

# Data Summary: Stillaguamish River Watershed Fecal Coliform, Dissolved Oxygen, pH, Mercury, and Arsenic Total Maximum Daily Load Study

## Abstract

This report provides a summary of the field measurements and laboratory data collected by the Washington State Department of Ecology between August 2000 and November 2001 for the *Stillaguamish River Watershed Fecal Coliform, Dissolved Oxygen, pH, Mercury, and Arsenic Total Maximum Daily Load Study*. The data included in this report were used to recommend total maximum daily load (TMDL) pollutant limitations for the Stillaguamish River basin (Joy, 2004).

ug/L	micrograms per liter

## Introduction

The Stillaguamish basin of western Washington State drains approximately 684 square miles from the Cascade Range to Port Susan of central Puget Sound (Figure 1). Two major forks, the North and South forks, come together at river mile 17.8 near the city of Arlington. At river mile 2.75, the Stillaguamish River splits into the Old Stillaguamish River Channel and Hatt Slough. Over 70 years ago, flow was redirected from the Old Channel to Hatt Slough following a series of floods and the release of several logjams. Hatt Slough is now the primary channel to Port Susan, and the Old Channel seasonally oscillates between functioning as a tidal slough during the dry season and a conduit for river discharge during the wet season.

Granite Falls (population est. 1,737) and Darrington (population est. 1,245) are located in the upper basin. Arlington (population est. 7,275) and Stanwood (population est. 3,345) are located in the lower basin, as is Interstate 5. Land use ranges from managed forest land in the upper basin to residential, business, and agricultural properties in the lower basin.

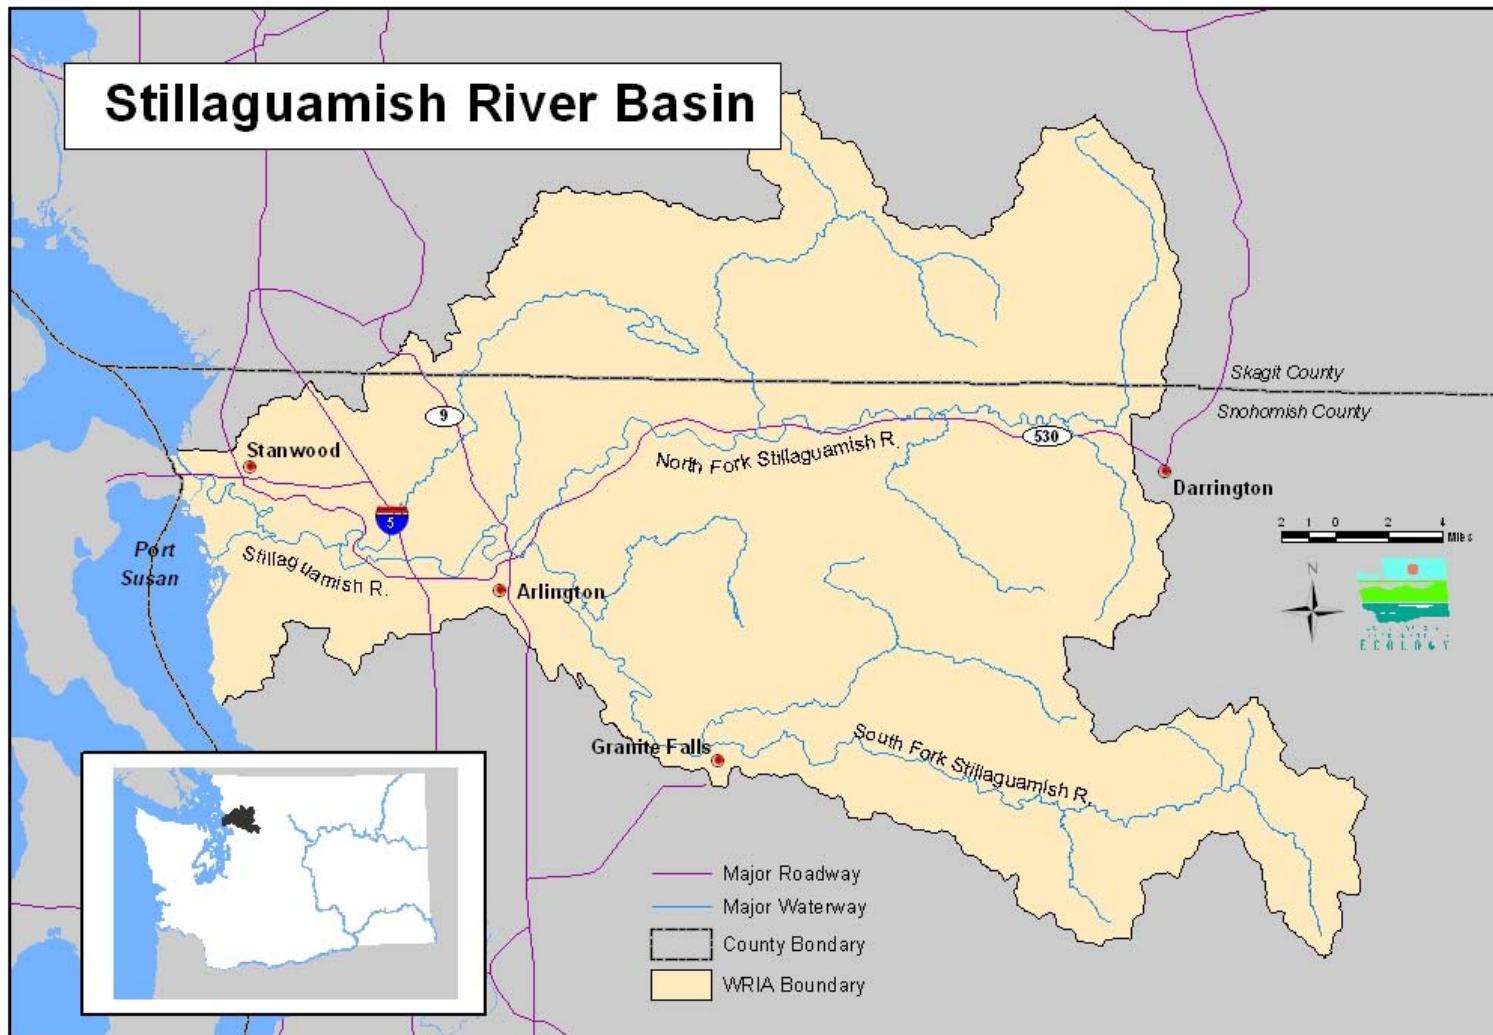

Figure 1. A map of the Stillaguamish River basin including Port Susan.

## Water Quality Issues

Chapter 173-201A of the Washington State Administrative Code (WAC) establishes water quality standards for surface waters in the state. Classifications are assigned based on general characteristics, characteristic uses, and water quality criteria. The mainstem of the Stillaguamish River, Old Stillaguamish Channel, and associated tributaries are designated as Class A waters. The North Fork Stillaguamish River and associated tributaries to Squire Creek at river mile 31.2 are also designated as Class A waters. Above Squire Creek, the North Fork and associated tributaries are designated as Class AA. The South Fork Stillaguamish River and associated tributaries to Canyon Creek at river mile 33.7 are designated as Class A waters. Above Canyon Creek, the South Fork and associated tributaries are designated as Class AA waters. Port Susan is designated as a Class A marine waterbody.

In 1996 and 1998 the Washington State Department of Ecology (Ecology) listed several rivers and streams in the Stillaguamish River basin under Section 303(d) of the federal Clean Water Act as not meeting water quality standards for fecal coliform bacteria, dissolved oxygen, pH, arsenic, ammonia, lead, copper, and nickel (Table 1). Water quality criteria associated with Class AA and A waters are outlined in Appendix A.

Table 1. Waterbodies and parameters on the 1998 Section 303(d) list included in the Stillaguamish River TMDL field studies.

	LU17DC	Unnamed Ck. #0456	Fecal Coliform

From 2000 to 2001 the Washington State Department of Ecology conducted a total maximum daily load (TMDL) study in the basin to determine if the Stillaguamish River, its tributaries, and Port Susan were in compliance with water quality standards. Ecology completed surveys in the study area between August 2000 and November 2001. The surveys were coordinated with

existing monitoring programs when possible. Data generated by Ecology and credible outside sources were incorporated into the TMDL study. This report will focus on the data from the Ecology TMDL surveys. Information about data from other sources can be found in the following publications or websites:

- Continuous stream discharge data collected by Ecology for the TMDL surveys were reported by C. Springer in: *Flow Summary for Gaging Stations on the Stillaguamish River and Selected Tributaries, May through October 2001*. Publication No. 03-03-019. <http://www.ecy.wa.gov/biblio/0303019.html>.
- Continuous discharge data collected by the U.S. Geological Survey is available at their National Water Information System (NWIS) website <http://wa.water.usgs.gov/data/realtime/nwisweb.htm>.
- Ecology Freshwater Ambient Monitoring Program data for sites in the Stillaguamish River basin can be found at [http://www.ecy.wa.gov/programs/eap/fw\\_riv/rv\\_main.html](http://www.ecy.wa.gov/programs/eap/fw_riv/rv_main.html).
- Freshwater water quality monitoring data collected by the Stillaguamish Tribe can be viewed at <http://www.stillaguamish.nsn.us/Water%20Quality%20Data%20Summary.pdf>.
- Snohomish County Surface Water Management water quality monitoring data were reported by K. Thornburg and G. Williams in: *State of the Waters, 2000: Water Quality in Snohomish County Rivers, Streams and Lakes*. The publication is available online at: <http://www.co.snohomish.wa.us/publicwk/swm/wq/publications/stateofwater.htm>.
- Snohomish County Surface Water Management monitoring data are available online at: [http://198.238.192.103/spw\\_swhydro/index.asp](http://198.238.192.103/spw_swhydro/index.asp).
- Tulalip Tribes have produced several reports on Stillaguamish basin water quality since 1991. The reports are available from: Tulalip Natural Resources 7615 Totem Beach Rd. Marysville, WA 98271 or at [tulalip@tulalip.nsn.us](mailto:tulalip@tulalip.nsn.us).

## Study Design

Fifty-seven TMDL monitoring sites were distributed throughout the Stillaguamish River basin and along Port Susan (Figures 2-4). The primary geographic focus of the surveys was the lower basin along the mainstem Stillaguamish River and the east shore of Port Susan. Field surveys focused on the following subjects:

- Diel changes in dissolved oxygen and pH.
- The effects of nutrients on aquatic productivity.
- Verification of metals concentrations.
- Water quality response to storm events and low-flow conditions.
- Monthly variability in indicator bacteria at freshwater recreational areas.
- Bacteria loads in Port Susan tributaries.

The survey schedule is presented in Table 2 and referenced in the site descriptions in Table 3.

Table 2. Surveys conducted by Ecology between August 2000 and November 2001 for the Stillaguamish River TMDL study.

Survey	Description	Date
A	Old Stillaguamish Channel Reconnaissance Survey	August 2000
B	Basin Indicator Bacteria Recreational Area Survey	Weekly: August – September 2000
C	Lower Stillaguamish Diel D.O. Survey	September 2000; repeat October 2001
D	Lower Stillaguamish River Synoptic Survey	September 2000; repeat October 2001
E	Basin Bacteria Synoptic Survey	September 2000
F	Old Stillaguamish Channel Low-flow Period Survey	October 2000; repeat July 2001
G	Metals Monitoring	Quarterly: January 2001 – October 2001
H	Storm Event Surveys	June and November 2001
I	Periphyton collection	July and October 2001
J	Port Susan Bacteria Source Surveys	Monthly: February – November 2001

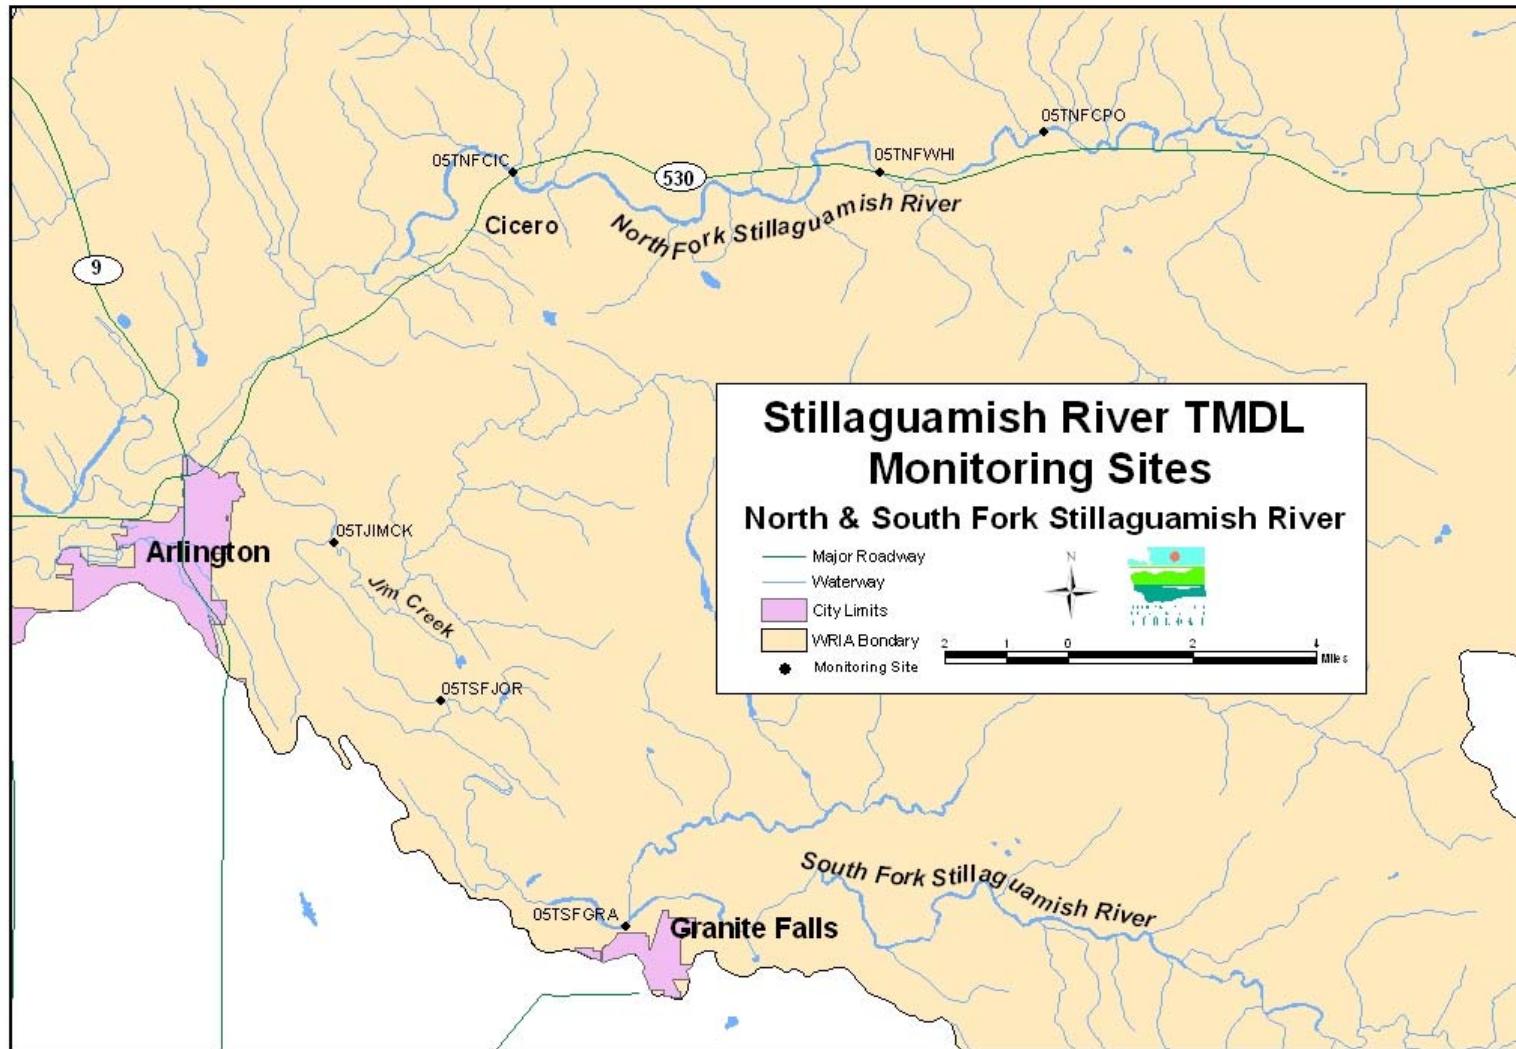

Figure 4. Stillaguamish River TMDL monitoring sites along the North and South forks of the Stillaguamish River.

## Methods

### Field

Streamflow gages were used to estimate flows at four sites. The location and operator of each gage are listed in Table 4.

Table 4. Streamflow gages used to estimate flows at selected sites included in the Stillaguamish River TMDL study.

Location	Operator
South Fork Stillaguamish at River Bend Park	Ecology
North Fork Stillaguamish at Cicero bridge (05TNFCIC)	USGS
Mainstem Stillaguamish at Interstate 5 (05TMS11)	USGS & Snohomish County
Armstrong Creek at hatchery gaging station (05TARMST)	Ecology

Field measurements, methods, and associated data quality objectives are outlined in Table 5. Further description of the field methods employed in the TMDL can be found in the Quality Assurance (QA) Project Plan (Joy, 2001).

Four diel surveys were conducted using multi-probe data loggers. Loggers were anchored in place at three to four sites to monitor temperature, dissolved oxygen, pH, and conductivity every 15 minutes for approximately 48 hours. Two surveys were conducted in the Lower Stillaguamish River in September 2000 and October 2001 to examine the daily ranges of the monitored parameters, with a focus on minimum dissolved oxygen concentrations. Two other surveys were conducted in the Old Channel of the Stillaguamish River in August 2000 and July 2001 to monitor changes in water quality over tidal and daily periods. The results of the surveys are depicted in Appendix D.

### Laboratory

Laboratory analyses, methods, and associated data quality objectives are outlined in Table 5. Manchester Environmental Laboratory (MEL) standard protocols were used for sample collection, preservation, and handling (MEL, 1994). USEPA protocols for sampling ambient water trace metals using two people were followed for metals sample collection and handling (USEPA, 1995). Containers and filters were pre-cleaned and supplied by MEL. All samples were stored in the dark, on ice, and transported to MEL within 24 hours of collection. Chain-of-custody signatures were not required during transport because samples were always within the possession of Ecology personnel or Greyhound Line employees.

Table 5. Methods and data quality objectives used in the Stillaguamish River TMDL study.

<b>Analysis</b>	<b>Method</b>	<b>Accuracy</b>	<b>Precision</b>	<b>Bias</b>	<b>Required</b>

<sup>3</sup> Precision standards were set after the Quality Assurance Project Plan was written

<sup>4</sup> Not anticipated in Quality Assurance Project Plan; sampled infrequently and no precision standards were set.

## Data Quality

### Field

Multi-probe meters, data loggers, and flow meters were calibrated according to Ecology's Environmental Assessment Program protocols and manufacturer instructions (WAS, 1993).

Calibration checks were conducted during and after sampling events to monitor multi-probe meter performance. Known pH and conductivity standards, and an alcohol thermometer, were used to assess the accuracy of the pH, conductivity, and temperature probes, respectively. Azide-modified Winkler titrations of randomly collected dissolved oxygen samples were used to assess the accuracy of the dissolved oxygen probe (Figure 5). Field meter data compared favorably to Winkler titration results (Figure 5).

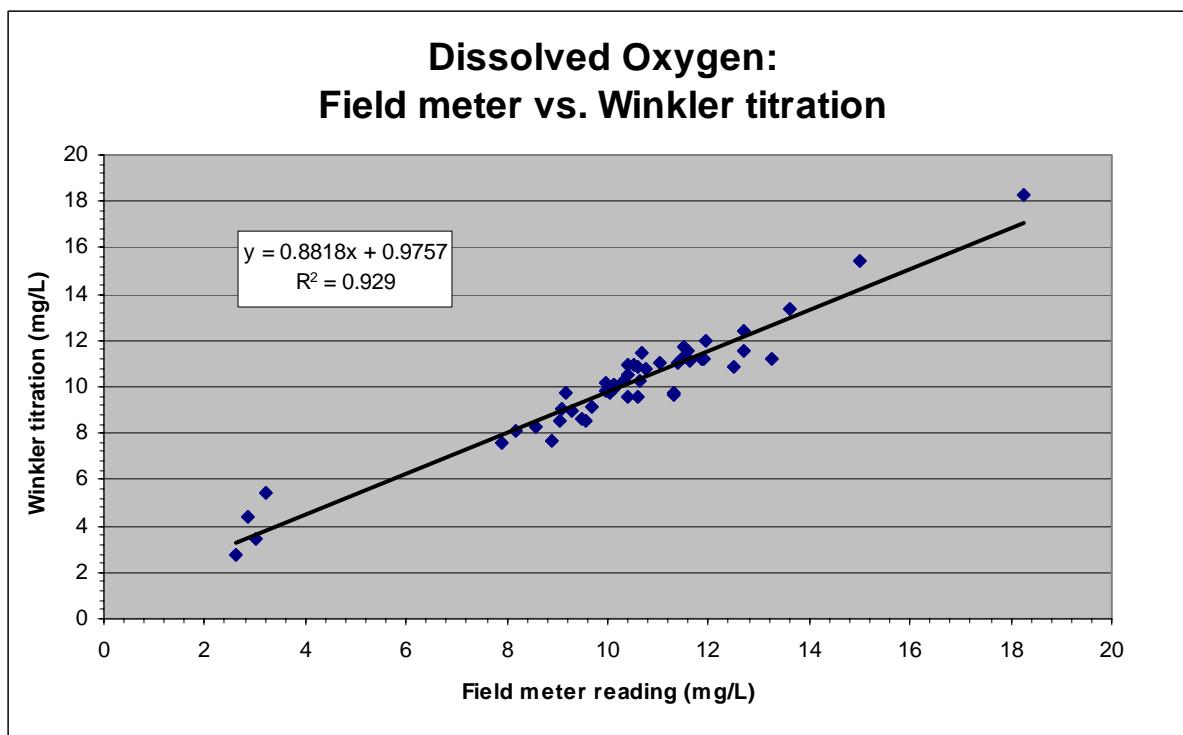

Figure 5. A comparison of dissolved oxygen field meter readings and associated Winkler titration results. Linear regression indicates a coefficient of determination of 0.929.

Field meters were used to evaluate the performance of data loggers. Checks were performed at the beginning, midpoint, and end of logging periods. No pH data were retrieved from the data logger placed near river mile 11 on the mainstem Stillaguamish River (05TMS11) during the October 2-4, 2001 Lower Stillaguamish River diel survey because the pH probe failed.

No data were retrieved from the data logger placed upstream of the Marine Drive Bridge (05TOC3) during the August 7-9, 2000 Old Stillaguamish Channel diel survey because the logger was stolen. No salinity data were retrieved from the data logger placed upstream of Irvine Slough (05TOC1) during the August 7-9, 2000 Old Stillaguamish Channel diel survey because the conductivity probe used to calculate salinity failed.

## Laboratory

Laboratory samples were analyzed according to quality assurance and quality control procedures followed by MEL (MEL, 2000). Some samples were qualified by the lab and should be used with caution. Descriptions of the qualifiers used by MEL can be found in Appendix B. Qualifiers are noted in the main data tables presented in Appendix C.

Field replicates and duplicate laboratory analyses were used to estimate precision. Field replicates are two samples collected from the same site at the same time. Duplicate laboratory analyses are performed using multiple aliquots from one sample container.

Field replicates were collected for at least 10% of all microbiology and metals samples, and at least 7% of all general chemistry samples analyzed by MEL (Table 6). Replicates were also collected for over 5% of the dissolved oxygen samples to evaluate field sampling precision for Winkler analysis (Table 6). Field replicate samples were collected to estimate total sampling precision, expressed as the median percent relative standard deviation (%RSD). Percent RSD is calculated by dividing the standard deviation by the mean of the duplicate pairs, and multiplying the result by 100. Precision standards for field replicates set in the QA Project Plan were met for all parameters sampled (Table 6).

Duplicate laboratory analyses were performed at a frequency of at least 10% (MEL, 2000). Duplicate analyses were used to evaluate laboratory precision, in %RSD, for general chemistry and microbiology parameters. Precision standards for duplicate laboratory analyses set in the QA Project Plan were met for all parameters in the aforementioned categories (Table 6).

Laboratory precision for metals was measured through matrix spike analyses and duplicate spike analyses. Matrix spike analysis is performed by adding a known amount of analyte to a sample aliquot. The aliquot is analyzed along with an unmodified aliquot from the same sample, and the percent recovery of the analyte from the representative sample matrix is calculated. All matrix spikes performed for this project were within the 75-125% control limits except two associated with the January 31, 2001 sampling event. Percent recovery for total recoverable copper (72 and 73%) and arsenic (62 and 63%) were outside control limits. Arsenic results were qualified as estimates, but the copper results were not because the percent recoveries were so close to control limits.

Duplicate spike analysis uses duplicate matrix spike samples to determine the repeatability of matrix spike results. Precision estimates based on duplicate spike analyses performed for this study were all within the acceptance criteria of  $\pm 20\%$ .

Table 6. A summary of the field sampling and laboratory precision data for the Stillaguamish River TMDL.

Parameter	n Pairs field	% of Total Field	Median RSD% field	n Pairs lab	Median RSD% lab	Precision Standard (RSD%)

<sup>1</sup> Log-transformed data

<sup>2</sup> Not anticipated in Quality Assurance (QA) Project Plan; precision standards were set after QA Project Plan written.

<sup>3</sup> Not anticipated in QA Project Plan; sampled infrequently and no precision standards were set.

Metals samples associated with the October 5 and October 17, 2000 sampling events were analyzed during the same time period. MEL used samples from the October 17 sampling event as spikes for the October 5 sampling event. No explanation for the substitution was given.

Certified river water reference material for trace metals (SLRS-4, Natural Resource Council of Canada) with values of 0.68 ug/L arsenic, 1.81 ug/L copper, 0.67 ug/L nickel, and 0.086 ug/L lead was used for laboratory control sample (LCS) analyses. One reference material sample was analyzed with each set of metals samples. All LCS recoveries performed for each metal analyzed in this study were within acceptance criteria.

Transfer blanks were submitted for each sampling event and analyzed to detect metals contamination arising from sample containers or the filtration process. Bottle blanks were prepared at MEL by filling 500 mL Teflon sample bottles with deionized water. Filter blanks were prepared by filtering half the contents of a bottle blank into a separate sample bottle supplied by the laboratory. Blanks were handled, transported, and analyzed in the same manner as the samples collected during the associated sampling event.

No analytically significant levels of the requested metals were detected in the transfer blanks except on two occasions when copper was found in the blanks for total recoverable metals. Blanks associated with the January 31, 2001 sampling event showed detectable levels of copper (0.10 ug/L). All samples associated with the blank had copper levels >10 times the level found in the blank, so no qualification was necessary. Blanks associated with the October 16, 2001 sampling event also indicated copper contamination. Samples were prepared a second time, and copper was still found at 0.10 and 0.15 ug/L. There was insufficient sample for further analyses, so copper results were qualified as estimates.

## Results

Field measurements and laboratory data collected by Ecology for the Stillaguamish River TMDL study are presented in Appendix D under four categories: field data, general chemistry analyses, microbiology analyses, and metals analyses.

Graphs depicting the results of the Lower Stillaguamish River diel surveys and the Old Stillaguamish Channel low-flow period diel surveys are found in Appendix D.

## Appendix A.

### **Class AA and Class A Designation and Water Quality Standards**

Table A-1. Characteristics and characteristic uses used to define Class AA and Class A waters in Washington State.

Class AA (extraordinary)	Class A (excellent)
<b>General Characteristics</b>	
Shall markedly and uniformly exceed the requirements for all, or substantially all uses.	Shall meet or exceed the requirements for all, or substantially all, uses.
<b>Characteristic Uses</b>	
Shall include, but not be limited to, the following: domestic, industrial, and agricultural water supply; stock watering; salmonid and other fish migration, rearing, spawning, and harvesting; wildlife habitat; primary contact recreation, sport fishing, boating, and aesthetic enjoyment; and commerce and navigation.	Same as AA.

Table A-2. Water quality criteria for Class AA freshwater, Class A freshwater, and Class A marine water in Washington State.

<b>Dissolved Oxygen</b>
<i>Class AA Freshwater</i> Minimum 9.5 mg/L
<i>Class A Freshwater</i> Minimum 8.0 mg/L
<i>Class A Marine</i> 6.0 mg/L with 95% vertically avg. daily max. salinity > 1 ppt
<b>Fecal Coliform</b>
<i>Class AA Freshwater</i> Geometric mean 50 cfu/100 mL 90 <sup>th</sup> percentile value 100 cfu/100 mL*
<i>Class A Freshwater</i> Geometric mean 100 cfu/100 mL 90 <sup>th</sup> percentile value 200 cfu/100 mL*
<i>Class A Marine</i> Geometric mean 14 cfu/100 mL 90 <sup>th</sup> percentile value 43 cfu/100 mL* Vertically averaged salinity ≥ 10 ppt
<i>In Food and Drug Administration (FDA) shellfish harvesting areas</i> Geometric mean 14 MPN/100 mL 90 <sup>th</sup> percentile value 43 MPN/100 mL*
<b>pH</b>
<i>Freshwater</i> Maximum 8.5 standard units Minimum 6.5 standard units
<i>Marine</i> Maximum 7.0 standard units Minimum 8.5 standard units
<b>Ammonia **</b>
<i>Freshwater</i> 4-day average over 3 years 1.35 mg/L as Nitrogen 1-hour average over 3 years 17.9 mg/L as Nitrogen
<i>Marine</i> 4-day average over 3 years 0.035 mg/L as Nitrogen 1-hour average over 3 years 0.233 mg/L

Table A-2 (cont.)

<b>Dissolved Arsenic</b>
<p><i>Freshwater Aquatic Toxicity</i>          4-day average over 3 years 190 ug/L          1-hour average over 3 years 360 ug/L</p>
<p><i>Marine Aquatic Toxicity</i>          4-day average over 3 years 36 ug/L; 21 ug/L to prevent non-lethal effects to diatoms          1-hour average over 3 years 69 ug/L; 95% vertically averaged daily maximum salinity &gt;1 ppt</p>
<p><i>Human Health</i>          Maximum 0.018 ug/L; consumption of water and organisms          Maximum 0.14 ug/L; consumption of organisms only</p>
<b>Dissolved Copper</b>
<p><i>Freshwater Aquatic Toxicity</i>          4-day average over 3 years 2.2 ug/L; at hardness of 15 mg/L as Ca CO<sub>3</sub>          1-hour average over 3 years 2.8 ug/L; at hardness of 15 mg/L as CaCO<sub>3</sub></p>
<p><i>Marine Aquatic Toxicity</i>          4-day average over 3 years 3.1 ug/L; 95% vertically averaged daily maximum salinity &gt;1 ppt          1-hour average over 3 years 4.8 ug/L; 95% vertically averaged daily maximum salinity &gt;1 ppt</p>
<b>Dissolved Lead</b>
<p><i>Freshwater Aquatic Toxicity</i>          4-day average over 3 years 7.7 ug/L          1-hour average over 3 years 0.3 ug/L</p>
<p><i>Marine Aquatic Toxicity</i>          4-day average over 3 years 8.1 ug/L; 95% vertically averaged daily maximum salinity &gt;1 ppt          1-hour average over 3 years 210 ug/L; 95% vertically averaged daily maximum salinity &gt;1 ppt</p>
<b>Mercury</b>
<p><i>Freshwater Aquatic Toxicity</i>          4-day average over 3 years 0.012 ug/L          1-hour average over 3 years 2.1 ug/L</p>
<p><i>Marine Aquatic Toxicity</i>          4-day average over 3 years 0.025 ug/L; 95% vertically averaged daily maximum salinity &gt; 1 ppt          1-hour average over 3 years 1.8 ug/L; 95% vertically averaged daily maximum salinity &gt; 1 ppt</p>
<p><i>Human Health</i>          Maximum 0.14 ug/L; consumption of water and organisms          Maximum 0.15 ug/L; consumption of organisms only</p>

Table A-2 (cont.)

Dissolved Nickel
<i>Freshwater Aquatic Toxicity</i> 4-day average over 3 years 31.6 ug/L 1-hour average over 3 years 2.84 ug/L
<i>Marine Aquatic Toxicity</i> 4-day average over 3 years 8.2 ug/L; 95% vertically averaged daily maximum salinity > 1 ppt 1-hour average over 3 years 74 ug/L; 95% vertically averaged daily maximum salinity > 1 ppt
<i>Human Health</i> Maximum 610 ug/L; consumption of water and organisms Maximum 4600 ug/L; consumption of organisms only

\* Criteria wording states that not more than 10% of the samples were used to calculate the geometric mean.

\*\* New ammonia criteria are proposed but are not presenting here.

## Appendix B.

### **Data Qualifiers used by Manchester Environmental Laboratory**

(adapted from Manchester Environmental Laboratory's Lab Users Manual, 7<sup>th</sup> Edition)

<b>Code</b>	<b>Definition</b>
E	Reported result is an estimate because it exceeds the calibration.
G	Value is greater than result reported; result is a minimum value.
J	Analyte was positively identified. The associated numerical result is an estimate.
N	For organic analytes there is evidence the analyte is present in this sample. For metals analytes the spike sample recovery is not within control limits.
NJ	There is evidence that the analyte is present. The associated numerical result is an estimate.
NAF	Not analyzed for.
QNS	Quantity not sufficient.
REJ	Data are unusable for all purposes.
U	Analyte was not detected at or above the reported result.
UJ	Analyte was not detected at or above the reported estimated result.
<b>Bold Type</b>	Analyte was present in the sample. Used as a visual aid to locate detected compounds on the report sheet.

*This page is purposely left blank for duplex printing.*
