Personal field log

[p. 4](#)

Today is Halloween. Are phytoplankton scary?

Climate conditions

[p. 6](#)

Continued warm temperatures with increased precipitation. The Fraser River flow is still below normal. PDO and upwelling are above normal.

Water column

[p. 7](#)

At the end of summer, temperatures are high in South Sound, salinities and dissolved oxygen are low in Central Sound. Do remains high in Hood Canal.

Moorings

[p. 38](#)

During October, the near-bottom mooring at our Mukilteo station measured salinity and oxygen higher than past few years, despite increased river discharges.

Aerial photography

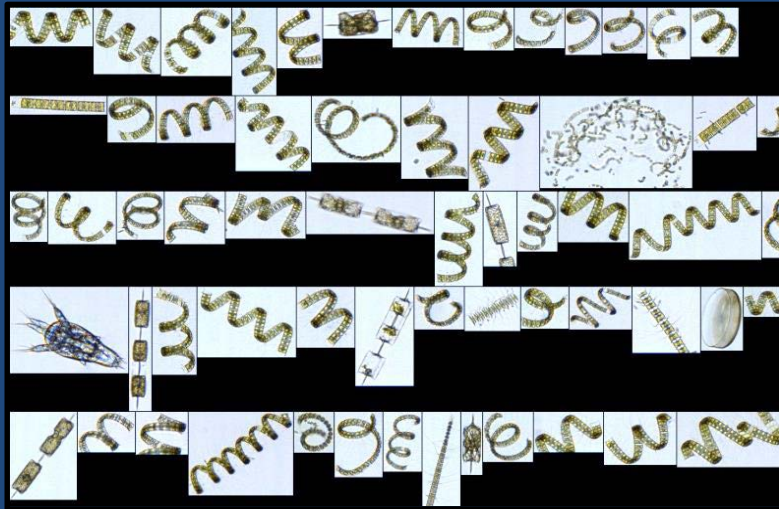

[p. 11](#)

Very dense and large patches of jellyfish seen in finger inlets of South Sound. It must be "Jelloween"! Red-brown blooms remain strong in smaller bays inside Puget Sound, particularly South Sound. Suspended sediment are increasingly visible.

Ferry and satellite

[p. 40](#)

Cooler temperatures and an increased fresh water at the triple junction in Central Sound are seen in the salinity and color characteristics of the water (CDOM).

↑ October diatom bloom at Pt. Jefferson (north central basin), dominated by *Chaetoceros debilis* (curly chains).

FlowCAM compound images

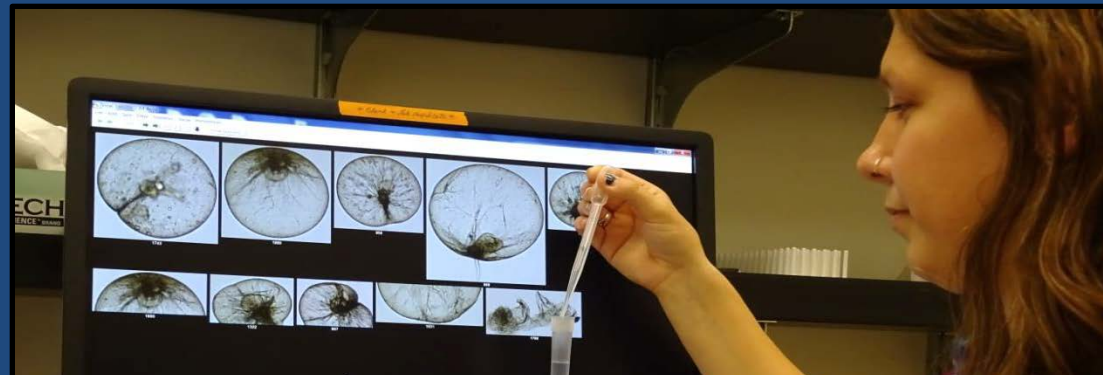

The dinoflagellate *Akashiwo sanguinea*, blooming in Quartermaster Harbor since late September. ↓

Gabriela Hannach,
King County
Environmental Lab

This year's unusually mild fall weather meant an extended growth season for phytoplankton.

1. Mostly diatoms - some dinoflagellates – still forming blooms.
2. *Noctiluca* populations have declined since August.

Analysis of phytoplankton using FlowCAM

This instrument combines a **microscope** with a fast, high resolution **camera** and image analysis **software**. This technology allows for detailed imaging of the complex mixture of particles that comprises a marine plankton sample.

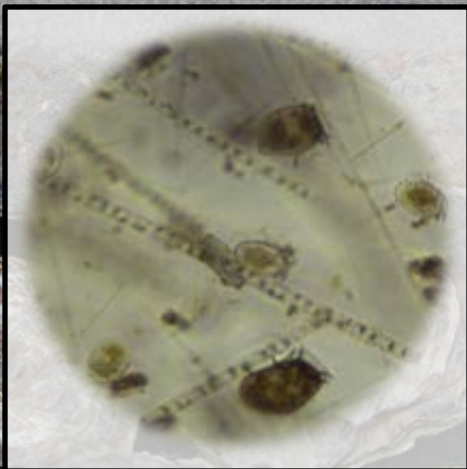

Data generated by FlowCAM include abundance, biovolume, size distribution, and taxonomic identity of all biological particles with an average diameter of 5 to 300 micrometers.

[Field log](#)[Climate](#)[Water column](#)[Aerial photos](#)[Ferry and Satellite](#)[Moorings](#)

All About Phytoplankton: Part 2

Are Algal Blooms Harmful?

The majority of algal blooms are not harmful. However, there are several species of phytoplankton that cause Harmful Algal Blooms (HABs). HABs can negatively impact the health of humans and animals that consume shellfish (such as clams, mussels, and oysters) that are exposed to these blooms.

Bloom of the HAB species
Dinophysis

Photo taken by Laura Hermanson

HAB species are harmful because they contain certain toxins. Since shellfish are filter feeders, they consume these harmful species in large quantities and accumulate the toxins in their tissues. These toxins do not affect the shellfish, but they can affect anyone who eats the shellfish.

What Causes Harmful Algal Blooms?

Illness caused by eating shellfish that contain HAB toxins can cause gastric distress, short-term memory loss, loss of motor control, and in extreme cases, death due to respiratory arrest. It sounds scary, but there are ways to protect yourself.

How can you stay safe?

Shellfish Safety Website:

<https://fortress.wa.gov/doh/eh/maps/biotoxin/biotoxin.html>

Dinophysis is a dinoflagellate that causes Diarrhetic Shellfish Poisoning (DSP).
Toxin Produced: Okadaic Acid

Alexandrium is a dinoflagellate that causes Paralytic Shellfish Poisoning (PSP).
Toxin Produced: Saxitoxin

Pseudo-nitzschia is a diatom that causes Amnesic Shellfish Poisoning (ASP).
Toxin Produced: Domoic Acid

Know before you dig! The Department of Health makes it easy to locate areas that are safe for recreational harvest. They also monitor commercial growing areas. Visit their website for shellfish safety information and beach closure status. The Department of Ecology is now partnering with DOH to help monitor for HABs.

Phytoplankton photos from King County Marine Monitoring Program:

<http://green.kingcounty.gov/marine/Photos.aspx>

New section! Climate and natural influences are conditions that influence our marine waters, including weather, rivers, and the adjacent ocean (previously called Weather). For an explanation of the figure, see: http://www.ecy.wa.gov/programs/eap/mar_wat/weather.html, page 26.

Summary:

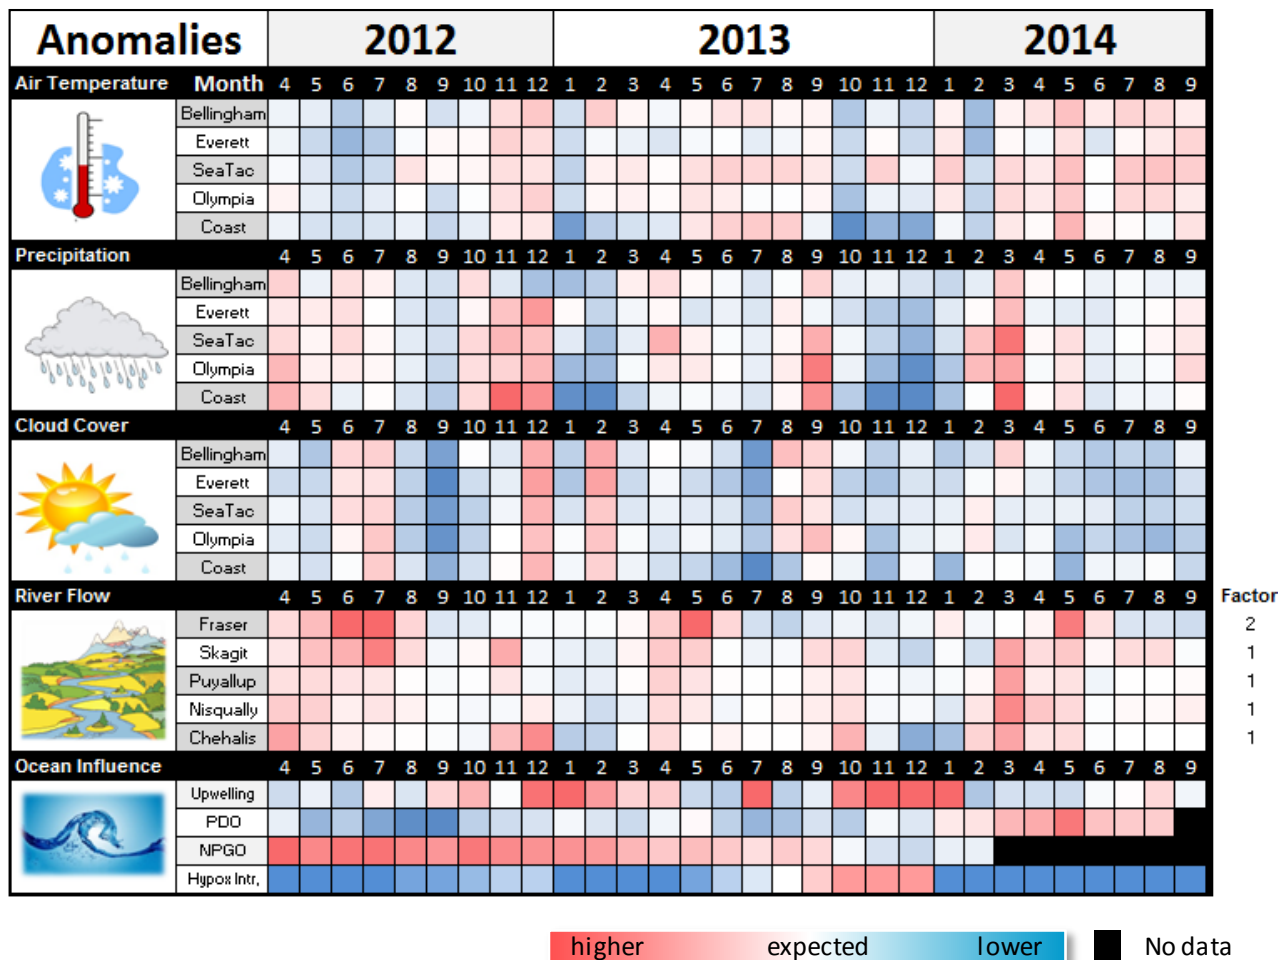

Air temperatures have generally been above normal continuing the trend of the past seven months.

Precipitation levels are increasing. The remnants of Hurricane Ana affect the PNW, aided by warmer-than-normal sea surface temperatures.

Cloud Cover has been lower than normal. Conversely **sunshine** has been above normal.

River flows are below normal for the Fraser River, but normal to above normal elsewhere.

PDO remains in the warm phase, and **upwelling** is below normal. Oceanic intrusions of low DO water were not predicted.

September, 2014: Temperature

Salinity low inside P. Sound

Oxygen lower

■ = higher than expected (>IQR, n>13)
 ■ = expected (=IQR, n>13)
 ■ = lower than expected (>IQR, n>13)
■ = higher than previous measurements
 ■ = no data
 ■ = lower than previous measurements

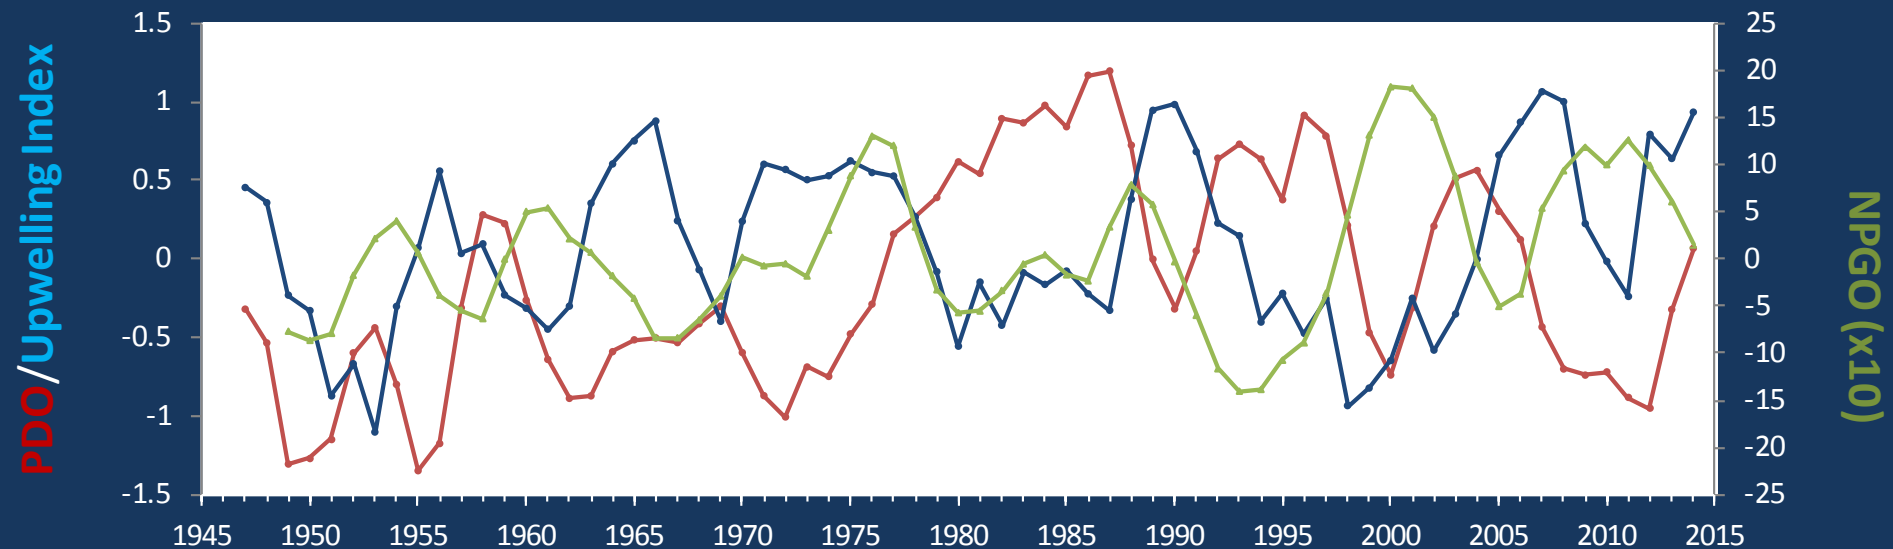

Puget Sound was warmer in 2013 than 2014. Early 2014 started colder and saltier with lower oxygen, then became fresher and warmer. At the end of summer, temperatures are high in South Sound and salinities and dissolved oxygen are low in Central Sound. DO remains high in Hood Canal.

The ocean affects water quality: Ocean Climate Indices

[Field log](#)[Weather](#)[Water column](#)[Aerial photos](#)[Ferry and Satellite](#)[Moorings](#)

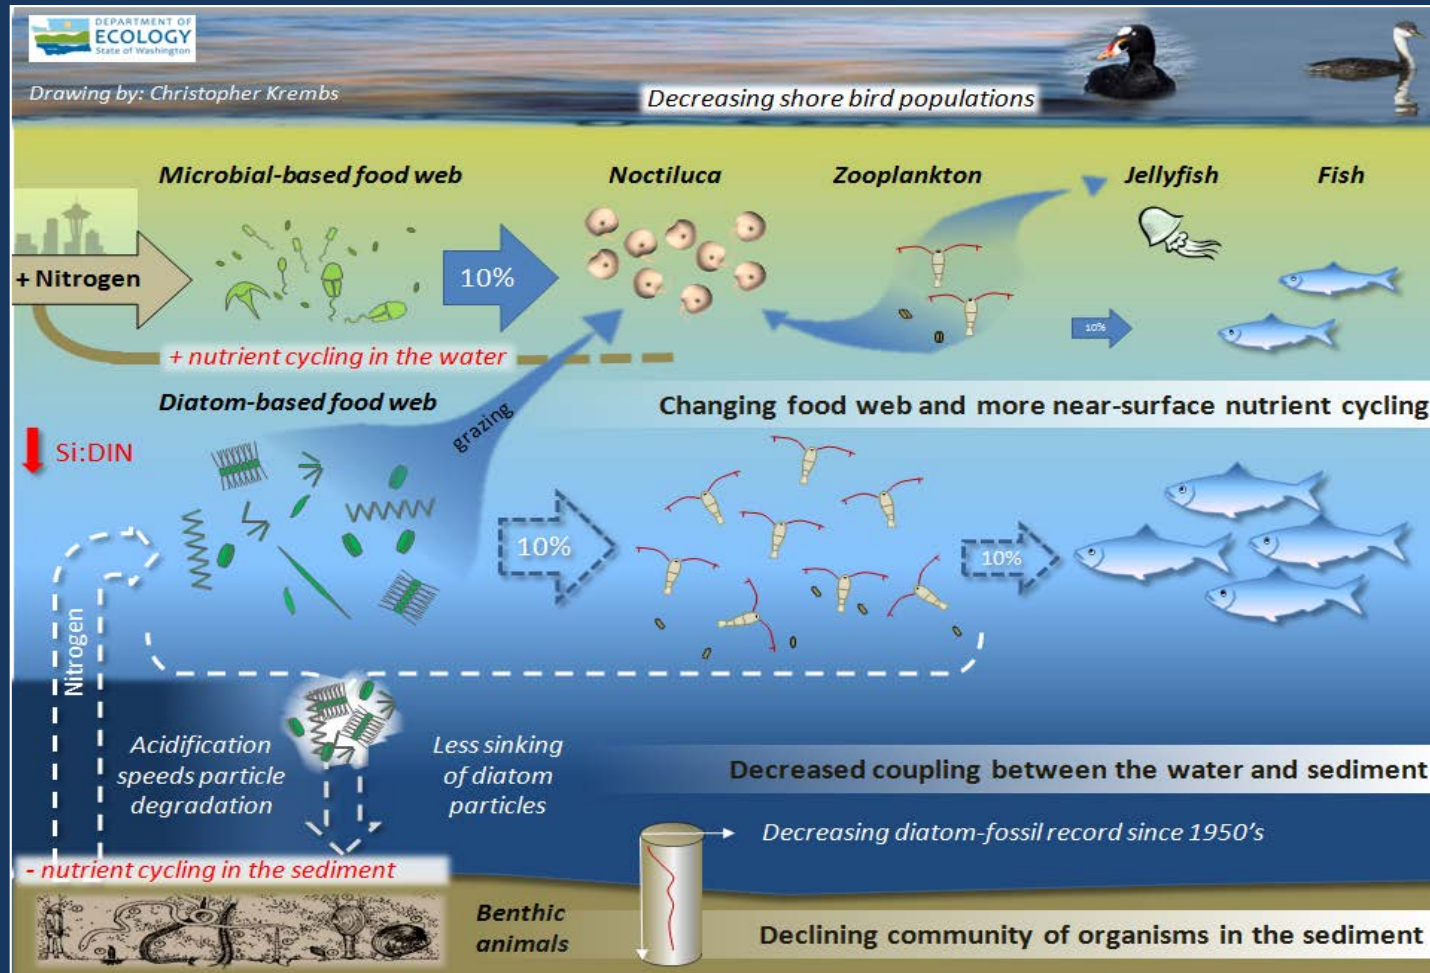

- a) Pacific Decadal Oscillation Index (**PDO, temperature**) [\(explanation\)](#)
- b) Upwelling Index (anomalies) (**Upwelling, low oxygen**) [\(explanation\)](#)
- c) North Pacific Gyre Oscillation Index (**NPGO, productivity**) [\(explanation\)](#)

Three-year running average of PDO, Upwelling, and NPGO indices scores

Ocean boundary conditions have been favorable for water quality in Puget Sound: (a) colder water (PDO), (b) less upwelled low oxygen and high nutrient ocean water reaching Puget Sound (Upwelling Index), and (c) higher surface productivity along the coast (NPGO). Where are we heading next?

Hypothesis for combining a series of recent observations affecting energy and material transfer to higher trophic levels

Hypothesis!

Increases in nitrate concentrations could be caused by a top-down control on phytoplankton biomass.

Noctiluca
a visible harbinger of a food web change?

Are changes in higher trophic levels part of a story of the low food web?

Comments:

Maps are produced by observers during and after flights. They are intended to give an approximate reconstruction of the surface conditions on scales that connect to and overlap with satellite images in the section that follows.

Debris:

Debris can be distinguished into natural and anthropogenic debris floating at the surface *sensu* Moore and Allen (2000). The majority of organic debris in Puget Sound is natural and mixed with discarded man-made pieces of plastic, wood, etc. From the plane, we cannot differentiate the quality of debris at the surface and therefore, call it for reasons of practicality just “debris”.

S.L. Moore, M. J. Allen. 2000. Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of the Southern California Bight. Marine Pollution Bulletin, 40(1): 83–88.

Hardware upgrades on the *Victoria Clipper IV* successfully restored near real-time data collection as of July 23, 2014; we are back online!

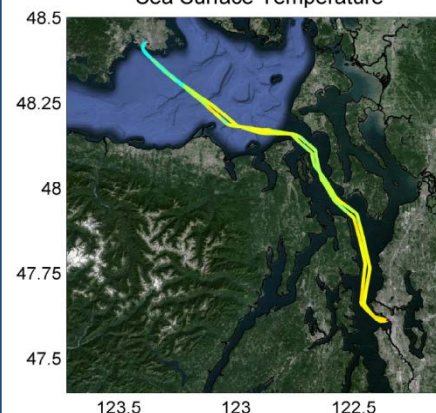

Brandon Sackmann

Contact: bsackmann@integral-corp.com

Start here

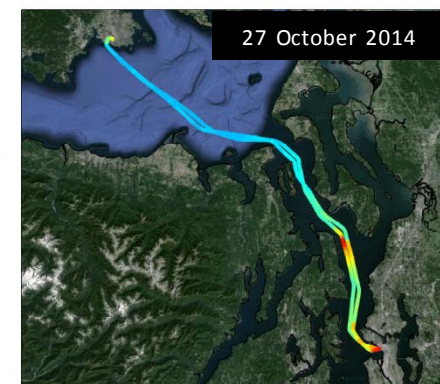

Sea Surface Temperature

Sea surface temperature (SST) is the water temperature close to the surface (2-3 m below). Warm colors show higher SST.

Freshwater Influence (CDOM Fluor.)

For More Information Contact:
Brandon Sackmann, Ph.D. (bsackmann@integral-corp.com)

Measurements of Colored Dissolved Organic Matter (CDOM) fluorescence can be high in rivers and stormwater. Warm colors are often associated with river influenced areas.

Current Conditions:

Cooler temperatures and an increased fresh water at the triple junction in Central Sound are seen in the salinity and color characteristics of the water (CDOM).

Field log

Climate

Water column

Ferry and Satellite

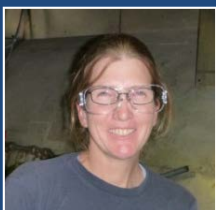

Moorings

The data logging upgrade that was done in July continues to be very successful!

Data are uploaded daily to: <http://107.170.217.21/VictoriaClipper30/level0/>.

When we serviced our fluorometer on Tuesday, we found plastic pieces in the sea chest and aquatic plant on the sensor. We have also found feathers, small fish, sea grass, etc.

One optical lens on the fluorometer has UV rays, so we wear safety glasses with UV protection.

Removing bolts from the sea chest to access the fluorometer.

Tools and gear are set up for easy access.

Mooring observations and trends

10-17-2014 to 10-30-2014

Field log

Climate

Water column

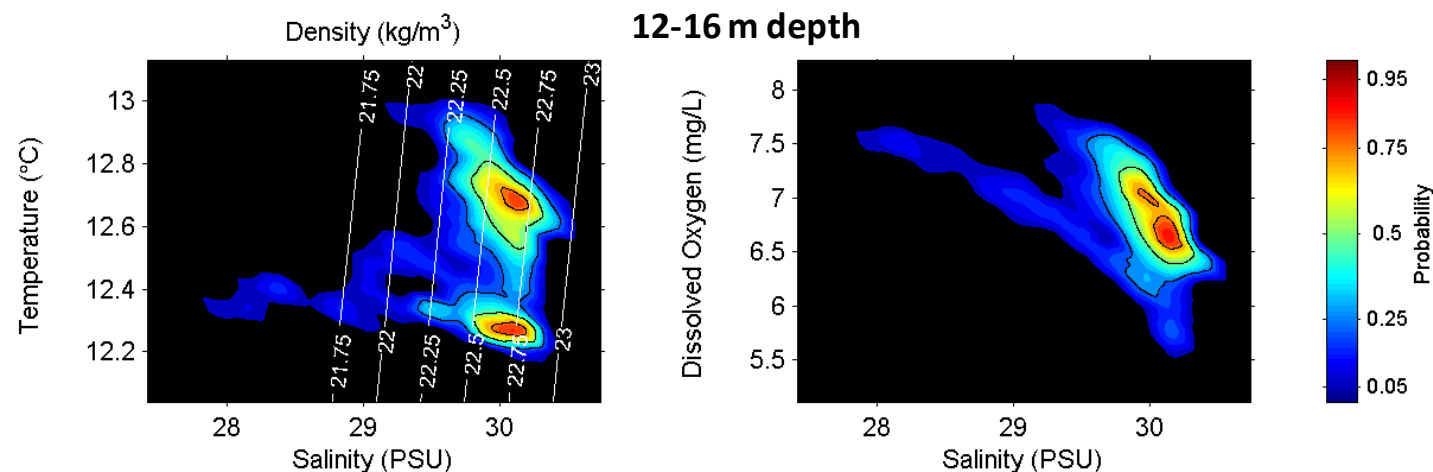

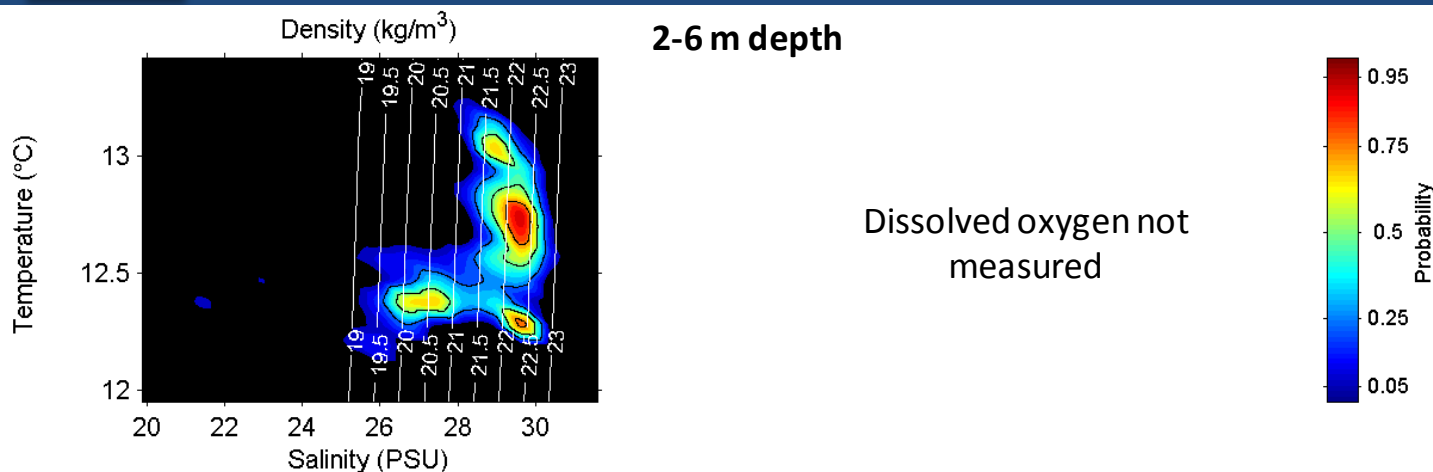

Aerial photos

Ferry and Satellite

Moorings

At Mukilteo, recent rains increased river flows and brought fresh water to our moorings during outgoing tides. In the upper mooring, tidal influences can be seen in the upper left plot. The deeper mooring measured high salinity and increased oxygen. For the entire month of October, temporal trends of temperature followed somewhat similarly to the tidal cycle (see next slide).

These plots show the probability of observations over the past two-week period. High probability shown in warm colors.

Left Panels: Density is defined by salinity and temperature.

Right Panel: Dissolved oxygen concentration in relation to salinity.

Mooring observations and trends

[Water column](#)
[Aerial photos](#)
[Ferry and Satellite](#)
[Moorings](#)

Our mooring station in Mukilteo is located in Whidbey Basin near Everett. It is also located at the transition between Possession and Central Sounds at a depth that is influenced by the Skagit and Snohomish river discharges, prevailing winds, and tidal mixing.

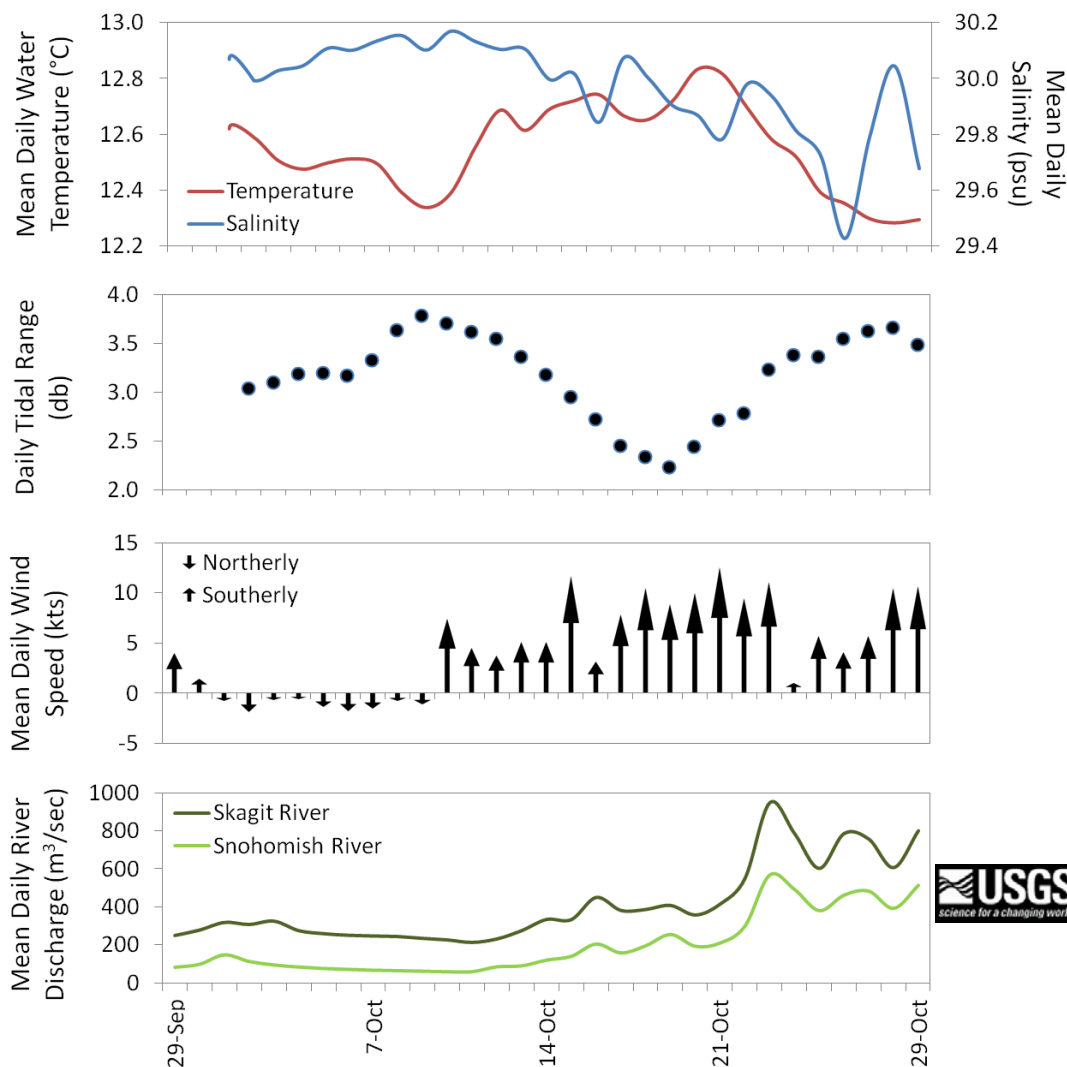

As the largest regional contributor of freshwater to Puget Sound, understanding the timing and magnitude of the Skagit river flow is important.

We present data of daily means for the past 31 days. Data are plotted in Pacific Standard Time. Wind data are from Paine Field in Everett. River flow data are from USGS.

Near-bottom sensor and associated environmental data at Mukilteo

Mooring observations and trends Mukilteo 2010 to 2014

[Field log](#)
[Climate](#)
[Water column](#)
[Aerial photos](#)
[Ferry and Satellite](#)
[Moorings](#)

At the Mukilteo mooring, we use the near-bottom sensor (12-16 m deep) to measure significant inter-annual variability in temperature, salinity, and dissolved oxygen.

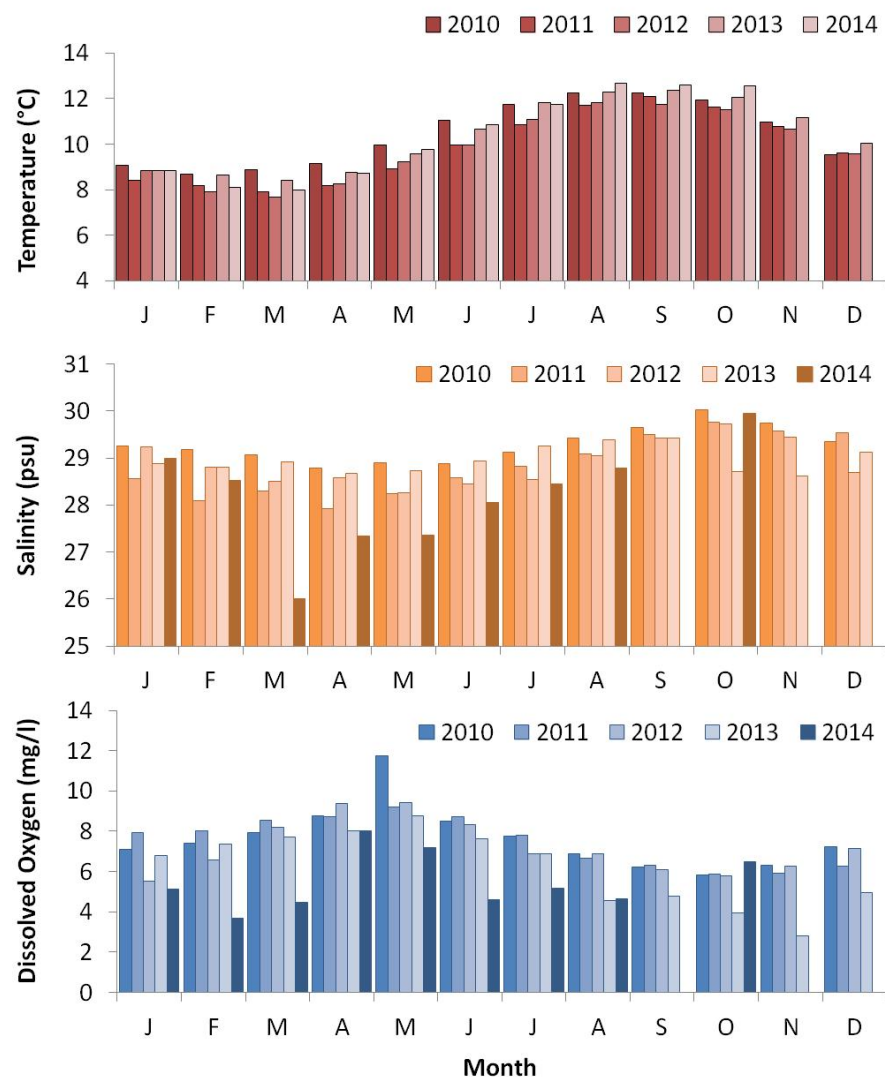

Inter-annual variability is shown over an almost 5-year period. All three variables show strong seasonality.

Through 2014, trends in salinity and dissolved oxygen appear to decline whereas trends in temperature are similar to 2013. For October, temperature and oxygen are higher than the past four years.

September 2014 data for salinity and oxygen are invalid after we found the sensor sitting on sediment. Our bath verifications indicated the dissolved oxygen sensor failed in early July and thus, dissolved oxygen data for July 2014 is from latter half of the month.

Please note that data are provisional. Data are in GMT.
