## Personal field log

[p. 3](#)

The Brown Pelican *Pelecanus occidentalis* and warmer water.

## Climate conditions

[p. 5](#)

The air temperature and ocean conditions remain warm. Rivers are above normal except at the coast (Chehalis). Sunshine and precipitation have been episodic during the past two weeks.

## Water column

[p. 6](#)

In 2014, temperatures got really warm, salinity decreased in Central and South Sound, and oxygen was mostly lower except in Hood Canal where a high anomaly persisted.

## A Hypothesis

[p. 9](#)

Nitrogen is significantly increasing. The nutrient balance is changing in Puget Sound. We need to talk about it!

## Aerial photography

[p. 10](#)

Numerous patches of jellyfish persist in clear water of finger inlets of South Sound. Willapa Bay reveals its interesting subtidal pattern and human activity during ebbing tide.

Once a month we travel to Grays Harbor and Willapa Bay for our Coast marine flight. During these flights we usually see brown pelicans. It is always entertaining to watch these large, beautiful pelicans fly and dive for food. So this month we wanted to highlight some facts about this charismatic coastal bird.

## The Brown Pelican *Pelecanus occidentalis*

### Characteristics

Pale yellow crown

White head

Very long bill that  
can hold about 3  
gallons of water

Silver/grey/brown  
body

3.25-5 ft. long  
6-12 lbs.

6-8 ft. Wingspan

Webbed feet

### Habitat

Coastal areas including sandy beaches, lagoons, and marine estuaries.

Sandy Beaches at Ocean Shores

Mudflats in Grays Harbor

### Range Map

Atlantic, Pacific, and Gulf Coast

Field log

Climate

Water column

Aerial photos

-

-

## Behavior

Brown pelicans are gregarious birds that roost, migrate, and feed in groups. They plunge dive from up to 60 ft. to catch fish with their huge bill pouches.

*Diving pelican*

*Brown pelicans and seagulls  
feasting on a school of fish in  
Willapa Bay*

## Diet

Marine invertebrates and mostly small forage fish such as...

Herring

Mullet

Sardines

## Conservation Connection

Brown pelicans almost went extinct in the late 1950's due to harmful pesticides, such as DDT, entering the food web.

Past protection under the endangered species act and banning DDT has enabled brown pelican populations to recover and thrive today.

## Affected by an Unusually Warm Ocean?

NOAA scientists observed much higher than usual sea surface temperatures in the North Pacific Ocean throughout 2014 that did not follow typical El Niño weather patterns. The warm waters may benefit some species and negatively impact others. Scientists also observed rare sightings of tropical species off the west coast due to these warmer waters.

**New section! Climate and natural influences** are conditions that influence our marine waters, including weather, rivers, and the adjacent ocean (previously called Weather). For an explanation of the figure, see: [http://www.ecy.wa.gov/programs/eap/mar\\_wat/weather.html](http://www.ecy.wa.gov/programs/eap/mar_wat/weather.html), page 26.

## Summary:

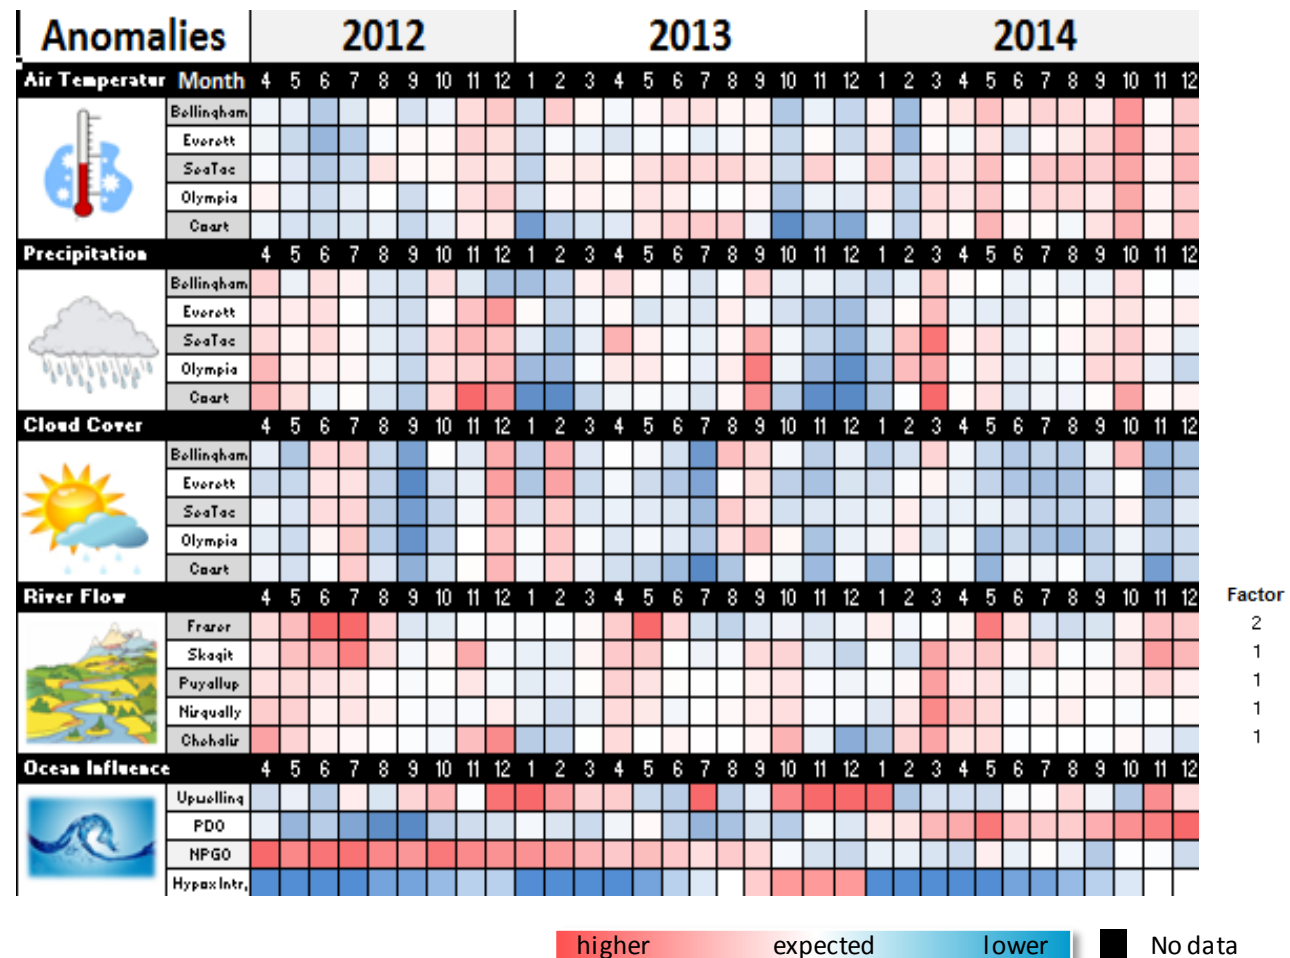

**Air temperatures** have generally been above normal continuing a 9-month trend.

**Precipitation** has been episodic, with several rain events in the past two weeks.

**Sunshine** has alternated with clouds over the past two weeks.

**River flows** are above normal across the Puget Sound region, but below normal at the coast (Chehalis River).

**PDO** remains in the warm phase, and **upwelling** is increasing.

We communicate data and environmental marine conditions using:

1. Marine Water Condition Index (MWCI)
2. Eyes Over Puget Sound (EOPS)
3. Anomalies and source data

# 2014: Very Warm Fall! Physical conditions in the water column

Field log

Weather

Water column

Aerial photos

-

-

Temperature warmer

Salinity lower in Central & South

Oxygen lower except HC

■ = higher than expected (>IQR, n=13)  
■ = higher than previous measurements

■ = expected (=IQR, n=13)  
■ = no data

■ = lower than expected (>IQR, n=13)  
■ = lower than previous measurements

In 2014, conditions were dominated by warm water during summer and fall, associated with the NE Pacific warm surface anomaly. In October and November, temperatures were the highest on our record since 1989. Salinity was higher in early 2014, then waters south of Admiralty Reach became fresher while saltier conditions persisted in the San Juans. Oxygen was mostly lower except in Hood Canal where a high anomaly persisted into the fall.

# The ocean affects water quality: Ocean Climate Indices

Field log

Weather

Water column

Aerial photos

-

-

- a) Pacific Decadal Oscillation Index (**PDO, temperature**) [\(explanation\)](#)
- b) Upwelling Index (anomalies) (**Upwelling, low oxygen**) [\(explanation\)](#)
- c) North Pacific Gyre Oscillation Index (**NPGO, productivity**) [\(explanation\)](#)

## Three-year running average of PDO, Upwelling, and NPGO indices scores

Ocean boundary conditions have been favorable for water quality in Puget Sound: (a) colder water (PDO), (b) less upwelled low oxygen and high nutrient ocean water reaching Puget Sound (Upwelling Index), and (c) higher surface productivity along the coast (NPGO). Where are we heading next?

# Hypothesis for combining a series of recent observations affecting energy and material transfer to higher trophic levels

## Hypothesis!

Increases in nitrate concentrations could be caused by a top-down control on phytoplankton biomass.

**Noctiluca**  
a visible harbinger of a food web change?

Are changes in higher trophic levels part of a story of the low food web?

## Comments:

Maps are produced by observers during and after flights. They are intended to give an approximate reconstruction of the surface conditions on scales that connect to and overlap with satellite images in the section that follows.

## Debris:

Debris can be distinguished into natural and anthropogenic debris floating at the surface *sensu* Moore and Allen (2000). The majority of organic debris in Puget Sound is natural and mixed with discarded man-made pieces of plastic, wood, etc. From the plane, we cannot differentiate the quality of debris at the surface and therefore, call it for reasons of practicality just “debris”.

*S.L. Moore, M. J. Allen. 2000. Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of the Southern California Bight. Marine Pollution Bulletin, 40(1): 83–88.*
