End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Paula Bennett

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Joanne Jensen

Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Marjorie Millner

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Stephen Humphrey Pacios

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Coral Shaffer

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Lyle Wirtanen

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Ian Jezorek

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Bruce Horowitz

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Leslie Quenell

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Cynthia Zimmermann

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon horribly for far too long. I am distraught--and very angry--to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to stress the importance of waiting to reach a decision on the water quality permits at issue. There currently is litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species.

Both of these developments are ongoing, and both will affect the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all affected local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

I also request that the Department of Ecology revisit its conclusion that the issuance of these permits will not change the effect on water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, with regard to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met promptly with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans also must be carefully considered in this permit process. We absolutely cannot afford to let another Cypress Island spill occur in Puget Sound.

In summary, I urge Ecology to use extreme caution before reaching a decision on the draft water discharge permits, since they would allow the company to continue operating its net pens in the state. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been a paramount problem with Cooke's Atlantic salmon operations. These issues are not mitigated simply by

raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the multiple harms of industrial ocean fish farming is to remove the operations from our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have absolutely no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Bobette Jones

First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Joel Flank

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

David Sugarman

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Abigail Fanestil

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Glenna Johnson

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Kathy Wilson

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Ron Beckham

Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Lin Provost

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Leslie Sherman

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Karen Genest

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Sandra Gehri-Bergman

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

cheryl sloan

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Diane Dishion

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Dale Russ

Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Trudy Cordes

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Judy McDonald

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Marcia Culver

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Candice Kalb

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Shirley Carmichael

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

FRANCE MORROW

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Antonia Lawrence

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Calista Whitney

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

David Arntson

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Michael Nesbitt

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Russell Watson

"

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Virginia (Ginny) Ramey

"Dear Ms. Niewolny:

I live on the shores of Puget Sound and had the opportunity to go very close - in a small boat -to the Cooke Aquaculture nets off Cypress Island. These nets had given way months before and polluted Puget Sound with non-native salmon! It was chilling to see the potential for another disaster, as I looked at those throbbing nets!!

.

Because of another disaster like that is possible, why has the Dept. of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout??

Instead of this long delay, I would like to see the following actions taken by you:

1. WAIT to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology.
2. Ecology should undergo consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.
3. D. of E. must revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. Issues of that still are not resolved:
 - a. Water quality
 - b. Net pen safety & escapement
 - c. Switching species from Atlantic salmon
to steelhead trout

These measures do not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Instead, they pose new and different risks!

Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated do all it can to ensure Cooke's compliance of all rules and limitations! Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well.

In short, I urge Ecology to use extreme caution before reaching a decision on the draft water discharge permits. Why should we allow this company to continue operating its net pens in Washington state??!

Our waters have been threatened by pharmaceuticals, viruses, parasites, and other water quality pollutants! . These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female.

The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to REMOVE the operations from our waters entirely! Moreover, it's clear that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Cooke needs to go! Permanently!

Therefore, any proposed, tougher restrictions – although well-intended "" are not enough! Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible. You must proceed with extreme caution and eventually DENY Cooke's NDPES permit applications.

We can not afford another disaster in Puget Sound waters!

Sincerely,

Virginia Ramey

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Nicholas Jurus

Vashon, WA 980704961

I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

WOODY SIMMONS

In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

linda howard

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Ryan Reid

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Rajwantee Robinson

Linda Schuyler

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Sandra Wilson

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Deonet Wolfe

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Paul Weiss

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

I was so proud of Hillary Franz's decision to disallow Cooke's permits to farm fish in our waters! It gave me renewed confidence that the State was really looking out for the best interest of Washingtonians and our precious environment. And recently we saw the old net pens being hauled away, which felt SO good . . . and so wonderfully final.

I read in the PDN (Peninsula Daily News) today that the Tribe and Cooke Aquaculture are planning to raise steelhead in fish farm nets--again in the Port Angeles harbor--and that the State is re-considering?

Even if they raise steelhead instead of salmon, we all know the net pens damage the water quality and the native fish environment, and should not be allowed. Additionally, Cooke Aquaculture has PROVEN that they are not to be trusted to act responsibly for the sake of our marine environment.

Please don't go backwards--don't let Cooke and the Tribe raise any kind of fish in Washington's nearshore waters!

The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Robert Horn

Max DeNise

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Jacob struiksmā

There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Maria Magana

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Suzanne Nevins

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPES permit applications.

Sincerely,

Sybil Kohl

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Any noncompliance should swiftly be met with harsh penalties, including immediate permit revocation. Cooke's escape prevention and escape response plans must be carefully considered in this permit process as well. We cannot afford to let another Cypress Island spill occur in Puget Sound.

In short, I urge Ecology to heed extreme caution before reaching a decision on the draft water discharge permits, as they would allow the company to continue operating its net pens in the state.

Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from

our waters entirely. Moreover, it's clear from recent history that Cooke has no intention of operating in accordance with our environmental conservation and protection laws and regulations. Therefore, any proposed, tougher restrictions – although well-intended – are not enough. Cooke's destructive facilities have no place in our waters.

Please do all you can to end Cooke's incredibly harmful practices in our waterways as soon as possible, including by proceeding with extreme caution and eventually denying Cooke's NDPEs permit applications.

Sincerely,

Sierra Sanchez

End Cooke Aquaculture's operations

"Dear Ms. Niewolny:

Industrial ocean fish farming has been polluting our waters and harming our wild, native salmon for far too long. I am distraught to see that the Department of Ecology has gone against public opinion and prepared draft water quality permits that will allow Cooke Aquaculture to bypass the industry phaseout and transition its existing Puget Sound net pens to cultivate steelhead trout.

I want to urge the importance of waiting to reach a decision on the water quality permits at issue. There is currently litigation pending against the Department of Fish and Wildlife's flawed permitting process and decision, and the National Oceanic and Atmospheric Administration is in the process of conducting an Endangered Species Act biological opinion on the impacts of Puget Sound net pens on protected species. Both of these developments are ongoing, and both will impact the water quality permitting processes and decisions before Ecology. In addition, Ecology should undergo formal consultation with all impacted local, state, federal, and tribal governments before reaching a decision on these permits. Ecology should place a hold on any further action related to the draft water quality permits until these actions are fully and finally completed.

Moreover, I request the Department of Ecology to revisit its conclusion that the issuance of these permits will not change the effect to water quality in Puget Sound. First, there is substantial new information that was not considered during the SEPA process for the permits (including Cooke's plan for marking steelhead, Cooke's "no-recovery response" plan, and Cooke's plans for new pen structures). Second, Washington's landmark 2018 law, HB2957, created a new and stricter regulatory regime for marine net pen aquaculture, which places higher standards for regulating and monitoring water quality. Under HB2957, Ecology must adopt the new standard of review to achieve the state's goal to "eliminate...escapement and to eliminate negative impacts to water quality and native fish, shellfish, and wildlife." Third, switching species from Atlantic salmon to steelhead trout does not reduce the rampant daily pollution and water quality risks posed by open water net pen aquaculture. In fact, the proposed change in species poses new and different risks, and there are a number of inherent problems with this industry regardless of the species being cultivated (including but not limited to, fish effluent and waste, amplification and discharge of pathogens, and discharge of antibiotics and medical effluent). Ecology should reconsider all water quality risks associated with this industry and not limit the scope of their review to risks associated with only a change of species.

Finally, speaking to the draft permits themselves, Ecology is obligated to do all it can to ensure Cooke's compliance of all rules and limitations set by the NPDES permits. Pharmaceuticals, viruses, parasites, excess nutrients, and other water quality concerns have been paramount with Cooke's Atlantic salmon operations. These issues are not mitigated by simply raising a different fish species – even if the stock is partially sterile/all-female. The only way to truly protect our coastline and wildlife from the harms of industrial ocean fish farming is to remove the operations from
