## **Abstract**

The Washington State Department of Ecology (Ecology) collected monthly water quality data at 118 stream monitoring stations during Water Year (WY) 2007 (October 1, 2006 through September 30, 2007). We also collected 30-minute interval temperature data at 54 sites, mostly from July through September 2007. The principal goals of this ongoing monitoring program are to characterize the rivers and streams of Washington State and to track changes in water quality.

This report documents methods and data quality, and presents the data for WY 2007. A description of Ecology's long-term monitoring program and access to historical data can be found on Ecology's Internet web site at [www.ecy.wa.gov](http://www.ecy.wa.gov) by clicking on "Environmental Assessment," "Long-term Monitoring," and then "River and Stream Water Quality."

Most quality control results were within the limits specified in our Quality Assurance Management Plan and were consistent with findings in previous years. Except where noted otherwise, data collected in WY 2007 by Ecology's River and Stream Monitoring Program can be used without qualification.

## Acknowledgments

Many Ecology staff contributed time, effort, and expertise to the Water Year 2007 program.

- Casey Clishe, Chris Coffin, Jim Garner, Craig Homan, Jason Myers, Jim Ross, and Bill Ward collected samples. These guys spent long hours behind the wheel in all kinds of weather, traffic, and road conditions. Without their dedication, Appendix D would be much longer.
- Jason Myers spent hours standing before the buret titrating dissolved oxygen samples for our holding time experiment.
- Bill Ward was responsible for the continuous stream temperature monitoring project.
- Brad Hopkins and Will Kendra reviewed the draft report.
- Cindy Cook and Joan LeTourneau formatted and edited the final report.

Staff at Ecology's Manchester Environmental Laboratory:

- Deborah Case, Pam Covey, and Nancy Jensen performed sample tracking services. Pam retired at the end of this water year—she will be missed.
- Michelle Aylward, Daniel Baker, Kamilee Ginder, Katie Curl, Aileen Richmond, Kari Rolnick, and Rebecca Wood performed general chemistry analyses.
- Nancy Jensen, Sally Cull, and Susan Carrell were responsible for the microbiology.
- Sally Cull, Meredith Jones, Dean Momohara, and Sara Sekerak worked on low-level metals.
- Leon Weiks, Sally Cull, and Dean Momohara provided sample container supplies and transport services.

# Introduction

The Washington State Department of Ecology (Ecology) and its predecessor agency have operated a long-term ambient water quality monitoring program since 1959. The basic program consists of monthly water quality monitoring for conventional characteristics at 62 long-term stations and 20 basin (rotating) stations on rivers and streams throughout Washington State.

In Water Year 2007, we monitored 36 additional stations associated with special project: 23 in the Eastern Region, 4 in the Northwest Region, 1 in the Central Region, and 8 in the Southwest Region.

- Twelve of these stations were associated with the “Intensively Monitored Watersheds” project (see [www.ecy.wa.gov/programs/eap/imw](http://www.ecy.wa.gov/programs/eap/imw)).
- Fourteen special projects stations were designed to evaluate water quality conditions in Snake River tributaries.
- Six stations were added as part of a larger Spokane River study.
- Three supported a Total Maximum Daily Load (TMDL) study in the South Fork of the Palouse River.
- One evaluated fecal coliform bacteria concentrations entering the state in the Palouse River.
- One was added to assess the feasibility of moving the Wenatchee River station upstream to Sleepy Hollow.

We also collected 30-minute interval temperature data from about July through September 2007 at many long-term and a few basin stations, as well as conducted bi-monthly metals monitoring at selected stations.

The primary goals of the *River and Stream Ambient Monitoring Program* are to characterize water quality and to evaluate spatial and temporal changes in water quality (trends).

Within Ecology, data generated by ambient monitoring are used to:

- Determine if designated uses are supported (e.g., [www.ecy.wa.gov/programs/wq/303d/2002/2002-index.html](http://www.ecy.wa.gov/programs/wq/303d/2002/2002-index.html)).
- Identify trends in water quality characteristics (e.g., Hallock, 2005).
- Refine and verify TMDL models.
- Develop water quality based permits.
- Provide water quality information necessary to prioritize grant awards.
- Conduct miscellaneous site-specific evaluations (e.g., Hallock, 2004).

Our data are provided free to the public and are widely used by academics, consultants, local government entities, schools, and others interested in the quality of Washington’s flowing waters.

The purpose of this report is to describe the WY 2007 monitoring program, discuss data quality, and present results. More detailed analyses and interpretations of ambient monitoring data are reported elsewhere.

A generalized assessment of water quality at particular stations is provided online ([www.ecy.wa.gov/programs/eap/fw\\_riv/rv\\_main.html](http://www.ecy.wa.gov/programs/eap/fw_riv/rv_main.html)) in the form of a water quality index (WQI; Hallock, 2002). The WQI and trends at long-term stations are reported in *Washington State Water Quality Conditions in 2005 Based on Data from the Freshwater Monitoring Unit* (Hallock, 2005).

Other Ecology programs conduct their own analyses. For example, Ecology's Water Quality Program applies its own data reduction procedures prior to producing Washington State's Water Quality Assessment [303(d) & 305(b) Report] ([www.ecy.wa.gov/programs/wq/303d/2002/2002-index.html](http://www.ecy.wa.gov/programs/wq/303d/2002/2002-index.html)).

# Methods

## Sampling network

The ambient monitoring network in WY 2007 consisted of monthly water collection at 62 long-term stations, 20 regional ("basin") stations, and 36 special project stations (Table 1 and Appendix A). All 118 stations were sampled year-round except three special project stations on the Palouse River that were dropped after April 2007, and six special project stations on the Spokane River that were not established until June 2007.

- Long-term stations are monitored every year to track water quality changes over time (trends), assess inter-annual variability, and collect current water quality information. These stations are generally located near the mouths of major rivers, below major population centers, where major streams enter the state, or upstream from most anthropogenic (human-caused) sources of water quality problems.
- Basin stations are generally monitored for one year only (although they may be re-visited every five years) to collect current water quality information. These stations are selected to support the waste discharge permitting process, TMDL assessments, and site-specific needs, and to allow expanded coverage over a long-term network. Some basin stations are selected to target known problems and may not necessarily reflect conditions representative of the basin.
- Special project stations are typically sampled to address a particular question, and they are usually supported by funding external to the ambient monitoring program. Special project stations will not necessarily represent typical water quality conditions.

The locations of ambient stations monitored during WY 2007 are presented in Table 1. Appendix A lists current and historical monitoring locations and the years they were monitored by Ecology and its predecessor agency. Historical data for these stations are available from the ambient monitoring program on request. Also, a description of our long-term monitoring program, access to historical data, and previous annual reports can be found on Ecology's internet web site at [www.ecy.wa.gov](http://www.ecy.wa.gov) under the "Environmental Assessment" program, "Long-term Monitoring," and "River and Stream Water Quality."

## Sample collection and analysis

We collected samples from the majority of stations (86) as single, near-surface grab samples from highway bridges. The rest of the stations were sampled from the bank, off of footbridges, or from culverts. (Sampling locations are identified on our web site.)

Twelve water quality characteristics were monitored at all stations monthly in WY 2007 (Table 2).

Table 2. Water quality characteristics monitored in Water Year 2007.

Characteristic	Method	Reporting Limit
ammonia, total	SM 4500 NH3H	0.01 mg/L
conductivity	SM 2510 B	NA
fecal coliform bacteria	SM 9222 D	1 colony/100 mL
metals: mercury	EPA 245.7	0.002 µg/L
metals: other	EPA 200.8	various
nitrate + nitrite, total	SM 4500 NO3I	0.01 mg/L
nitrogen, total	SM 4500 NB	0.025 mg/L
oxygen, dissolved	SM 4500 OC	NA
pH	EPA 150.1	NA
phosphorus, soluble reactive	SM 4500 PG	0.003 mg/L
phosphorus, total	EPA 200.8 M	0.001 mg/L
suspended solids, total	SM 2540 D	1 mg/L
temperature	Thermistor	NA
turbidity	SM 2130	0.5 NTU

(SM = APHA, 1998; EPA = U.S. Environmental Protection Agency, 1983).

Besides the 12 water quality characteristics, we also record barometric pressure (to calculate percent oxygen saturation) and stream height measurements, where necessary, to enable flow determination for most long-term stations and many basin stations. Sample collection and analytical methods are described in an earlier annual report (Hallock et al., 1998), our field monitoring protocols (Ward et al., 2001), standard operating procedures (Ward, 2007), ambient monitoring quality assurance documents (Hallock and Ehinger, 2003, Hallock, 2007a, and Hopkins, 1996), and Manchester Environmental Laboratory *Lab User's Manual* (Ecology, 2005).

All long-term monitoring programs experience changes in sampling or analytical procedures that can potentially affect results. Normally, changes will result in improved precision or reduced bias. Most changes will have only a minor effect on a synoptic analysis of the data, but even minor improvements in procedures should be considered when evaluating long-term trends.

We made no substantive changes to collection, analytical, or quality control procedures in WY 2007. However, at the end of the WY (beginning October 1, 2007), we changed total phosphorus analytical methods from EPA200.8M (ICP-MS) to SM4500PH (colorimetric with

manual digestion). We made this change because we discovered that at turbidities greater than 4 NTUs, the ICP method is biased low compared to the colorimetric method (Hallock, 2007b).

All known and suspected changes to methods and procedures during the history of the stream monitoring program, as well as large-scale environmental changes that may affect a trend analysis, are documented in Appendix B.

## Continuous temperature monitoring

Ecology's Freshwater Monitoring Unit collects temperature data at 30-minute intervals at many of our long-term and some current basin ambient monitoring stations as well as at some special request stations. Temperature loggers were deployed at 57 sites in 2007, and data were successfully retrieved from 54 sites. The purpose of this monitoring effort is to collect summer, diel (24-hour) temperature data that may be used for trend analyses and to determine compliance with water quality standards.

Two Onset Stow Away TidbiT® temperature loggers were deployed at each site, one in water and one in air. All loggers were shaded with a PVC pipe and installed in a location representative of the surrounding environment. Stream temperature loggers were installed about six inches off the stream bottom to minimize potential influence from groundwater inflow. Loggers were placed in a free flowing location at a depth to avoid exposure to air resulting from low flows.

We deployed the loggers mostly in July and retrieved them in September. Detailed protocols are found in Ward (2003), and quality control requirements are found in Ward (2005).

## Metals monitoring

Metals monitoring continued in WY 2007 at 12 stations (Table 3). Metals samples were collected every other month beginning in October 2006 (except for 4 missed samples). Samples were analyzed for hardness, total mercury, and total recoverable and dissolved arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc. Collection and analytical methods are discussed in more detail in Hopkins (1996).

We selected stations for metals monitoring based on known problem areas (Spokane River) and where we have little current data.

## Quality assurance

Ecology's Manchester Environmental Laboratory (MEL) Quality Assurance (QA) Program includes the use of quality control (QC) charts, check standards, in-house matrix spikes, and laboratory blanks, along with performance evaluation samples. For a more complete discussion of laboratory QA, see MEL's *Quality Assurance Manual* (Ecology, 2001) and the *Lab User's Manual* (Ecology, 2005).

The QA program for field sampling consisted of three parts: (1) adherence to standard operating procedures for sample/data collection and periodic evaluation of sampling personnel, (2) consistent instrument calibration methods and schedules, and (3) the collection of field QC samples during each sampling run. Our QA program is described in detail in Hallock and Ehinger (2003).

Three types of field QC samples were collected.

1. *Duplicate (Sequential) Field Samples* - These consisted of an additional sample collection made approximately 15-20 minutes after the initial collection at a station. These samples represent the total variability due to short-term, instream dynamics, sample collection and processing, and laboratory analysis.
2. *Duplicate (Split) Field Samples* - These consisted of one sample (usually the duplicate sequential sample) split into two containers that are processed as individual samples. This eliminates the instream variability; remaining variability is attributable to field processing and laboratory analysis.
3. *Field Blank Samples* - These consisted of the submission and analysis of deionized water. These are field process blanks: the blank water was poured into cleaned sample collection equipment to simulate collecting a water sample. The expected value for each analysis is the reporting limit for that analysis. Significantly higher results would indicate that sample contamination had occurred during field processing or during laboratory analysis.

QC samples were submitted semi-blind to the laboratory. They were identified as QC samples, but sample type (duplicate, split, or blank) and station were not identified.

Altogether, 137 field QC samples were processed: 11 field blanks, 63 field duplicates (sequential), and 63 field split samples. In addition, the laboratory conducted its own splits of some field QC samples. The central tendency of the variance of pairs of split field samples was summarized by calculating the square root of the mean of the sample-pair variances (root-mean-square - RMS). These figures provide an unbiased (and higher) estimate than other commonly used statistics (for example, mean or median of the standard deviations).

A two-tiered system was used to evaluate data quality of individual results based on field QC. The first tier consisted of four automated checks: holding time, variability in field duplicates, reasonableness of the result, and the balance of nutrient species. Results exceeding pre-set limits were flagged. The second tier QC evaluation was a manual review of the data flagged in the first tier. Data were then coded from 1 through 9 (1 = data meets all QA requirements, 9 = data are

unusable). Criteria for assigning codes are discussed in more detail in Hallock and Ehinger (2003). We do not routinely use or distribute data with quality codes greater than 4.

Finally, data management includes verification at several stages:

- Field data entry is verified quarterly by comparing field data forms to printouts from the database.
- At the end of the WY, data in Ecology's Environmental Information Management system (EIM) and in the database used for our web presentation are compared to the primary database.
- Plots of flow vs. stage height are visually checked for anomalies.

Flows were plotted against stage for all stations with stage data, and the plots were visually inspected for outliers. For flows determined independent of stage records, this method confirms the flow. (Most flows are derived from continuous recorders and based on date and time, not our stage measurements.) For flows based on our stage, this method confirms that the flow was correctly determined from the flow curve, but can't ensure that stage was correctly recorded.

## Dissolved oxygen procedures

For oxygen determination, we use the azide-modified Winkler method, the most precise and reliable titrimetric method (SM 4500 OC; APHA 1998). We do not use calibrated sensors like the Clark-cell probe because most of our samples in a given day are collected at different elevations, which can be problematic for accurate oxygen determination by Clark-cell probe unless the probe is recalibrated at each station. Ward (2007) documents our sample collection and analysis procedures in detail.

APHA (1998) specifies that samples should be titrated within a few to eight hours after adding acid. There are, however, arguments for holding samples before adding acid. Acid oxidizes organic matter (APHA, 1998) and re-suspends the bound iodine, which can result in its loss through the glass stopper during elevation and temperature changes (Mountford, 1969). Both of these effects can cause negative errors. Also, we don't want to carry concentrated sulfuric acid in our sampling vans, nor to process samples in the field. Therefore, we have modified our analytical procedures from APHA by holding the samples in the dark for up to three days before adding acid and titrating.

Some years ago, we tested the effect of holding samples (Rushing, 1990), and we recently conducted a similar experiment. Results from both studies are reported here.

Rushing (1990) analyzed three treatments, two from the Deschutes River (one acidified upon collection and one prior to titration) and aerated tap water acidified prior to titration (Table 4). Rushing collected samples using our standard procedures, and she analyzed samples in triplicate after four different holding times.

Table 4. Study design for evaluating the effect of holding time on dissolved oxygen results.

Treatment	Source	Acidification	Holding times (hours)
A	Deschutes River	At collection	<2, 8, 24, 72
B	Deschutes River	Prior to titration	<2, 8, 24, 72
C	Tap Water	Prior to titration	<2, 8, 24, 72

In our more recent study, we collected 40 samples each from two sites, the Deschutes River at Military Road and Woodard Creek at 28<sup>th</sup> Lane. We expected the Deschutes site to have relatively low biological oxygen demand (BOD) and high saturation, and the Woodard Creek site to have low saturation and high BOD. We collected samples from the bank, in accordance with Ward (2007).

We randomly assigned the 40 samples to one of four treatments, each with 10 replicates. We added acid to half the samples from each site upon collection; for the other half, acid was added just prior to titration in accordance with Ward (2007). We titrated half the samples immediately upon returning to the lab. We titrated all remaining samples after three days. The four treatments, then, were:

- Acid added in the field, titrated immediately.
- Acid added in the field, titrated after three days.
- Acid added prior to titration, titrated immediately.
- Acid added prior to titration, titrated after three days.

### Continuous temperature monitoring

The quality of the continuous temperature data was assessed by calibration checks using a certified reference thermometer before and after a deployment. If a pre-survey calibration check indicated a logger's accuracy was not within the required limits (either 0.2 °C for water or 0.4 °C for air) when compared to a certified reference thermometer, the logger was rejected and not deployed (Ward, 2005). If a logger failed a post-survey calibration check, the results may be rejected or, if the bias is small and consistent (i.e., the pre-deployment bias was just within the required limits and in the same direction), results may be adjusted.

In addition, the data were compared to field temperature measurements taken at deployment and retrieval with a calibrated alcohol thermometer. Results were also compared to the monthly measurements collected during normal monitoring surveys. All data were reviewed graphically and anomalies were deleted prior to finalizing results in the database.

# Results and Discussion

The primary purpose of this report is to present the results of Ecology's stream monitoring in WY 2007. The body of the report describes the sampling program and interprets QC results. Appendix C contains results for each station monitored in WY 2007. Raw data are available in computer formats on request and are posted on Ecology's website ([www.ecy.wa.gov](http://www.ecy.wa.gov)). Unpublished data are also available online but are considered "preliminary."

## Monthly ambient monitoring

A station-by-station data analysis is not within the scope of this report. Individual results not meeting the 1997 water quality criteria in Washington's Water Quality Standards (Washington Administrative Code, Chapter 173-201A), excluding unionized ammonia, are identified in reports on our web site ([www.ecy.wa.gov/apps/watersheds/riv/exceed](http://www.ecy.wa.gov/apps/watersheds/riv/exceed)). The unionized ammonia criteria are complicated to determine and are rarely exceeded. In WY 2007, only Bonaparte Creek, at stations both at and above Tonasket, exceeded the chronic criteria (both stations on February 12, 2007).

Effective December 20, 2006, Ecology adopted an aquatic life system for classifying the state's waterbodies, dropping the AA, A, B, and C system in the 1997 standards (Ecology, 2006). Some of the numeric criteria from the new 2006 Water Quality Standards are listed in Tables 5 and 6. Our web presentation still uses the 1997 system. In any case, the ambient monitoring program's comparison of results to water quality criteria is not a formal determination of water quality *violations*. A determination of violations requires additional considerations such as human impact or multiple results not meeting a criterion, and in some cases requires continuous data (see [www.ecy.wa.gov/programs/wq/303d/2006/policy1-11\\_rev.html](http://www.ecy.wa.gov/programs/wq/303d/2006/policy1-11_rev.html)).

Table 5. Water quality criteria in the 2006 water quality standards associated with aquatic life uses. <sup>a</sup> Results outside the ranges indicated do not meet the criterion.

Aquatic Life Use	Temperature (7DADM) <sup>b</sup>	Oxygen (1-day minimum)	pH
Char spawning	<=9°C	--	--
Char spawning and rearing	<=12°C	>9.5 mg/L	6.5<=pH<=8.5
Salmon and trout spawning	<=13°C	--	--
Core summer salmonid habitat	<=16°C	>9.5 mg/L	6.5<=pH<=8.5
Salmonid spawning rearing and migration	<=17.5°C	>8.0 mg/L	6.5<=pH<=8.5
Salmonid rearing and migration only	<=17.5°C	>6.5 mg/L	6.5<=pH<=8.5
Non-anadromous interior redband trout	<=18°C	>8.0 mg/L	6.5<=pH<=8.5
Indigenous warm water species	<=20°C	>6.5 mg/L	6.5<=pH<=8.5

<sup>a</sup> WAC 173-201A-602 (2006) identifies use designations for waterbodies and some exceptions to the standard criteria listed above. Metals criteria, most of which are a function of hardness, are not listed here.

<sup>b</sup> 7DADM = seven day average of the daily maximum temperature. Some of the temperature criteria only apply during specified seasons.

Table 6. Water quality criteria in the 2006 water quality standards associated with contact recreation. <sup>a</sup> Results outside the ranges indicated do not meet the criterion.

Recreation Use	Fecal Coliform Bacteria	
	10 Percent	Geometric Mean
Extraordinary primary contact recreation	<=100	<=50
Primary contact recreation	<=200	<=100
Secondary contact recreation	<=400	<=200

<sup>a</sup> WAC 173-201A-602 (2006) identifies use designations for waterbodies.

Of the 16,000 possible standard water quality results in WY 2007, 541 results (3.4 percent) were missed. Most of these (468) were missed because the station was inaccessible, frozen, or dry. Other reasons for missing results include sampler error (16) and equipment problems (56). We seemed to have particular trouble with pH cables in WY 2007 (this will be discussed at a future Freshwater Technical Coordination Team meeting). Appendix D gives more detailed explanations for each missed sample.

Instantaneous discharge was recorded at all of the 62 long-term stations. On 12 occasions at various long-term stations, flows were either not available or could not be determined because the sampler didn't record the stream height. Flows at Nisqually River at Nisqually (11A070) are coded as estimates because the nearest gage was a considerable distance upstream.

Discharge was recorded at 29 of the 56 basin and special stations.

## Continuous temperature monitoring

Fifty-four stations were successfully monitored in 2007 (Table 7). One logger was not retrieved (from the upper Yakima River due to ice). We hope to be able to retrieve this logger when flows drop. The logger from the Kettle River near Barstow was lost, presumably due to vandalism.

Table 7. Temperature monitoring summary for Water Year 2007 based on 30-minute interval measurements (°C; refer to Table 1 for station names). Deployment maximum results exceeding 1997 criteria, and 7DADM results exceeding 2006 criteria (excluding special seasonal criteria), are shown in bold.

<sup>a</sup> This is the seven-day period with the highest average of daily maximum temperatures.

<sup>b</sup> There may be other dates or other seven-day periods with the same maximum.

<sup>c</sup> Date shown is middle of seven-day period.

The seasonal maximum at most stations (45 stations; 83 percent) failed to meet 1997 water quality criteria. Likewise, the 7DADM failed to meet the basic 2006 criteria at most stations (47 stations; 87 percent). High though these percentages are, they are lower than we measured last year.

The four stations with the warmest seasonal water temperatures were:

- Alkali Flat Cr nr Mouth, 35U070, 33.1 °C.
- Palouse R @ Palouse, 34A170, 29.5 °C.
- Foster Cr @ Mouth, 50B070, 29.4 °C.
- Walla Walla R nr Touchet, 32A070, 29.3 °C.

## Metals monitoring

Of the 1,224 possible metals results (12 stations x 6 months x 17 analytes), 68 results were missed during the WY. One station, Columbia River at Grand Coulee, was not established as a metals station until after December's samples had been collected. One sample each was missed at the Willapa River (sampler error) and the Little Klickitat River (no access). Of the 612 dissolved metals and total mercury results reported, 6 (1.0 percent) exceeded 2006 Washington State water quality standards chronic criteria; all of those were from the Spokane River at Stateline (Table 8).

Table 8. Metals results from Water Year 2007 exceeding the 2006 water quality standards chronic criteria.

Station	Name	Date	Metal	Criterion (µg/L)	Hardness (mg/L)	Result (µg/L)	Percent Over Criterion
57A150	Spokane R @ Stateline Br	10/03/2006	Zinc, Dissolved	28.7	21	36.0	25%
57A150	Spokane R @ Stateline Br	12/05/2006	Zinc, Dissolved	28.3	21	56.9	101%
57A150	Spokane R @ Stateline Br	04/03/2007	Lead, Dissolved	0.50	23	0.98	98%
57A150	Spokane R @ Stateline Br	04/03/2007	Zinc, Dissolved	30.2	23	66.4	120%
57A150	Spokane R @ Stateline Br	06/06/2007	Lead, Dissolved	0.40	19	1.33	229%
57A150	Spokane R @ Stateline Br	06/06/2007	Zinc, Dissolved	25.9	19	66.9	158%

## Quality assurance

In 2007 we collected more than 17,000 non-QC water quality results, including metals and various other characteristics collected in addition to the standard 12 listed under “Sample Collection and Analysis.”

- Forty-one results (0.2 percent) were coded “4” indicating that the data are usable, but there were questions about the quality. These were all nutrients where the result for the total fraction was less than the dissolved fraction by a sufficiently large margin to render one or both results questionable.
- Of the 55 results (0.3 percent) coded “5” or greater (indicating serious data quality questions; these data will not be routinely used), all but four were pH. The pH results were coded as having poor quality because of misbehaving equipment and, in some cases, sampler error in failing to repair it. Results coded >4 are not normally used but are provided on request. This practice gives us the opportunity to explain quality issues to prospective users.

MEL assigned a qualifier to 14 percent of results. A total of 421 results (2.5 percent) were qualified as estimates (“J”), 1,920 results (11.2 percent) as below the reporting limit (“U”), and 18 results (0.1 percent) were coded for both reasons (“UJ”). Seventy-four percent of all ammonia results were below the reporting limit, as were 11 percent of orthophosphate results (Table 9).

Table 9. Results qualified by Manchester Environmental Laboratory as being below the reporting limit.

Analyte	Reporting Limit (mg/L except NTU for turbidity)	Number of results coded U or UJ	Number of results recorded	Percent of results coded U or UJ
ammonia	0.01 (mostly)	954	1281	74.5%
fecal coliform	1	96	1285	7.5%
metals	Various	483	884	54.6%
nitrate+nitrite	0.01	84	1281	6.6%
nitrogen, total	0.025	6	1281	0.5%
organic carbon, dissolved	1	15	98	15.3%
organic carbon, total	1	32	198	16.2%
orthophosphate	0.003	140	1281	10.9%
phosphorus, total	0.001	3	1281	0.2%
solids, total non-volatile	1	2	4	50.0%
suspended sediment concentrations	1	5	9	55.6%
suspended solids	1 (mostly)	83	1302	6.4%
turbidity	0.5	35	1281	2.7%

Data verification identified 46 instances where results in EIM were different than results in our primary database. These were due to corrections to a temperature calibration that were made in the primary database and not in EIM. In addition, 34 results did not get loaded into EIM, probably because these results were awaiting verification of automated QC checks which would

have prevented them from loading with the rest of the data for the month. These data have since been loaded.

There were no instances where results in the web database differed from those in our primary database. However, in the fall of 2007 I retroactively changed the total phosphorus method in our primary database for WYs 2003 to 2006 from "TP\_P" to "TP\_P\_ICP" to highlight the ICP-MS method used during that period. This change was not made to the web database until January 2008.

## Comparison to quality control requirements

### Decision Quality Objectives

Decision Quality Objectives (DQOs) are based on RMS values by concentration range (Table 10). In practice, estimates of variability are strongly influenced by extreme values, especially when the sample size is small. Also, the variability estimate is skewed downward for the lowest concentration ranges because data below the reporting limit are censored and have a variance of zero for sample pairs below this limit.

Table 10. Root mean square (RMS) of the standard deviation of sequential samples, field splits, and laboratory splits. Results exceeding QAMP DQO criteria (Hallock and Ehinger, 2003) are shown in bold.

Characteristic (units)	Range	S <sub>error</sub> (mp) <sup>a</sup>	Field Sequential RMS	n	Field Split RMS	n	Lab Split RMS	n
Specific conductance ( $\mu\text{S}/\text{cm}$ )	$\leq 50$	4.4	0.41	9	NA	0	No lab splits	
	>50-100	8.8	0.64	22	0.00	1		
	>100-150	13.2	0.91	6	0.71	1		
	>150	26.4	1.11	24	0.87	17		
Fecal coliform bacteria (colonies /100 mL)	1-1000	88	39	60	No field splits	6.78 100	191 2	
	>1000	176	<b>185</b>	2				
NH <sub>3</sub> -N ( $\mu\text{g N/L}$ ) (all stations)	$\leq 20$	1.76	<b>2.33</b>	51	0.39	50	0.25	66
	>20-100	8.8	<b>14.9</b>	9	2.18	10	1.02	13
	>100	17.6	<b>78.1</b>	2	<b>75.7</b>	2	1.12	2
NH <sub>3</sub> -N ( $\mu\text{g N/L}$ ) (long-term and basin stations)	$\leq 20$	1.76	1.41	38	0.26	38	0.175	49

<sup>a</sup> Maximum permissible standard deviation to meet Quality Assurance Monitoring Plan (QAMP) data quality objectives (DQO) (Hallock and Ehinger, 2003).

n = number of sample pairs.

NA = not applicable.

In general, variability of repeated measures followed the expected pattern of field sequential samples > field split samples > lab split samples. In a few cases, field sequential samples had less variability than the field splits. Usually, a single field split pair with poor precision was responsible.

Variability between paired samples as measured by RMS was generally low but higher than that reported in previous years. This may be because we sampled more small high-concentration streams this year (i.e., Snake River evaluations; see Table 1, status=S4). These streams may not be as well-mixed or may carry debris than can be collected in one sample and not in a replicate or split sample. I separated the ammonia results by station type to illustrate this point: variability of field splits was much worse at special project stations, except for one extremely bad split that was entirely responsible for the high mid-range RMS at long-term/basin stations. (Table 10).

Three field split characteristic/concentration ranges (out of 24 evaluated) failed our QAMP Data Quality Objectives (DQOs) (Hallock and Ehinger, 2003), which specifies that DQOs be evaluated against field splits, where possible. One of two upper-range ammonia split pairs had a particularly high variance. Two phosphorus split pairs had high variance, one in the mid-range and one in the upper range. A single sample (from Steptoe Cr @ Mouth) was responsible for two of the three ranges that failed criteria. This station was also responsible for a disproportionate amount of the variance in sequential samples.

Thirteen field sequential characteristic categories (out of 37) failed to meet the DQO criteria, but instream variability is included in these sample pairs so their variability is not a true measure of sampling plus analytical error. Most high RMSs occurred in the upper concentration range and can be attributed to one or two pairs with poor variance. The variability in sequential samples for total suspended solids concentrations was particularly high at higher concentrations; this underscores the inherent variability in measurements of stream sediment.

The criteria in Table 10 are based on desired trend power. (We want to be able to detect a twenty percent change over a ten-year period with 90 percent confidence). Characteristics that consistently do not meet the DQO criteria are unlikely to meet our goals for trend detection. The variability in most characteristics indicates equivalent or greater trend power than the goal specified in our QAMP (Hallock and Ehinger, 2003). Our ability to detect trends in total suspended solids, however, is likely to be worse than our goal.

## Measurement Quality Objectives

MQOs for accuracy are based on comparisons (usually against standards) during calibration checks (Hallock, 2007). Checks failing criteria cause an immediate corrective action, usually recalibration. Bias MQOs are evaluated at the laboratory based on spike recovery. Precision MQO evaluations are based on comparisons to average relative standard deviation (RSD) of field split pairs. Results of the precision MQO evaluations are presented in Table 11.

Table 11. Average relative standard deviation of replicate samples collected in Water Year 2007. *n* is the number of samples. Results exceeding QAMP MQO criteria (Hallock, 2007) are shown in bold.

Analyte (units)	Precision MQO (%)	Sequential Sample RSD (%)	<i>n</i>	Field Split RSD (%)	<i>n</i>
Specific conductance	10	0.4	61	0.2	19
Fecal coliform bacteria (>20 colonies /100 mL)	50% < 20 90% < 50	6 16	29	No field splits	
NH <sub>3</sub> -N	10	7	62	3	62
Nitrogen, total	10	5	62	3	62
NO <sub>3</sub> NO <sub>2</sub> -N	10	2	62	0.7	62
Oxygen, dissolved	10	2	62	No field splits	
pH	10	1	60	No field splits	
Phosphorus, soluble reactive	10	6	62	3	62
Phosphorus, total	10	7	63	6	62
Solids, suspended	15	<b>18</b>	61	No field splits	
Temperature	10	1	62	No field splits	
Turbidity	15	14	61	No field splits	

No field split samples exceeded MQO criteria. For sequential samples, only total suspended solids exceeded MQO criteria and that was by only three percentage points, an amount that could easily be attributable to instream variability.

## Blanks

Almost all results for analyses of blank samples were “below reporting limits,” and less than three  $\mu\text{S}$  (micro Siemens) for specific conductivity (Table 12). Temperature, dissolved oxygen, pH, and fecal coliform were not measured on blanks.

Table 12. Results of blind field process blank (deionized water) samples.

Analyte	Reporting Limit	Number Above Reporting Limit (concentration)	Sample Size, n
Metals ( $\mu\text{g/L}$ )	Various	3 (1 total recoverable nickel at 0.11; 2 dissolved zinc both at 3.4)	3 samples x 17 analytes
$\text{NH}_3\text{-N}$ ( $\mu\text{g/L}$ )	10	0	11
$\text{NO}_3/\text{NO}_2\text{-N}$ ( $\mu\text{g/L}$ )	10	0	11
Soluble reactive P ( $\mu\text{g/L}$ )	3	0	11
Specific conductivity ( $\mu\text{S}$ )	NA	NA (mean: 1.4; std dev: 0.9)	11
Suspended solids ( $\mu\text{g/L}$ )	1 and 2	0	7
Total nitrogen ( $\mu\text{g/L}$ )	25	0	11
Total phosphorus ( $\mu\text{g/L}$ )	1	1 (1 $\mu\text{g/L}$ )	11
Turbidity (NTU)	0.5	0	7

Few metals blanks are normally collected because many samples are below reporting limits anyway (Table 9). Protocols specify that four dissolved metals blank samples should be submitted annually, one from each run. In WY 2007, samplers collected a total recoverable blank, as well. One run did not collect a blank. Each of the samples was analyzed for 17 different metals. Three results exceeded reporting limits: one total recoverable nickel sample (reported concentration = 0.11  $\mu\text{g/L}$ , reporting limit = 0.1  $\mu\text{g/L}$ ), and two dissolved zinc samples (reported concentration both = 3.4  $\mu\text{g/L}$ , reporting limit = 1  $\mu\text{g/L}$ ).

Laboratory staff assessed the remaining elements of the laboratory QA program through a manual review of laboratory QC results including check standards, in-house matrix spikes, and laboratory blanks. Results were within acceptable ranges as defined by MEL’s *Quality Assurance Manual* (Ecology, 2001), or were either re-run or coded as determined by laboratory staff (e.g., as an estimate, “J”).

## Changes in the results of automated quality control checks over time

The ambient monitoring program has evaluated the four automated QC checks discussed in the Methods/Quality Assurance section of this report in a consistent manner for more than 15 years. The percent of results flagged by holding time, reasonableness of the result, and variability in field duplicates showed no obvious trends or patterns, except a slight decrease in variability about month 49 (October 1994; Figure 1, middle).

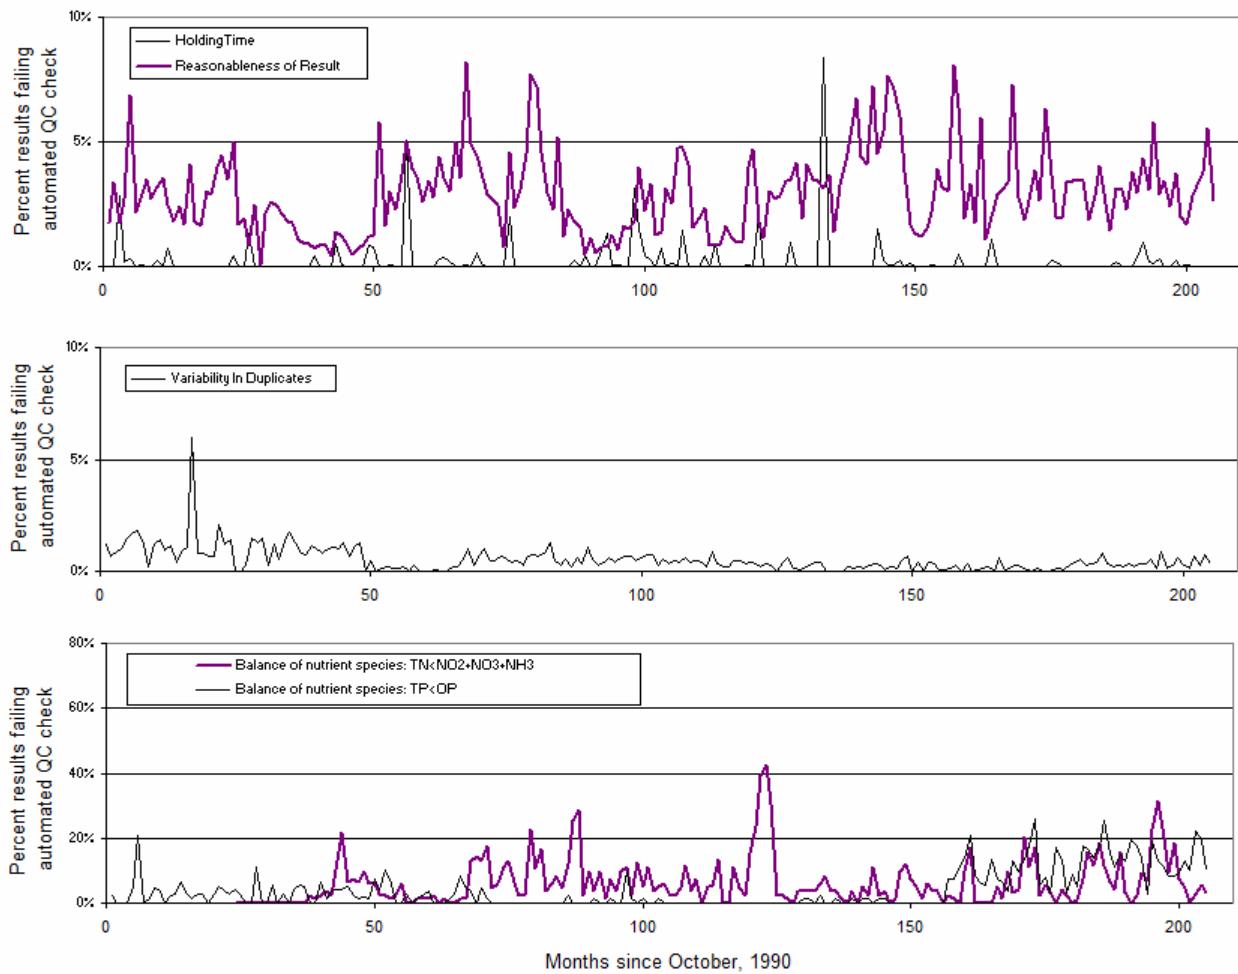

Figure 1. Percent of results each month flagged during automated quality control checks.

TN = total nitrogen, NO<sub>2</sub>+NO<sub>3</sub> = nitrate plus nitrite nitrogen, NH<sub>3</sub>=ammonia nitrogen,  
TP = total phosphorus, OP = orthophosphorus.

We didn't begin collecting TN regularly until month 37 (October 1993). The reason for the strong peak in the percent of TN exceeding NO<sub>2</sub>+NO<sub>3</sub>+NH<sub>3</sub> from months 119 to 124 (August 2000 to January 2001; Figure 1, bottom) is unknown; however, the reporting limit increased from 0.01 to 0.025 mg/L around this time.

Changes in the rate of occurrence of total phosphorus (TP) < orthophosphorus (OP) can be explained by changes in TP methods and reporting limits (Figure 1, bottom). Prior to month 157 (October 2003), the TP reporting limit was 0.01 mg/L and OP rarely exceeded TP. After month 157, the TP reporting limit changed to 0.001 mg/L due to a change in methods. With a higher OP reporting limit (0.003 mg/L) than TP, occasional occurrences of TP<OP are expected.

## Oxygen analysis modifications

In our earlier experiment (Rushing, 1990), there was no obvious effect of various holding times on oxygen concentration for samples that were acidified upon collection (Figure 2, Treatment A). For samples acidified before titration, relative to results obtained after <2 hours holding, Deschutes River water gained in concentration (an average of 0.14 mg/L over all holding times), while tap water lost concentration (an average of -0.19 mg/L over all holding times). In both cases, most of the gain or loss occurred in the first 8 hours, and all in the first 24.

I don't know why these two water types should behave differently. Unfortunately, percent saturation was not recorded, nor was water temperature. I also don't know whether the samples were analyzed randomly or whether each treatment was analyzed as a group. If the latter is the case, the differences observed could be due to titration errors.

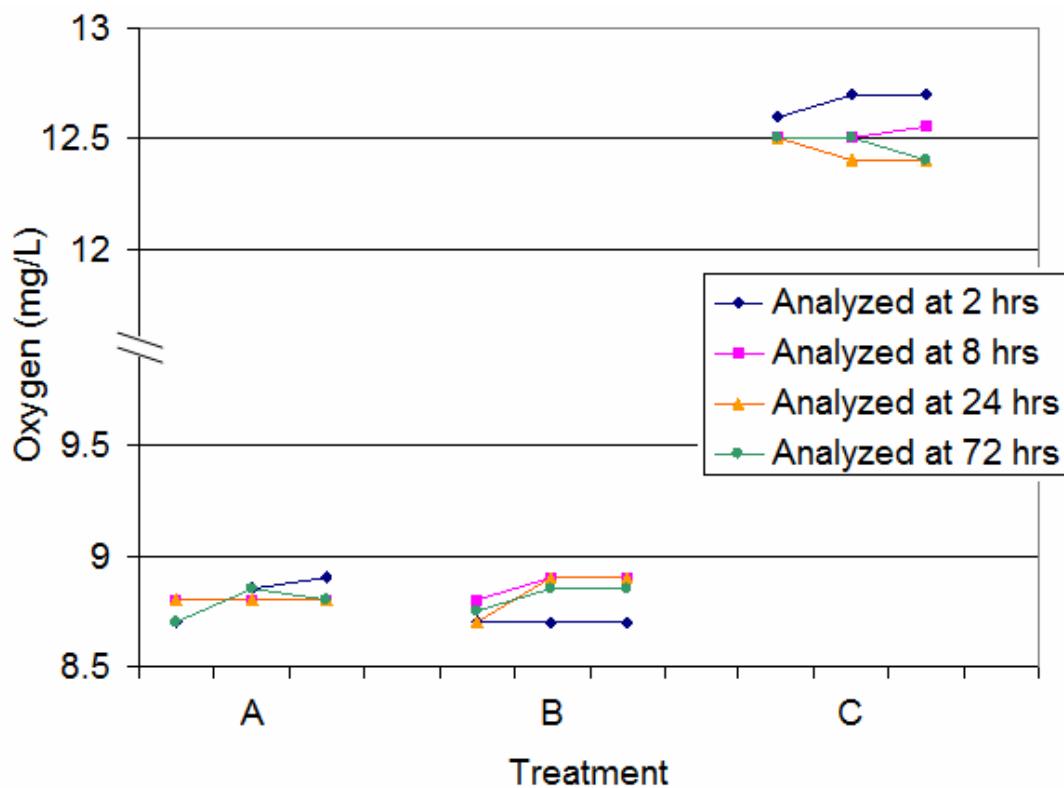

Figure 2. Oxygen concentrations from triplicate analyses after four different holding times. Treatment A=Deschutes River water, acidified at collection, B=Deschutes River water, acidified before titration, C=tap water, acidified before titration.

These unknowns are one reason we decided to re-run the experiment using two natural water sources, Woodard Creek and the Deschutes River. Woodard Creek samples were only half saturated ( $56\% \pm 0.04$  standard error), and replicates were strongly affected by time of collection, with concentrations increasing towards mid-day (Figure 3). To account for time of collection, results were modeled using the linear regression:

$$\text{Oxygen} = \text{constant} + \text{time of collection} + \text{held}$$

where "held" is a dummy variable to indicate whether samples were analyzed immediately (held=0) or after three days (held=1). The "held" coefficient, then, is the amount of oxygen gained or lost by delaying the titration.

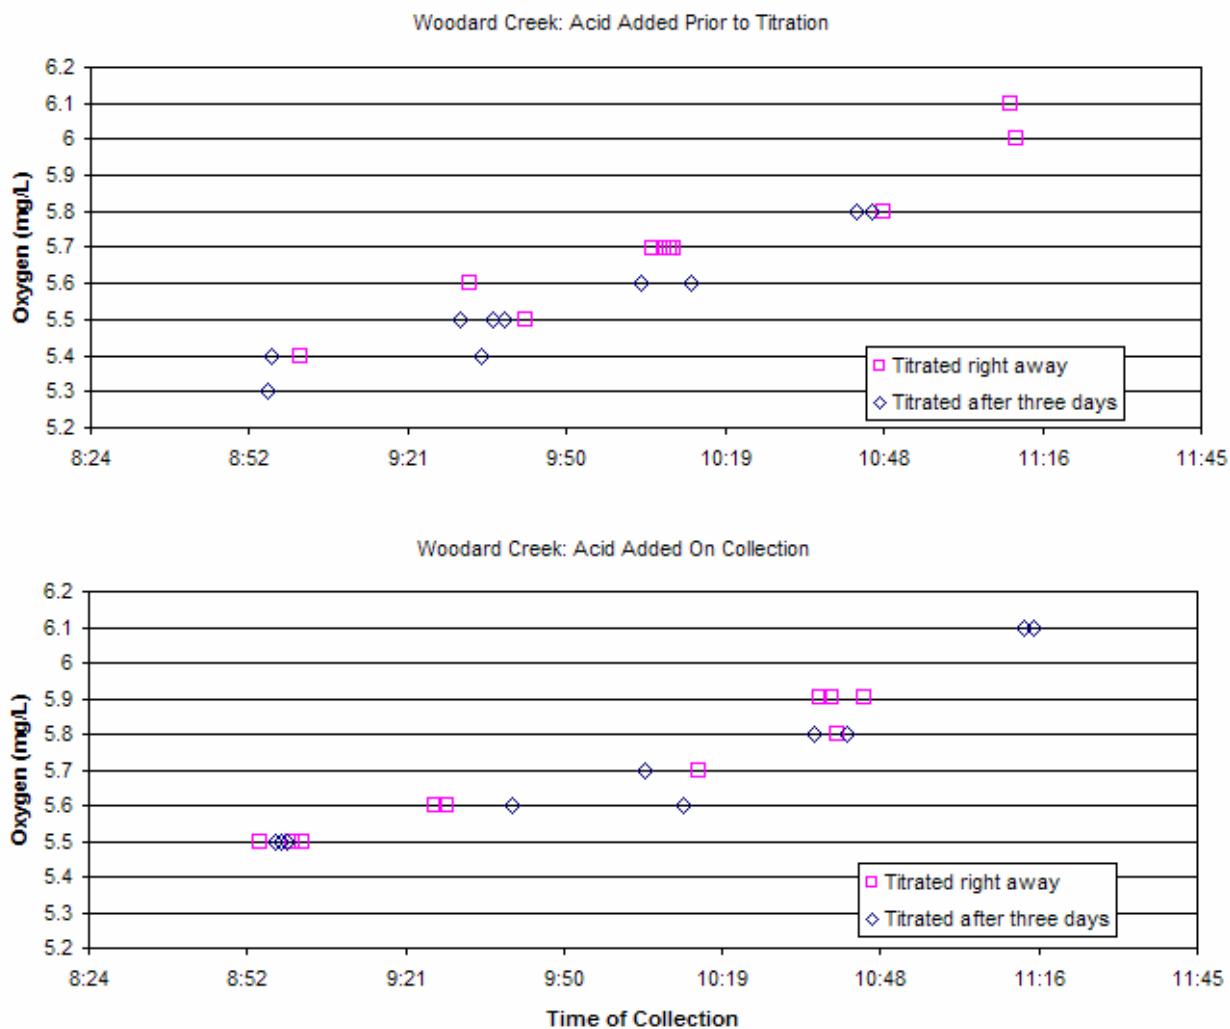

Figure 3. Oxygen concentrations in Woodard Creek when adding acid prior to titration (top) and in the field (bottom), and titrating right away ( $\square$ ) compared to holding samples for three days ( $\diamond$ ).

Deschutes River samples were nearly fully saturated ( $99\% \pm 0.02$  standard error), and replicates were only slightly affected by time of collection. Both within-treatment and, for the most part, between-treatment replicate results were within 0.3 mg/L (Figure 4).

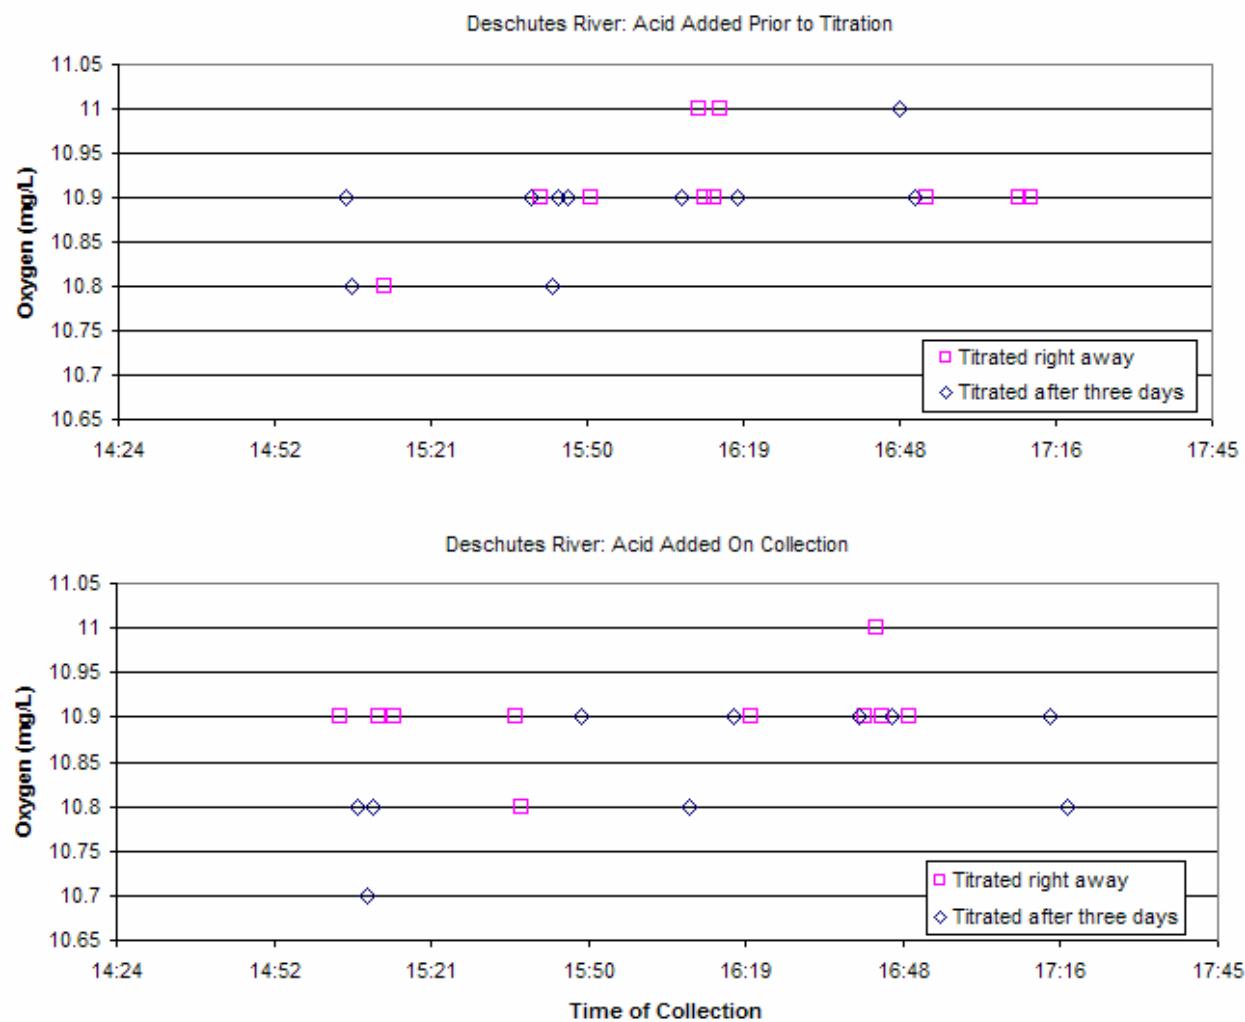

Figure 4. Oxygen concentrations in the Deschutes River when adding acid prior to titration (top) and in the field (bottom), and titrating right away ( $\square$ ) compared to holding samples for three days ( $\diamond$ ).

In Woodard Creek, holding the samples for three days resulted in a loss of 0.07 mg/L oxygen when acid was added prior to titration ( $p=0.013$ ; Table 13). When acid was added in the field, the change in oxygen was not significant ( $p=0.653$ ).

In the Deschutes River, holding the samples for three days resulted in an insignificant change in oxygen concentration when acid was added prior to titration ( $p=0.83$ ; Table 13). When acid was added in the field, there was a loss of 0.07 mg/L oxygen ( $p=0.014$ ).

Table 13. Regression results for the model. {oxygen concentration (mg/L) = time of collection + held}, where held=0 for samples analyzed immediately, and 1 for samples analyzed after 3 days. P(held) is the significance of the “held” variable.

Treatment	Regression	P(held)	$r^2$
Woodard Creek acid at titration	Oxygen = 2.957 + 6.500 (time) - 0.071 (held)	0.013	0.94
Woodard Creek acid at collection	Oxygen = 3.397 + 5.568 (time) - 0.013 (held)	0.65	0.90
Deschutes River, acid at titration	Oxygen = 10.254 + 0.966 (time) - 0.005 (held)	0.83	0.22
Deschutes River, acid at collection	Oxygen = 10.308 + 0.887 (time) - 0.066 (held)	0.014	0.38

In all cases, the effect of holding samples for three days was relatively small and within our MQO requirements of 0.2 mg/L. Furthermore, because oxygen concentration changes continually during the day, grab-sample oxygen concentrations should be considered a coarse screen, perhaps used to trigger a continuous oxygen monitoring study (a program we are currently developing).

### Continuous temperature monitoring

Post-deployment calibration checks using a certified reference thermometer were within criteria for all instruments (Ward, 2005).

Most temperature loggers were deployed by late-July. Almost all of the loggers in eastern Washington recorded the seasonal seven-day average maximums. Unfortunately, nearly all of the loggers in western Washington did not record the seasonal seven-day average maximums. This was due to the cooler than usual weather between mid-July and early August, which is when seasonal maximums have typically occurred. For future deployments, this problem can be avoided by having the west-side loggers deployed by mid-July.

# Conclusions

I concluded the following as a result of this study:

- Most quality control results were within the limits specified in our Quality Assurance Management Plan and were consistent with findings in previous years.
- Except where noted otherwise, data collected in 2007 by Ecology's River and Stream monitoring program can be used without qualification.
- In studies of streams smaller than those typically included in the ambient monitoring network, project managers should expect less precision in their data than root mean square values reported here.
- For the most part, automated quality control checks have been consistent over the past 15 years.
- At times, holding oxygen samples for up to three days may cause a statistically significantly change in concentration; however, the magnitude of the change is well below our measurement quality objective requirements.

## **Recommendations**

I recommend the following as a result of this study:

- In studies of streams smaller than those typically included in the ambient monitoring network, project managers should plan for poorer precision than the root mean square values reported here.
- The effect of changing total phosphorus reporting limits should be considered when conducting trend analyses.
- Discuss "missing data," especially lost pH results due to bad cables, at a future Freshwater Technical Coordination Team meeting.

## **Appendix B. Historical changes in sampling and laboratory procedures, and large-scale environmental changes potentially affecting water quality**

This appendix provides a record of changes in methods and procedures used by the Environmental Assessment Program to collect and analyze river and stream water quality data. Environmental changes that may potentially affect water quality over a large area are also recorded here.

Many of the changes listed below are anecdotal and may or may not have affected data quality. Comments prior to October 1988 are based on interviews with individuals involved with the earlier program. Comments after that date have usually been recorded as the changes occurred.

### **General**

- Jun to Sept 1985: Laboratory moved from Ecology's Southwest Regional Office to Manchester.
- Oct 1988: Implemented QA/QC program (See memo from David Hallock, October 17, 1988.)
- Prior to WY91: Samples were sent to contract labs from time to time. These occurrences are not all recorded here. Records are not detailed and only available from bench sheets archived by Manchester Environmental Laboratory.
- 1994: The use of Polyacrylamide (PAM) to control erosion from rill irrigation is becoming widespread in eastern Washington. Water quality effects are unknown.
- 1996: Began monitoring discharge at some stations ourselves (mostly basin stations), rather than contracting with USGS.
- 2001: Began running Central (Nov 2001) and Eastern (Feb 2002) runs out of regional offices. Barometric pressures calculated from airport readings, either uncorrected, if available, or re-converted to sea level.
- Jan-Jun 2002: Some barometric pressures collected from the western part of the state may be off by 1.0 mmHg due to calibration errors. The effect of this amount of error on the percent oxygen saturation calculation is insignificant.
- Oct 2005 (except the NW run, which made the change several months earlier): Previously, aliquots for pH, conductivity, and turbidity were obtained from the stainless steel bucket used to collect the oxygen. However, this presented a risk of contamination from the oxygen bottles. The sampler was re-designed so that only the oxygen sample is obtained from the bucket; all other samples are collected in passengers.

### **Nutrients**

- General: Prior to 1980, USGS labs analyzed samples.
- 1966-1969: One gallon of sample was collected in glass jars and held at room temperature for indefinite periods without preservative.
- 1970-1973: Unknown methods; may have been preserved with HgCl. Filtered in field.
- 1973: Laboratory moved from Tacoma to Salt Lake City.
- 1973-1974: Chilled, no preservative. Held as long as one week. Filtered in field; kept in brown poly bottle.
- 1972-1974?: For a short time, TP and NO<sub>3</sub> may have been added by filters (probably 72-74). (Personal communications with Joe Rinella, USGS).
- Sept 30, 1978: USGS laboratory moved to Arvada, CO. Joint program samples sent there; samples collected for Ecology project only may have been analyzed in-house.

- ~1978: Chilled. Brown poly bottle? (the brown poly bottle may have been introduced later). 30-day holding time for NO<sub>2</sub>+NO<sub>3</sub> implemented (status of other nutrients is unknown). (Source of methods prior to 1979: pers. comm. Joe Rinella, USGS, and Earl L. Skinner, "Chronology of Water Resources Division activities that may have affected water quality values of selected constituents in Watstore, 1970-86. Provisional Report Feb 1989.)
- 1979: For a while, the USGS lab reported nutrient results to the nearest 0.01 units. Values below 0.005 were reported as 0.00. USGS decided to change all Watstore data = 0 to 0.01K back to 1973 for NO<sub>2</sub>+NO<sub>3</sub>. Decision on other nutrients is unknown, but they may also have been changed. Most of the 0s in our database have been converted to 0.01K (K-below the detection limit) but a few 0s may remain in the older data.
- 1980: USGS requires NO<sub>2</sub>+NO<sub>3</sub> be preserved with HgCl. Status of other nutrients is unknown. Ecology requirements are unknown.
- June 1, 1980 to 1986: Nutrients analyzed by Pat Crawford at Southwest Regional Office.
- Aug 1985: High phosphate values, presumably a result of lab error. (Coded '9-do not use' in our database). (See "Trends in Puget Sound," 1988, Tetra Tech, App. B.)
- 1986 to Apr 1987: Analyzed by various people, mostly Helen Bates, Steve Twiss, and Wayne Kraft at Manchester Laboratory.
- June 1985: Switched from Technicon to Rapid Flow Analysis (Alpkem) auto-analyzers.
- Apr 1987 to present: Analyzed by various people at Manchester.
- Jan 1987 to Jul 1987: NO<sub>3</sub>, NH<sub>3</sub>, and TP analyzed by contract lab.
- Mar 1990: Began using MFS cellulose acetate filters for field filtration of nutrients. Previously use Millipore, type HA (cellulose nitrate?).
- Sept 17 - Oct 12, 1990: All nutrient samples were contracted out.
- Oct 1990: Dissolved ammonia (P608) and dissolved nitrate+nitrite (P631) were added to the Marine network. Totals (P610 and P630) were dropped.
- Feb 1991: All nutrients sent to contract lab.
- Mar 1991: All nutrients sent to contract lab.
- ~1993: Began collecting nutrients in acid-washed poly-bottle passenger rather than in the stainless-steel bucket used for oxygen determinations.
- Jul 1994: The phosphorus content in laundry detergents is restricted to 0.5% and dishwashing detergent to 8.7% statewide (SSB 5320; WAC 70.85L.020). Phosphorus use had been limited in Spokane County one (?) year earlier.
- Feb 1999: MEL switched from manual to inline digestion for total phosphorus. In early 2003, during the course of evaluating a different method for phosphorus analysis, MEL discovered that the in-line method contained a high bias (4 to 20 ppb). Trend analyses of total phosphorus data should be interpreted carefully if results collected between Feb 1999 and Sept 2003 are included. (See email from Dean Momohara to David Hallock, 31 March 2003.) Total phosphorus data analyzed using this method have been coded "4" indicating a potential quality problem, and given a different name ("TP\_PInline" rather than the usual "TP\_P").
- Oct 2000: Nitrate+nitrite method nomenclature changed from EPA 353.2 to SM 4500NO3I because the latter method is more specific. Actual procedures were not changed.
- Oct 2000: TP method changed from EPA 365.1 to SM 4500PI. The former method specifies a manual digestion, while the latter correctly refers to the in-line digestion used by MEL's *Lachat* instrument.
- Oct 2000 to Feb 2001: A low bias may apply to TN data. Except for December data, MEL deemed the bias to be small enough that the data did not need to be qualified. December TN results were coded as estimates (See email from M. Lee to David Hallock, March 8, 2001.)
- Oct 2003: TP method changed from SM 4500PI to EPA 200.8M, an ICP/MS method with low detection limits and without the bias associated with in-line digestion. Samples are collected in a

60mL container with HCl preservative instead of the earlier 125mL container with H<sub>2</sub>SO<sub>4</sub> preservative.

- Oct 1, 2007 we changed total phosphorus analytical methods from EPA 200.8M (ICP-MS) to SM 4500PH (colorimetric with manual digestion). We made this change because we discovered that at turbidities greater than 4 NTUs, the ICP method is biased low compared to the colorimetric method. (See email from Dave Hallock to Bob Cusimano, October 25, 2007.)
- Jul 2008: The phosphorus content in dishwasher detergents is restricted in Spokane County as of this date (RCW 70.95L.020). (A new law signed in March 2008 eliminated Clark County from the July 1 deadline and weakened regulations that will start in Whatcom County. Phosphorus in laundry detergents has been restricted since 1994.)
- Jul 2010: The phosphorus content in dishwasher detergents will be restricted statewide as of this date (RCW 70.95L.020).

### **Suspended Solids**

- General: Filters were usually used, but sometimes Gooch crucibles were used.
- Feb 1978: Began collecting as passenger to oxygen sampler (was previously collected as aliquot of oxygen sampler). (See memo from Bill Yake, 30 Jan 1978 and Ambient Monitoring Procedure-1978(?) notebook.)
- Mid-1985: Amount filtered changed from 250 (?) to 500 ml.
- Sept 17 - Oct 12, 1990: Suspended sediment samples were contracted out.
- Apr 1991: Began collecting 1000 ml of sample.
- Jul 2002: A number of suspended solids results entered into our database as '0' were deleted. We do not know if these results were below reporting limits or "missing data"; 138 results collected between 1972 and 1981 were affected.
- Mar 2003: TSS method reference changed from EPA 160.2 to SM 2540D. Methods did not change; the latter reference more accurately reflects analytical procedures. See email from Karin Feddersen, March 24, 2003.

### **Conductivity**

- Feb 1978: Began calibrating twice monthly using 40, 70, 140, and 200 µmho/cm standards. (See memo from Bill Yake, 30 Jan 1978 and Ambient Monitoring Procedure-1978(?) Notebook)
- Oct 1991: All meters were re-calibrated Oct 11, 1991. One conductivity meter was not calibrated above 500 µmhos/cm (and could not be calibrated). This meter had last been calibrated about 1 year earlier. Most meters read higher than the 100 µmhos/cm standard.
- Oct 1994: Switched from Beckman model Type RB-5 (which could not be field calibrated) to Orion Model 126 meter, calibrated daily.
- 1998: Orion meter calibration began drifting during the day. Sometimes meter could only be calibrated to within 4 µmhos/cm of the standard. At first, some samplers would correct the data, others would not. Now, these data are uncorrected and coded "J" (estimate).

### **Fecal Coliform Bacteria**

- Early 1980s: field personnel may have analyzed some samples.
- Oct 7, 1975 to Nov 1981: fecal data from eastern Washington may be questionable during this period.
- 1980 to Mar 1988: No changes; analyzed by Nancy Jensen and others at Manchester. However, there is an apparent drop in monthly geometric means in late 1985. This may be coincident with moving the lab to Manchester (see memo from Dave Hallock to Dick Cunningham, June 18, 1991).
- Mar 1988: Switched to new filter with slightly better recovery.
- Nov 2000: Holding time was changed from 30 hours to 24 hours (Standard Methods changed to 24 hours with the 17<sup>th</sup> edition, 1989). As a result, more data have been coded "J" since then due to exceeding holding times.
- Sept 2003: FC method reference changed from SM 16-909C to SM 9222D. Methods did not change; the latter reference more accurately reflects analytical procedures. See email from Karin Feddersen, September 15, 2003.

### **Turbidity**

- 1970s: EPA specified a 2100A turbidimeter. Formerly, turbidity units were FTU (?)
- Jan 1976: Turbidity units changed from Jackson Turbidity Units (JTU) to Nephelometric Turbidity Units (NTU). (Source: review of historical reports.) These are roughly equivalent when greater than 25 JTU/NTU, otherwise not.
- Sept 1993: Lab began using a new turbidimeter, Hach model "Ratio X/R."
- Jan 2003: In our database, the units for turbidity results collected prior to January were changed from NTU back to JTU. Though roughly equivalent at JTUs > 25, these are not equivalent for lower measurements; the original units should have been retained.

### **Field pH**

- Oct 7, 1975 to Nov 1981: pH data from eastern Washington are questionable during this period.
- Feb 1978: Began calibrating meter twice monthly. Previous procedures unknown. (See memo from Bill Yake, 30 Jan 1978 and Ambient Monitoring Procedure-1978(?) notebook)
- 1986: Changed to Beckman digital pH meter with gel probe.
- Dec 1991: Changed to Orion model 250A meter with "spare water" liquid probe (uses 1M KCl, rather than 4M). Calibrated daily and checked calibration three times during the sampling day. Began using low ionic strength buffers.

### **Temperature**

- Feb 1978: Switched from thermometer in bucket to thermistor in river. (See memo from Bill Yake, 30 Jan 1978 and Ambient Monitoring Procedure-1978(?) notebook)
- Feb 1985: Checked thermistor calibration daily (internal calibration check based on red-lining needle, not a check against a NIST thermometer) (Memorandum from John Bernhardt, Feb 7, 1985).
- Spring 1994: Switched to YSI 300 meter (accuracy +/- 0.4C).
- Jan 1, 2001: Began calibrating thermistors prior to each run rather than annually. Some thermistors were found to be as much as 1-2 °C low.
- About May 2006: Began evaluating thermistor calibration at several temperatures and calculating correction coefficients based on a linear regression correction. Corrections are applied upon data entry by the database rather than by the sampler.

## **Oxygen**

- Oct 1, 1977: Began measuring barometric pressure to calculate percent saturation. Previous saturation calculations were presumably based on elevation.
- Mar 1989: Began applying correction factor to results of Winkler analyses based on titration with sodium biiodate to correct sodium thiosulfate normality to 0.025. Previously, thiosulfate was standardized upon preparation, but not during use.

## **Barometric Pressure**

- Feb 1985: Began calibrating barometer before each run based on National Weather Service report from Olympia airport (Memorandum from John Bernhardt, Feb 7, 1985).
- \_\_\_\_ 1995: Began calibrating barometer prior to each run using an on-site mercury barometer rather than pressure as reported by the Olympia airport.
- \_\_\_\_ 2003(?): Began calibrating barometer prior to each run using an on-site digital barometer rather than the mercury barometer. Calibrated digital barometer to mercury barometer annually.

## **Chlorophyll**

- Mar 15, 1990: Switched to fluorometric method (from spectrophotometric). New method has lower detection limit (0.02 µg/L) but less accuracy. (See memo from Despina Strong, April 12, 1990.)

## **Hardness**

- Jul 1, 1991: Began using 125 ml bottle with HNO<sub>3</sub> as preservative. (Previously, aliquot from unpreserved general chemistry bottle was used.)

## **Metals**

- May 1994: Implemented low-level dissolved metals monitoring at selected stations. Metals results prior to this date are questionable unless well above detection limits and have been quality-coded "9" in our database so that they will not routinely be retrieved. Quality problems include inconsistent blank correction and indications of simultaneous peaks and troughs in data series from unrelated stations for results above reporting limits.

## **Appendix C. Water Year 2007: raw data**

Data listed in this appendix are available in electronic format by contacting the Washington State Department of Ecology regional offices:

- Ecology Central Region: Chris Coffin (509.454.4257; ccof461@ecy.wa.gov)
- Ecology Eastern Region: Jim Ross (509.456.2874; jros461@ecy.wa.gov)
- Ecology Northwest Region: Bill Ward (360.407.6621; bwar461@ecy.wa.gov)
- Ecology Southwest Region: Craig Homan (425.649.7008; chom461@ecy.wa.gov)

Ambient monitoring data from the most recent complete Water Year are available over the Internet on Ecology's web pages ([www.ecy.wa.gov](http://www.ecy.wa.gov)). Look under the "Environmental Assessment" program, "Long-term monitoring," and "River and Stream Water Quality."

The first two digits of each station number is the Water Resource Inventory Area (WRIA) number. This number can be used to identify which Water Quality Management Areas (WQMA) or "basin" each station is in, according to the table, below:

Basin	WRIs	Basin	WRIs
Cedar/Green	8-9	Nooksack/San Juan	1-2
Columbia Gorge	27-29	Okanogan	48-53
Eastern Olympics	13-14, 16-19	Puyallup/Nisqually	10-12
Esquatzel/Crab Creek	36, 42-43	Skagit/Stillaguamish	3-5
Horseheaven/Klickitat	30-31	Spokane	54-57
Island/Snohomish	6-7	Upper and Lower Snake	32-35
Kitsap	15	Upper Columbia/Pend Oreille	58-62
Lower Columbia	24-26	Upper Yakima	38-39
Lower Yakima	37	Wenatchee	40, 44-47
Mid Columbia	41	Western Olympics	20-23

Remarks codes in historical data are defined below. Only "U" and "J" were used in WY 2007.

- B, V Analyte was found in the blank indicating possible contamination  
E Result is an estimate due to interference  
G, L True result is equal to or greater than reported value  
H Sample was analyzed over holding time  
J The reported result is an estimate  
K, U The analyte was not detected at or above the reported result  
N Spike sample recovery outside control limits  
P Result is between the detection limit and the min. quantitation limit (applied to metals)  
S Spreader: one or more bacteria colonies were smeared, possibly obscuring other colonies  
X High background count of non-target bacteria, possibly obscuring additional colonies

*This page is purposely left blank*

Waterbody:

WA-15-0000

Date/Time	Temp deg. C	Flow CFS	Conduc- tivity umhos/cm	Oxygen mg/L	ph	Suspend. Solids std units	Total Pers. N.	Ammonia Nitrogen mg/L	Nitrate+ Nitrite mg/L	Total Phosp. mg/L	Soluble Reactive P mg/L	Turbid- ity NTU	Fecal Coliforms #/100/mL
10/17/2006	14:29	10.5	0.98	99	11.3	4	0.281	0.038	0.16	0.02	0.016	1.8	23
													I sampled the station at high tide. No coho at the trap. Matt Gillam WDFW said they had passed a total of 6 coho upstream to date, one of the lowest totals at this time of year on record.
11/7/2006	14:15	11.5	39.6	59	10.3	7.8	17	0.516	0.01 U	0.262	0.0187	0.0061	6.6
													The station is big and brown from tannin, not turbidity. There is evidence of high water debris on the weir.
12/20/2006	14:35	5	70.2	42	12.8	6.72	6	0.33	0.01 U	0.275	0.0073	0.0064	2.2
1/17/2007	13:50	3.4	34.5	47	13.4	6.9	2	0.316	0.01 U	0.247	0.0058	0.0055	1.5
													The stream is low and clear with tannin color. There were no fish present at the weir.
2/13/2007	13:30	7.3	19.9	60	12.35	7.15	1	0.22	0.01 U	0.157	0.0074	0.0051	0.9
3/14/2007	15:00	8.6	68.8	44	11.6		3	0.291	0.01 U	0.198	0.0065	0.0044	1.5
													Sampled on the upstream side of the weir. Sadly, the Big Beef Creek field station, once the flagship of the University of Washington's School of Fisheries, is slowly crumbling to ruin. I rarely, if ever, see any evidence that students are using the facility.
4/10/2007	13:15	10.2	17.4	64	11.95		1	0.17	0.01 U	0.1	0.0081	0.0054	0.7
													Sampled at the mouth of the fan trap which is now fishing. A small school of coho smolts were at the mouth of the trap when I arrived (unusual to see them moving during the daytime).
5/16/2007	13:25	12.5	5.95	78	10.9	7.78	1	0.21	0.01 U	0.132	0.0088	0.0065	0.8
													Sampled at the mouth of the fan trap. No fish seen.
6/20/2007	15:15	15.3	6.53	92	10.4	7.56	2	0.275	0.01	0.178	0.0145	0.0099	0.5 U
													The smolt traps are removed.
7/17/2007	14:15	16.7	6.53	98	9.8	7.51	2	0.341	0.01 U	0.261	0.0231	0.02	1.3
													Sampled upstream of the weir. The channel is now confined to one narrow area near the far valley wall.
8/15/2007	13:31	14.9	6.84	95	10.19	7.65	1 U	0.21	0.01 U	0.172	0.0132	0.012	0.7
													I sampled at the far valley wall where the stream is now running following the construction of what appears to be a temporary berm in the channel upstream of the fish wier.
9/18/2007	14:45	13.2	6.84	97	10.75	7.51	2 U	0.23	0.026	0.134	0.0251	0.021	1.3
													The adult weir is in place at the stream. A few summer chum were present.

## Conventional Data Report

Hoh R @ DNR Campground  
20B070

Class: AA Latitude: 47 48 35.3  
 Rivermile: 16.5 Longitude: 124 14 51.7  
 Waterbody: WA-20-2010

Date/Time	Temp deg. C	Flow CFS	Conduc-tivity umhos/cm	Oxygen mg/L	ph	Suspend. Solids std units	Total Pers. N.	Ammonia Nitrogen mg/L	Nitrate+ Nitrite mg/L	Total Phosp. mg/L	Soluble Reactive P mg/L	Turbid- ity NTU	Fecal Coliforms #/100/mL	
10/16/2006	11:20	10	1030	84		7.34	12	0.069	0.01 U	0.039	0.0133	0.0036	12	260 J
									The Hoh river was low with some color.					
11/6/2006	10:28	10.3	49400	33	11.5	7.01	4600	0.24	0.163	0.146	0.605	0.0635	3100 J	200000 J
									Big water! Very large trees moving downstream in a river looking more like a mudflow. Boulders are audible coming down the rapid. The Queets river that I drove over an hour earlier was almost frightening. I could feel the 101 bridge shaking when I drove over it.					
12/19/2006	11:20	6	3540	75	12.65	6.83	14	0.093	0.01 U	0.093	0.0187	0.011	22	3 J
									I inspected all of the restrooms in the campground with the DNR representative responsible for latrine maintenance (Mary Taffer). None of the restrooms showed signs of leakage during the November floods.					
1/16/2007	11:15	4.5	2080	79	12.9	6.82	10	0.1	0.01 U	0.09	0.0103	0.0046	7.5	2 J
									One fisherman at the sampling station mentioned he had caught and released a wild steelhead earlier that morning. The river was in fine shape.					
2/12/2007	11:25	6.3	3030	71	12.2	6.67	18	0.073	0.01 U	0.06	0.0162	0.0035	14	3 J
									The river was moderately high and greenish brown.					
3/13/2007	11:45	5.3	7710	64	12.6		167	0.08	0.01 U	0.074	0.0854	0.016	140	5 J
									The Hoh was moderately high and gray.					
4/9/2007	10:40	6.9	3650	76	12.25		55	0.053	0.01 U	0.044	0.0412	0.008	31	41 J
									Heavy rain showers! The Hoh was moderately high and gray.					
5/15/2007	10:55	9.2	1590	87	12		2	0.044	0.01 U	0.01 U	0.0037	0.003 U	2.1	1 UJ
									The Hoh was low and clear. I met Steve Allison, the water quality specialist for the Hoh Tribe.					
6/19/2007	11:15	10.4	1510	83	11.6	7.27	5	0.088	0.01 U	0.01 U	0.0072	0.0032	2.5	1 UJ
									The Hoh was low and clear.					
7/16/2007	10:40	10.8	2230	71	11.5	7.05	16	0.025 U	0.01 U	0.01 U	0.0208	0.003 U	21	11 J
									The Hoh was low with some color from glacial flour.					
8/14/2007	10:45	12.3	1040	83	11.3	7.23	5	0.025 U	0.01 U	0.01	0.0057	0.003 U	5.1	5 J

									The Hoh was low and emerald green in color.					

## Conventional Data Report

## Humptulips R nr Humptulips

22A070

Class: A Latitude: 47 13 47.3  
 Rivermile: 23.6 Longitude: 123 57 42.6  
 Waterbody: WA-22-1010

Date/Time	Temp deg. C	Flow CFS	Conduc- tivity umhos/cm	Oxygen mg/L	ph	Suspend. Solids std units	Total Pers. N.	Ammonia Nitrogen mg/L	Nitrate+ Nitrite mg/L	Total Phosp. mg/L	Soluble Reactive P mg/L	Turbid- ity NTU	Fecal Coliforms #/100/mL
10/16/2006	9:27	10.4	274	68	10.75	8	2	0.15	0.01 U	0.093	0.0057	0.0045	1 220 J
Stage value is taken from the USGS wire weight gage. The pH meter was calibrated before the sample. Salmon fishermen at the bridge.													
11/6/2006	8:30	10.2	19800	34	11.5	7.69	564	0.22	0.019	0.21	0.162	0.013	500 230 J
Heavy rain, very large flood, numerous large trees floating downstream. In order to sample I had to move close to the edge of the bridge because the velocities were incredibly high. The river is 10 feet higher than when I sampled in October.													
12/19/2006	9:20	6.3	1920	52	12.3	6.97	7	0.16	0.01 U	0.156	0.0097	0.0065	5.8 9 J
The stage was taken from the USGS wire weight gage. The flow was moderate and green. I calibrated both the pH and conductivity meters just before sampling at this station.													
1/16/2007	9:30	4.3	1170	53	12.9	7.07	7	0.16	0.01 U	0.141	0.006	0.0049	3.6 1 J
The stage was taken from the USGS wire weight gage. The Humptulips was the color of liquid emerald this morning.													
2/12/2007	9:15	6.8	1690	49	12.2	6.48	14	0.11	0.01 U	0.091	0.0136	0.0056	12 3 J
The pH and conductivity meters were calibrated just prior to sampling this station. The stage was taken from the USGS wire weight gage.													
3/13/2007	9:45	6.1	5110	43	12.4		80	0.11	0.01 U	1.06	0.0452	0.021	70 3 J
The stage was taken from the USGS wire weight gage. The hump was moderately high with some color. The pH meter did not calibrate well on this run--see notes on calibration sheet.													
4/9/2007	9:00	8.4	1130	52	11.2		3	0.078	0.01 U	0.063	0.0053	0.005	3 17 J
The stage was taken from the USGS wire weight gage. The stream was moderately high and green/clear.													
5/15/2007	8:55	10.6	514	58	11.4		1	0.06	0.01 U	0.017	0.0029	0.0039	0.8 5 J
The stage was taken from the USGS wire weight gage on the bridge. The flow was very low and clear. The pH value seems high (see calibration notes for today).													
6/19/2007	9:45	12.5	274	62	11	7.18	1	0.057	0.01 U	0.019	0.0035	0.005	0.5 9 J
Stage taken from the USGS wire weight gage which is suffering from neglect.													
7/16/2007	8:55	16	214	70	9.9	7.16	1 U	0.055	0.01 U	0.022	0.0045	0.0051	0.5 U 23 J
The USGS wire weight gage on the bridge has been vandalized and is inoperable. The lock was missing from the gage and the crank handle for retrieving the weight is bent. The river was very low and clear.													
8/14/2007	9:15	13.9	270	70	10.4	7.09	1	0.089	0.042	0.016	0.0038	0.0069	0.8 26 J
The stage was taken from the USGS wire weight gage on the bridge that has been repaired and serviced since the last visit. Despite cool, rainy weather the river continues to be low and clear.													
9/17/2007	7:45	13.6	199	68	10.19	7.2	1 U	0.063	0.01 U	0.014	0.0115	0.013	0.8 97 J
The stage was taken from the USGS wire weight gage. The humptulips was low and clear.

## **Appendix E. Acronyms and abbreviations**

Following are acronyms and abbreviations used frequently in this report.

DQO	Data quality objective
Ecology	Washington State Department of Ecology
EIM	Environmental Information Management system
EPA	U.S. Environmental Protection Agency
MEL	Manchester Environmental Laboratory
MQO	Measurement quality objectives
NTU	Nephelometric turbidity units
OP	Orthophosphorus
QA	Quality assurance
QAMP	Quality Assurance Monitoring Plan
QC	Quality control
RMS	Root mean square
RSD	Relative standard deviation
SM	Standard method
TMDL	Total Maximum Daily Load
TN	Total nitrogen
TP	Total phosphorus
TSS	Total suspended solids
USGS	U.S. Geological Survey
WAC	Washington Administrative Code
WY	Water Year
