Personal impressions

[p. 4](#)

During this time of year, humans and seals hang out at the beach!

Climate conditions

[p. 6](#)

In June, air temperatures and sunlight are above normal. Precipitation is near-normal, but some rivers in the north are still lower than normal.

Water column

[p. 7](#)

June: salinity is still lower than normal, and record-breaking water temperatures continue; but luckily, dissolved oxygen is at expected levels. At the coast lower oxygen, higher salinities and a higher-than-normal upwelling index suggest the influence of upwelling.

Aerial photography

[p. 11](#)

Jellyfish smacks in Eld and Budd Inlets. Blooms in Budd, Eld, Totten and Carr Inlets. Macro-algae on beaches in Carr Inlet and Vashon Island and adrift in Central Sound. Abundant organic debris between Port Orchard and Agate Passage.

Continuous monitoring

[p. 35](#)

Surface temperature >15 °C. Algae continue to be abundant. On July 4th blooms extended into the Strait of Juan de Fuca. Windy conditions on July 9-11 temporary reduced algae biomass.

Streams

[p. 37](#)

For July, river flows are improving relative to last year's levels. Glacial flour in some rivers is high because meltwater is predominantly from glaciers instead of snowpack.

Critter of the Month - The Glistenworm (*Chaetoderma argenteum*)

The Glistenworm

This month's critter belongs to the Phylum Mollusca, but you won't find its shell on the beach like other snails and clams. Find out how this little "naked mollusc" fits into the Puget Sound benthic community!

Fun Facts!

- A. Tooth-like feeding structure.
- B. Covered with microscopic spines that give it a shiny, fuzzy appearance.
- C. Burrows in sediment using a shield around its mouth.

Harbor Seals of Puget Sound – *Phoca vitulina*

Mattie Michalek, Washington Conservation Corps Intern

Harbor seals are the most common marine mammal in the Puget Sound, and we often see them from the float plane while monitoring water quality. These small, spotted mammals weigh about 250-300 pounds, can dive 300 feet, and stay underwater for up to 28 minutes. During this time of year, we can see seals spending more time on beaches at lower tides, a practice known as “hauling out.”

This seal pup is hanging out on shore in Padilla Bay while mom forages for food nearby. Photo Credit: Padilla Bay National Estuarine Research Reserve

Seal haulout site

Credit: Washington State Department of Fish and Wildlife

Haulout sites are important for seals. They provide a place for seals to rest, give birth, and nurse their young, and provide protection from predators. In these warmer months, we see harbor seals on shorelines and sand spits on almost every flight .

What is the visibility in the water for divers?

	Best /Depth		Least /Depth
	(Depth is in feet)		
1)	19 / 79		6 / 5
2)	23 / 98		7 / 8
3)	19 / 49		11 / 7
4)	39 / 77		13 / 18
5)	37 / 5		8 / 38
6)	36 / 80		23 / 10
7)	23 / 61		4 / 23
8)	35 / 89		3 / 3
9)	6 / 16		5 / 3
10)	17 / 98		13 / 16
11)	24 / 95		11 / 10
12)	9 / 97		7 / 3
13)	18 / 25		4 / 5

Find depths with high and low visibility

- **Best visibility** was around 35 feet or more.
- **Poor visibility** occurred in many places of Puget Sound in the first 10 feet of the surface.
- In June, compared to May, visibility improved in Central Basin to the south of Seattle.
- Elliott Bay visibility improved from 22 feet to 39 feet.
- We use transmissometer readings from our CTD package and convert them into horizontal visibility.

This is a new feature, and we are soliciting feedback on it (salb461@ecy.wa.gov). Eventually we will feature the most recent data.

Climate and natural influences, including weather, rivers, and the adjacent ocean, can affect our marine waters. Graphics are based on provisional data and are subject to change.

http://www.ecy.wa.gov/programs/eap/mar_wat/weather.html, page 26.

Summary for June:

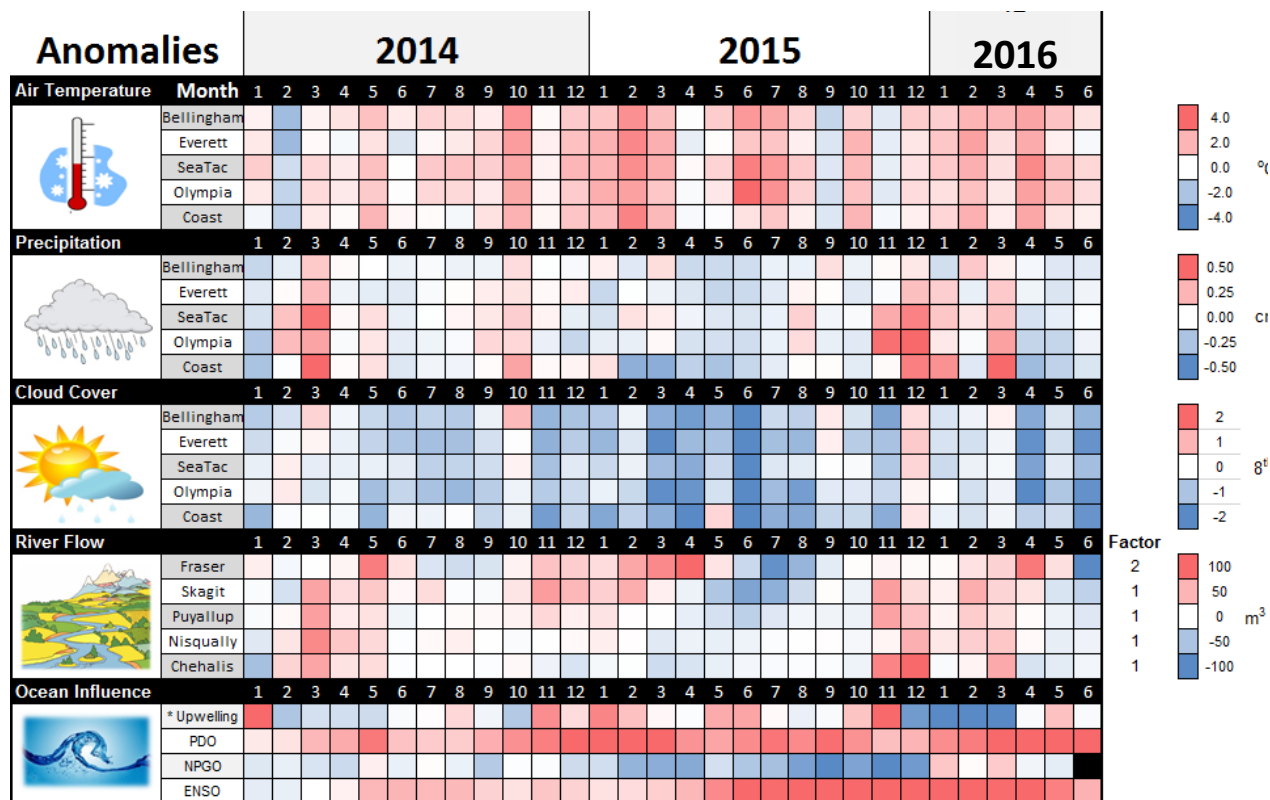

Air temperatures remain above normal in the Puget Sound lowlands, though less extreme than earlier in the year.

Precipitation levels are normal to below-normal.

Sunshine levels have been above normal.

River flows are below normal, particularly in the north.

Upwelling is normal, and ENSO & PDO are above normal. (See Ocean Climate Indices page.)

Upwelling Anomalies (PFEL)

ENSO = El Niño Southern Oscillation

PDO = Pacific Decadal Oscillation

Stations are sampled monthly by region using four independent flights. The float plane is equipped with a CTD package.

We use a boat and a chartered float plane to access our monthly monitoring stations.

Start here

We communicate data and environmental marine conditions using:

1. Marine Water Condition Index (MWCI)
2. Eyes Over Puget Sound (EOPS)
3. Anomalies and source data

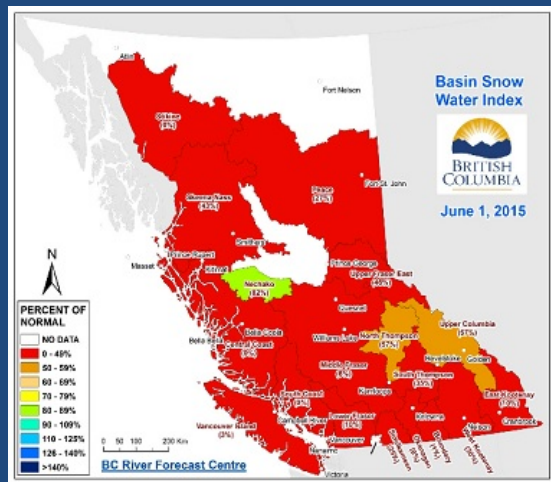

Year 2016 continues to have record-breaking global temperatures. In our region, the Fraser River has not been flowing as high as last year, and now flows have plummeted. **Estuarine circulation is important because water temperatures in Puget Sound are still warmer than normal and continue to break new records!** The Fraser River is the largest freshwater source for the Salish Sea, significantly affecting and driving estuarine circulation.

In winter and spring 2016, the Fraser River and other rivers discharged prematurely. This year's Fraser summer flow is extremely low, in response to warm winter temperatures and lack of snowpack in BC. **Very low summer flows inhibit the renewal of water in Puget Sound.**

Source: http://wateroffice.ec.gc.ca/index_e.html

<http://bcrcf.env.gov.bc.ca/bulletins/watersupply/SnowIndexMap.htm>

BC, Canada didn't have much snow left by June 2016.

NOAA

Long surface water residence time reduced snowpack

Credit: Christopher Krembs

Very low Fraser River flow this summer means stagnant water in the Salish Sea and reduced exchange with the coast. As a consequence, water warms and pollution accumulates.

Field log

Climate

Water column

Streams

A record-warm spring brought ample meltwater to Puget Sound. Salinity is still lower than normal. Record-breaking water temperatures continue in June, and dissolved oxygen is at expected levels. At the coast (Grays Harbor and Willapa Bay), temperatures are at expected levels, salinity is higher, and oxygen is lower, suggesting upwelling effects.

Temperature still high

Salinity still below normal

Oxygen at expected level

Summary of *Victoria Clipper IV* ferry data:

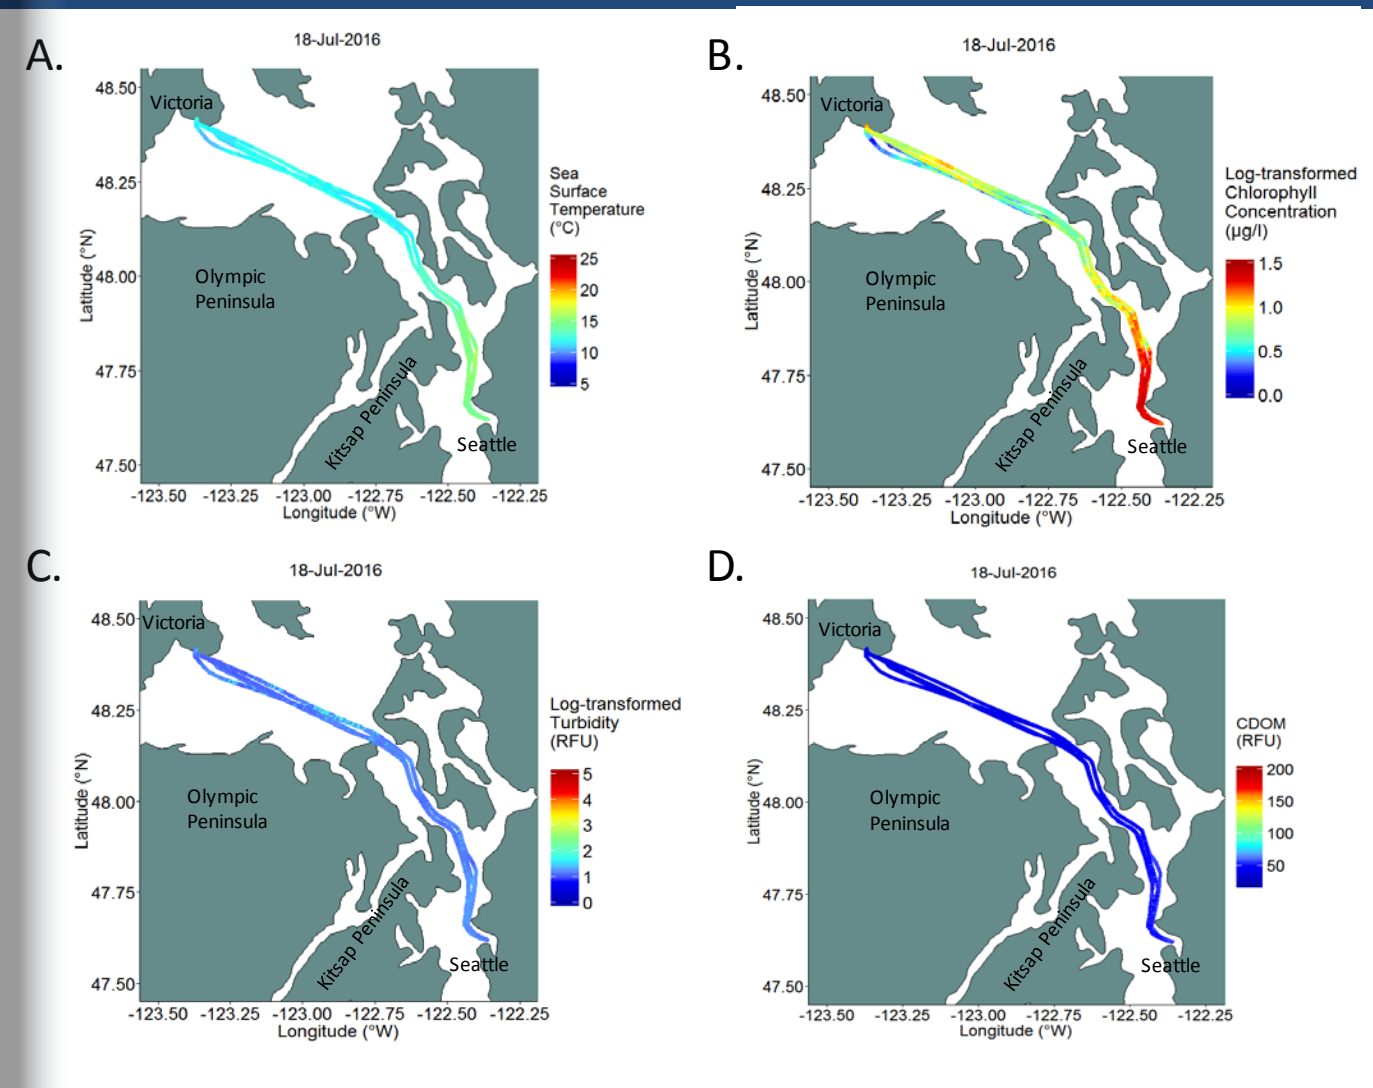

Summer conditions are apparent, with temperatures $>15^{\circ}\text{C}$ in Central Sound. Algae (chlorophyll) continue to be abundant, extending into the Strait of Juan de Fuca on July 4th. Windy conditions on July 9-11 temporarily reduced algae. Turbidity and CDOM remain low, except for July 4th, when a plankton bloom spread throughout the system.

The *Victoria Clipper IV* carries sensors in its sea chest. The sensors allow us to plot over time transects of:

- A. Temperature
- B. Chlorophyll
- C. Turbidity
- D. CDOM = colored dissolved organic matter

Over time, we see the dynamics of these variables in surface water between Seattle and Victoria, BC.

Figures show daily data from sensors installed on the ferry which measure near-surface waters at 5-sec intervals while the Victoria Clipper IV transits between Seattle and Victoria, BC.

- A. Sea Surface Temperature:** Water is warm in Central Basin, with temperatures over 15 °C.
- B. Chlorophyll:** Concentrations are high in Central Basin, with patchy conditions in the Strait of Juan de Fuca.
- C. Turbidity:** Turbidity was low on the entire route.
- D. Colored Dissolved Organic Matter (CDOM):** Humics (brown-yellow) from rivers are low in Central Basin and the Strait of Juan de Fuca.

*Markus
von Prause,
Ecology*

Flow levels for the Puget Sound Ecoregion have greatly increased in 2016, compared to the 2015 drought year. Snow water equivalents are now exhausted, and meltwater comes primarily from glaciers, as can be seen by glacial flour in the Puyallup River, for example.

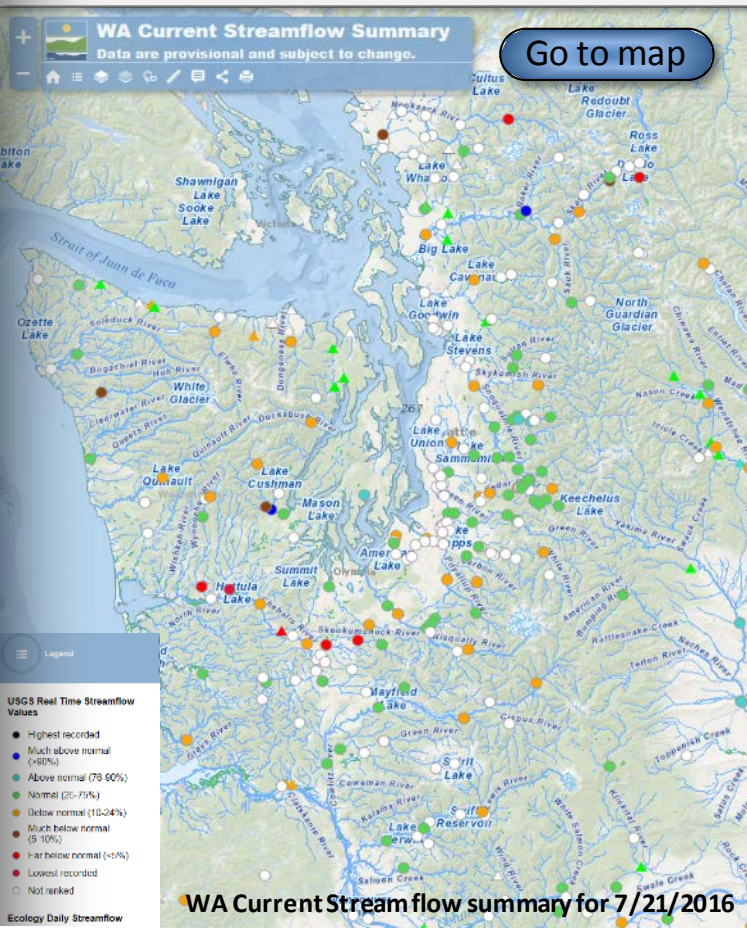

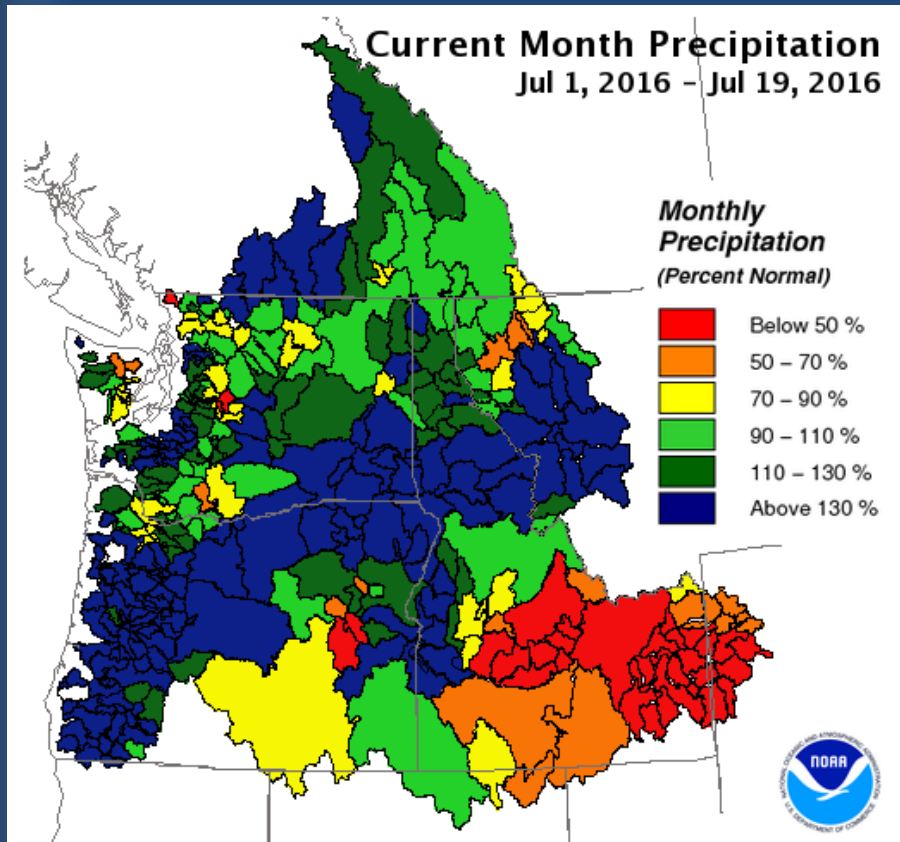

Table shows river flows in 2015 and 2016, relative to historical values for the same month (% of normal).

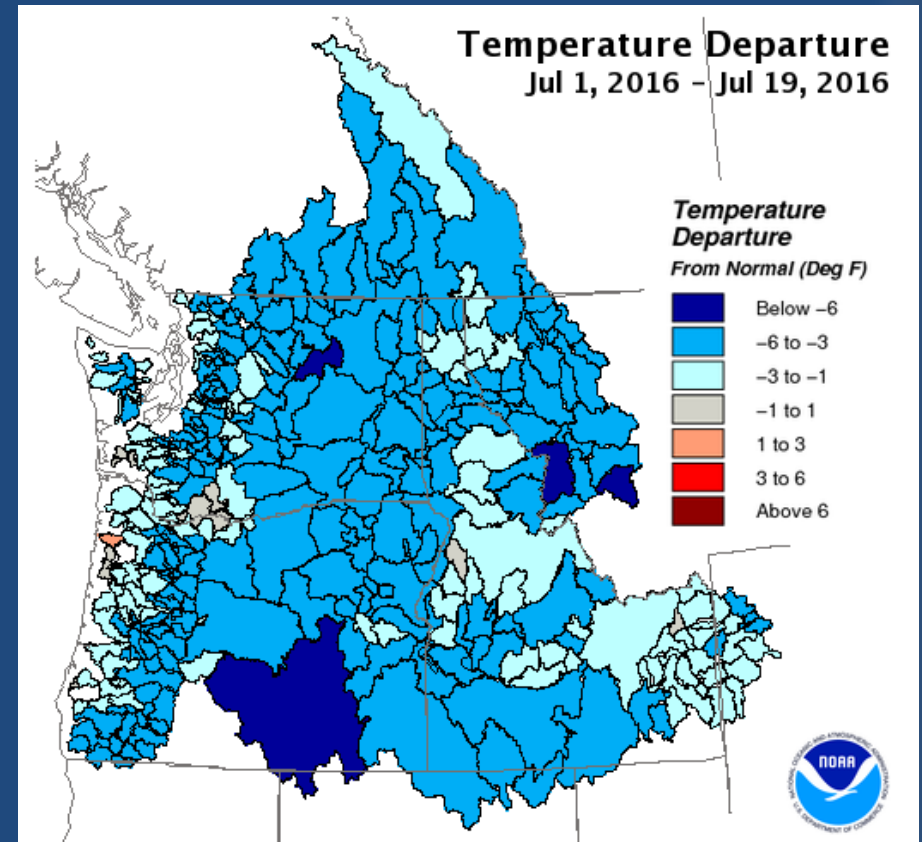

During July 2016, increased flows at Ecology and USGS stream monitoring sites were at normal levels as precipitation levels were well above normal.

■ new min ■ less 20%
■ less 50% ■ less 80%

USGS Site Location	July 2015	July 2016
