Client: Lanxess Corporation (formerly Emerald Kalama Chemical)
Service Request: K2310979
Project: 2023 NPDES Annual-Biannual
Date Received: 09/28/2023
Sample Matrix: Wastewater

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Four wastewater samples were received for analysis at ALS Environmental on 09/28/2023. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Semivolatiles by GC/MS:

Method 625.1, 10/26/2023: The spike recovery of Benzidine for Laboratory Control Sample (LCS) KQ2317294-03 was outside the lower control criterion. The analyte in question was not detected in the associated field sample. The error associated with reduced recovery indicated a potential low bias. Additional analysis of the associated field sample was not performed because the holding time had already elapsed. The data was flagged to indicate the problem.

The following analytes were searched for and quantitated as Tentatively Identified Compounds (TICs): Dibenz(a,h)acridine, Dibenz(a,j)acridine, Dibenzo(a,e)pyrene, Dibenzo(a,h)pyrene, Dibenzo(a,i)Pyrene, 3-Methylcholanthrene, and Perylene. No quantitative standards were analyzed for these analytes.

The detection limit was slightly elevated for all analytes in sample 002 Grab due to less than optimal sample volume received for analysis.

Semivoa GC:

Method 608.3, 11/01/2023:The upper control criterion was exceeded for Endrin in Continuing Calibration Verification (CCV) KQ2318924-02. The field sample analyzed in this sequence did not contain the analyte in question. Since the apparent problem indicated a potential high bias, the data quality was not affected. No further corrective action was required.
Method 608.3, 11/07/2023:The analysis of Chlorinated Pesticides and PCB Aroclors by EPA 608.3 requires the use of dual column confirmation. When the Continuing Calibration Verification (CCV) criterion is met for both columns, the lower of the two sample results is generally reported. The primary evaluation criteria were not met on the confirmation column for Decachlorobiphenyl, Aroclor 1016 and Aroclor 1260. The results were reported from the column with an acceptable CCV KQ2319839-01. The data quality was not affected. No further corrective action was necessary.
Method 608.3, 11/03/2023: The upper control criterion was exceeded for many analytes on one or both columns in Continuing Calibration Verification (CCV)KQ2318956-02. The Method Blank (MB) analyzed in this sequence did not contain the analytes in question; the recovery for the analytes in question were in control in the Laboratory Control Samples (LCS/DLCS) analyzed in this sequence. The data quality was not affected. No further corrective action was required.
Method 608.3, 11/01/2023:The upper control criterion was exceeded for Aroclor 1016 in Duplicate Laboratory Control Sample (DLCS) KQ2317362-05. No target Aroclors were detected in the associated field sample. The error associated with elevated recovery indicated a high bias. The sample data was not significantly affected. No further corrective action was appropriate.

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- Except as qualified, Clean Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 136, including but not limited to the following EPA Method reference revisions:
  EPA 300.1 Rev. 1.0-1997
  EPA 300.0 Rev. 2.1-1993
  EPA 353.2 Rev. 2.0-1993
  EPA 410.4 Rev. 1.0-1993
  EPA 420.4 Rev. 1.0-1993
  EPA 365.1 Rev. 2.0-1993
  EPA 200.7 Rev. 4.4-1994
  EPA 200.8 Rev. 5.4-1994
  EPA 245.1 Rev. 3.0-1994
- Except as qualified, Safe Drinking Water Act sample analyses are consistent with methodology requirements in 40 CFR Part 141.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.

1	The holding time for EPA Method 218.6 is 24 hours. Per 40 CFR Part 136, EPA Method 218.6 allows a 28-day holding time if samples are preserved to pH 9.3 to 9.7 with ammonium sulfate buffer upon collection. This sample had a pH outside of this range upon receipt and was analyzed after the 24-hour holding time had expired

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

					Laboratory Duplicate (DUP) Report

TY2309792-001	Anonymous	Cyanide, free	----	E339	0.0050	mg/L	<0.0050	<0.0050	0	Diff <2x LOR	----

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Cyanides (QCLot: 1167381)						
Cyanide, free	----	E339	0.002	mg/L	<0.0020	----

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Cyanide, free	----	E339	0.002	mg/L	0.125 mg/L	99.8	80.0	120	----

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Calibration Curve Relative Error Evaluation - Inorganics

Method:	420.1 PHENOLICS
Run Number:	819319
Instrument:	K-UV-VIS-06
Date:	10/04/23

Instructions:

1) Enter slope (a) and intercept (b) from calibration raw data.
2) Enter calibration true values (do not include the origin (0,0) as a clibration point).
3) Enter the measured response for each calibration point.
4) If different than ±10%, update the %RE criteria to the method's CCV criteria.
   (Note that the low point criteria is ± 50% for all methods)
5) Reject the calibration if any standard point "Fail".

Y = aX + b

Appendix from EXT-3510
For Extracting 8270/**625.1** Mod in water by
EPA Method 3510C

Procedure:

1. Rinse all glassware prior to extraction with DCM. Let samples, surrogates and spikes warm to room temperature
2. Mark the meniscus of the sample on the sample container for determination of sample volume. Check container number and sample ID.
3. Add DI water for LCS/DLCS and MB corresponding to the largest volume of bottle size (250 mL for 250 mL amber bottle). Check the SR for any detection limit requirements needed due to volume size*.
4. Add surrogate and matrix spikes. (Must be in-bottle spiking)
5. Pour entire contents of the sample bottle into the appropriate sized separatory funnel then rinse the bottle one time with 30 mL of DCM (60 mL if at least 500 mL sample volume is used).
   **If the sample contains a small amount of material, shake the sample to mix the material into the sample and pour/analyze the entire sample. If the amount of material is enough to interfere with sample extraction, the Project Chemist should be notified to determine the procedure to be used.*
6. Add the bottle rinse to the corresponding separatory funnel.
7. Check the pH with pH paper and adjust to a pH of ≤2 with 1:1 H_2SO_4. Use narrow range pH strips.
8. Secure cap to the separatory funnel and begin shaking, for 2 minutes, ensuring to vent.
   **DCM creates excessive pressure very rapidly; therefore, initial venting should be done immediately after the separatory funnel has been sealed and inverted once.*
9. Remove cap and allow the organic layer to separate from the water phase.
10. Once the organic layer has separated from the water phase, drain the DCM portion into a clean 125mL Erlenmeyer flask (or 250 mL flask for a large volume extraction) labeled A.
11. Repeat the extraction and drain steps two more times with 30 mL of DCM being added directly to the separatory funnel each time (60 mL of DCM for a large volume extraction).
12. Store extracts in the refrigerator.
13. Adjust the pH between 11 and 13 with 1:1 NaOH. Use narrow range pH strips. Allow the sample to rest for 25 minutes after adjusting the pH.
14. Repeat steps extraction three times at pH 11-13, using 30 mL of DCM each time (60 mL of DCM for a large volume extraction). Collect each fraction in a second set of 125mL Erlenmeyer flasks (or 250 mL flask for a large volume extraction) labeled B and store extracts in the refrigerator.

Finishing:

15. Prepare a DCM-rinsed KD apparatus with a modified funnel (set up with a plug of glass wool and a layer of Na_2SO_4). Pour the sample through the modified funnel (always pour the primary pH fraction first), rinsing each flask three times and adding the rinsate to the modified funnel. After both pH fractions have been added to the modified/KD apparatus, rinse the sulfate down with DCM and apply vacuum to complete the transfer.
16. Concentrate the extracts on an S-EVAP with the water bath temperature set at 70-75°C, recording temperature. When the solvent level has concentrated enough to be able to remove the collector, remove the KD from the S-Evap. Make sure to not evaporate the extracts too low or to dryness.
17. Move the collectors containing the extracts to the N-EVAP and concentrate to <1mL, using a gentle stream of nitrogen. Use caution to ensure that you do not concentrate the extracts too low or to dryness.
18. Bring to a 1mL F.V. in DCM, placing it in a labeled, clear 2mL autosampler vial. Deliver the extracts to the instrument lab.
19. Complete all necessary paperwork for review.
