What are they? - Are they harmful to humans? - Why are we seeing them?

Velella velella was spotted daily in the Pacific Ocean by Julia Bos, who recently sailed from Hawaii to Washington

Cluster of Velella velella off the coast
of Westport, WA.

Velella velella on
Rialto Beach, WA.
Photo courtesy of Chris Hartman

There have been recent reports of strange UFO (unidentified floating object) sightings in the waters off the coast of Washington. These small, jelly-like organisms can be found floating in clusters on the surface of the water or washed up on beaches. Beachcombers and boaters are curious as to what they are seeing.

Moorings

Velella velella or *by-the-wind sailors*

Velella velella

Photo courtesy of Julia Bos

While related to jellyfish and anemones, these creatures are actually a type of hydrozoa. Like the Portuguese man o' war, *Velella* is a "super colony" of tiny predatory individuals working together as one.

René Lesson and Pancrace Bessa

The Portuguese man o' war has similar stinging cells that can really hurt!

Why are we seeing them now?

Velella are found around the world, generally in warmer waters. They bloom in spring/summer, and are carried by the wind many miles before washing up on the beach.

Have you seen jellies?

Contribute to science and report your sighting: www.jellywatch.org

UFO Sighting? Email us:

lafr461@ecy.wa.gov

Are they harmful to humans?

Velella is not harmful to humans, but it would be wise to avoid touching your eyes and face if you come in contact with them.

Two week summary:

Air temperatures have been generally above normal for the past two weeks.

Sunshine levels have been above normal until the rain event last week.

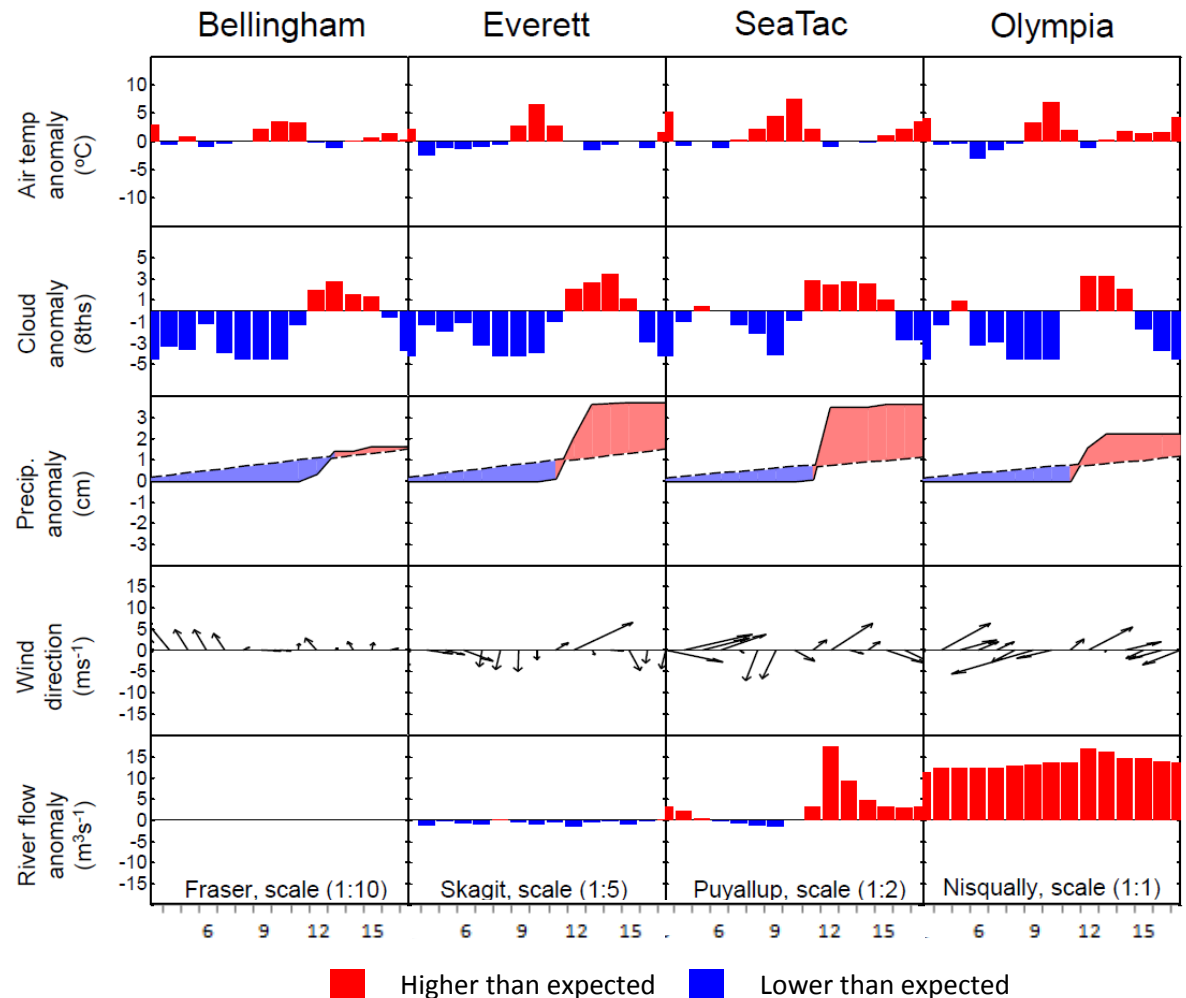

Precipitation occurred last week and was heavy in central sound.

Winds have been primarily from the north for the past few days, but from the south during the rain event.

River flows are normal for the Fraser, below normal for the Skagit, and above normal for the Nisqually and Puyallup.

Our new presentation of meteorological conditions! For monthly data and an explanation of the figures, see our weather webpage at:

July 2014: Temperature increasing

Salinity Increasing

Oxygen Stays Lower

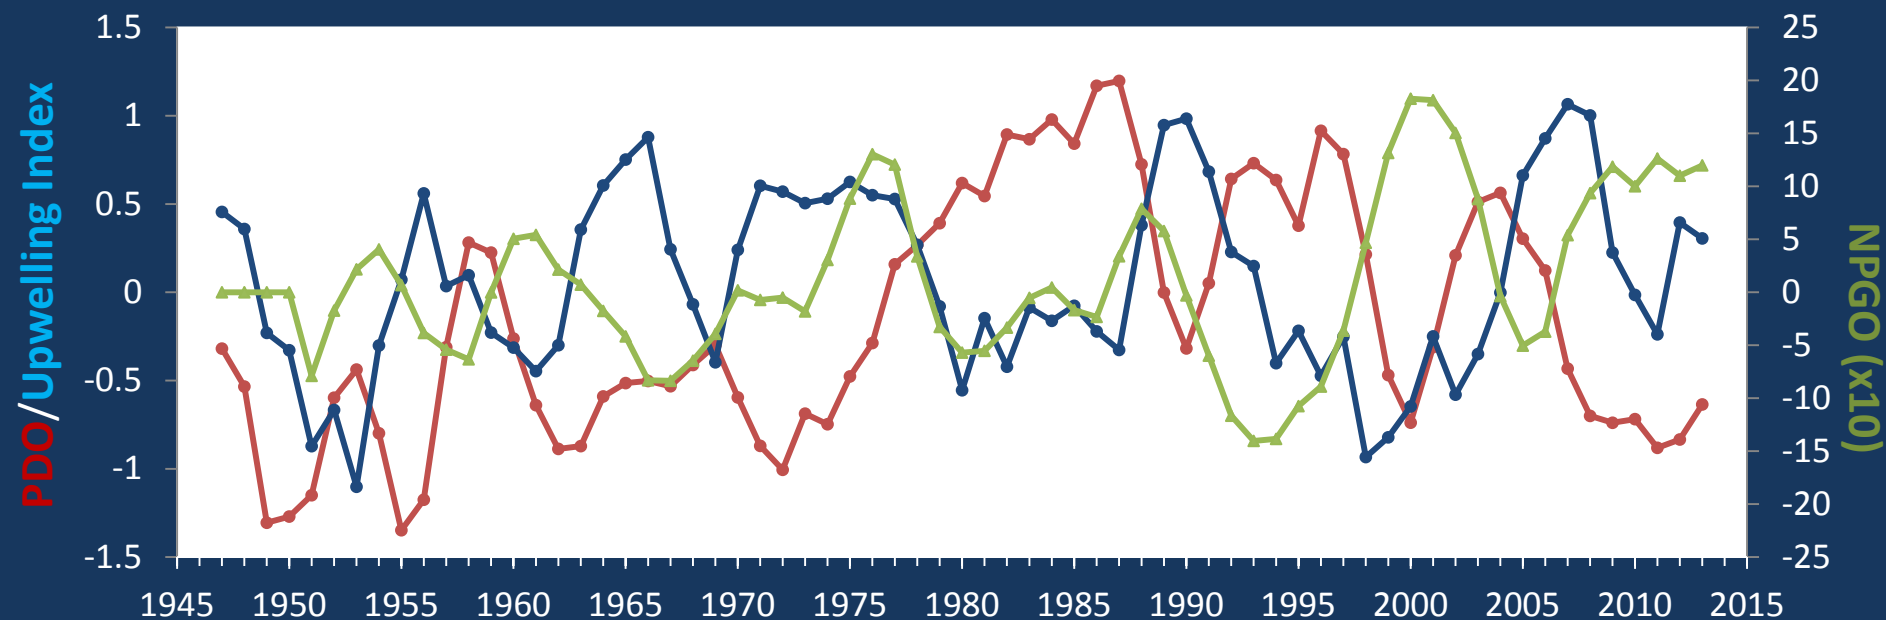

In 2013, Puget Sound was warmer with normal salinity. Early 2014 brought colder, saltier conditions to Puget Sound with lower oxygen in several basins. Starting in March, Puget Sound-wide salinities were lower due to high rain events in the spring. Now temperatures are warmer, salinity is increasing, DO stays lower, and Hood Canal remains unusually cold and salty with higher DO.

The ocean affects water quality: Ocean Climate Indices

[Field log](#)[Weather](#)[Water column](#)[Aerial photos](#)[Ferry and Satellite](#)[Moorings](#)

- a) Pacific Decadal Oscillation Index (**PDO, temperature**) [\(explanation\)](#)
- b) Upwelling Index (anomalies) (**Upwelling, low oxygen**) [\(explanation\)](#)
- c) North Pacific Gyre Oscillation Index (**NPGO, productivity**) [\(explanation\)](#)

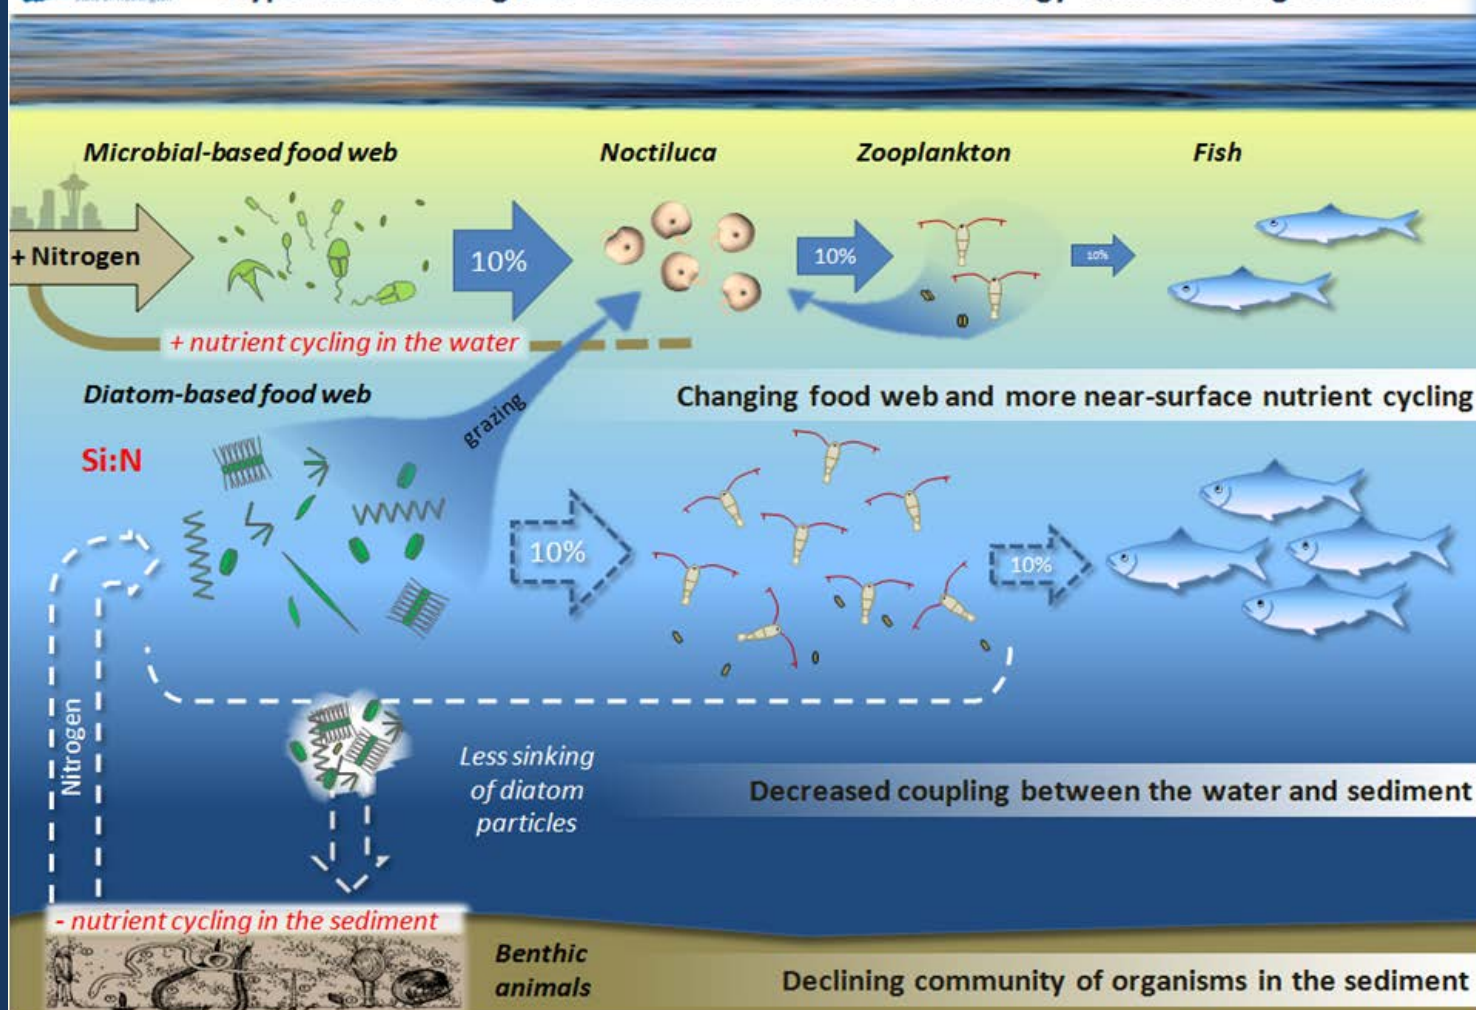

Three-year running average of PDO, Upwelling, and NPGO indices scores

Ocean boundary conditions have been favorable for water quality in Puget Sound: (a) colder water (PDO), (b) less upwelled low oxygen and high nutrient ocean water reaching Puget Sound (Upwelling Index), and (c) higher surface productivity along the coast (NPGO). Where are we heading next?

Is the food web changing in Puget Sound?

Hypothesis: Changes in the Marine Food Web and Energy Transfer in Puget Sound

Drawn by Christopher Krembs

Hypothesis!

Should we pay greater attention to nutrient ratios, energy transfer, and material cycling in Puget Sound?

Noctiluca blooms are a visible harbinger of a changing microbial food web in Puget Sound's waters.

Comments:

Maps are produced by observers during and after flights. They are intended to give an approximate reconstruction of the surface conditions on scales that connect to and overlap with satellite images in the section that follows.

Debris:

Debris can be distinguished into natural and anthropogenic debris floating at the surface *sensu* Moore and Allen (2000). The majority of organic debris in Puget Sound is natural mixed with discarded man-made pieces of plastic, wood, etc. From the plane, we cannot differentiate the quality of debris at the surface and therefore, call it for reasons of practicality just “debris”.

S.L. Moore, M. J. Allen. 2000. Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of the Southern California Bight. Marine Pollution Bulletin, 40(1): 83–88.

Start here

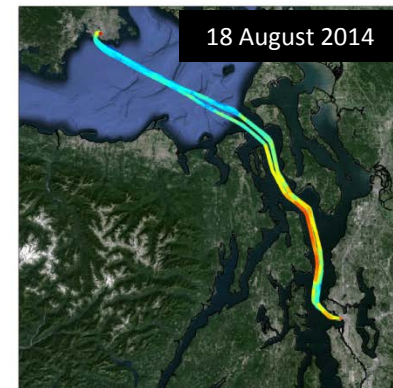

Sea Surface Temperature

Sea surface temperature (SST) is the water temperature close to the surface (2-3 m below). Warm colors show higher SST.

Algal Biomass (Chlorophyll Fluor.)

Chlorophyll a fluorescence gives an estimate of algal concentration/biomass. Warm colors show larger concentrations.

Current Conditions:

Warm, fresh water entering central Puget Sound from Whidbey Basin. Sea surface temperatures > 15 °C. Moderate fluorescence and turbidity near Triple Junction associated with phytoplankton bloom.

Field log

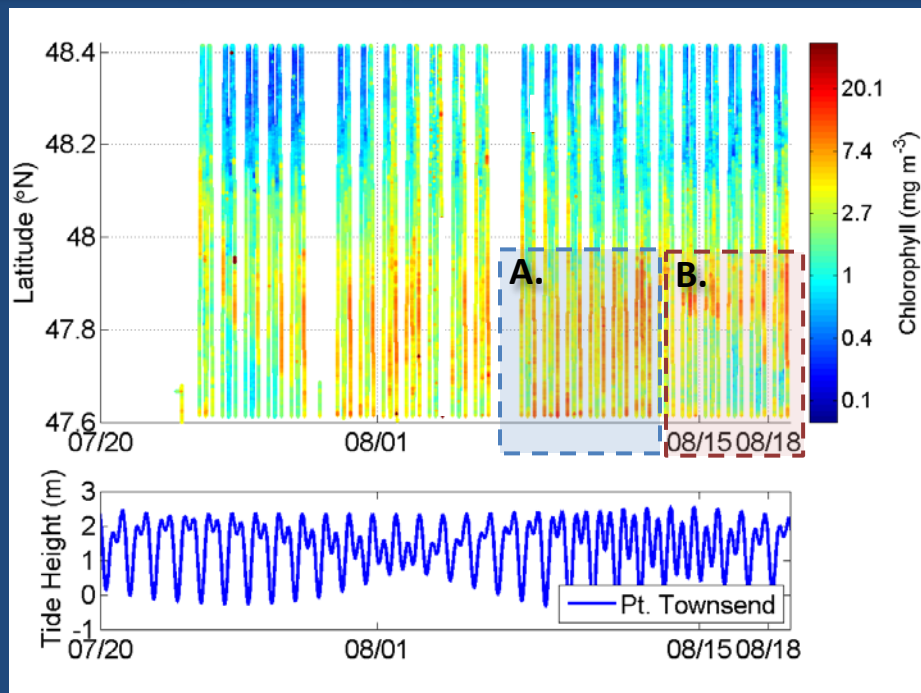

Weather

Water column

Aerial photos

Ferry and Satellite

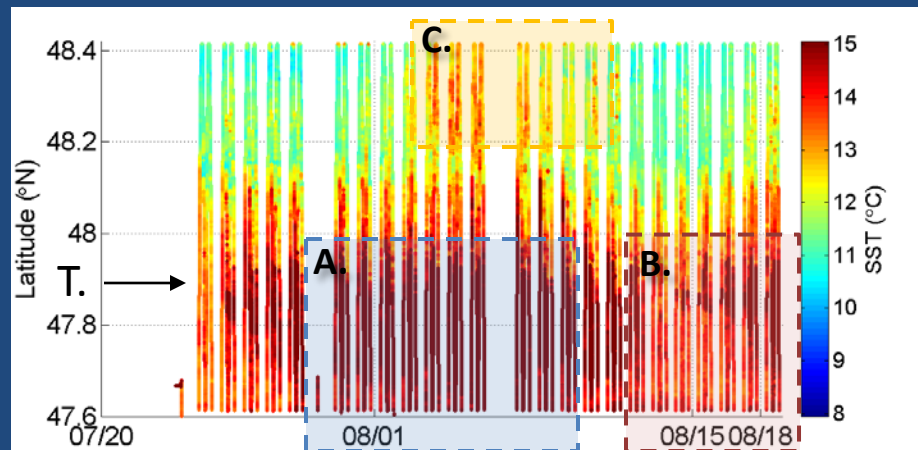

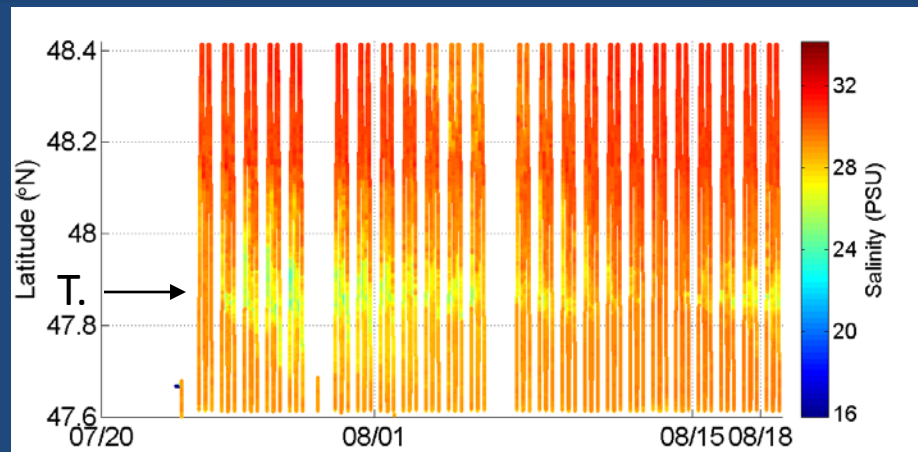

Moorings

A. Warm temperatures in central Puget Sound in early August lead to stratification and promote algal growth.

B. Stratification shows signs of weakening (temperature reduced, salinity increased) and elevated fluorescence is limited to Triple Junction (T).

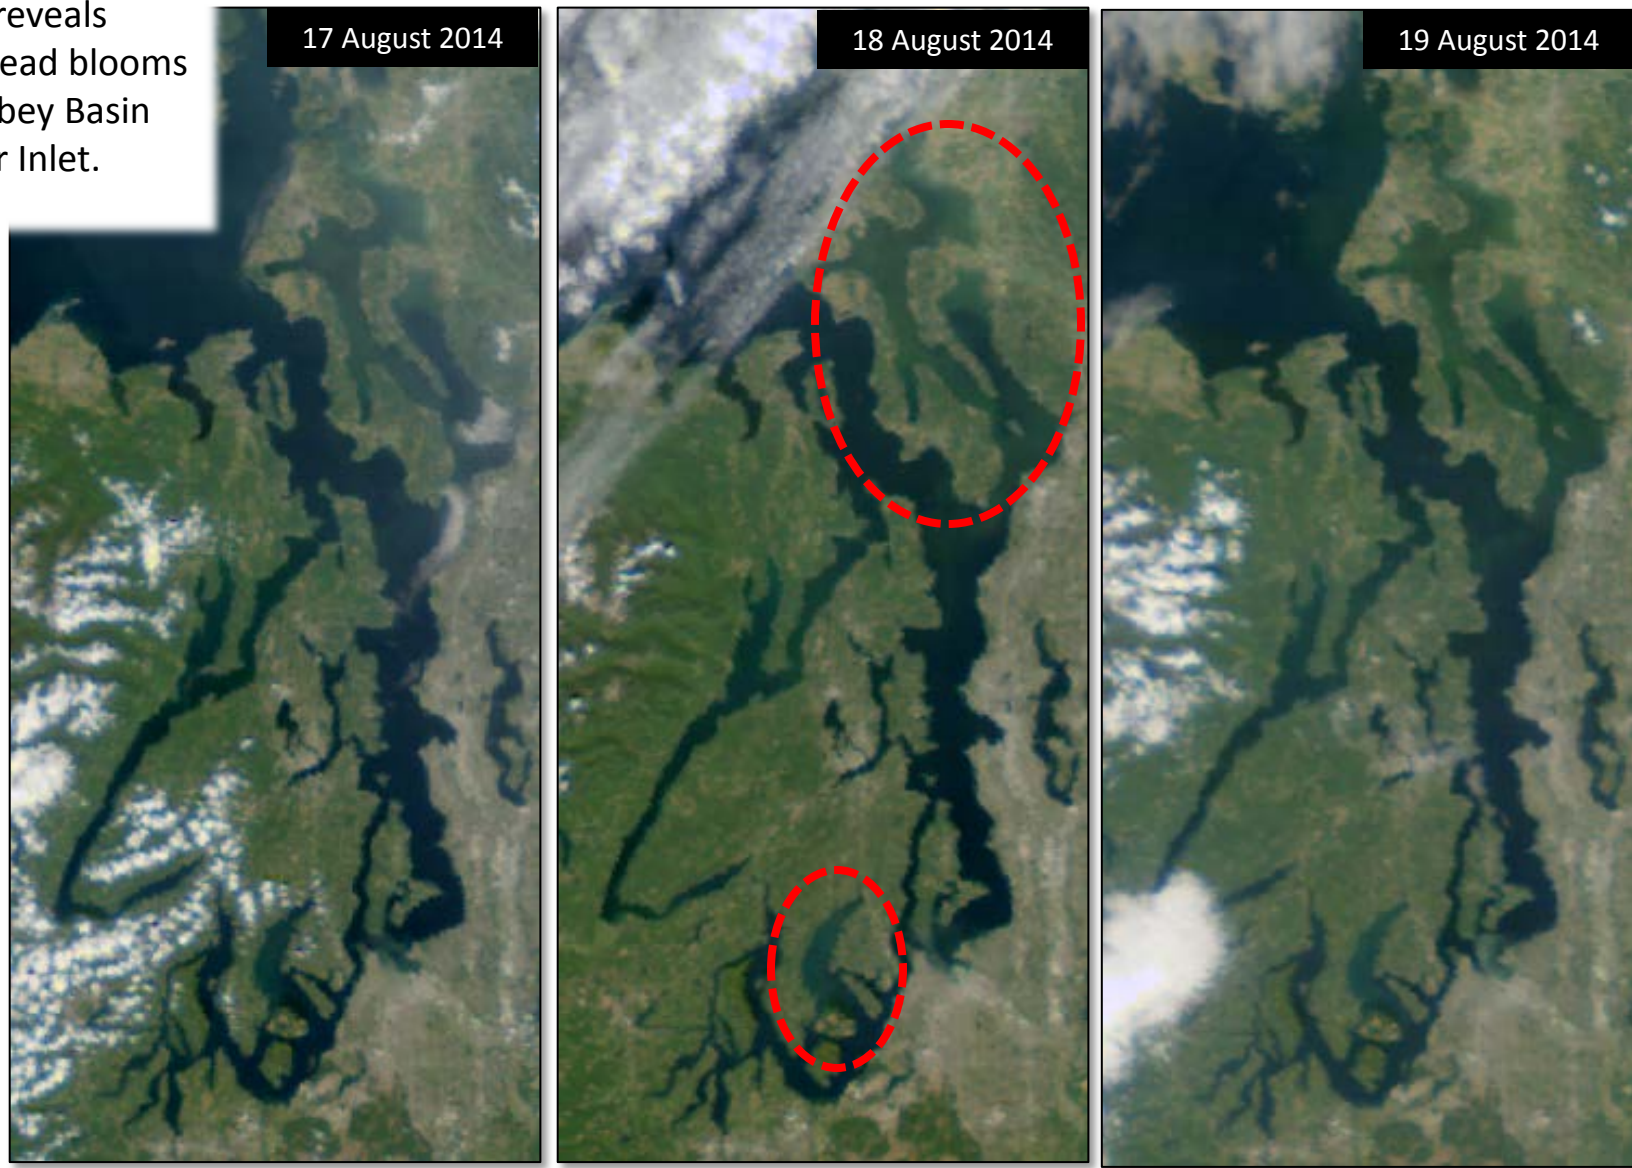

C. Weak tides associated with warmer temperatures export from Puget Sound into Strait of Juan de Fuca.

Rendezvous in Admiralty Reach, 10:10 AM

MODIS reveals widespread blooms in Whidbey Basin and Carr Inlet.

Mooring observations and trends

8-6-2014 to 8-18-2014

Field log

Weather

Water column

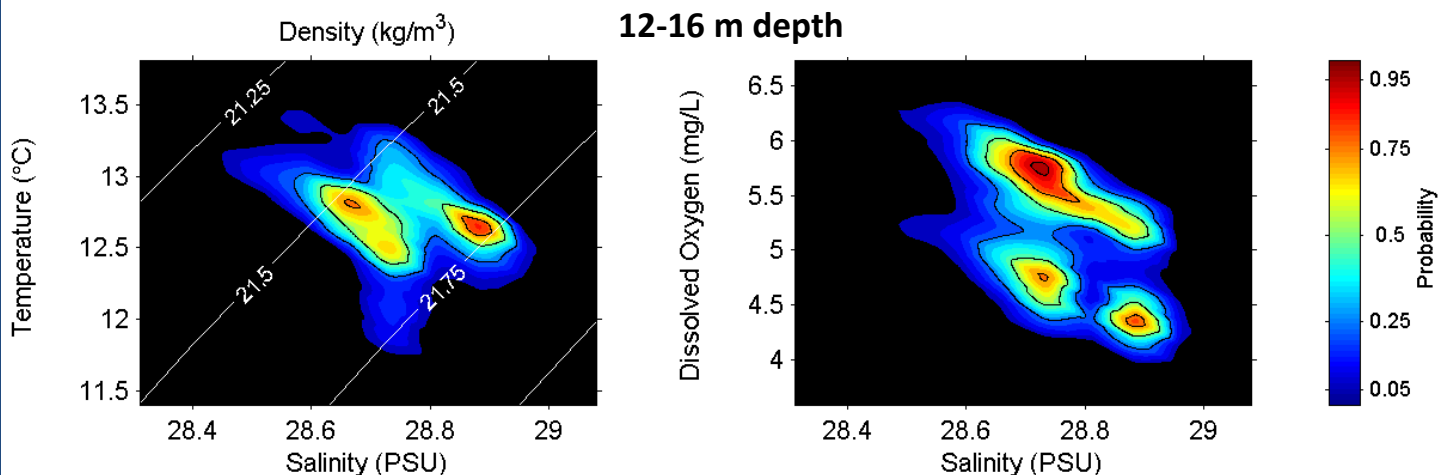

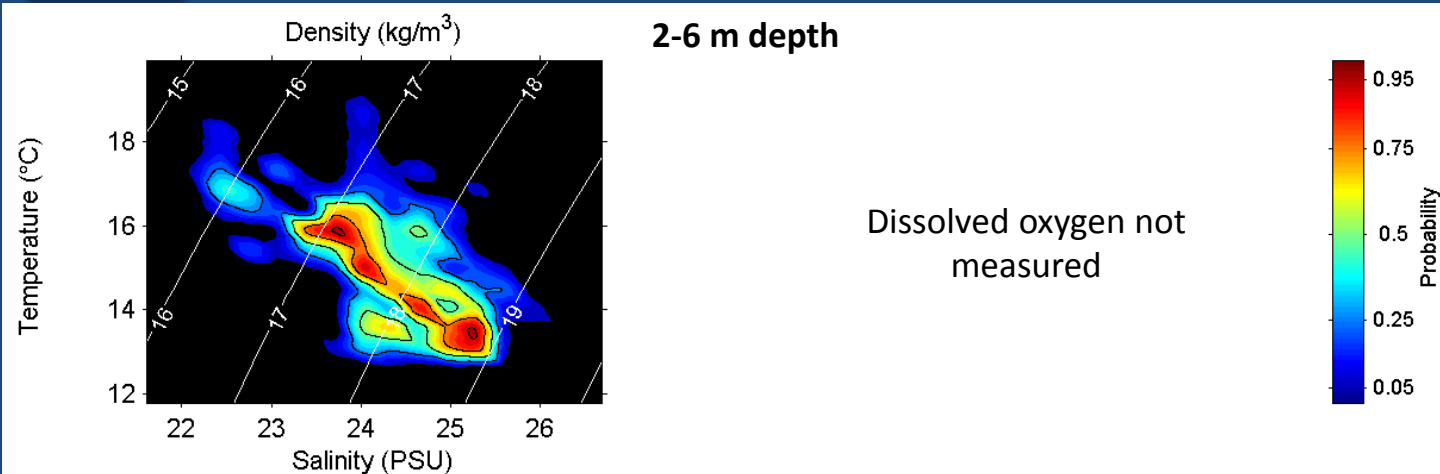

Aerial photos

Ferry and Satellite

Moorings

At Mukilteo, we observed strong vertical gradients between our upper and lower moorings based on temperature, salinity, and dissolved oxygen. Consistent winds from the north and reduced river flows lessen the export of freshwater leaving Puget Sound. Two rainfall periods, July 23 and August 13, and heightened tidal range contributed to temporary increases in river discharges and lower salinity.

These plots show the probability of observations over the past two-week period. High probability shown in warm colors.

Left Panels: Density is defined by salinity and temperature.

Right Panel: Dissolved oxygen concentration in relation to salinity.

Mooring observations and trends

7-16-2014 to 8-18-2014

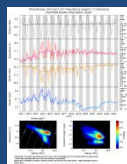

[Field log](#)
[Weather](#)
[Water column](#)
[Aerial photos](#)
[Ferry and Satellite](#)
[Moorings](#)

Our mooring station in Mukilteo is located in Whidbey Basin near Everett. It is also located at the transition between Possession and Central Sounds at a depth that is influenced by the Skagit and Snohomish River discharges, prevailing winds, and tidal mixing.

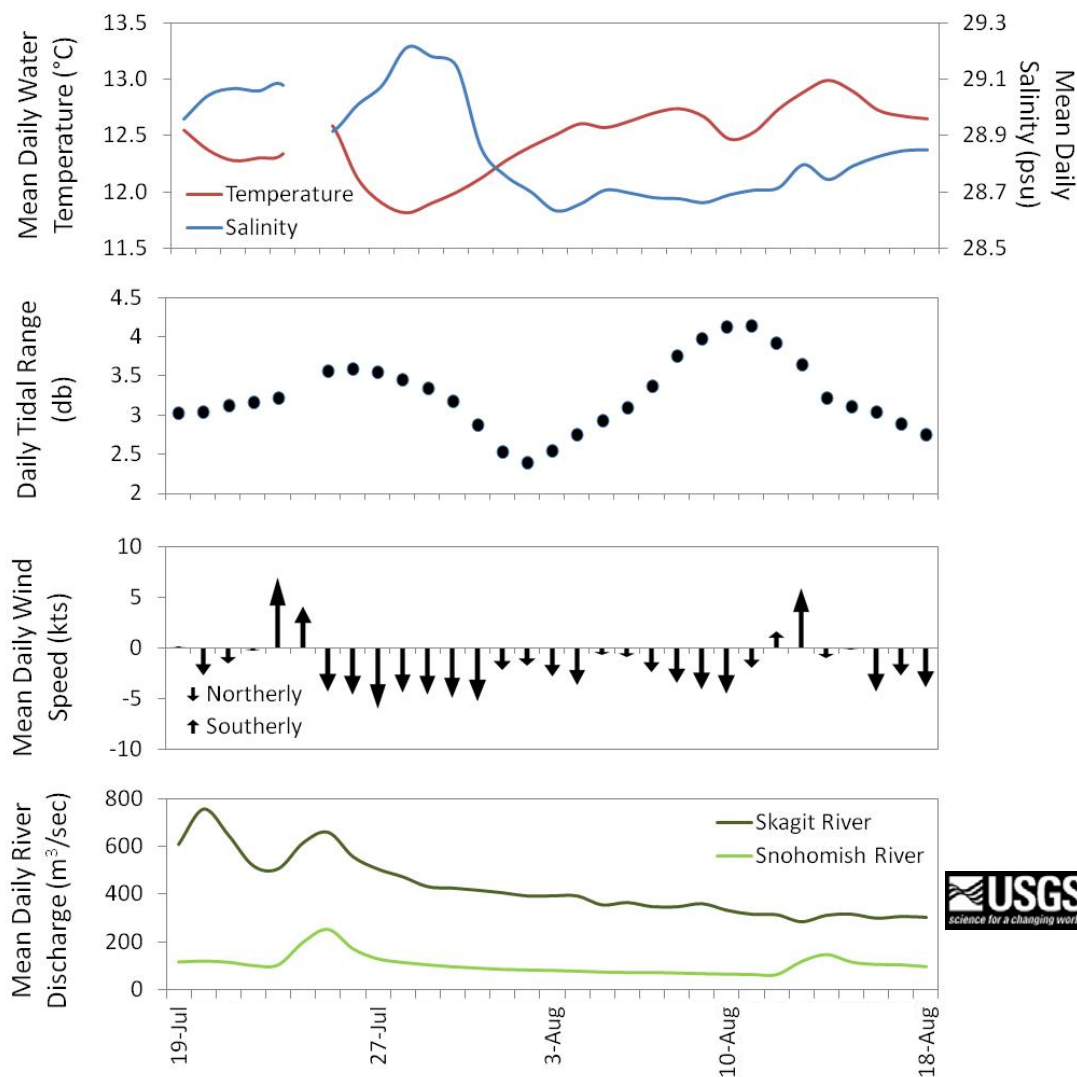

As the largest regional contributor of freshwater to Puget Sound, understanding the timing and magnitude of the Skagit River flow is important.

We present data of daily means for the past 31 days. Data are plotted in Pacific Standard Time. Wind data are from Paine Field in Everett. River flow data are from USGS.

Near-bottom sensor and associated environmental data at Mukilteo

Mooring observations and trends Mukilteo 2010 to 2014

[Field log](#)
[Weather](#)
[Water column](#)
[Aerial photos](#)
[Ferry and Satellite](#)
[Moorings](#)

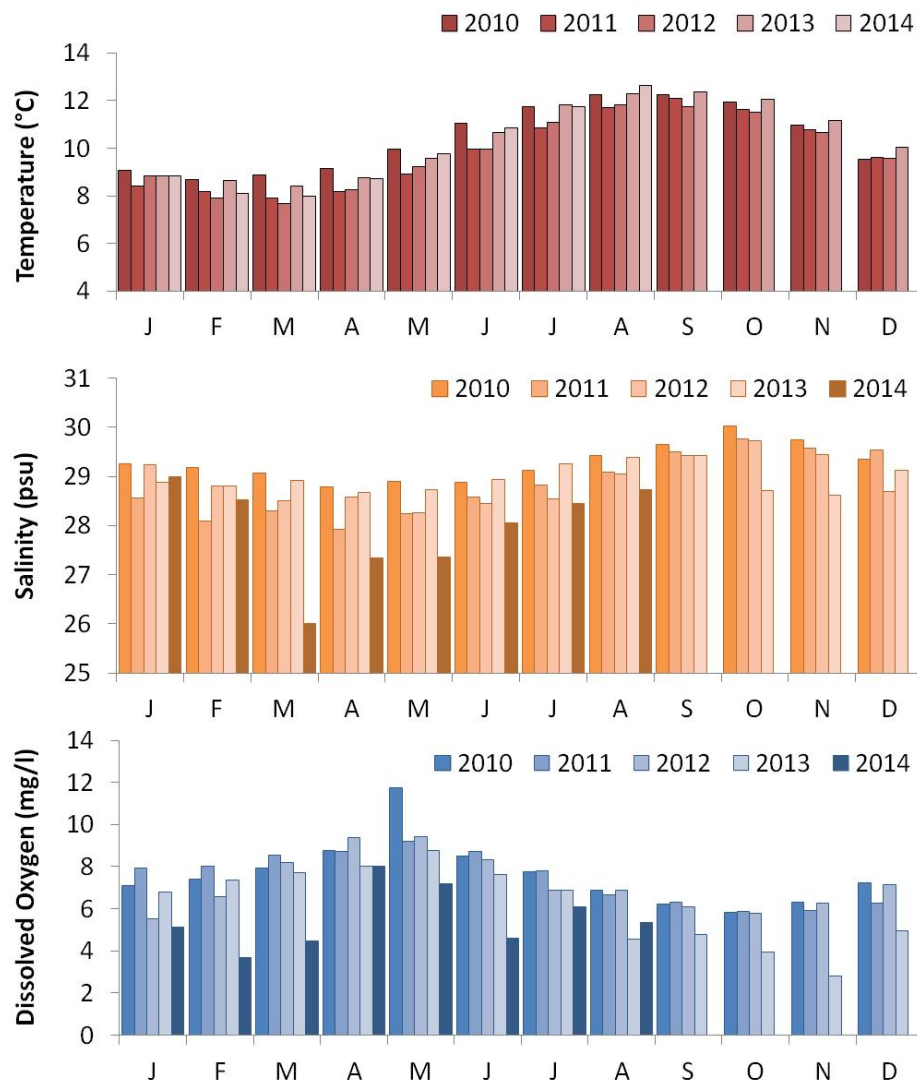

At the Mukilteo mooring, we use the near-bottom sensor (12-16 m deep) to measure significant inter-annual variability in temperature, salinity, and dissolved oxygen.

Inter-annual variability is shown over a 4.5-year period. All three variables show strong seasonality.

In 2014, trends in salinity and dissolved oxygen appear to decline whereas trends in temperature are similar to 2013. Our bath verifications indicated the dissolved oxygen sensor failed in early July and thus, dissolved oxygen data for July 2014 is from latter half of the month.

Please note that data are provisional. Data are in GMT.

Monthly means of temperature, salinity, and dissolved oxygen
