcas faced with imminent extinction. Applicant has not delineated precisely which pollutants will be introduced directly into the water, the home of the Southern Resident Orcas, but vaguely asserts that there will not be a significant change from those presently utilized.

According to Applicant's first statement in 2017 and renewed in its present NPDES application, these contaminants include the following:

Feed Additives

Canthaxanthin and/or Astaxanthin - Natural and/or synthetically produced compounds of the two types of carotenoid pigments may be added to the fish feed in levels ranging from 30 ppm to 70 ppm. Both canthaxanthin and astaxanthin are approved by the USFDA for use in fish feeds to enhance the pink to orange/red coloration of salmonid flesh. In the animal kingdom, carotenoids are heavily utilized as a source for pigmentation, a vitamin A precursor, for improving intercellular communication, enhancing immune responses, and as antioxidants in vivo [1,2] . . .

Antioxidants - Antioxidants are added to the fish feed mixture to stabilize the vitamin supplements and increase the shelf life of the feed . . .

Antibiotic Medicated Feed - Medicated feed may be periodically used to treat bacterial disease at the marine net pen sites . . .

Romet 30 (Sulfadimethazine-ormetoprim) - Romet 30 is the trade name for an aquatic animal premix containing a sulfadimethazine-ormetoprim antibiotic that is used to treat bacterial disease. When medicated feed is prescribed, the premix is added by the feed manufacturer during the feed milling process. Romet 30 is used to treat Furunculosis, Vibrio, Myxobacterial and other bacterial pathogens if they occur in the cultivated fish stocks. When a disease treatment is prescribed by a veterinarian, the Romet 30 medicated feed is manufactured at a concentration of 2.27 grams of active ingredient per one (1) pound of fish feed. The medicated feed is then fed to the fish to achieve a dosage rate of 50mg of active ingredients per one (1) kilogram of fish per day, for a treatment period of five (5) consecutive days.

Terramycin TM 200 (Oxytetracycline HCL) - TM 200 is the trade name of for [sic] an aquatic animal antibiotic premix that is used to treat Furunculosis, Vibrio, Myxobacteria and other bacterial diseases. The TM 200 pre-mix is added to the feed by the manufacturer when prescribed by the veterinarian to treat specific disease events. TM 200 is mixed to achieve a concentration of 5 grams of active ingredient per one (1) pound of fish feed. The medicated feed treatment is fed to achieve a dosage rate of 75mg active ingredient per one (1) kilogram of fish per day, for a period of ten (10) consecutive days.

Aquaflor - (Florfenicol) - Aquaflor is the trade name for the premix containing the antibiotic Florfenicol., and is approved by the USFDA for the use in freshwater food fish to

treat bacterial disease. In marine finfish aquaculture, Aquaflor can be used under the Investigational New Animal Drug (INAD) system administered by the USFWS and USFDA. When prescribed, Aquaflor medicated feed is used to treat bacterial disease and is mixed into the feed by the feed manufacturer at the active ingredient concentration rate of 0.302 grams per one (1) pound of fish food. Aquaflor medicated feed is fed to the fish to achieve a dosage of 10mg of active ingredients per one (1) kilogram of fish per day, for a period of ten (10) consecutive days.

Disease Control Chemicals - Other disease control chemicals that may be used at the farm sites are Finquel MS222, Iodophor disinfectants and sodium hypochlorite (chlorine bleach) disinfectant solutions.

Finquel MS222 - Finquel (MS222) is a USFDA approved fish anesthetic that is periodically used when the fish are sampled for weight and condition factors. A small number of fish are periodically captured by dip net from a pen and then immersed in a tote of seawater with a small amount of MS222 mixed in. The MS222 anesthetizes the fish so that they can be safely handled, inspected, weighed and then returned unharmed back to the fish pen .

Chlorine Bleach Solution and/or Argentyne Iodophor Solution - These surface disinfectants are used as a bio-security measure in footpaths at the farm sites and to periodically sterilize any shared equipment between the sites. Argentine [sic] Iodophor solutions are used in foot baths at the farm sites during the entire year. Estimated average annual consumption rates for each farming area of Iodophor solutions at the Bainbridge Island, Cypress Island, Hope Island and Port Angeles farm sites is approximately 55 gallons per facility. The use of sodium hypochlorine or chlorine bleach solutions at the net pen sites is infrequent.

Iodophor solution and chlorine bleach. Disinfectant used in footbaths and to disinfect farm equipment. Small quantities are used through out [sic] the year. Finquel MS222. A fish anesthetic used occasionally during size sampling of juvenile fish during the production cycle.

Medicated Fish Feeds – Romet 30 - Sulfadimethozine-ormetoprim. (Described in previous answer above) Terramycin TM 200 (Oxytetracycline HCL) (Described in previous answer above)

Aquaflor - (Florfenicol) (Described in previous answer above)

2017 Applicant NPDES Net Pen Permit Renewal Application Additional Information at 1-3; 2020 NPDES Renewal application.

The PCBs not only will be present in the hatchery feed of the change of species See “Overview” supra, but also will be present in the fish, the fish waste and the water column. Moreover, a substantive and expansive list of the chemicals set forth by the DOE for “fish hatching and rearing facilities” is provided in the Fact Sheet for the Upland Fin-Fish Hatching and Rearing General NPDES Permit. These include: 23 chemicals for “Internal Control”, 9 chemicals for “External Control” and 9 chemicals for “Disinfectants/Other”. Id at 9.

Applicant's Submission

The Governor's Southern Resident Task Force report was not cited by the Applicant in its NPDES permit application and attachments. Applicant's extensive bibliographies apparently have

not one study about the harm to the Southern Resident Orcas from toxins which significantly contribute to the very demise of this endangered species. As in the Washington Department of Fish and Wildlife (hereafter “WDFW”) application, Applicant sets forth only a few paragraphs generally surmising that a level of harm will not be reached by the changes of species in its farms and other commensurate actions.⁴

Incidental Take of Endangered Species

Applicant relies, in part, on the WDFW issuance of its permit issuance to Applicant on the basis of only an MDNS. 2020 NPDES Application, Attachment F. Such reliance is misplaced, because the WDFW permit issuance was a violation of governing federal law. Aside from the incorporation of the above-referenced Attachment D, consisting of a few paragraphs in total on the effects and impact to the Southern Resident Orcas, WDFW undertook no analysis of the harm from Applicant’s farms accelerating the extinction of the Southern Resident Orcas. WDFW did not incorporate by reference, cite to or discuss the Governor's Southern Resident Orca November

⁴ SOUTHERN RESIDENT KILLER WHALE

Potential Effects from Atlantic Salmon Floating Net Pen Aquaculture Southern Resident Killer Whale (SRKW) are regular inhabitants of Puget Sound. Marine net pens are insignificant in their overall size and are therefore not expected to impact SRKW habitat. Vessels that service these facilities may cause short-term and localized disturbances but are not expected to have any lasting effects. There is adequate space to accommodate SRKW passage around the existing net pen facilities so that any effects on passage are expected to be insignificant (Thom 2010).

No outbreaks of parasites related to net pen operations have been observed in Puget Sound. Therefore, NMFS concludes that the operation of net pen facilities would have insignificant and discountable effects on salmonids regarding sea lice infestation. In addition, NMFS anticipates discountable effects on prey quality because net pen operators comply with NPDES permit requirements related to maintaining water quality and sediment quality. A Not Likely to Adversely Affect (NLAA) determination was supported for listed salmonids in Puget Sound; therefore, SRKW are also not likely to be adversely affected since salmonids are a primary prey base (NMFS 2011).

Other than limited and non-lethal predator control permitted by NMFS, the technical memorandums do not state any concerns of adverse effects to marine mammals in Puget Sound in relation to Atlantic Salmon rearing facilities (Nash 2001). Furthermore, the Washington Pollution Control Hearings Board (PCHB) specifically noted in its 1997 ruling that the operation of net pen facilities in Puget Sound does not have a negative impact on marine mammals Ecology 2007. Therefore, Atlantic Salmon culture in floating marine net pens May Affect but is Not Likely to Adversely Affect Southern Resident Killer Whale. NMFS also concurs with the EPA effect determination of May Affect, Not Likely to Adversely Affect SRKW critical habitat. Existing Cooke Aquaculture Puget Sound marine net pens are required to comply with Washington State water quality standards through NPDES permit compliance. NMFS anticipates effects on prey quantity and quality will be discountable or insignificant within the action are and within designated critical habitat of SRKW. And the potential for vessels or the net pens themselves to interfere with passage within SRKW critical habitat is expected to be short-term and localized and therefore insignificant NMFS 2011. Potential Effects from the Proposed Net Pen Species Conversion

Conversion of the net pen facilities from Atlantic Salmon to triploid all-female Rainbow Trout/steelhead will not change significant threats to Southern Resident Killer Whales through reduced quantity and quality of prey, persistent pollutants that could cause immune or reproductive system dysfunction; oil spills; and noise disturbance from vessels or any other means. Therefore, the action to convert from Atlantic Salmon to Rainbow Trout/steelhead rearing is Not Likely to Adversely Affect Southern Resident Killer Whales. Applicant Submission in Support of Permit to Change Species, Attachment D, WDFW Application; Attachment D, NPDES Application 47-48

2018 report in its MDNS determination.

WDFW declined to ask a single recorded question about the harm or impact to the Southern Resident Orcas by the toxins, or the pollutant species in the subject fish farms. Attachment B, Additional Information: Response to WDFW Questions.

Direct and Indirect Harm to Southern Resident Orcas from Fish Farm Operations

Neither DOE nor WDFW applied for an Incidental Take Permit regarding the Southern Resident Orcas or operations of these fish farms. Neither DOE nor WDFW has developed, let alone received approval of, a Habitat Conservation Plan with respect to the Southern Resident Orcas. Applicant has not applied for an Incidental Take Permit regarding the Southern Resident Orcas or operations of these fish farms. Applicant has not developed, let alone received approval of, a Habitat Conservation Plan with respect to the Southern Resident Orcas.

III. DISCUSSION

A. ESA State Liability

The ESA is “the most comprehensive legislation for the preservation of endangered species enacted in any nation.” Tenn. Valley South. v. Hill, 437 U.S. 153, 180 (1978). Congress enacted the ESA “in the plainest of words, making it abundantly clear that the balance has been struck in favor of affording endangered species the highest of priorities. Id. at 194 (emphasis added).

This mandate of the United States expressly encompasses all persons including, but not limited to the partnerships, companies, state agencies, officers, agents and any and all individuals. No one is permitted to act, permit, attempt to commit nor is absolved from actions which violate the ESA.

Specifically, ESA provides:

- (1) Except as provided in section s 6(g)(2) and 10 of this Act with respect of any endangered species of fish or wildlife pursuant to section 4 of this Act it is unlawful for any person subject to the jurisdiction of the United States to-
- (B) take any such species within the United states or the territorial high sea of the United States
- ...
- (G) violate any regulations pertaining to such species or to any threatened species of fish or wildlife listed pursuant to section 4 of this Act promulgated by the Secretary pursuant to the authority provided by this Act.

Id. Section 9

In holding that the definition of “take” includes incidental conduct, the Supreme Court unequivocally instructed that the legislative history of the ESA supports a broad sweep. The Committee Reports that accompanied the bills, that became the ESA, make clear that Congress

intended “take” to apply broadly to cover indirect as well as purposeful actions. The Senate Report stressed that “‘take’ is defined...in the broadest possible manner to include every conceivable way in which a person can ‘take’ or attempt to ‘take’ any fish or wildlife. Babbitt v. Sweet Home Chapter, Communities for Great Ore., 515 U.S. 687, (1995). The term ‘harm’ includes “acts which annoy (wildlife) to such an extent as to significantly disrupt essential behavioral patterns, which include, but are not limited to, breeding, feeding or sheltering. Id. 699 n. 12. (emphasis added).

The expansive reach of the ESA to incidental takes of species, with the greatest care to those listed as “endangered” on the brink of extinction, is compelled by the intent of Congress “to halt and reverse the trend to species extinction, whatever the cost.” Id. (citations omitted).

The Act provides an express exception to the imposition of penalties for violations: If the Secretary finds, after opportunity for public comment, with respect to a permit application, and the related conservation plan that –

- . (i) The taking will be incidental;
- . (ii) The applicant will, to the maximum extent practicable, minimize and mitigate the impacts of such taking;
- . (iii) the applicant will ensure that adequate funding for the plan will be provided;
- . (iv) the taking will not appreciably reduce the likelihood of survival and recovery of the species in the wild; and
- . (v) the measures, if any, required under the subparagraphs (A) (iv) will be met; and he has received such other assurances as he may require that the plan will be implemented, the Secretary shall issue the permit. The permit shall contain such terms and conditions as the Secretary deems necessary or appropriate to carry out the purposes of this paragraph, including, but not limited to, such reporting requirements as the Secretary deems necessary for determining whether such terms and conditions are being complied with.

Id. (2) (B) (vi)

B. Judicial accord; Individual, state and local agency liability for incidental harm to federally listed Endangered Species

United States Courts of Appeal have underscored both the need for and imposition of equitable sanctions, specifically injunctive relief for incidental harm to listed species permitted by state agencies.

The Ninth Circuit led the way in imposing vicarious liability in Palila v. Hawaii Department of Land and Natural Resources (“Palila I”), 639 F. 2d 495 (9th Cir, 1981) and Palila v. Department of Land and Natural Resources Hawaii (“Palila II”), 852 F. 2d 1106 (9th Cir, 1981). In both cases, the listed, endangered species at issue was a tiny six-inch bird, a member of the Hawaiian honeycreeper family. The Hawaii Department of Land and Natural Resources had permitted goats and sheep in the palila’s critical habitat on Mauna Kea. The sheep and goats were instrumental in preventing the regeneration of the palila’s habitat by harming the mamane trees upon which the birds depended.

The Ninth Circuit affirmed the decision of the district court that the goats and sheep were preventing regeneration of the mamane forest upon which the birds depended for their survival. The court held that the State, by authorizing the permit for the grazing of the sheep and goats, violated Section 9 of the ESA. “Harm’ pursuant to the ESA “did not require the plaintiffs to produce actual corpus delicti of deceased birds...only that the palila population was near a biologically survivable minimum and the goats and sheep were destroying its only remaining habitat.” James c. Kilbourne, *The Endangered Species Act Under The Microscope: A Closeup Look From a Litigator’s Perspective.*” 21 Envtl. L. 499, 502 (1991).

In Palila II, the State of Hawaii had introduced feral sheep into the same critical area on Mauna Kea, damaging the endangered bird’s habitat. The court again affirmed the district court, requiring the State to remove the sheep entirely from the critical habitat of the endangered bird. In finding that the State was in violation of Section 9 of the ESA, the court reasoned in pertinent part that the sheep and the endangered bird could not co- exist, despite the increasing number of the palila. “The district courts (and the Secretary’s) interpretation of harm as including habitat destruction that could result in extinction, and findings to that effect are enough to sustain an order for the removal of the mouflon sheep” Id. at 1110.

Mandatory injunctive relief ordering the states to remove fish and animals that may harm indigenous federally listed endangered species is the requisite remedy. These cases are the law of the Ninth Circuit, which encompasses the State of Washington.

Other federal courts have followed suit. In Strahan v.Coxe 127 F. 3d. 155 (1st Cir. 1997) the federal appellate court affirmed the district court, ordering the environmental agencies in the State of Massachusetts to apply for an incidental take permit for Northern Right Whales and develop a critical habitat proposal to protect the whales from harm. The state agency, the Massachusetts Division of Marine Fisheries, had authorized permits to private parties to use gillnets and lobster pots within the critical habitat.

The court held that the State commercial fishing regulatory scheme exacted a taking in violation of the ESA. “But for” the permitting process, the actions of the private third parties that resulted in an incidental take of the Right Whales, could not occur. “A governmental third party pursuant to whose authority an actor directly exacts a taking of an endangered species may be deemed to have violated the provisions of the ESA.” When sections 9 and 10 are read together, these provisions prohibit “acts by third parties that allow or authorize acts that exact a taking that, but for the permitting process, could not take place.” Strahan at 159, 163. See Loggerhead Turtle v. County Council, 148 F. 3d 1231 (11th Cir. 1998) (permitted beach lighting, which harmed nesting loggerhead and green sea turtles sufficient allegation under ESA for standing purposes); United States v. Town of Plymouth, 6. F. Supp 2d. 81 (D. Mass 1998) (injunction ordered where municipality allowed off road driving that caused a take of piping plovers in violation of ESA.)

C. Harm to endangered Southern Resident Orcas from Applicant’s fish farms and State of Washington approved and pending permits

Each and every fish farm operation of Applicant occurs within the protected critical habitat of the federally listed endangered Southern Resident Orcas.

The open net pens are just that. They exist for the waters of the United States to constantly flow through, for wild fish and bio organisms in the food chain to flow through, and for fecal waste, chemicals, toxins, contaminants in fish farm feed, to enter the critical habitat of the Southern Resident Orcas and their prey. As stated by a leading scientist and researcher in WDFW, "There is something unique about the Puget Sound...what gets in the sound stays in the sound." Encyclopedia of Puget Sound, Puget Sound Institute; "New theory rethinks spread of PCBs and other toxins in Puget Sound" (May 18, 2016.) (emphasis added).

The EPA, NOAA and the Governor's Southern Resident Task Force all agree that primary threats to the very survival of the Southern Resident Orcas are lack of prey and toxins. Applicant's fish farms and the switch to the new species significantly and egregiously thwart the recovery of this endangered species and hasten the pace of their extinction.

These Orcas rely heavily on urban chinook. They will eat other fish, including the "steelhead", "but their preference overwhelmingly is chinook -- and in particular, runs that are themselves endangered or threatened, including Puget Sound Chinook." Seattle Times, "Struggling orcas heavily rely on urban chinook from Seattle area river, new analysis shows" (Updated May 13, 2019.)

As the Governor's Task Force expressly underscored, the "Southern resident orcas and their prey are exposed to an ever-increasing mixture of pollutants in the marine environment." Southern Resident Orca Task Force at 30.

High levels of persistent toxic contaminants including PCBs PBDEs and DDTs are present in the blubber of Southern Resident Orcas, potentially resulting in harmful health effects including alterations in hormone levels, reproductive distribution or miscarriages, reduced immunity to diseases, neurotoxicity, neurobehavioural disruptions and cancer. The toxic effect of these contaminants is further exacerbated by periods of weight loss, which can redistribute contaminants from fat stores (blubber) to other tissues, increasing the toxic response.

Id. at 31.

A source of these persistent organic pollutants (POP) in fish farms is the feed. "EPA and Ecology are not aware of a feasible way to reduce PCBs in fish feed for hatcheries." Fact Sheet For The Upland Fin-Fish Hatching and Rearing General NPDES Permit at 20. Significant published scientific literature has set forth the levels of these contaminants, which are uniformly recognized as contributing to the extinction of the Southern Resident Orcas. Several recognized authorities have published measurements of contaminants in fish feed and oils. P. J. Suther et al; "Occurrence of persistent organic pollutants in sediments collected near fish farm sites." Aquaculture 254, 243-247 (2006)

Moreover, the effluent from fish farms does not stay static and the blooms travel throughout the critical habitat of the endangered species. Dilution is not a solution for drifting waste in fish farm settings. Stanford Report, “For coastal fish farm waste, dilution is not an automatic solution, Stanford researchers say.” (April 7, 2011)

The use of antibiotics in fish farming – and particularly trout farming – should have set off alarms to the state of significant habitat impact. The Southern Resident Orcas in a depleted state may have a variety of needs, which this resistance may impact. There is great concern about the level of antibiotic resistance endemic in salmonid trout farming. Seafood Watch: Rainbow Trout Consulting Researchers (October 2, 2017).

Regarding the effect of such antibiotics on native fish populations, antibiotics as administered to salmonids in Chile have been reported in commonly consumed wild fish...it is concerning that several fish species affected are routinely consumed by humans. There is also the possibility that excessive levels of antibiotics in sediments and in the water column can affect the phytoplanktonic and zooplanktonic community diversity, potentially in turn affecting the health of animals and humans...

Id. at 45.

Applicant has listed a significant quantity of antibiotics that are currently, and apparently to be administered into open net pens/farm fish therein and potentially into the food chain of the Southern Resident Orcas, the food chain of the Puget Sound and waters of the United States. Seafood Watch scientific studies have necessitated a failing score of 2 out of 10 for chemical use in the famed rainbow trout due to the “high concern”. No analysis or even mention of this is included in the WDFW MDNS or DOE NPDES statements to date regarding Applicants 2020 permit requests.

The escape consequences of farmed trout, allegedly sterile or not, on the environment is potentially more harmful to the Southern Resident Orcas and their necessary food chain than that of Atlantic salmon. The compendium on farmed rainbow trout in Chile concluded that “rainbow trout are farmed in open systems and the available data...indicate large numbers (greater than 500,000) of fish have escaped since the early 1990s” Id. at 55.

It is generally agreed that escape and establishment of populations of non-native salmonids do have detrimental impacts on native fish due to predatory and interference competition and widespread ecological damage. Rainbow trout are known to be particularly detrimental in Chile due to their greater potential to establish self-sustaining populations, relative to other salmonids...feral rainbow trout (inclusive of both escaped and intentionally stocked) have been shown to significantly affect native fish populations due to competition for food. ...there is a high overlap of diets between escaped fish and native species, leading to inevitable competition.

Id. at 58 (citations omitted) (emphasis added)

There is a conclusion of WDFW and Applicant that escapes hopefully will be rare and that the trout hopefully, but not conclusively, will be sterile. The problem, however, is the competition for the food by the escaped rainbow trout to the point that those in Chile have had a significant negative impact on survival of other prey species.

Contributing to the starvation of the Southern Resident Orcas is a result entirely incompatible with federal law.

Transmission of viruses and lice themselves onto native wild populations has been extensively documented. A primary concern is that pathogens, old and new, are transferred by the lice to the native wild fish causing high native species mortalities. This is a particular threat to the Southern Resident Orcas who are starving and will eat not only native chinook, but also the threatened steelhead populations.

Species to species transmission has no barriers. Voiseett et al and Vectors "Parasitic sea louse infestations on wild sea trout; separating the roles of fish farms and temperature" (2018); Thorstad et al Aquaculture Environment Interactions "*Effects of a Salmon lice *Lepeophtheirus salmonis* on wild sea trough Salmon trout – a literature review*" (2015)

D. The DOE prior general and individual NPDES permits issued to Applicant violate the ESA

Applicant's fish farms have and will be involved in an incidental take of the Southern Resident Orcas. The toxins, pollutants, chemicals, potential for escapes, discharge and waste have and will harm the endangered species, from interfering with breeding to advancing actual starvation. The change to a new species only exacerbates the harm to the cherished Southern Resident Orcas.

The general and individual present NPDES permits for Applicant's fish farms were authorized without an incidental take permit or habitat management plan and are violative of ESA sections 9 and 10. The Constitution of the United States commands compliance with the laws of the United States, including the CWA and the ESA. The Constitution and federal laws made under its authority "are the supreme law of the land." Constitution of the United States, Article IV, Clause 2. Accordingly, DOE, WDFW and persons involved as the agents permitting the harm to the Southern Resident Orcas, are in violation of the laws of the United States and subject to injunction.

IV. CONCLUSION

For the foregoing reasons, Applicants current NPDES applications should be denied in full and the prior NPDES issued to Applicant by the DOE allowing discharge into the critical endangered species habitats and harm to the citizens, species and ecosystems of the United States and Washington State, revoked. These are the only remedies consistent with governing law.

Judith Akins

Ms. Laurie Niewolny
Permit Lead and Acquisition Specialist
Washington State Department of Ecology
PO Box 47600
Olympia, WA 98504
Email: laurie.niewolny@ecy.wa.gov

Re: Cooke Aquaculture Pacific, LLC NPDES permit modification application.

Dear Ms. Niewolny,

Thank you for the opportunity to comment on Cooke's request to raise sterile all-female triploid Rainbow/Steelhead at existing marine net pen sites in Puget Sound . I belong to many groups that are interested in making Puget Sound waters a healthy habitat for the flora and fauna which reside there as well as for human activity .There needs to be a net gain to these waters of Puget Sound to overcome the practices of the past.

While the Washington State Department of Fish and Wildlife has approved this project under SEPA, stating that the proposal "does not warrant an Environmental Impact Statement and the proposal will likely not have significant adverse impacts on the environment",I question the non-significance of this aquaculture project. I believe there will be significant impacts to the Puget Sound by these four projects and one only has to look at the comments already submitted by The Wild Fish Conservancy, Skagit Audubon Society, Swinomish Indian Tribal Community, Evergreen Islands, Our Sound Our Salmon.

Looking at the additional requirements being placed on Cooke I find some statements which are troubling. In the modifications DOE is requiring Cooke to prohibit release. Was not Cooke also charged with this prohibition when in August 2017, they allowed 250,000 salmon to escape and did not report this incident until days later? They are required to report unusual events, Cooke had a highly "unusual event" occur in 2017 and they did not report it until after others had reported seeing the Atlantic Salmon in their nets.

Fish feeding is an issue and the requirement that Cooke increase their monitoring, however they do not plan any changes in their feeding program. Fish feed along with the antibiotics are a very real threat to our native species and the surrounding waters. Farmed triploid rainbow trout are fed antibiotics which are widely used in modern aquaculture to prevent or treat bacterial diseases in farmed fish. The Seafood Watch program suggests that people should only eat these fish from indoor recirculating tanks because of levels of these antibiotics etc. in the fish.

Ecology has required Cooke to follow AKART analysis (All Known Available and Reasonable Methods of Treatment) to avoid excessive accumulation of marine growth.This contribution to marine waters of eutrophication, feces and uneaten food pellets alter the organic matter in the sediment, which can change the consumption of oxygen and can cause local eutrophication. According to the Institute For Coastal Marine Environment, "The most common negative

environmental effect is water eutrophication, water quality, and transmission of animal diseases." (Monique Mancuso, Institute for Coastal Marine Environment (IAMC) www.journaloffisheries.com) This can cause changes in the abundance and composition of microflora. The eutrophication causes dense growth of plant life and death of animal life and the spread and outbreak of diseases. Studies by both Ecology and WDFW: the 2000 Seventh Report of the Puget Sound Ambient Update finds "Widespread evidence of the declining population of Puget Sound marine organisms suggests the importance of new efforts to protect and recover populations. Recovery plans based on an ecosystem perspective will require additional information about the specific relationships among various Puget Sound species and the influences of various natural and human-caused environmental stresses on marine populations." WA State is spending millions of dollars for salmon recovery which depends on healthy seas. Continued fish aquaculture by Cooke and their proven record of abuse will only continue the decline to these waters.

Cooke is being required to improve their Net Hygiene in accordance with DNR protocol. Although Cooke has been required to do so, it has not maintained and cleaned net pens in the past and allowed buildup of mussels and other marine organisms which led to the net pen collapse in August 2017. The Department of Natural Resources report on Cooke's net pen collapse states that the net pens were not properly designed. (Negligence caused August net pen collapse News Date January 30, 2018, dnr.wa.gov) and as Cooke is making no changes to their structures the possibility of another collapse is real.

As government agencies address the effects of fish-farming in the Puget Sound waters, there is almost no scientific evidence that supports that this a healthy addition to our marine waters and in fact there is much evidence that supports that fish aquaculture contributes to the detriment of our water quality and life within the marine environment. It is my belief that Land-based Recirculating Aquaculture Systems (RAS) are a far better alternative for aquaculture farms. These systems located upland, allow for fin fish aquaculture but would greatly reduce or eliminate the impacts to the marine environment caused by net pens.

While "WDFW has determined that this proposal will likely not have a significant adverse impact on the environment", science is proving that this proposal will have significant adverse impacts to the marine environment and waters of Puget Sound. WA State is spending millions of dollars for salmon recovery which depends on healthy seas. Continued fish aquaculture by Cooke and their proven record of abuse will only continue the decline to these waters. We must study any and all impacts of any industry that will affect the Salish Sea and cannot allow any industry to threaten an already threatened environment and do further harm. I strongly urge that a new permit process be conducted on these projects and ones that include new SEPA analysis, threshold determination and a public hearing.

I am looking forward to seeing that the Department of Ecology carefully consider all the comments and decide in favor of a healthy and viable Puget Sound.

Comments on the draft NPDES permit modifications for Cooke Aquaculture's Puget Sound open water net pens at Hope Island and Rich Passage

Over-arching comments

As noted in comments I submitted on the applications for these permits, I have serious concerns and request that you **not proceed** with issuance of these permit modifications.

- 1) This company and its predecessors have a poor record in maintaining the structural integrity of their facilities and reporting issues and emergencies in a rapid and timely manner so that appropriate mitigation can take place before there is excessive release of fish or other environmental harm. In the release of Atlantic salmon at Cypress Island in 2017, Cooke Aquaculture avoided responsibility for the fish release in their public statements and did not promptly inform authorities. Why should we expect them to behave differently now or trust their management to protect the environment from harm when their bottom line is profits?
- 2) Given how much additional experience and information is now available pertaining to the safety and issues associated with in-water net pen culture of finfish, proceeding with this permit without an updating and thorough review of the SEPA document from the 1990's, that is the basis for assessing environmental impacts of this industry, is irresponsible and an abrogation of the State's responsibility to protect the waters of the state.
- 3) The people of this State and the Legislature have expressed their high priority for protecting the ESA-listed native salmonid runs and the endangered southern resident Orca population in Puget Sound. Given that, what is the basis for furthering an activity in public waters that adds pollutants to the Sound, interferes with salmonid migration routes, and in particular, poses a risk of amplifying disease in the native fish populations? This is not just a question of whether the permit modifications will increase the level of pollution over the current discharges, but about whether these permits are an appropriate use of the state's waters in light of the ESA listings. Evaluating risk involves both looking at the likelihood of an occurrence and the severity of the potential impacts. Likelihood of some escape and likelihood of disease are both high, based on the past record of this industry. Impacts are serious if they affect the native runs of salmonids in the Sound.

I have not reviewed each of the four draft modified permits, but have chosen to review the draft permit for the Clam Bay net pen facility, WA0031526, as an example of what I presume are parallel conditions, but on different pages, of the other draft permits. Therefore, please apply my permit comments to all four draft permits for Cooke Aquaculture under consideration with the public notice.

Specific Comments on Permit Terms and Conditions

My primary concerns, beyond those expressed above, have to do with the monitoring and reporting requirements.

- 1) If I understand correctly, under Section S1, Discharge Limits, page 7, any release of fish from the net pens is prohibited and each fish released is a separate permit violation. Section G3 A.1., on page 29, goes on to state under Permit Actions that a violation of any permit term or condition is cause for “terminating the permit during its term or for denying a permit renewal application.” I support these terms and hope that the State will respond appropriately when a release occurs, both terminating the permit, and fining the company per permit violation, as found under Section G.14., page 33.
- 2) Section 2, Monitoring Requirements. Monitoring should be done by a third party contractor agreed to by Ecology, not by the company. This section is confusing in terms of how the decisions proceed on whether to perform Exceedance and Enhanced Monitoring. What governs how soon after the initial sediment monitoring the applicant is required to perform Exceedance and Enhanced Monitoring? Sediment biological impacts and toxicity should be assessed as soon as an exceedance is detected, not after the annual monitoring report is submitted to Ecology in January, in order to accurately assess the full extent of impacts from the exceedance.
- 3) Section S 2.L, Antibiotic Resistance Monitoring, on page 13 should be a required element of this permit modification rather than requiring reliance on the vague threshold of an “unusually high usage” level, and the administrative processes to revise the permit requirements after the fact. Antibiotic usage should be assumed to be ongoing with these facilities, and antibiotic addition to the marine environment is a pollutant with ecosystem impacts.
- 4) Section S3, Reporting and Recording Requirements

S3.B.3.a. – Fish Mortality Monitoring and Reporting – it appears that the only concern is to report to WDOH when fish mortality exceeds 5% of the fish in any calendar week due to a harmful algal bloom. This is important in terms of monitoring toxic algal blooms and potential impacts on shellfish harvesting, fishing and ingestion of water by swimmers. However, what does not appear to be addressed is how a decision is made as to when the fish disease incidence and mortality from pathogens in the pens is at a level that is an unacceptable risk to native fish and wildlife nearby. Monthly DMR reporting of fish mortality is insufficient to halt a serious disease outbreak that threatens populations outside the net pens. Increase reporting of fish mortality and its causes.

S3.G.2.b. – page 18, 24-hours is too long a period to allow for reporting of a noncompliance occurrence that “may endanger health or the environment.” For

example, an accidental release of fish from a net pen failure should be reported immediately. How is the quoted phrase above to be interpreted?

5) Section 4, Operations and Maintenance Manual

S4.A.3.e. – pg. 20, How is “frequent basis” defined for removal of fish carcasses? Disintegrating carcasses can carry disease and become particles that are disease vectors in either the water column or sediments outside the pens. Please specify a frequency and what would constitute a reason to increase that frequency of removal of carcasses.

S.4.a.3.l – pg 21. There should be no discharge of toxic chemicals unless specifically authorized by the permit.

S9. Fish Escape Prevention, Reporting and Response Plan

S.9.N, pg 26 – fish escapes must be reported immediately, not within 24 hours. The initial response is critical for recovering fish and assessing the size of the escapement

S.9.X, pg 27 – Ironically, an Annual Fish Release Report presupposes that this activity will result in release of fish. This entire circumstance is unacceptable and has already been declared as a permit violation that can (and should) result in termination of the permit.

Jules Michel

Summary: It is premature to issue discharge permits to Cooke Aquaculture's proposed open net pens growing mostly sterile rainbow trout in Puget Sound until EPA and NOAA have completed their Biological Opinion, started only due to a court decision. Issuing those permits only puts Washington State at risk of litigation, a long and expensive process. Alternatives exist which protect Puget Sound's marine ecosystem. Cooke Aquaculture has the land and the technology exists.

Thank you for the opportunity to comment on the proposed discharge permits which would allow Cooke Aquaculture to grow mostly sterile rainbow trout in Puget Sound and create plumes of untreated waste discharged into Puget Sound's public waters.

As background, I was born, raised and educated in Washington State. My family has owned property on the shoreline of Puget Sound for four generations now. I have seen development along the shoreline, in the tidelands and in the waters evolve over those many years to levels not considered in the past.

There is no question that aquaculture has been largely ignored until recently, most believing it is benign with little to no adverse impacts. The recent court case which negated the Corps of Engineers Nationwide Permit 48 clearly demonstrates cumulative impacts have not been considered adequately, whether in the form of shellfish aquaculture or in this case net pen aquaculture. The more recent court decision which forced NOAA and the EPA to begin a Biological Opinion should shine a bright enough light on this process to show the Department of Ecology it is premature to consider, let alone issue any discharge permits to Cooke Aquaculture, no matter the species grown.

The press release from Wild Fish Conservancy summarizes adequately that decision and process, found here: https://wildfishconservancy.org/pressrelease10.11.2018/at_download/file

Thank you for the opportunity to comment and to help protect Puget Sound.

Laurie Niewolny
Water Quality Program, Department of Ecology
P.O. Box 47600 Olympia, WA 98504

Dear Ms. Niewolny,

Please accept the following public comments.

A bit of background, I moved to the island in 2010 and knowingly bought a home by the fish farm. I thought at the time, it was interesting. Prior to Cooke's ownership, my issues with the owners of the fish farm were mainly about safety issues regarding trucking of food and nuisance issues such as noise, smell, and visible blight that need to be resolved again and again with each new owner. When Cooke took over ownership, instead of an Indonesian company with only a Florida resident address, I was excited after our first meeting with the company. However, I was soon in for a **rude awakening!** Several months later they began violating their NPDES agreement by over water power washing their nets. I spent 38 years working for a global environmentally sensitive company with a strong management culture steeped in honesty, safety, operational integrity, controls, and a "In God We Trust, All Others Bring Data" attitude. My former company strove to be in absolute compliance with both the letter and spirit of all laws. **Cooke's approach was the direct opposite of my former company.** That led me to dig into the regulatory background, science of fish farming, and integrity of Cooke as a global company. The key for an environmentally sensitive industry is managing risk which I truly believe Cooke is not capable of managing the risks of escapement and environmental pollution. **The consequence to a native endangered species, Steelhead, will be disastrous.**

Items in black are our comments. Items in **blue** are quotes from external sources. Items in **green** are from state agencies. Items in **red** are from Cooke.

Risk Assessment

While not a scientist, I personally reviewed all materials and new scientific articles presented to Washington Department Fish and Wildlife for approval to change species of fish being raised. I searched for new scientific research specifically related to raising Steelhead, industry experience with both Steelhead and triploid fish. I found the application lacking.

Cooke has advocated in legislative testimony for permitting based on a scientific basis. However, the proposals in this application are based on an Environmental Impact Statement from 1990 that is only minimally updated primarily for the Endangered Species Act and based on Net Pen Guidance from 1988. Both are geared specifically to Atlantic salmon rather than native species. Scientific studies tend to support conclusions that follow their funding sources. This applies to both sides of the argument, environmentalist and industry. There is conflicting scientific evidence and many of the claims have not been resolved for the purpose of Net Pen Aquaculture regulation in Washington State. Efforts to update Net Pen Guidance based on best available science and practices was halted in 2017.

"There is a rich body of literature about many topics involved in the production of rainbow trout. Feed formulation and improvement, production methods, pollution control, and disease control are research areas that have received much attention. Research at academic institutions and government research stations will likely continue to supply the industry with scientific advances to improve production and help the industry progress in the coming years. As with many forms of aquaculture, little comprehensive research has been conducted and relatively little scientific literature is available on the environmental impacts of rainbow trout farming in the U.S." (Seafood Watch, Farmed Rainbow Trout, 2006,)

Since Cooke is requesting a significant change in species from Atlantic salmon to steelhead that are raised in marine net pens, it should not be permitted to use a 1990 EIS for consideration which assumes the impact and risks are the same. Nothing of this type and scale has ever been done in Washington State. A new EIS is critical so that a valid risk assessment can be performed.

Similarly, the State's regulatory agencies should complete their assessment of net pen guidance since both science and technology have changed in the last thirty years. This guidance would help define mitigation strategies. Using the same set of practices, processes and depreciated facilities will not mitigate the risks associated with the raising of native fish. WDFW has stated in testimony that they are much more concerned about the escapement of native fish.

A more meaningful approach to risk assessment has been advocated in one of the scientific articles that Cooke did cite in their Attachment C – Annotated Bibliography (Genetic Risks Associated with Marine Aquaculture, NOAA, Waples et al. (2012)). This includes both the potential risks and benefits.

“Informed decisions about appropriate use of marine aquaculture are best made following a comprehensive assessment of potential risks and benefits.”

...

“Potential benefits are of two types: benefits to society and benefits to natural populations. Evaluating societal benefits (economic, social, political) involves a host of normative considerations and is not attempted here, but this is a crucial component of any comprehensive risk-benefit analysis.”

Cooke fails to make a strong case for the use of public waters for private gain by supplying any benefits to society or benefits to natural populations to offset the risks associated with the rearing of a native species. The risks associated with a change in species will be addressed in later comments. Some of the areas of concern regarding benefits are described below:

Economic: Somehow the hundreds of jobs stated by Cooke in Washington State legislative testimony have shrunk. The limited number of full-time of jobs potentially impacted are geographically dispersed.

Social: Salmon and Steelhead are relatively expensive food products that are not feeding mass populations. In contrast, Cooke has annual revenues expected to be several billion dollars.

Corporate values were called into question when Animal rights activists recently exposed Cooke practices.

<https://www.fis.com/fis/worldnews/worldnews.asp?country=0&monthyear=&l=e&id=104876&ndb=1&df=0>

Glenn Cooke, CEO of the Cooke family of companies, provided the following statement after the company was contacted by the Maine Department of Agriculture regarding an animal welfare complaint submitted by an activist veganism organization for a Cooke Aquaculture USA freshwater fish hatchery in Bingham, Maine.

“I am disappointed and deeply saddened by what I saw today. As a family company, we place animal welfare high in our operating standards and endeavor to raise our animals with optimal care and consideration of best practice. What we saw today is most certainly not reflective of these standards.

Political: Do the revenues that Washington State receives from Cooke offset the ongoing costs required to supervise their compliance with the state's regulations? Did the money that the State received as part of the Cypress Island incident offset the costs to capture escaped fish and to assess the soundness of their facilities? Does the money that the state receives offset the costs associated with salmon and steelhead restoration?

Benefits to natural populations or environmental benefits: Cooke's proposal will not foster the growth of native fish.

From the Marine Survival Project, Why focus on the Salish Sea: [Of these salmon, Chinook, coho, and steelhead have experienced tenfold declines in survival during the marine phase of their lifecycle, and their total abundance remains well below what it was 30 years ago.](https://marinesurvivalproject.com/the-project/why/) <https://marinesurvivalproject.com/the-project/why/>

Most of the farmed ocean raised steelhead is imported from Norway or Chile and uses production methods similar Atlantic Salmon. Imported farmed trout can be raised in saltwater netpens, which release waste directly in the ocean and escapes potential endanger wild populations unlike farm raised rainbow trout or steelhead which uses environmental sustainable means (Seafood Watch, Farmed Rainbow Trout, 2006,)

Cooke has been recently cited for incidents at their net facilities for overstocking and not conducting environmental testing.

<https://www.seafoodsource.com/news/aquaculture/cooke-to-pay-fine-for-overstocking-maine-salmon-farms-not-conducting-environmental-testing>

“Cooke was cited by the Maine Department of Environmental Protection for a number of incidents at its net pen sites in Hancock and Washington counties, including having too many fish in pens, failing to conduct environmental sampling, and failing to follow a number of procedural measures laid out in the company’s operating permit, including on-time filing of pollution sampling reports and fish spill prevention plans.”

Facility Condition

Cooke knowingly bought a depreciated facility and took on the existing management to operate it.

Since prevention of escapes in the first place is the most important strategy for dealing with escapement, there appears to be some inconsistencies in the application of the law and lack of coordination between the State agencies.

*Furthermore, DNR, Ecology, and WDFW have inspected each facility at least once since 2017. Finally, as part of the new law that sunsets nonnative finfish marine aquaculture in Washington State (EHB 2957), Cooke is required to have each net-pen facility inspected above and below waterline by an engineering firm approved by WDFW, **roughly every two years when the facilities are fallow**. Transport of fish into the net-pens is contingent on the findings from that inspection. In other words, WDFW will not approve transport permit applications for net-pen facilities whose structural integrity is inadequate.*

Based on the last inspection of Cooke's facilities by DNR during September 2017 through January 2018, an inspection would be due about now. Based on the approval of Cooke's NPDES permit for the Bainbridge facilities on July 19, 2019 an inspection would not be due until 2021 (see citation below).

*The permittee must obtain a marine engineering firm to conduct inspections to assess structural Integrity of the net pens. Inspections **must occur within two years of the effective date** of the permit if not completed and to be done routinely, approximately every two years, when net pens are fallow, and must include current Doppler data, topside and mooring assessments related to escapement potential, structural integrity, permit compliance, and operations. The net pen structural integrity assessment reports must be certified by a licensed professional engineer and submitted to Ecology within 60 days of the completion of the inspections.*

The timing of inspections is out of sync. This is further complicated by Cooke's growing cycles of 12 to 18 months. Currently on Bainbridge, the Fort Ward and Clam Bay pens and only a portion of Orchard Rocks-South

are fallow. Orchard Rock-North is fully stocked. Could Cooke could potentially delay inspections to every three or four years creating an unacceptable level of risk?

We believe that Cooke knowingly purchased facilities in 2016 that were reaching the end of their useful life. The average life span of the net pen structures is 15 years, as stated in Cooke’s DNR lease agreement. Some of the previous management continued to be employed by Cooke and should have understood the condition of the facilities purchased. To our knowledge, all of the Bainbridge net pens were replaced after a 1999 escapement. That would put the Orchard Rock pens beyond their useful life per the DNR lease agreement. In looking at the Mott McDonald Engineering Assessment, it would appear that the prior owner replaced pens at the end of their life. These net pens are continuing to depreciate and deteriorate. No structural analyses were performed by Mott McDonald in 2017 according to their report. The following is our attempt to understand the age and status of these pens:

| | First Built | Replaced (1) | Life per Lease Agreement | Last Inspected | Next Inspection Due | Current Status |
|-------------------------|-----------------------------|--------------------|--------------------------|----------------|---------------------|--|
| Fort Ward | 1970 | 2000 (2007 moved?) | 2015 | November 2017 | November 2019 | Fallow since 05/2019? |
| Orchard Rock | 1970 | 2000 | 2015 | December 2017 | December 2019 | South-partially fallow since March 2019, North-fully stocked |
| Clam Bay | 1970 | 2000 (2006?) | 2015 | September 2017 | September 2019 | Fallow since August/September? |
| Hope Island | 1986 | 2001 | 2016 | December 2017 | December 2019 | ? |
| Cypress Island 1 | 1985 | 2001 | 2016 | | | ? |
| Cypress Island 2 | Assumes 1985 | Assumes 2001 | 2016 | Not applicable | Not applicable | Removed in August 2017 due to escapement |
| Cypress Island 3 | 1985 | 2001 | 2016 | | | |
| Port Angles | 1990? Based on Google Earth | 2002 | 2017 | December 2017 | Not applicable | Lease revoked. Net Pen Not removed. |

1 Note Replacement dates from Mott McDonald Engineering Assessments are vague and inconsistent

A two-year inspection schedule complicated by the growing cycle may not be adequate as the pens approach the end of their expected life span. After a certain point, perhaps net pen structures should be inspected every time they are fallow and before a fish transfer permit is issued and never partially filled (like Orchard Rocks South is today) so as to cause an inspection delay.

The industry on Bainbridge Island has been grandfather on a 1988 conditional use permit. Cooke’s approach to maintenance and replacement is to piece meal both. This allows them to avoid triggering SEPA and allows them to avoid coming into full compliance with existing regulation and industry best practices.

Pollution

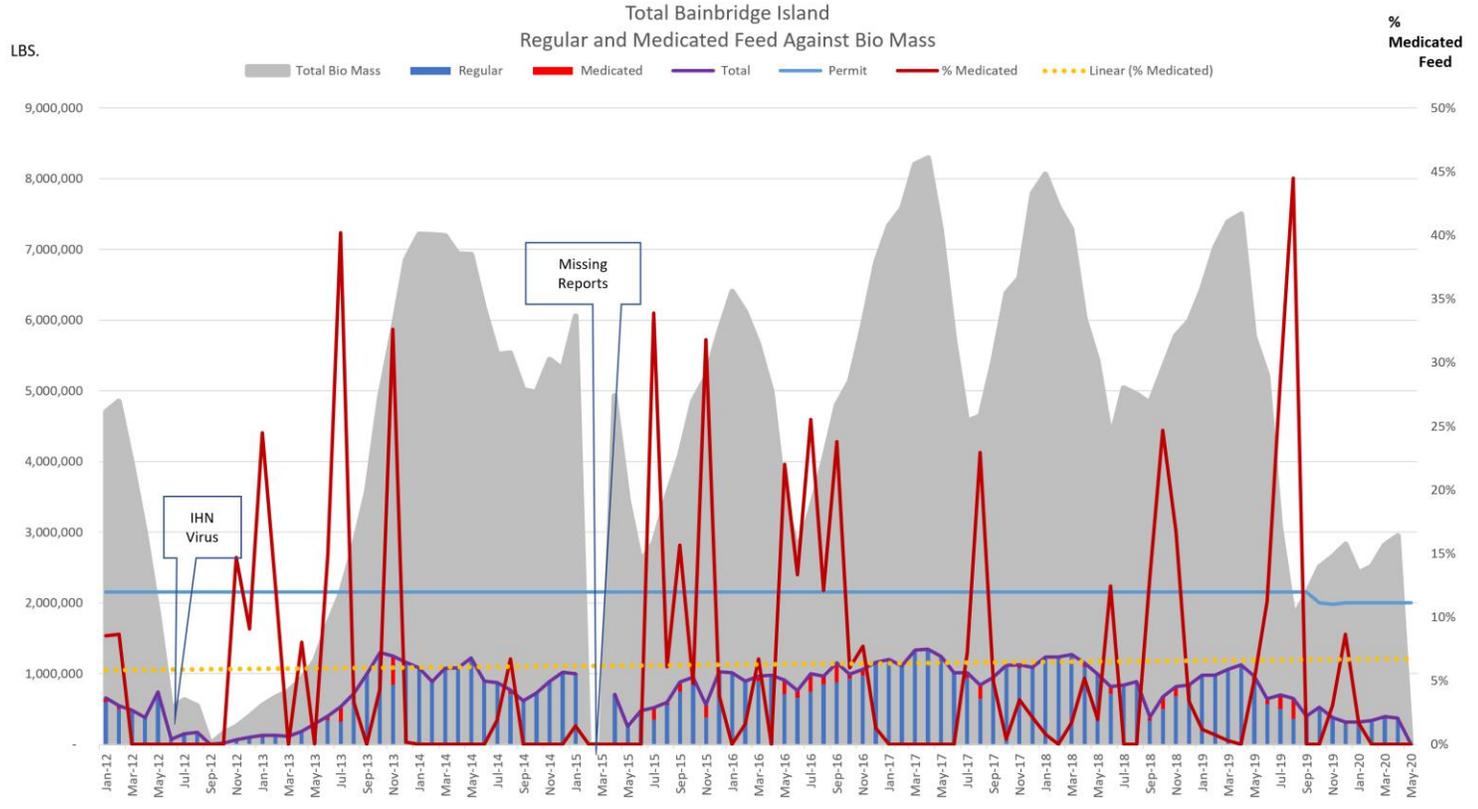

The Department of Ecology has developed a State of Basis which serves as an amendment to the Fact Sheet and describe changes made to the permits that are now up for public comment.

<https://ecology.wa.gov/Water-Shorelines/Shoreline-coastal-management/Aquaculture/Net-pens>

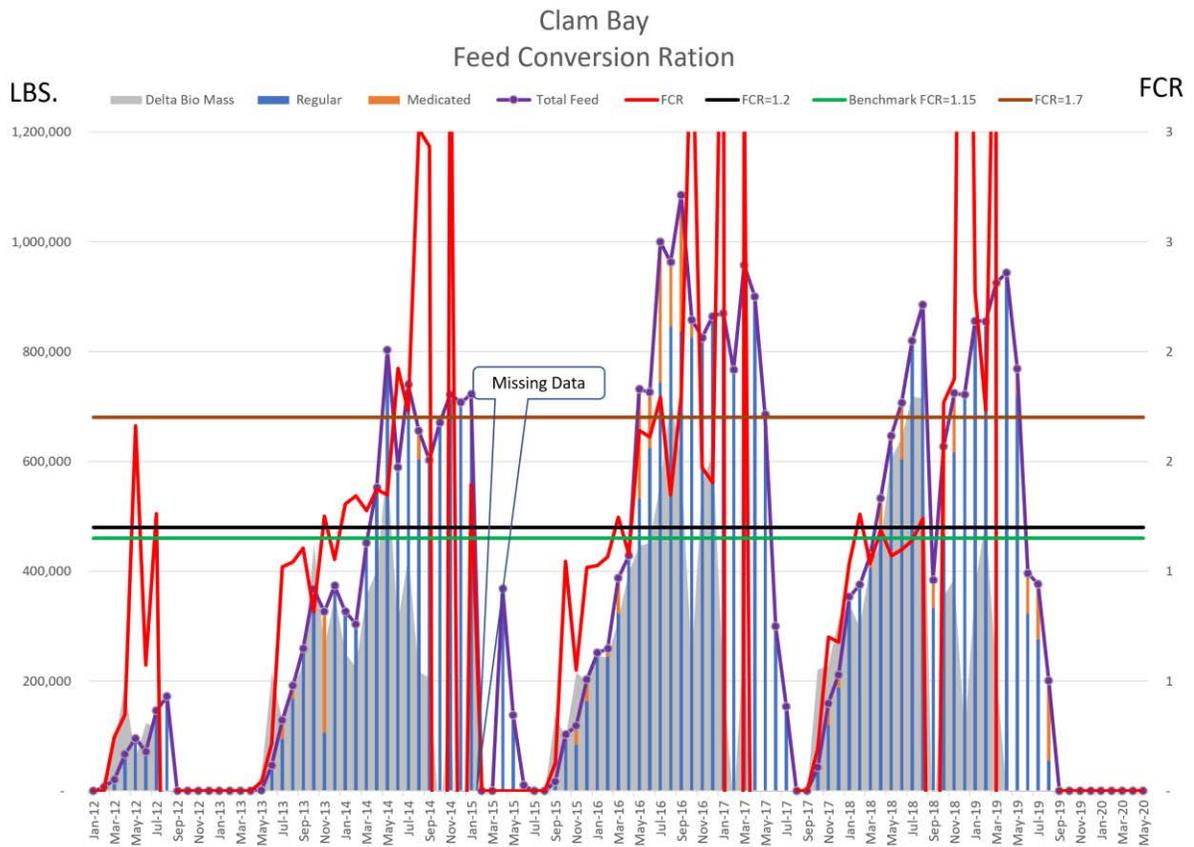

As an existing discharger, state law exempts the modification of Cooke’s wastewater discharge permit from the SEPA process as long as the permit contains conditions no less stringent than federal effluent guidelines and/or state rules and regulations (RCW43.21C.0383). Ecology has assessed Cooke’s switch from non-native Atlantic salmon to native triploid (sterile) all-female stock of steelhead for factors that could affect the characteristics of the discharge. Regardless of species, discharges from finfish

aquaculture operations may contain fish feces, uneaten fish food, disease control chemicals milled into fish feed, biofouling organisms displaced from routine net cleaning, and escaped fish.

When you talk about fish waste, antibiotics, and uneaten feed it is difficult to get a picture of the impact because it all happens underwater. The graphs below are based on monthly data from January 2012 to May 2020 that was submitted to the Washington Department of Ecology by the industry. The period was selected based on current NPDES permits. Total Bainbridge Island (Clam Bay, Orchard Rocks, and Fort Ward Pens) chart shows the total Bio Mass in grey (amount of fish) over 8+ years and the regular and medicated feed (antibiotics). The dark red line shows the percentage of medicated feed over time. With this many fish in the water, there is a significant amount of fish feces as anyone who has had an aquarium or goldfish bowl would know. The percentage of medicated feed in the water is not insignificant.

The second graph shows the Feed Conversion Ratio (FCR) for the largest net pen, Clam Bay. There are approximately a million fish. A perfect FCR is 1.0 or one pound of feed produce a 1 pound gain in a pound of fish. The graph shows industry benchmarks as straight lines for 1.15, 1.2, and 1.7 which represent the best FCR and industry clams. The Red Line indicates the calculated FCR from monthly monitoring data which is outside the industry benchmark lines.

The State Agencies should not ignore Cooke's record

From the public's view point, it is impossible to ignore Cooke's past and **ongoing** behaviors. Cooke purchased the pens in Washington State in 2016. Let's take a look a time line of their corporate behaviors since that purchase in Maine and Canada alone to gain a perspective on how they choose to operate as a company that is "...dedicated to producing a high-quality seafood in a sustainable and environmentally sound manner."

Documented incidents in Washington State:

| Date | Description | Source |
|------------------|---|---|
| August 25, 2016 | Warning Letter: National Pollutant Discharge Elimination System | Department of Ecology PARIS |
| May 2017 | Anchor Slip/Break Clam Bay | Confirmed by facility personnel and photos. |
| July 24, 2017 | Ecology Illicit discharge noncompliance notification | Department of Ecology PARIS |
| August 23, 2017 | Notice of Violation | Department of Ecology PARIS |
| AUGUST 22, 2017 | It's open season on Atlantic salmon as the public is urged to help mop up a salmon spill from an imploded net holding 305,000 fish at a Cooke Aquaculture fish farm near Cypress Island . In a statement Tuesday morning, Cooke said "exceptionally high tides and currents coinciding with this week's solar eclipse" caused the damage. Cooke estimates several thousand salmon escaped following "structural failure" of a net pen. | https://www.thenewstribune.com/news/local/article168636307.html |
| October 10, 2017 | Just a week after the state Department of Fish and Wildlife approved shipment of 1 million more farmed Atlantic salmon to Cooke Aquaculture's fish farm near Bainbridge Island, another state agency says it has found a hole in the nets and corrosion in the structure of the facility. The Department of Natural Resources on Monday notified Cooke that it is in default of the terms of its lease at its Rich Passage operation. It ordered the facility repaired within 60 days, or the department may cancel the company's lease for the facility, which operates over public lands. | https://www.seattletimes.com/seattle-news/environment/fish-farm-has-60-days-to-fix-net-pens-outside-seattle-as-1-million-atlantic-salmon-move-in/ |

| Oct 15-20, 2019 | Orchard Rocks net pen sinking due to hole in pontoon | Personal observations and photos |
| December 18th, 2018 | The Washington Department of Fish and Wildlife considers the exotic strain of PRV to be an unacceptable risk to native stocks of Pacific salmon. Under the conditions of its permit, Cooke Aquaculture Pacific was required to destroy the fish. | https://www.seattletimes.com/seattle-news/environment/fish-farmer-destroys-800000-juvenile-atlantic-salmon-due-to-disease-second-purge-in-past-year/ |
| October 22, 2019 | "A small hole was identified in one bulkheaded pontoon on the Southeast portion of the Orchard Rocks net pen and we completed the necessary welding repairs immediately today. We will also have an engineer onsite tomorrow to assess the welding repair and pontoon. There were no fish in the corner section of the pen where the pontoon required repair," said a Cooke Aquaculture representative in a statement | https://www.king5.com/article/news/local/no-salmon-released-when-cooke-aquaculture-pen-sinks/281-b4741721-30f3-402a-bd2a-017edcc87b7b |

These types of incidents are not just unique to Cooke here in Washington State. Below is a recap of events in North America:

| Approximate Date | Description | Source |
|------------------|---|---|
| March 4, 2016 | New Brunswick-based multi-national farmed salmon producer Cooke Aquaculture had nothing but bad news during the past month, including yet another product recall from the Canadian Food Inspection Agency (CFIA), a valuable complaint from the mayor of the town housing Cooke's Nova Scotia headquarters and a notice to consumers to avoid eating Cooke's primary product, Atlantic salmon grown in Nova Scotia, New Brunswick and Newfoundland. | http://www.southcoasttoday.ca/content/more-troubles-cooke-aqua-product-recall-do-not-buy-notice-farmed-salmon-loan-demands |

| Approximate Date | Description | Source |
|--------------------|--|--|
| | <p>Government product recalls</p> <p>In late January, CFIA issues a recall notice for salmon products produced by subsidiary True North Salmon, based on evidence that the fish might contain particles of a foreign substance. In 2012, CFIA issues a recall warning when Cooke distributed framed mussels which were alleged to contain marine biotoxins. Also in 2012, three Cooke executives - including CEO and founder Glenn Cooke - faced federal felony charges for dumping gallons of deadly insecticides near their salmon cages in the Bay of Fundy.</p> | |
| September 11, 2017 | <p>Atlantic salmon, believed to be part of a cohort that escaped from a U.S.-based fish farm on Aug. 19, are being hauled in by anglers fishing out of French Creek on mid-Vancouver Island. Cameron Wheatley, owner of the French Creek Store at the marina just north of Parksville, received the head of an apparent Atlantic salmon from a local angler late Sunday morning, Sept. 10. He is freezing the head, along with two more fish heads and one whole farm-raised salmon, to turn over to Fisheries and Oceans Canada</p> | <p>https://fisherynation.com/archives/63166</p> |
| October 12, 2017 | <p>Cooke Aquaculture offered to pay a premium price for Atlantic salmon caught by the Lummi Nation after a major spill from the company's Cypress Island fish farm if the tribe would not advocate getting rid of net pen aquaculture. The tribe tartly rejected the offer. "Your demand to keep quiet for a few extra dollars is insulting," Timothy Ballew II, chairman of the Lummi Indian Business Council, responded in a Sept. 14 letter. Nell Halse, vice president for communications for Cooke, said Wednesday the offer "was not an attempt to muzzle or insult the Lummi Nation, but rather an effort to negotiate toward common ground and respect the interests and concerns of both parties at the table</p> | <p>https://mynorthwest.com/781546/lummi-chairman-calls-bribery-attempt-insulating-and-preposterous/?show=comments#comments</p> |
| March 30, 2018 | <p>Cooke Aquaculture harvested all the fish at its site near Gaultois last October following the detection of five fish with the infectious disease, and did so again in a facility on the south coast of Newfoundland in February.</p> | <p>https://aquaculturemag.com/2018/04/03/isa-virus-found-in-salmon-at-southern-newfoundland-aquaculture-site/</p> |
| April 3, 2018 | <p>Freedom of Information Act request asking for the status of a \$25 million loan extended to Cooke Aquaculture in 2012. A newspaper article disclosed that Cooke Aquaculture is eligible for \$4 million in "loan forgiveness" to fund a university research chair named after the company. The \$800,000 spent by Cooke funded a chair held by an industry friendly researcher.</p> | <p>https://www.halifaxexaminer.ca/featured/cooke-aquaculture-is-eligible-for-4-million-in-loan-forgiveness-to-fund-a-university-research-chair-named-after-the-company/#1. | Approximate Date | Description | Source |
|-------------------|--|--|
| May 17, 2018 | For the second time in five years, a Canadian salmon aquaculture firm has admitted in a New Brunswick courtroom to illegally using a pesticide known to kill lobsters for treating salmon off an island that abuts the Maine border. Cooke was fined \$500,000 Canadian. | https://bangordailynews.com/2018/05/17/business/report-canadian-salmon-firm-admits-using-lobster-killing-pesticide-near-maine-border/ |
| August 7, 2018 | Between 2,000 and 3,000 fish escaped from Cooke Aquaculture's Hermitage Bay salmon farm on Newfoundland's south coast in July, the company confirms. Incident happened after net extensions were sewn onto a pen at the operation. extensions were sewn onto a pen at the operation. The escape of thousands of farmed salmon on the south coast of Newfoundland is a significant concern, as is the lack of public notification about the incident. | https://www.asf.ca/news-and-magazine/salmon-news/salmon-escaped-from-cooke-aquacultures-farm-company-confirms https://fisherynation.com/archives/tag/cooke-aquaculture |
| December 14, 2018 | British Columbia will phase out 17 commercial salmon farms off the northeast coast of Vancouver Island to aid in the migration and restoration of wild West Coast salmon runs, under an agreement between the B.C. government and Aboriginal First Nations | https://www.seattlepi.com/local/politics/article/British-Columbia-salmon-orca-fish-farm-phase-out-13467254.php |
| August 20, 2019 | A pipe broke at the Deer Island Bay of Fundy Cooke facility while fish were being transferred from a net pen to a boat for sea lice treatment. Initial estimates by Cooke Aquaculture set the total of escapees at 2,500, but company representatives have since lowered that estimate to 1,000 fish, Researchers for the Atlantic Salmon Federation have captured and removed 53 Atlantic salmon from a New Brunswick river | https://www.asf.ca/news-and-magazine/news-releases/salmon-escape-in-bay-of-fundy |
| October 9, 2019 | Maine Department of Agriculture finds that unacceptable fish handling incidents have occurred at the Bingham hatchery after a video went viral. | https://www.timesrecord.com/articles/maine-1/ingham-aquaculture-facility-kept-fish-in-cruel-unsanitary-conditions-group-says/ |
| October 16, 2019 | As part of a consent agreement with the Maine Department of Environmental Protection, Cooke Aquaculture has agreed to pay \$156,213 to fund the Marine Rearing Atlantic Salmon Machias River Project, which aims to breed and restore native populations of Atlantic salmon in the Machias River. Cooke violated its operating permit by having too many fish in one or more pens, failing to conduct environmental sampling, and failing to follow a variety of clerical procedures that include timely filing of complete and accurate pollution sampling reports and timely submissions of fish spill prevention plans. The infractions violated the terms of Cooke's operating permit, DEP rules and state law. "The administrative consent agreement was created to determine a path forward and to start anew - wipe the slate clean," Cooke spokesman Joel Richardson said. | https://bangordailynews.com/2019/10/16/news/down-east/canadian-salmon-firm-will-pay-156k-over-fish-pen-violations-to-fund-salmon-restocking/ https://www.seafoodsource.com/news/aquaculture/cooke-to-pay-fine-for-overstocking-maine-salmon-farms-not-conducting-environmental-testing |

| Approximate Date | Description | Source |
|------------------|--|---|
| October 31, 2019 | Just weeks after Cooke Aquaculture agreed to pay the state more than \$150,000 to settle numerous violations at several of its salmon net pen sites in eastern Maine, the Department of Marine Resources is asking for public comment on the company's application for a 20-year lease renewal. | https://www.ellsworthamerican.com/maine-news/waterfront/dmr-seeks-comment-on-cooke-aquaculture-lease-renewal/ |
| November 6, 2019 | Last week, the Atlantic States Marine Fisheries Commission, the partnership, or "interstate compact," that sets harvest limits for 27 fisheries up and down the Atlantic Coast, officially accused Virginia of allowing Omega Protein to overfish,,. In a December 2017 press release on the deal, Cooke hinted at a new use: "The animal feed ingredients produced by Omega Protein are an important component in Cooke Aquaculture's production of healthy Atlantic salmon, making this acquisition a strategic move that greatly enhances Cooke's vertical integration." So instead of rockfish, maybe the Bay's menhaden will be feeding farm-raised salmon in Canada. | https://fisherynation.com/archives/tag/cooke-aquaculture |

In January 2019, Cooke applied to Washington Department of Fish and Wildlife to raise Steelhead. Cooke follows a consistent pattern of bad behavior of an unreliable tenant.

<https://salmonbusiness.com/cooke-aquaculture-to-settle-332k-fine-for-puget-sound-salmon-escape/>

Cooke Aquaculture to settle \$332K fine for Puget Sound salmon escape (30 April 2019)

Settlement agreement reached between the company and the Washington Department of Ecology for collapse of floating fish farm pen near in 2017.

On Tuesday morning, Cooke Aquaculture Pacific Vice President of Public Relations Joel Richardson wrote the following in a press release:

“Cooke Aquaculture Pacific was not interested in going through the hearing, putting additional stress on our employees, and reliving the regretful events of August 2017. When presented with the opportunity to dedicate 80% of the penalty (\$265,600 USD) to a supplemental environmental project, Cooke made

the decision to not litigate the penalty amount, and instead dedicate its resources to a project that will directly result in fisheries enhancement in the North Puget Sound region. Cooke is actively working on identifying such a project and partners in enhancing fisheries in North Puget Sound.

Conclusion

Decisions to modify water quality permits should include Cooke's record both past and present. The addition of more restrictions here is not a guarantee of future compliance. This industry and Cooke in particular should not be allowed to mine and pollute the public waters of Washington State for personal profit at the expense of Washington citizens. Please deny the modification to Cooke's current NPDES permit.

Comments attached in a pdf.

To whom it may concern,

RE: Cooke Aquaculture Pacific NPDES permits modifications to raise steelhead

The question is simple. It has nothing to do with whether aquaculture should be done in Puget Sound. The current leases are valid for another couple of years. Leading up to the end of that time period, that discussion can take place. The only question here: Is Atlantic salmon waste and risk significantly different from sterile Rainbow trout for the Department to not allow Cooke to continue to culture fish under the current NPDES permits. All information says no, there is no difference. This shouldn't really take this kind of process and the Department should really be able to make this decision on their own. It is simple for the Department of Ecology to decide this allow the permit modification.

The exhaustive Environmental Impact Statement on Net pens by the Department of Fisheries has been criticized for being from 1990 and not being relevant to today's changed Puget Sound. However, nitrification is still nitrification today. The contribution of the key nutrient, nitrogen, by net pens has been shown to be insignificant compared to all other sources. The EIS summarized that the impact of 100 farms producing 34,100 MT/yr of salmonids would "be minimal and largely negligible". Even with any changes in Puget Sound, the 4 Cooke sites are just a fraction of this and are still negligible to today's total input. The EIS still provides relevant information to gauge the impact.

The EIS's statement on disease transmission risk is still relevant: "The risk of transmission of disease from farms to wild fish is not likely a significant problem. Disease observed in fish farm culture of salmonids in Washington results from the holding of the fish in captivity. Such diseases are non-exotic; infectious agents that cause such diseases originate from environmental sources or wild fish."

These pens have been in Puget Sound for nearly 40 years. They have been through multiple owners from US to International; from private to corporate. Facts and science (not politics and vested interests) show that fish farming is one of the most environmentally benign industries out there. The know-how and dedication of the skilled workers required to produce wholesome seafood should not be taken for granted. Many have been working on the net pens for most of that entire period. The value of their acumen should not be taken for granted. It can be translated from Atlantic salmon to Steelhead culture and for the sake of our oceans and Sound should not be lost. Despite what detractors say, we should be proud of the pioneering aspect of WA State net pen culture.

Spike Mafford

The inadequacies of Washington State's Department of Ecology's modifications to the existing NPDES permits for Cooke's former salmon farms, enabling Cooke to switch to Triploid Steelhead/Trout, are overwhelming. We strongly urge the Department of Ecology to deny any new permits.

Here are a few things to consider:

Cooke Aquaculture Pacific is not a responsible citizen, they have continually broken Washington State's trust through their negligent actions, lack of maintenance, and escapes. They are a bad actor and should not be rewarded with more opportunity to profit again off Public Waters.

Transfer of Viruses and Diseases from concentrated feedlot farmed animals to local waters, and native fish populations.

Farmed Fish need to be physically marked, so that they can be identified from Wild Steelhead populations if they escape.

-to be marked so as to distinguish an aquaculture-raised steelhead from conventional hatchery-raised steelhead and from wild, natural-origin, steelhead. It is critical that aquaculture-raised steelhead be provided with an externally visible mark that is distinct from the adipose clip used to identify conventional hatchery-reared steelhead.

Ecology needs to focus on the net-pen waste and feces stream, and its attractant implications as an unnatural pesticide, pharmaceutical, and antibiotic-laden food source for at-risk and struggling Puget Sound herring and forage fish populations, immature salmonids, and Native Steelhead smolts.

I am also concerned with the potential for attracted forage fish, immature salmonids, and Native Steelhead smolts, to become trapped residents in the pens, and a "take" from the Public Commons as an added "free" food source for the Cooke fish farms.

This has been well-documented through the use of underwater cameras in British Columbia aquaculture operations.

The other concern is the transfer of sea lice parasites from the swarms that develop and expand at the farms, to wild and resident fish populations. Low-count lice loading has been proven to be detrimental and fatal to immature salmonids, forage fish, and Native Steelhead smolts.

Floating Feed Lots are endangering the health of Washington's waters which support our culture, economy, wild salmon, and Orca whales.

Save the Sound, the whales and the wild salmon from this predatory practice.

Alexandra Gayek

I urge you to reject this proposal by Cooke Aquaculture. I am not in favor of farmed fish in our oceans. Regardless of species, the process of farming creates pollution, breeds disease, attracts sea lice, and results in a product that is less healthy for human consumption than wild fish. Our efforts should be to clean up the oceans to support native, wild fish. Farmed fish operations should exist only as land-based operations, if at all. Further, the organization applying for the permit has shown historic disregard for environmental regulations in the past. Tightening the regulations is therefore unlikely to result in compliance. I agree with the comments submitted by Stephanie Ross.

Jon Russell

Why grant these permits to CAP when time and time again they have broken trust through negligent actions, lack of maintenance and allowing escapes to occur? They are a bad actor and to give this permit is to make negligence permissible. And further, you're allowing negligence to profit off of public waters. Not to mention allowing them to self regulate/self report is ridiculous.

Allowing farmed steelheads and trout to be added will almost certainly cause vast harms to the wild populations and the surrounding environment. It's well documented that feedlot fed farmed fish are extremely dangerous when they escape due to viruses, diseases, and transfer of parasites.

It is extremely dangerous and negligent to allow this permit for Cooke Aquaculture Pacific

Anonymous Anonymous

Wild Salmon Nation Supports Wild Salmon and Habitat from Baja to the Bering Sea.

After reviewing the inadequacies of Washington State's Department of Ecology's modifications to the existing NPDES permits for Cooke's former salmon farms, enabling Cooke to switch to Triploid Steelhead/Trout, Ecology is strongly urged to deny any new permits. These are our concerns:

1. Cooke Aquaculture Pacific is not a responsible corporate citizen, they have continually broken Washington State's trust through their negligent actions, lack of maintenance, and escapes. They are a bad actor and should not be rewarded with more opportunity to profit further off of Public Waters that belong "in common" with all Washington State Citizens

2. Self-Regulation and Self-Reporting by Cooke? Seriously, with their track record? 3 Strikes and you're out, or does Cooke keep getting more at bats, and more tries to embarrass the Department of Ecology?

3. Transfer of Viruses and Diseases from concentrated feedlot farmed animals to local waters, and native fish populations.

4. Marking- Farmed Fish need to be physically marked, so that they can be identified from Wild Steelhead populations if they escape.

-to be marked so as to distinguish an aquaculture-raised steelhead from conventional hatchery-raised steelhead and from wild, natural-origin, steelhead. It is critical that aquaculture-raised steelhead be provided with an externally visible mark that is distinct from the adipose clip used to identify conventional hatchery-reared steelhead.

5. Ecology needs to focus on the net-pen waste and feces stream, and its attractant implications as an unnatural pesticide, pharmaceutical, and antibiotic-laden food source for at-risk and struggling Puget Sound herring and forage fish populations, immature salmonids, and Native Steelhead smolts.

6. We are also concerned with the potential for attracted forage fish, immature salmonids, and Native Steelhead smolts, to become trapped residents in the pens, and a "take" from the Public Commons as an added "free" food source for the Cooke fish farms.

This has been well-documented through the use of underwater cameras in British Columbia aquaculture operations.

7. The other concern is the transfer of sea lice parasites from the swarms that develop and expand at the farms, to wild and resident fish populations. Low-count lice loading has been proven to be detrimental and fatal to immature salmonids, forage fish, and Native Steelhead smolts. Just a few sea lice can induce mortality in smolts.

8. Floating Concentrated Feed Lots are endangering the health of Washington's waters which support our culture, economy, wild salmon, and killer whales.

9. Jobs. A few hundred jobs for Cooke, versus tens of thousands that rely intact habitat, healthy

clean water, and Wild Native Fish Populations.

Comments re. Cooke Aquaculture Pacific draft modified NPDES permits modifications to raise steelhead in net pens

As a resident of the San Juan Islands, as an advocate for wild fish and their habitat, as a lifelong Washingtonian who has seen the disappearance of so many of our natural resources, I am greatly concerned about the switcheroo that Cooke Aquaculture is proposing for their Puget Sound net pens. The disastrous mismanagement of Cooke's Atlantic salmon pens should be warning enough to say that no NPDES permits should be granted no matter what is in those pens. Cooke didn't follow the law which led up to the 2017 pen collapse, what is to ensure they will in the future? Is switching to a new product supposed to be automatically OK? No!

The risks of water pollution from a net pen are there no matter what is in that pen. Washingtonians need to know: what are the full and lasting impacts to our water quality, native wild fish, and the SRKWs population from these proposed net pens -- any net pens?

No permitting or leases should be authorized until the Court decides on the legal challenge to WDFW's decision to issue an MDNS, stifling the SEPA review process. And no permitting or leases should be authorized until all local, state, federal and tribal governments weigh in.

Washington's 2018 law, HB 2957, banning Atlantic salmon net pens set a new standard of safety to our environment. Can Cooke hold to those standards? The law dictates that Cooke needs to prove that their proposed new operations "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife."

Not one of Ecology's new requirements (increased monitoring, regular inspections, improved maintenance, and response plans) guarantees there will be no pollution, no disease, no escapement. An "escape response plan" is too little too late. We've seen what happens, why would we risk this all over again? Please, no more net pens in Washington waters.

Thank you for this opportunity to submit these comments.

Hugh Mitchell

All right. Okay, well, thanks for this opportunity. So, I am-- I have two degrees in marine biology and marine ecology, bachelor's and master's. I have a doctorate in veterinary medicine, and I've been practicing fish medicine for over 30 years all over the world in private and public and even tribal fish hatcheries. So, just instead of getting into the science, I don't think this appropriate here, I just want to give a bit of context here as I do travel all over the world.

Currently, the US is an embarrassment to the rest of the world. I mean, by that, we import \$20 billion dollars more seafood than we produce. Half of the deficit is made up with imported foreign sea food. We lag woefully behind in volume technology and know-how with most of our seafood produced internationally outside our control and economic benefit. The gap is widening because we are bogged down in silly, vested politics that hamper current aquaculture production and constrain any real growth. Real science is ignored and fear mongering politics and frivolous lawsuits abound.

Now, environmentally, Norway with its pristine, pure fjords, which are a priceless tourist attraction still has close to a 1,000 net pens. The sights growing 2 million metric tons of salmon in these fields and along its coastline. Salmon is its number two export, and the only significant discharge the oceans from this vast number of farms is nitrogen, and, as, you know, nitrogen is an essential nutrient for primary production at the very base of the food web of the ocean ecosystem.

There are countless other sources, but it's not it's a necessary nutrient for all life in our seas. The key is not to overload the input as excess can result in harmful algal blooms and anoxic conditions

Study after study in Norway and Puget Sound has shown that the nitrogen output from salmon grown and net-pens is insignificant compared to all other sources and to the overall and nitrogen budget. In fact, the original 1990 EIS study by Washington Department of Fisheries, which has been criticized for being dated, calculated the Puget Sound could sustain a 100 net-pen sites without significant impact.

Even if conditions of change in the relevance of this study is in question, we're only talking about four sites here, not a 100, and for 40 years before Cooke rescued the business, and I've done contract work for Cooke and for previous owners, these sites have operated without a single shred of evidence that their nitrogen output is of any concern. In fact, several studies have shown that it isn't, and as we all are aware a couple years ago, the state made non-native fish, such as Atlantic salmon, illegal for net pen aquaculture, even though the scientific evidence is scant, but Cooke

complied and is planning to switch to native and sterile rainbow trout/steelhead, so it doesn't lose the time honored important, maritime business, and its workforce of very skilled and underappreciated animal husbandry technicians remain.

So Department of Ecology's net-pens permit for Cooke needs to be changed from Atlantic salmon to a sterile rainbow trout and the production here, we're only talking about 8,000 metric tons, if that. This should not have taken a hearing or a comment period, such as this to do so, but that's part of politics of aquaculture in the Pacific Northwest these days.

Scientifically, there is no difference between the nitrogen output of two salmonids Atlantic salmon and steelhead. Furthermore, as several escapee [phonetic] over the years before Cooke, there's been no impact whatsoever of these fish on established runs, but with current technology escapee [phonetic] risk is far less and sterile steel had would even less than that risk disease.

Risk is not an issue. That's my field. I'm not going to elaborate in that for the sake of time, but I'll just stand and say the Department of Ecology, if acting scientifically, has no choice but to immediately implement the permit modification.

Thank you

Kevin Bright

Hi, I'm Kevin Bright. I work at Cooke Aquaculture now. I started in this business in 1990. I've got a degree in marine biology, and I truly believe that aquaculture is the answer to providing food for people, just like agriculture on land provides food for people.

So, I just wanted to say that in 1996 the first and NPDES permits for commercial net pen operations were issued. Those permits required the company to report monthly feed, monthly antibiotic use and monthly biomass for the site, so since 1996, the various companies have been required by the NPDES permit to report all those quantities in ecology, so they have that data. It's publicly available to people, and it's been publicly available since 1996.

I think, in my opinion, ecology has these additional permit modifications and additions that ecology has developed more than adequately will further safeguard the water quality conditions around these facilities. This is a switch from one species of salmonid to another species of salmonid. The fish feeds that we will use are going to be nearly identical and as pointed out in the application materials, probably shorter growing periods, which means increased fallowing periods and more resting periods between generations of fish.

When I first started, we had three generations of the fish at the site. Those sites never went empty. We were adding juvenile fish onto adult fish and the pens constantly remain full of fish. Now we've got a break in the cycle. You put a generation in and then you pull them out. That's a standard aquaculture practice for various reasons. It gives a resting period to the environment. It breaks any disease cycles if there are any. Any parasite cycles if there are any.

It's no different than what happens when you drive through the fields out there in the Skagit Valley and there's nothing planted. There's no tulips. It's an empty field, right? So we take a rest and break, give nature a chance to take a breather.

Ecology's never been easy with the since these NPDES permits came about. Every year that they-- every permit cycle that they've been renewed, there's been new and additional requirements of the industry- pollution prevention plans, escape prevention plans, more reporting. These permits now we are going to do more water quality, sampling, more benthic sediment sampling annually, and sometimes twice a year no for benthic sampling.

So, ecology's done a job of increasing the regulatory environment around aquaculture in Washington State and it's done a good job, I believe, in helping this industry evolve. It's a new industry and it's evolved and it's adapted and I think this is a step of the right direction to start raising sterile, native, all female triploid steelhead, and we're not raising a non-native species anymore. We're raising a native species, which is what a lot of people wanted us to do a long time ago. I had lots of my friends ask me why we weren't raising native species and I gave them various explanations why Atlantic salmon was the fish of choice at the time in the 1990's, but the world's changed and this is a native species and there's a market for steelhead. There's a market for fresh, sustainable seafood and there's a market for jobs in this environment, so that's what I want to say, and thank you for your time.

Shari Tarantino

My name Shari Tarantino. I am the executive director for the Seattle based nonprofit, Orca Conservancy, and we work on recovering and advocating for the critically endangered population of southern resident, killer whales.

We focus on law and science and part of what we believe is, and I think Ecology can also relate to this, is that Congress passed a clean water act to restore and maintain the chemical, physical and biological integrity of our nation's waters. You can go to 33 U.S.C. 1251(a), and you can also locate number D 1. 511 U.S. 707.14, which is the National Mgal, being to achieve water quality, which provides for the protection and propagation of fish, shellfish and wildlife, and provides for recreation in and on the water.

Congress responding to the nation's need for clean water supplies tasks the Clean Water Act to creating means by which to reduce the amount of water pollution nationwide. In order to correct the water pollution program the Clean Water Act defines the term "discharge of pollutants" to mean, any addition of any pollutant to navigable waters from any point source.

The Clean Water Act defines a point source as any discernible, confined and discrete conveyance, including, but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rally, stock, concentrated animal feeding operation or vessel, or other floating craft from which pollutants are, or may be discharged.

Nonpoint sources are defined as those sources not traceable to a single conveyance. Additionally, the Clean Water Act defines "pollutant" as a direct spoil, solid waste, incinerator, residue, sewage garbage, sewage sludge, munitions chemical waste, biological materials, radioactive materials, heat, racked or discarded equipment, rocks and cellar dirt, industrial municipal and agricultural waste discharged into the water.

This Clean Water Act extends to both animate and inanimate pollutants. The statute, for example, regulates fecal coliform, living bacteria as conventional pollutants in the Washington Pollution Control Board has also found that escaped salmon are agricultural or industrial waste.

Another statutory example of the definition of a pollutant.

As a federal government also considers aquaculture to be a form of agriculture, escaped salmon may similarly be treated as agricultural industrial waste under the Clean Water Act. Our goal, obviously, is to work towards advocating for the critically endangered population of southern resident killer whales.

Open net farms, regardless of the species, can discharge significant amounts of waste water, containing nutrients, chemicals and pharmaceuticals that impact the surrounding environment. I mean, I can go on and on. Furthermore, feed and fecal matter from these facilities can deplete the dissolved oxygen concentrations around and certainly within the facilities. Even the anti-fouling agents, copper, which I need to research, to keep these cages and pens clean are highly toxic.

Therefore, Orca Conservancy and its 45,000+ members and supporters stand in direct opposition of said permits from Cooke Aquaculture. This company is not a good respectable neighbor. They have proven time and time again that they are unable to be respectful to our waterways.

We have welcomed them into our waters and they have done nothing but disrupt and decimate what our waters are trying to protect.

Please rescind this permit if at all possible and protect our waterways, our salmon, and our critically endangered population of southern resident killer whales. Thank you.

Jim Parsons

Thank you. So, my name is Jim Parsons. I'm the general manager for Cooke Aquacultures Pacific Operations here in Washington State. We truly appreciate the Department of Ecology for their thorough review of the existing science that was used in determining that the proposed modification to our NPDES permit, a switch from non-native Atlantic salmon to sterile native rainbow trout will result in no increases in nutrient discharge and may even, in fact, lessen any discharge impacts from our marine farming operations.

We will reserve our comments on specific aspects of the permit changes involving increase data submission and analysis of our operational factors for our written this month.

It does seem appropriate at this time, however, to remind our regulatory agencies and those listening that the United States currently imports 80% to 90% of its seafood. Given that food has been shown to be increasingly important for our collective health and that over half of the seafood that is imported comes from aquaculture operations in foreign lands, which may be far less regulated than that in our own country and state

Food and nutritional security alone should dictate that we should be looking at ways to increase [audio breaking up] instead of reducing or eliminating it. Couple of the importance of rural, working waterfront economies and employment, we clearly need to expand this industry.

All food production systems have some form of environmental impact. Latest research trends from throughout the globe are finally demonstrating that the growing of aquatic organisms is one of the most environmentally friendly forms of protein production on our planet. CAP will continue to work with regulators to implement new production technologies as they develop and to continuously improve our operations and minimize our impact, while providing much needed local and safe seafood to our communities.

Thank you for the time to comment tonight.

Jeanne McKnight

Alright, thank you. Yes, I'm Jeannie McKnight, and I'm the executive director of the Northwest Aquaculture Alliance, formerly the Washington Fish birds Association. We changed our name to reflect the fact that our members represent growers such as Cooke and a number of other growers, as well as support industries that by the way also represent and work with the wilds fish sector.

I want to thank you for the opportunity to talk tonight. We are absolutely convinced as an alliance, and we are one of many such organizations throughout the world that aquaculture, whether it's marine, freshwater or closed containment has a role to play as others have mentioned in food security and the creation of robust blue economy here in Washington.

Others have talked about the fact that we import 90% of the seafood or 80 to 90%, so I don't need to go into that too much, but one thing I must say is that one of the lessons that we've learned from the pandemic is that we need to grow our own and we need to become better at growing our own seafood, because we are just one pandemic away from borders being closed and food not being able to come our way.

I want to also say that prior to becoming the agriculture alliance, the fish growers association conducted some consumer research, and one of the things that came up in that research of 700 Washington households, western Washington households was that overwhelmingly, and I can provide backup for this - this was done by GMA research - overwhelmingly people felt that aquaculture done sustainably, fish farming done sustainably was something that they could accept, and part of that came from people feeling that they wanted - this pre-pandemic - that they wanted to have locally grown food.

Tonight we're here to support our member Cooke Aquaculture Pacific and its request to grow sterile rainbow trout in the four net-pen sites that were previously permitted for Atlantic salmon. We're here not just for Cooke, though. We're here I'm here, to talk about the fact that it is whole idea of opening up our economy to aquaculture as the rest of the country, the rest of the world has done is something that is so important right now.

As an aside we now know that there was a growing body of evidences in the record, in the public record, about steelhead being nearly identical to that in the use of in feed conversion to Atlantic salmon. In fact, after Ron Hardy, a leading researcher on this topic, believes that steelhead made metabolize commercial fish feeds more efficiently than Atlantic salmon do and meaning that the

proposed switch maybe in fact more beneficial to water quality.

I want to also say that I've worked aquaculture business for the past 25 years. I started out my career working for the Alaska Seafood Marketing Institute at an organization called the West Coast Fisheries Development Foundation. Absolutely loved working for the wild fish sector, but as luck would have it, salmon runs were depleting, commercial, let's say whether you were trolling or trying to get bottom fish, you know, things have changed in the environment and even though the US has a very well managed fishery, climate is changing and fish are going elsewhere, so we can't we can't catch enough fish to feed our people, so we've got to do something about this.

Not only does marine aquaculture, however, have the lowest environmental footprint of any animal protein farming production system on the planet, but it has lower feed requirements, lowest water usage, low energy requirements, resulting in low greenhouse gas emissions, and everybody's in love with these days. They think that and some previous speakers have alluded to this about closed containment land-based systems. We, the alliance believe that we need all forms of aquaculture, and we are here to support because we believe that this will become the basis of a very robust economy here.

On a final note, I often get messages from colleagues and friends that I've met through my work in aquaculture all around the world saying what is going on in Washington state. What they mean is, why all the hurdles? Why the opposition? And why can't Washington get with the program? And believe me what happens in Washington does not stay here when it comes to aquaculture. People are watching all over. The eyes of the world are upon us, but with these permit modifications, and the requirements that, go with it, we think we have the chance to do things, right. To lead the nation and becoming a sustainable producer of nutritious seafood. The production of which will create much needed employment opportunities here in Washington.

I personally and we trust that the Department of Ecology will make the right final decision in the right way to permit modification based on science and not politics. Thank you.

Walt Dickhoff

All right, thank you. I'm Walt Dickhoff, retired professor of fisheries, University of Washington, retired senior scientist with NOAA Fisheries. I've been-- I worked with salmon net-pens for 40 years in Puget Sound, and have quite a big experience.

I'd like just to comment that we've looked at impacts of salmon net-pen rearing in Puget Sound on endangered species, including Pacific salmon in southern resident killer whales and we never considered them a major threat to those groups. There are persistent organic pollutants that are a major threat to those southern resident killer whales, but these are mostly of terrestrial origin and not really a threat from net-pen culture. So, I like to commend the Department of Ecology for developing these guidelines and working with Cooke and urge their approval of the permit. So, thank you for this opportunity.

Coastal Watershed Institute

Attached. Thank you for timely action to end inwater netpens in Washington state.jas

Our mission: "To protect and restore marine and terrestrial ecosystems through scientific research and local community, place based partnerships."

17 September 2020

To whom it may concern,

We are providing comments per the Wed, Sep 9, 2020 email from Laurie Niewolny, Washington state Department of Ecology, lnie461@ecy.wa.gov, calling for comments on draft modified NPDES permits to raise steelhead in net pens.

- [Draft Clam Bay \(Rich Passage\) permit, support document](#) explaining changes to the permit
- [Draft Fort Ward \(Rich Passage\) permit, support document](#)
- [Draft Orchard Rocks \(Rich Passage\) permit, support document](#)
- [Draft Hope Island \(Skagit County\) permit, support document](#)

Our comments apply to all the proposed in water net pens-including those with proposed permit modifications. We have provided these comments before, which include but are not limited to the points listed below.

Synopsis: In addition to a number of significant administrative reasons to deny modified NPDES permits, the bottom line is that changing the species that are grown in net pens doesn't improve/minimize the environmental impacts of net pens as detailed below, and in the past. Native species in fact may even pose a greater risk of harm to ESA-listed Puget Sound steelhead and salmon. Net pens are well documented to be sources, amplifiers, and vectors of disease, viruses, and parasites including HSMI/PRV and sea lice. They are well known both globally and regionally to be catastrophic to wild salmon and ecosystems. Washington state has literally spent hundreds of millions of dollars to conserve and restore these same resources and ecosystems, only to then locate devastating net pens square in the migration corridors of vulnerable watersheds and coastal ecosystems we are trying to restore. This management is short sighted and economically nonsensical. It clearly undermines our invaluable resources and earnest science based conservation and restoration efforts.

Net pens are no longer water-dependent and there is a clear alternative. ALL net pens should be required to be upland contained. The technology exists-in fact the fish that are reared in net pens are transferred to net pens FROM upland contained systems. The clear logic is simple. KEEP them upland contained.*

In addition, we also offer the following comments to include but not limited to:

- 1) Ecology should not authorize Cooke's modified NPDES permits at all, and certainly not until the ongoing lawsuit challenging the State Environmental Policy Act (SEPA) environmental review process and determination is complete and it is determined whether or not the original SEPA determination will be invalidated and additional review necessary.
- 2) Ecology should delay issuing Cooke's modified NPDES permits until NOAA Fisheries has provided the final biological opinion on the impact of Puget Sound net pens on ESA-listed species.
- 3) There is substantial new information that was not considered during the SEPA process including points outlined in this comment letter.
- 4) Ensuring compliance of rules set by NPDES permits is crucial.
- 5) Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture.
- 6) Switching species does NOT reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with a change of species. Including:
 - 6a. Fish Effluent
 - 6b. Fish Waste
 - 6c. Amplification and Discharge of Pathogens (Viruses, Parasites, and Diseases)
 - 6d. Discharge of antibiotics and medical effluent.
- 7) The change in species poses new and different risks.
- 8) Escape prevention and the adequacy of Cooke's escape prevention and escape response plans must be carefully considered in this permit process.
- 9) Ecology should not issue NPDES permits to allow in water aquaculture as aquaculture is no a longer water dependent use. ALL NPDES permits should be limited to UPLAND CONTAINED.

Details, by item include (but are not limited to):

- 1) Ecology should not authorize Cooke's modified NPDES permits.

The Department of Fish and Wildlife's (WDFW) decision to issue a Mitigated Determination of Nonsignificance (MDNS) granted Cooke key permits and ended the environmental review process under SEPA. This decision was flawed, and is currently being legally challenged in Washington State court with a trial date of September 24, 2020. Given the magnitude of scientific evidence WDFW failed to consider during the review, it's possible the Court could render this determination invalid and require WDFW to reinstate the SEPA process to conduct additional environmental review such as an environmental impact statement. No permitting should be authorized until the Court reaches a decision in this legal matter, as additional environmental

review could unveil new or presently unknown pollution and water quality risks posed by this expansion and extension of net pen aquaculture that would need to be addressed or incorporated into NPDES permits.

2) NOAA Fisheries is currently conducting a biological opinion of Puget Sound net pens in response to the Environmental Protection Agency's initial determination that Puget Sound net pens "are likely to adversely impact" ESA-listed Puget Sound salmon, steelhead, and rockfish populations. Ecology should delay issuing Cooke's modified NPDES permits until that ESA consultation is complete. This consultation is addressing water quality standards needed to issue the permits and therefore the permits should not be issued until NOAA Fisheries has provided the final biological opinion on the impact to ESA-listed species.

3) There is substantial new information that was not considered during the SEPA process.

The SEPA determination issued in January, 2020 (Mitigated Determination of Non significance (MDNS), requires Cooke to prepare and submit a plan for marking steelhead (clipping the adipose fin) in ways that will distinguish fish from their pens from hatchery-raised fish swimming freely in Puget Sound. That plan is not part of this record, and review of the NPDES permit application should await that filing.

The MDNS also requires Cooke to submit a plan for a "no-recovery response" to escapes. That plan is not part of the escape plan submitted in Cooke's application, and it is impossible to assess the adequacy of Cooke's pollution prevention plan until that plan is included in the application.

During the emergency response to the Orchard Rocks partial sinking, Cooke told DNR that they planned to replace some existing net pens in Puget Sound. If indeed that plan is under way, the NPDES review should include engineering data on the new pen structures in order to assess the adequacy of those pens for Puget Sound's dynamic conditions, and the escape risk and other risks the new pens might pose to Puget Sound.

The SEPA review led by the Washington Department of Fish and Wildlife which produced the MDNS, is currently being appealed (see #1). Given the potential for a Court ruling requiring additional environmental review under SEPA and this new information described above, Ecology should delay drafting any NPDES permit until the evidentiary record and ruling can be incorporated.

4) Ensuring compliance of rules set by NPDES permits is crucial.

Following the 2017 Cypress Island net pen collapse, Wild Fish Conservancy sued Cooke Aquaculture under the Clean Water Act (CWA). That suit resulted in rulings that the company had violated the terms of its permits, including by failing to conduct required inspections of net pen moorings and anchors, to accurately monitor and report the number of fish escaping from pens, to develop operational plans that include necessary procedures for inspecting cages, storing chemicals, disposing of harvest blood, and to track the number of fish in its cages and lost to predation. Cooke's history of CWA violations is important to consider in this process, if nothing else to ensure that the permits are drafted to ensure that violations are detected before catastrophe ensues.

Incidents like the partial sinking of the Orchard Rocks pen in October, 2019 demonstrate that the risks of additional escapes are very real, given the state of the existing pen structures. The response to that incident was conducted by several Washington State agencies, including Ecology, and the records from that incident and state agencies' documentation of Cooke's inadequate emergency response should be included in this record to ensure that emergency plans incorporate lessons learned, and acknowledge the degraded state of the surviving pens as identified by state inspectors and Cooke's own contractors.

5) Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture.

In 2018, Washington's passed a law, HB 2957, banning Atlantic salmon net pens on the grounds that the practice placed too great a risk on the ecosystem, created a new and stricter regulatory regime for marine net pen aquaculture.

As such, it is not sufficient to say that conditions of the current NPDES application are similar to those of past permits. HB 2957's new standards require re-examining past decisions to hold Cooke Aquaculture to that higher standard of eliminating these risks.

In reviewing Cooke's submissions and other materials submitted through this public process, the standard of review should be specifically on whether the policies in place achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife."

6) Switching species does NOT reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should not limit the scope of their review to risks associated with a change of species.

Decades of experience shows real effects on water quality in a plume around the net pens, which the terms of Cooke's current permit application does not eliminate. This NPDES review should re-examine existing data on effluents from industrial products, medicines, feed, fish waste, and dead and rotting fish to assess whether the current plans eliminate all of those risks.

6a. Fish Effluent

Open water net pens routinely disperse large volumes of feed into public waters within the boundaries of the net pens. Some portion of the feed may not be consumed by penned fish, and thus makes its way into, and have an impact upon, the surrounding marine environment. The high-energy tidal zones in which net pens are located may drive broad dispersal of unconsumed feed and other dietary supplements, including medicines. This dispersal of feed into public waters represents a continuous and constant act of chumming, and attracts native fish species as well as other wildlife (see #8). Divers near net pens have observed large schools of fish swimming in and out of the pens, and reports from British Columbia on bycatch and incidental take of wild species during harvest operations indicate that many native species enter the pens, likely because of the food attraction.

Small fish species, such as forage fish species and outmigrating and rearing wild salmon and trout (including ESA-listed Chinook and steelhead), have to migrate past net pens as they swim across the shoreline, and may be attracted by net pen feed to the point where they physically enter a net pen facility and are vulnerable to disease associated with farmed salmon in the pens-regardless of species.

The constant dispersal of feed may also cause disruptions in the natural migratory patterns of wild fish, as the pens provide a constant and unnatural food source that may cause wild salmon or trout to occupy a single location for a longer period of time than is typical, and deter rearing or migrating wild fish from developing key feeding strategies which are critical to their early growth and development, as well as subject them to net pen concentrated disease.

Additionally, feeding and harvesting steelhead from the net pens attracts wildlife to the vicinity of the pens, including birds, sea lions, orcas, seals, and other fish. Cooke's NPDES permits need to consider this additional biomass and waste from these attracted species when setting limits for phosphorous, nitrogen, and other discharge.

Aside from water quality concerns, this attraction increases the chances that orcas and other marine mammals will be harassed, and that endangered wild fish will be accidentally harvested, injured, or preyed upon.

6b. Fish Waste

No matter the species, there is no mechanism to capture waste from open water net pen aquaculture. Fish waste, excess food, dead fish, and tissue sloughed off of live fish, all flow from net pens into surrounding waters. This nutrient imbalance in the vicinity of pens can be harmful to some wild species, and can cause unhealthy growth of other species, including algal blooms. Additional climate change impacts suggest die-offs from algal blooms could be more frequent. Read about an example in BC's Clayquoet Bay.

Unlike highly-regulated land-based agriculture and production where animal manure is collected and composted, waste (feces, urine, medicines, and uneaten feed) from open water is discharged directly into public water. The most prominent organic nutrient waste involved are phosphorus (P) and nitrogen (N). Based on calculations made by Wild Fish Conservancy using a bioenergetics program and data provided by Cooke in their monthly NPDES reports, the estimated amount of untreated N discharged by Atlantic salmon net pens in Puget Sound on a daily basis is roughly equivalent to the amount of N discharged in waste treated by the city of Tacoma. For the same comparison with regards to P, the amount of discharge is roughly equivalent to the cities of Port Angeles, Everett, Bellingham, and Tacoma combined.

The attraction of wildlife including birds, sea lions, orcas, seals, and other fish (described in 5a) concentrates animal waste near the pens, further increasing levels of phosphorous and nitrogen.

Currently, Ecology only considers the impacts of the nutrients and chemicals discharged on the environment directly below or in close vicinity to the pens. As part of risk assessment and monitoring, Ecology should utilize the Pacific Northwest National Laboratory's Salish Sea Model, a predictive ocean-modeling tool developed by the federal government for coastal

estuarine research, restoration planning, water-quality management, and climate change response. This tool could analyze how discharge and pollution from net pens travels through the dynamic, tidal marine environment, therefore allow Ecology to better evaluate the risk the pollution poses and the geographic range the pollution would impact.

6c. Amplification and Discharge of Viruses, Parasites, and Diseases

Rearing concentrated populations in what are effectively aquatic animal feedlots, face greater risk of disease, parasitic, and viral amplification than wild fish populations. When outbreaks break out in net pens, the disease-causing organisms are rapidly amplified in number and discharged to the surrounding aquatic environment in large numbers. Because wild steelhead, forage fish, and other species of concern (i.e. coho salmon, ESA-listed Chinook salmon and bull trout and forage fish and as required by WAC 197-11-080) swim in close proximity to the pens, there is likely to be a spread of disease from infected farmed fish to these endangered wild populations. For example, see map of net pen and herring spawning sites in the Salish Sea.

In 2017, a B.C. study documented a strong correlational connection between disease prevalence in net pens and disease transfer to wild fish populations (Morton et al., 2017). Recent research in British Columbia found novel viruses in endangered salmon, and found evidence that these novel viral infections may originate from farmed salmon and trout (Mordecai et al., 2019).

Such pathogens fall within the definition of pollutants, and the NPDES permit review should ensure that Cooke's plans will eliminate the risk of these pollutants harming the integrity of the Sound ecosystem and the biological integrity of its wild species.

Net pens chronically discharge particles of decaying fish flesh that are often consumed by native fish and birds. These particles may be contaminated with pathogens, parasites, pharmaceuticals or chemicals that may be ingested by native fishes, including wild steelhead, salmon, and other trout. Studies have shown that these particles are potential vectors for pathogens. While Cooke now is required to recover dead fish and transport them upland for disposal, there is currently no mandate that those mortalities be submitted to the state for testing before disposal.

6d. Discharge of antibiotics and medical effluent.

In order to treat specific diseases of fungal occurrences or to prevent infection, chemicals and pharmaceuticals are often applied by the industry to the fish, water, or feed in the net pens. Among the potential and likely harmful impacts to designated uses of surrounding water is the use of these chemical or pharmaceuticals for treating infections, parasites or diseases such as "yellow mouth" where the U.S. Food and Drug Administration (FDA) requires a 30 day waiting period before treated fish may be approved for human consumption. Native fishes in the immediate vicinity of the treated pens may also be exposed to or consume the very same chemicals and pharmaceutical treatments (including fish that may enter the pens attracted by the presence of feed and fish odors). These fish may then be caught in recreational or commercial fisheries and unknowingly be consumed by the public within FDA's required 30 day waiting period. This risk to the public and to wild fish must be addressed in the NPDES review.

The SEPA checklist submitted by Cooke Aquaculture and included in this record refers to the use of unspecified probiotic supplements. These unspecified introduced microbes are likely to colonize the microbiome of native fish and the environment near net pens. Given the growing scientific appreciation of the role of the microbiome in health and development of fish and other animals and plants, these supplements should be detailed, and a plan for monitoring surrounding areas and fish populations for colonization or excess growth of these bacteria should be required. This monitoring should also test for growth of antibiotic resistance in nearby areas.

It should also examine new data on antibiotic resistance in protected marine mammals (research discussed in this recent report from High Country News). These risks were discussed in the SEPA comments submitted by the Our Sound, Our Salmon coalition in 2019, and comments to the previous Atlantic salmon NPDES review.

7) The change in species poses new and different risks.

The change in species poses new and different risks, in addition to the harms open water net pen aquaculture has caused for decades. Some policies which may have been permitted for Atlantic salmon under the pre-2017 status quo, pose additional risks with the proposal to introduce a highly-domesticated and partially-sterile form of steelhead. The differences in this circumstance were considered as far back as 1990, when the last comprehensive Environmental Impact Statement was drafted. The prior permitting for these pens and their operations all addressed risks associated with a non-native species. In dealing with biologically-altered, domesticated steelhead and Puget Sound's federally-listed steelhead population, different risks apply, and standards laid out in the 1990 EIS have not been met for these purposes.

For example:

The "a minimum distance of separation between farms and river mouths" has never been considered and adopted in state policy, as section 5.7.2.2 of the 1990 EIS would require for aquaculture involving native fish (and as is required in many other nations). Since escapes, and their risks to threatened steelhead and rainbow trout, constitute pollution and are within the scope of Ecology's review, this guidance and an analysis of the proximity of pens to steelhead spawning rivers should be included in Ecology's review of these NPDES permits. In addition, the assessment of risks from pollution (including diseases) should account for the migration corridors in areas like Rich Passage, which may concentrate wild salmon near the pens.

The behavioral response of wild steelhead to a large aggregation of wild steelhead may be different than it was to Atlantic salmon. If wild schools are attracted to the captive domesticated steelhead in pens, the pollution from the pens may do greater harm to hatchery-reared steelhead and to threatened wild Puget Sound steelhead.

Despite treatment to render the fish infertile (triploid), many fish in the pens will be capable of reproducing. When a net pen collapses, it will release more fertile female steelhead than exist in many endangered wild steelhead runs. When an escape happens, it will be nearly impossible to manage a recovery effort that removes farmed steelhead and does no harm to endangered wild steelhead and bull trout, endangered and threatened salmon, endangered southern resident killer whales, and other protected wildlife in Puget Sound.

The escape of steelhead from any of the Puget Sound aquaculture facilities, whether from small scale leakage or catastrophic facility failure, will pose risks to native salmon, steelhead, and rainbow trout rearing in nearshore marine habitats and rivers due to competition for food and foraging space. This will be particularly true in the case of Cooke's proposed triploid (treatment to render the fish infertile) steelhead because as noted in Cooke's materials, triploid fish have appetites that are likely to be considerably greater than wild juvenile salmon and steelhead due to the faster inherent growth rate of these triploid fish. This means escapees may outcompete wild steelhead, or indeed predate upon them.

8) Escape prevention and the adequacy of Cooke's escape prevention and escape response plans must be carefully considered in this permit process.

The steelhead Cooke proposes using in their net pens are highly-domesticated, biologically-altered to be partially-sterile, and genetically dissimilar to wild stocks. Similar to nonnative farmed Atlantic salmon, these fish are considered and regulated as a pollutant under the Clean Water Act if they escape into public waters.

Escape prevention and the adequacy of Cooke's escape prevention and escape response plans must be carefully considered in this permit process. The determination from the SEPA review process requires Cooke to develop a "no-recovery" option to be added to their escape response plan, which is not included in these NPDES application materials. The NPDES review must be based on their full escape plan, not this incomplete record. The SEPA determination also required Cooke to develop a plan for marking their domesticated stock (clipping the fins) to distinguish them from free-swimming wild and hatchery steelhead. That marking plan is not included in these NPDES materials, but is an important aspect of escape recovery.

Despite treatment to render the fish infertile, many fish in the pens will be capable of reproducing. When a net pen collapses, it will release more fertile female steelhead than exist in many endangered wild steelhead runs. When an escape happens, it will be nearly impossible to manage a recovery effort that removes farmed steelhead and does no harm to endangered wild steelhead and bull trout, endangered and threatened salmon, endangered southern resident killer whales, and other protected wildlife in Puget Sound.

9) Ecology should not issue NPDES permits until all net pens are transitioned to upland contained systems. *NOTE THE FISH THAT ARE TRANSFERRED TO NETPENS COME FROM AN UPLAND CONTAINED FACILITY*. KEEP THEM THERE. Furthermore, finfish aquaculture as practiced at these sites is no longer water-dependent under the terms of RCW 79.105.060. Innovations in land-based aquaculture are now more affordable and practical since these pens were first installed in Puget Sound thirty years ago.

Today, these land-based facilities are being built throughout the U.S. and world and represent a steadily growing industry and an environmentally-responsible farming practice. By endangering the health and productivity of Puget Sound ecosystem services, net pen aquaculture has the potential to harm actual water-based uses that cannot exist without access to healthy and productive marine and freshwater environments in the Puget Sound region. Ecosystem services in

Puget Sound support thousands of jobs throughout the region and generate billions in local economic capital.

Land-based aquaculture using closed-containment systems eliminates all of the risks open water net pens pose to the natural ecosystem, offering the industry an ecologically-safe opportunity to produce farmed fish that can be marketed as a truly sustainable and responsible product. Examples of successful land-based aquaculture companies, such as Nova Scotia's Sustainable Blue which has been in operation since 2015, further demonstrate that commercial marine net pen finfish aquaculture is no longer water-dependent.

Industry representatives often claim transitioning to land-based facilities is simply too expensive. **However, under the current business model the net pen aquaculture industry is using the public's waters and resources to subsidize their expenditures and profits. Moving these facilities out of public waters shifts the responsibility and financial burden of oversight, monitoring, emergency response, and management of effluent and pollution away from the public and onto the company.** For that very reason, as long as governments around the world are willing to continue leasing public waters for use by this industry, companies have little incentive to invest and transition to sustainable and ecologically safe alternatives.

Washington state is the only west coast entity in BC and the United states that allows in-water netpens. This is irresponsible. By denying permits for open water net pen aquaculture, the state, including DoE should unite Washington with the rest of the coast which has committed to removing or already prohibited commercial marine net pen finfish aquaculture. This effort will support global efforts to transition this industry out of public waters and toward sustainable land-based alternatives.

In addition, many counties and municipalities have established new rules since the net pens were installed, which would prohibit the construction of new net pens in their waters. These prohibitions are based on science, and should be adhered to as best available science.

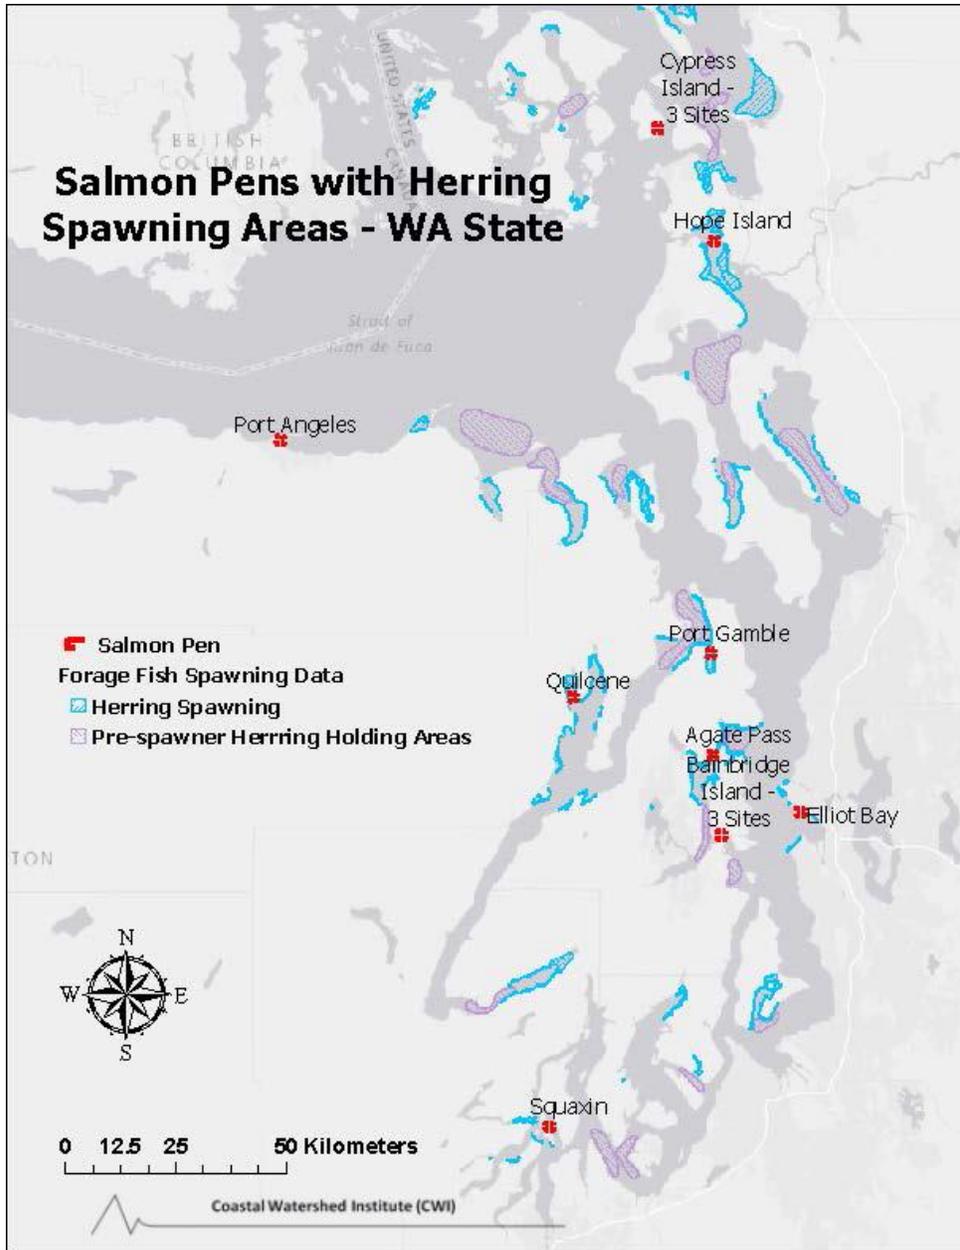

Do the right thing for our state's (and nations) invaluable coastal ecosystems. Deny these NPDES permits and deny future in water net pens in Washington state.

Respectfully,,

Anne Shaffer, PhD

Olympic Environmental Council

The Olympic Environmental Council has long been concerned about raising fish in pens and has tracked this industry for over 20 years. To be brief, our position opposes raising penned animals, feeding them toxic feed which then circulates through the marine system and to other animals, using dyes to color the fish -- dyes which can be harmful to humans, the diseases and parasites endemic to the penned fish and then sold for human consumption, the plastic introduced to the marine ecosystem from the pens, the pollution of the bottom lands, the history of thousands of escapees -- violating the rule that if one escapes that is pollution, the escapees ability to access the streams of wild fish and build reefs and crowd out the wild fish from their native streams, the introduction of non native species - even so-called native but of different genetic stock, and the fact that Cooke Aquaculture has provided the State a poor record of upkeep and oversight of its properties.

RE: Draft Cooke Aquaculture permit modifications to raise steelhead in four Puget Sound net pens.

Dear Laurie Niewolny,

Thank you for taking the time to consider our comment on the proposal put forth by Cooke Aquaculture Pacific, LLC to modify their existing NPDES permit from raising Atlantic salmon to raising steelhead (*Oncorhynchus mykiss*) at four of their existing marine net pen sites in Puget Sound. We recognize that changing the species from Atlantic salmon to rainbow trout will not result in significant changes to water quality, however we continue to oppose net pen aquaculture of any type because of their contribution of nutrients and toxic chemicals. We feel that net pens pose a significant threat to the marine ecosystem including threatened and endangered species.

RE Sources is a non-profit organization located in northwest Washington and founded in 1982. We work to protect the health of northwest Washington's people and ecosystems through the application of science, education, advocacy, and action. Our priority programs include Protecting the Salish Sea, Freshwater Restoration, Climate Action, and Fighting Pollution—all critical issues affecting our region. Our North Sound Baykeeper is also a member of the Waterkeeper Alliance, with over 300 organizations in 34 countries around the world that promote fishable, swimmable, drinkable water. RE Sources has thousands of supporters in Whatcom, Skagit, and San Juan counties, and we submit these comments on their behalf.

Fish net pens, regardless of species, contribute considerable organic waste including uneaten fish food, fish feces, and dead fish. These waste products result in excess nutrients that lead to eutrophication and subsequent hypoxic zones in Puget Sound.^{1,2} Research also shows that eutrophication is leading to a rising algae population that is shading out eelgrass and kelp causing a decline of these critical species.³ Nutrient inputs, therefore, are having a widespread and direct negative impact on the Puget Sound ecosystem, including the food web that is critical to our endangered orca whale.²

Growing any species of fish in high densities can lead to more parasites and diseases than would occur in the natural environment.^{4,5} Sea lice, viruses, and other emergent diseases all have the potential to further stress our dwindling native salmon populations.^{5,6} Furthermore, the use of fish food, pharmaceuticals, and

antifoulants to maintain the health of the salmonids and net pens contribute toxic chemicals and are additional stressors.⁷

In fact, a new study that identified pathogen environmental DNA in relation to salmon net pens found that net pens are potential reservoirs for infectious agents.⁸ This research suggests that native salmon and other fish that swim in proximity to net pens are at an elevated risk of contracting an infectious disease. This study not only highlights the potential danger net pen operations have on our native fauna but also illustrates that we are still learning about the potential dangers from net pen operations.

The National Pollutant Discharge Elimination System (NPDES) is intended to regulate point source pollution discharged to waters of the United States so that the discharge does not hurt water quality or people's health. The Cooke Aquaculture net pens are strategically situated in areas that are deep, well flushed, and have complicated circulation patterns. Therefore, this makes it impossible for the Department of Ecology to accurately measure and regulate the amount of discharge emitted by these net pens. These pollutants are continually released into the Puget Sound where they are dispersed and diluted yet continue to bioaccumulate and biomagnify in organisms.^{9,10}

We need to prioritize the recovery of our native salmon species over propagating farmed ones. Native salmonids will not benefit from net pens and could be adversely affected by them through worsening water quality. We strongly encourage all fish aquaculture operations be moved inland where pollutants can be measured and regulated before being discharged into waters of the state. Wastewater Treatment Plants will soon need to regulate their nutrient discharges and it only makes ecological sense for net pens to be required to do the same.

Net pens are contributing to the decline of the Salish Sea and are making recovery rates slower and more difficult, for this reason we oppose any type of net pen operation in Puget Sound. Thank-you for reading our comments and taking our concerns into consideration.

Sincerely,

Kirsten McDade

Laurie Niewolny, Water Quality Program
Washington State Department of Ecology
P.O. Box 47600
Olympia, WA 98504

Re: Comments on Ecology Draft Permit Modifications for Cooke Aquaculture Pacific

Dear Ms. Niewolny:

The Northwest Aquaculture Alliance (NWAA), an organization of producers and support businesses in Washington, Oregon, Idaho, Montana, and British Columbia that share a commitment to responsible aquaculture and a robust Blue Economy, appreciates the opportunity to comment on the DRAFT revised permits for Cooke Aquaculture Pacific (CAP), a global industry leader in sustainable seafood production for both wild and farmed species.

First and foremost, we are pleased that the agency has correctly concluded, based on best available science from leading researchers from the public and the private sector, that little or no difference exists in feed utilization and nutrient waste production between Atlantic salmon and rainbow trout/steelhead. This finding of fact should clear the way for a swift granting of permits so that this company can get back to doing what it does best: Producing high-quality, high-value, nutritious seafood for human consumption, creating well-paying jobs along the way.

At the same time, however, we urge the Department of Ecology to use restraint by not requiring CAP or any company in a similar situation to divulge proprietary information to the state. We see this as a dangerous precedent, and we respectfully request that the agency avoid adding additional new requirements or constraints on this company's existing permits.

We are all aware that there are very vocal groups in this state that do not support having net pens in state waters. However, it should be noted that commercial net pen aquaculture has been going on in Washington waters for more than 30 years. Today, in fact, several tribes are growing salmon for their delayed release fish enhancement projects by using net pens in the early life stages of their fish.

Technology has made this form of farming—in the water—the most sustainable, environmentally friendly form of food production of all types of protein production. As the federal government works toward its vision of farming in the open ocean, and seafood companies look to both offshore aquaculture as well as experimental land-based fish growing operations, the reality is that marine aquaculture worldwide remains one of the most efficient, environmentally responsible, and sustainable ways to produce the protein the world needs.

As our organization's diverse membership shows, the business of aquaculture is heavily dependent on science. To grow any kind of finfish (or shellfish), growers rely heavily upon science—including genetics, breeding, animal health, veterinary medicine, and nutrition, to name just a few areas of

study.

It is also heavily reliant on technology, including but not limited to the use of computers and underwater cameras that make sure no feed is being wasted to robotics to GPS systems. Companies like Cooke continue to embrace new technologies that help grow much-needed protein more efficiently, allowing producers to monitor the fish growing process through their entire life cycle.

In addition, feed companies have also embraced innovation, creating fish feeds that minimize the use of marine ingredients, increase the digestibility, and meet the exact nutritional requirements of the fish stocks at each stage of the growth cycle. We have come a long way as an industry and companies in our organization—particularly CAP in this instance—are leading the way in being stewards of the environment.

Finally, if the COVID-19 pandemic has taught us anything, it is that we as a state, region, and country need to put ourselves in the position of being food secure. That means, among other things, "growing our own" rather than importing. It means encouraging the development of rural natural resource jobs, of taking pride in what we grow in Washington's lands and waters.

Aquaculture is the future, and we in Washington are at a crossroads. We can either lead, follow, or get out of the way and let our food come from other countries where regulations may not be as stringent as those in the United States. There is no reason the United States cannot cultivate its own seafood resources and businesses right here at home in our own waters.

Because Washington state has done extensive research and monitoring of net pen operations in the state, and because current regulations on any discharges from net pen operations are among of world's most stringent, we are hopeful that Cooke Aquaculture Pacific will be granted the permits it seeks to begin to supply local and regional markets once again.

On behalf of our fish and shellfish grower members as well as the many companies involved in supplying our producers, we urge you to take a broad view of this request and grant Cooke Aquaculture Pacific the permits to begin operating, and to do so in an expeditious manner.

Thank you.

Sincerely,

Jeanne McKnight, Ph.D.
Executive Director
Northwest Aquaculture Alliance

Covington, Washington 98042 USA

Friends of the Earth

Please accept the attached comments from 1093 members and activists of Friends of the Earth who are opposed to the issuance of the proposed water quality permits for Cooke Aquaculture to raise steelhead trout in its existing net pens. Friends of the Earth joins these comments and urges Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters. Moreover, as detailed in the attached comment letter, we recommend that Ecology (1) wait to reach a decision on the permits until pending developments that impact the decision are resolved; (2) revisit its conclusion that issuance of the permits will not change the effect of Puget Sound water quality; and (3) if the permits are issued, ensure that any noncompliance of the permits will result in swift revocation of the permits and additional harsh penalties.

Thank you for accepting and considering these comments.

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Kathryn Bromley

Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

David Breckette

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Joan Christensen

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Beth Eisenbeis

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Gale Kessler

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Renne Adams

Redmond, WA 98052

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Jim Bartley

Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Tracy Fitterer

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Victoria Forsberg

Langley, WA 982609217

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Don Adair

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

ALBERT WAGNER

Port Ludlow, WA 983659668

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Charles Landau

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Somsaron Pheth

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Susan Shouse

Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Daniele Rubcic

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Anthony Troutt

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Holly Taylor

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Robert Seaman

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Ximena McIntosh

Bainbridge Island, WA 98110

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Constance Knudsen

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species.

Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology.

In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound.

First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures).

Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife."²

Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent).

Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be

met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from our waters entirely.

Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

I live in the area. I need wild caught salmon for health reasons.

Sincerely,

Gloria McClintock

Mount Vernon, WA 98274

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Celia Martin

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Linda Ball

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Selim Uzuner

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Howard Mizuta DDS

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Cindy Hart

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Fran Holme

"Dear Ms. Niewolny:

I live in western Washington on Camano Island. Like most of the people in the Puget Sound area, I value the natural beauty here very highly and want to see a return of salmon and orca. Cooke's operations have already failed badly and are pushing us in the wrong direction.

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Den Evans

In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Anne Almgren

WINIFRED DAISLEY

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Evelyn Lemoine

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Steve Williams

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Lemoine Radford

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Bonnie Benard

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Judith Landy

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Sally Martine

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a

different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Wendy Jarvis

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

The tides in Puget Sound move the water back & forth... which does dilute the fecal output from these pens. But it doesn't really remove that output. It becomes a plume, like we saw from the ASARCO smelter in Tacoma, where there are tracks of the deposits of poisonous elements that remain in the soil for decades.. maybe forever.

So there are plumes in both directions from these net pens.

It's kind of like having cancerous polyps in the colon... but with the added problem that "traffic" past those polyps will be going BOTH WAYS, unlike the "traffic" inside a colon.

We would be remiss if we only tried to control the outfall/output from these net pens, instead of simply removing them entirely from the Sound.

On another issue, the idea of feeding little fish to make these larger (& seemingly more valuable) fish, when the small fish is an excellent human food in its own right, is wasteful... and only makes "economic sense" by virtue of ad campaigns to "sell" salmon & steelhead as "superior & desirable" food.

Get rid of these net pens! If people want to raise salmon & trout for food, then it should be done AWAY from the Sound... if at all... like hatcheries.

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout. THIS IS RIDICULOUS, bordering on the CRIMINAL.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with CLOSURES, AND PEN REMOVAL.

Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Eugenia Haggin

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Aliza Winship-Freyer

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Jean Fee

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Jeff Freels

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. "Dear Ms. Niewolny:

ENOUGH of THIS!!!

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a

different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

THANK YOU!!!!!!!

Sincerely,

j, eggars
