## Personal stories [p. 3](#)

Meet our new Washington Conservation Corps intern, Juhi LaFuente

## Climate & Streams [p. 6](#)

During October air temperatures are cooler and precipitation higher than normal, while sunshine remained abundant. As a result tributaries throughout Puget Sound and the Olympic Mountains are generally flowing normal after below normal flows over the late summer particularly in the north Sound region.

## Marine waters [p. 10](#)

Puget Sound is fresher than it's ever been the past 17 years. Warmer temperatures remain in South Sound in September. In October surface water temperature in the Straits begin to cool and rivers discolor surface waters.

## Aerial photography [p. 12](#)

Blooms are small and confined to inlets. Jellyfish patches are practically absent. Leaves begin to drift on the water with some orange debris looking like a dying bloom of Noctiluca.

## Meet our new [Washington Conservation Corps](#) intern

*It is getting cold out there!  
Juhi's first marine survey on  
our research vessel Skookum.*

### Juhi LaFuente

Juhi joined our marine team to conduct water and sediment surveys, work in our laboratory, and support both the [Toxic Studies](#) and [BEACH program](#).

**We are really happy to have her in the program for the next year!**

### Juhi Brings Experience

Juhi graduated from Western Washington University with a BS in Environmental Science. She studied Tropical Marine Biology and Ecology in La Paz, Mexico, followed by an AmeriCorps position at the Port Townsend Marine Science Center. There she worked on aquaria, husbandry for the invertebrates and fish, and public communication and outreach.

## What was the visibility in the water for divers?

### Visibility (ft)/depth (ft)

Best/Depth, Least/Depth

1)	29	30	15	11
2)	16	30	9	94
3)	21	3	17	79
4)	40	43	19	5
5)	20	33	19	80
6)	37	57	16	15
7)	32	95	27	8
8)	38	97	13	13
9)	41	79	21	3
10)	15	43	4	5
11)	44	97	15	36
12)	25	57	7	31
13)	46	97	5	5
14)	7	31	6	13
15)	23	51	20	92
16)	22	97	17	16
17)	14	87	13	18
18)	13	48	5	20

### Find depths with high and low visibility

- **Best Visibility** was nearly 50 feet south of Three Tree Point toward Browns Point and Commencement Bay.
- **Poor visibility** occurred in many places in South Puget Sound, but also in Bellingham Bay and near Bremerton/Silverdale.
- We use transmissometer readings from our CTD package and convert them into horizontal visibility. See our recent publication for details: Underwater visibility Maps – a Tool for Scuba Divers.

Read poster

This is a new feature, and we are soliciting feedback ([salb461@ecy.wa.gov](mailto:salb461@ecy.wa.gov)). Eventually we will feature the most recent data.

## Critter of the Month – The Sea Spiders

Cowles, wallawalla.edu

### The Pycnogonids

BOO! If you're scared of spiders, this month's creepy Critter might give you a fright. Find out why the Sea Spider is not actually a spider at all, and why its amazing legs do many spooktacular things!

### Fun Sea Spider Facts

- Species from polar oceans can grow to the size of a dinner plate.
- Their blood is pumped by the gut, not the heart.
- The male sea spider cares for the eggs, holding them with a special pair of legs.

*Anoplodactylus viridintestinalis*

Cowles, wallawalla.edu

Tyler Burks, Jim Shedd

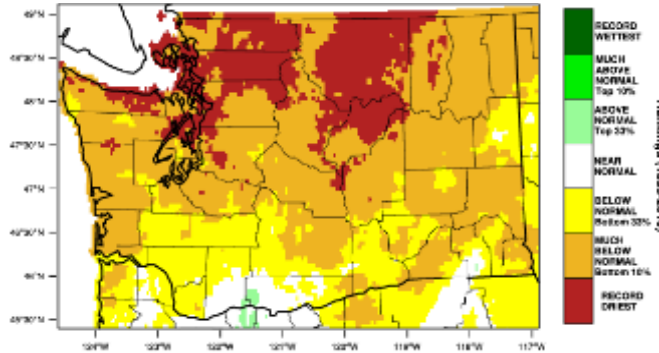

After warm and very dry summer conditions in the Puget Sound, conditions returned to mostly normal in October. Temperatures and precipitation were close to average throughout the region. As a result, tributaries throughout Puget Sound and the Olympic Mountains are generally flowing normally after below normal flows over the late summer, particularly in the north Sound region.

Washington Stream flows

Oct, 6, 2017 – Nov, 4, 2017

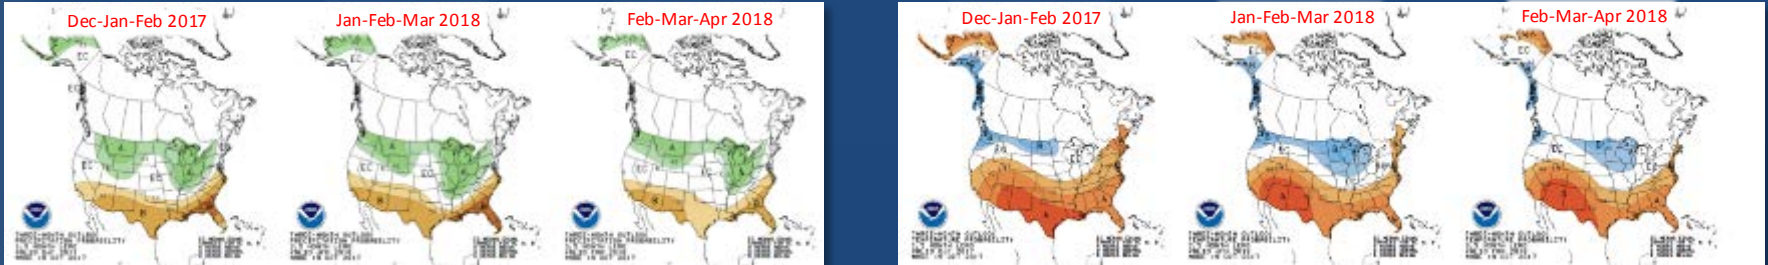

Generated 11/5/2017 at WRCC using proDivisional data.  
NOAA Regional Climate Centers

Streamflows returned to normal in October after much of the basin experienced below and much below normal flows in the month of September.

October saw the return of much needed precipitation after below average and even record breaking dry periods in parts of the Olympics and north Cascades. Last October (2016) saw record breaking precipitation in much of the Puget Sound region. Interestingly, Olympia had 28 rainy days in October 2016 in contrast to only 11 days this year. Yet October 2017 still saw normal to above normal precipitation.

Climatologists predict wetter and cooler conditions this winter and early spring due to an expected La Niña. Could this mean a good supply of cool water flowing to Puget Sound in the spring and summer?

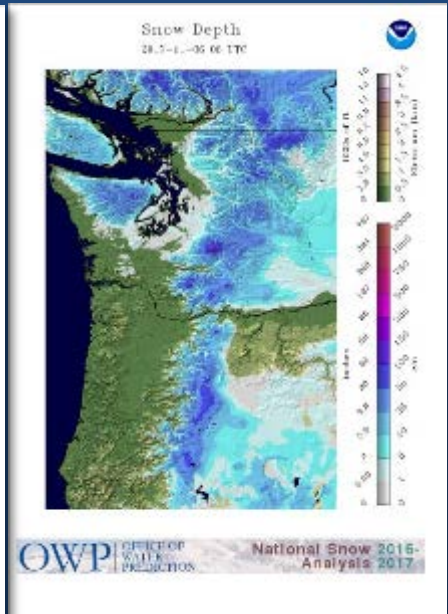

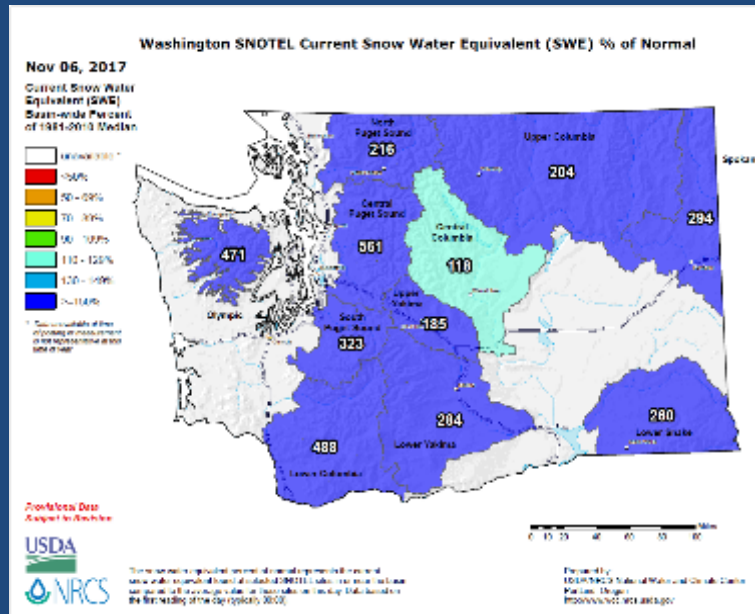

The map on the upper left shows higher than usual probability of above normal precipitation. The map on the right show a higher chance of cooler temperatures. [Click here](#)

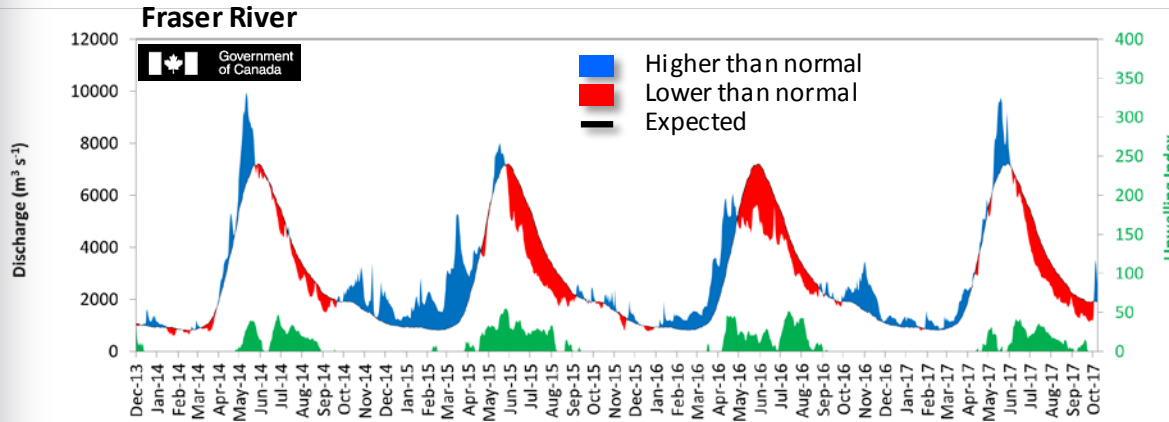

Very early snow water equivalence (SWE) in the mountains is off to a good start.

The past two years SWE was generally higher than normal.

Will we see the same in 2018? The graphics on the left shows current snow accumulation.

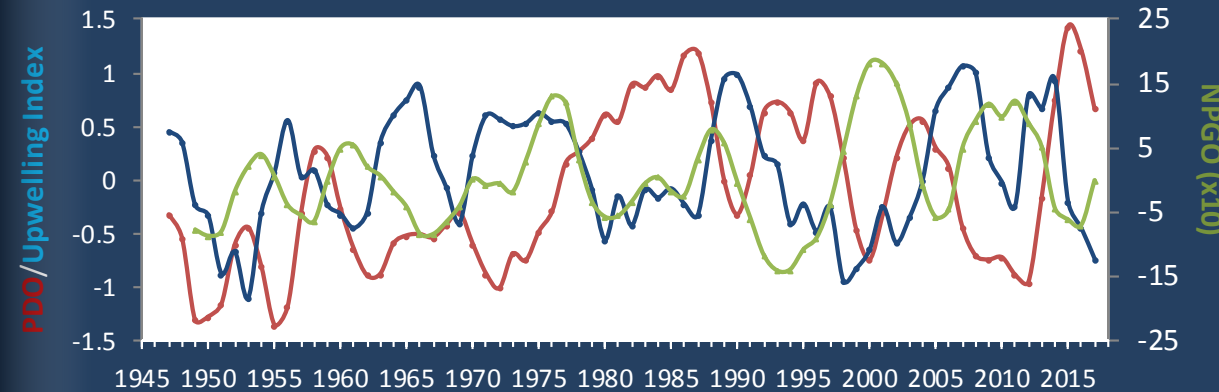

Historically, peaks of coastal upwelling and the [freshet](#) are in sync.

**The Fraser River is the major driver of estuarine circulation and water exchange with the ocean.**

Fraser River flows were higher than normal in July. Then flows got weaker. Lower Fraser River and weaker upwelling along the coast favored a reduced inflow of low-oxygen water from the coast and positively influence oxygen conditions.

Three-year running average of PDO, Upwelling, and NPGO indices

**How do ocean boundary conditions affect the quality of water we exchange with the ocean.**

Past years warm water is fading (PDO), upwelling of low oxygen and high nutrient ocean water are low (Upwelling Index anomaly), and surface productivity along the coast is near normal (NPGO).

Pacific Decadal Oscillation Index (**PDO, temperature, [explanation](#)**). Upwelling Index (anomalies) (**Upwelling, low oxygen, [explanation](#)**). North Pacific Gyre Oscillation Index (**NPGO, productivity, [explanation](#)**).

**Climate and natural influences** include weather, river flows, and the adjacent ocean conditions that affect our marine waters. This graphic provides context for interpreting Puget Sound marine conditions. All data from public sources: weather from UW Grayskies; river flows from USGS and Environment Canada; indices from NOAA, UW (PDO), and E. Di Lorenzo (NPGO).

### Summary:

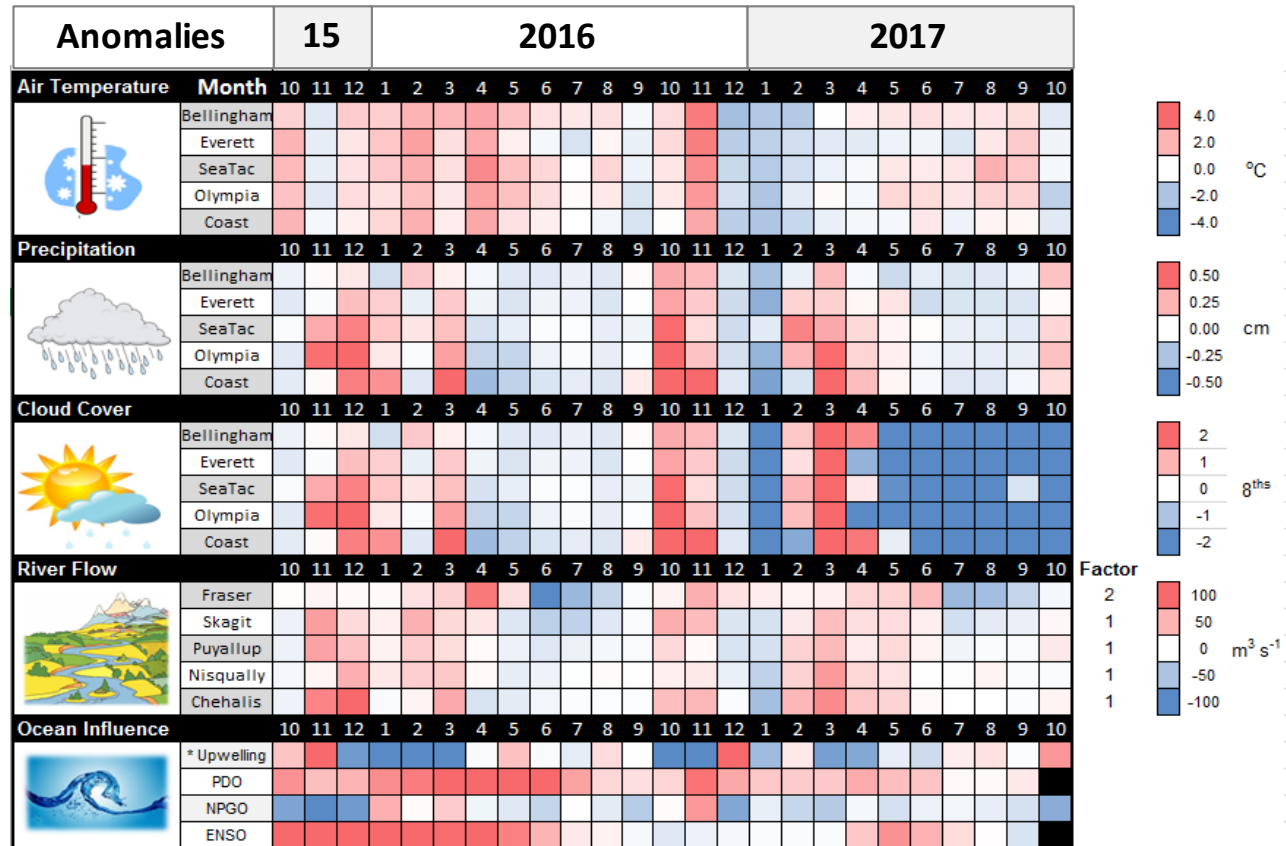

Air temperatures fell below normal during October after being mostly above normal since May.

**Precipitation** levels had been low, but are now above normal.

**Sunshine** levels have been consistently above normal since May.

**River flows** are increasing back to normal after low flows through the summer.

We expect **downwelling** in fall, but it's currently weaker. ENSO is trending cooler, towards La Niña.

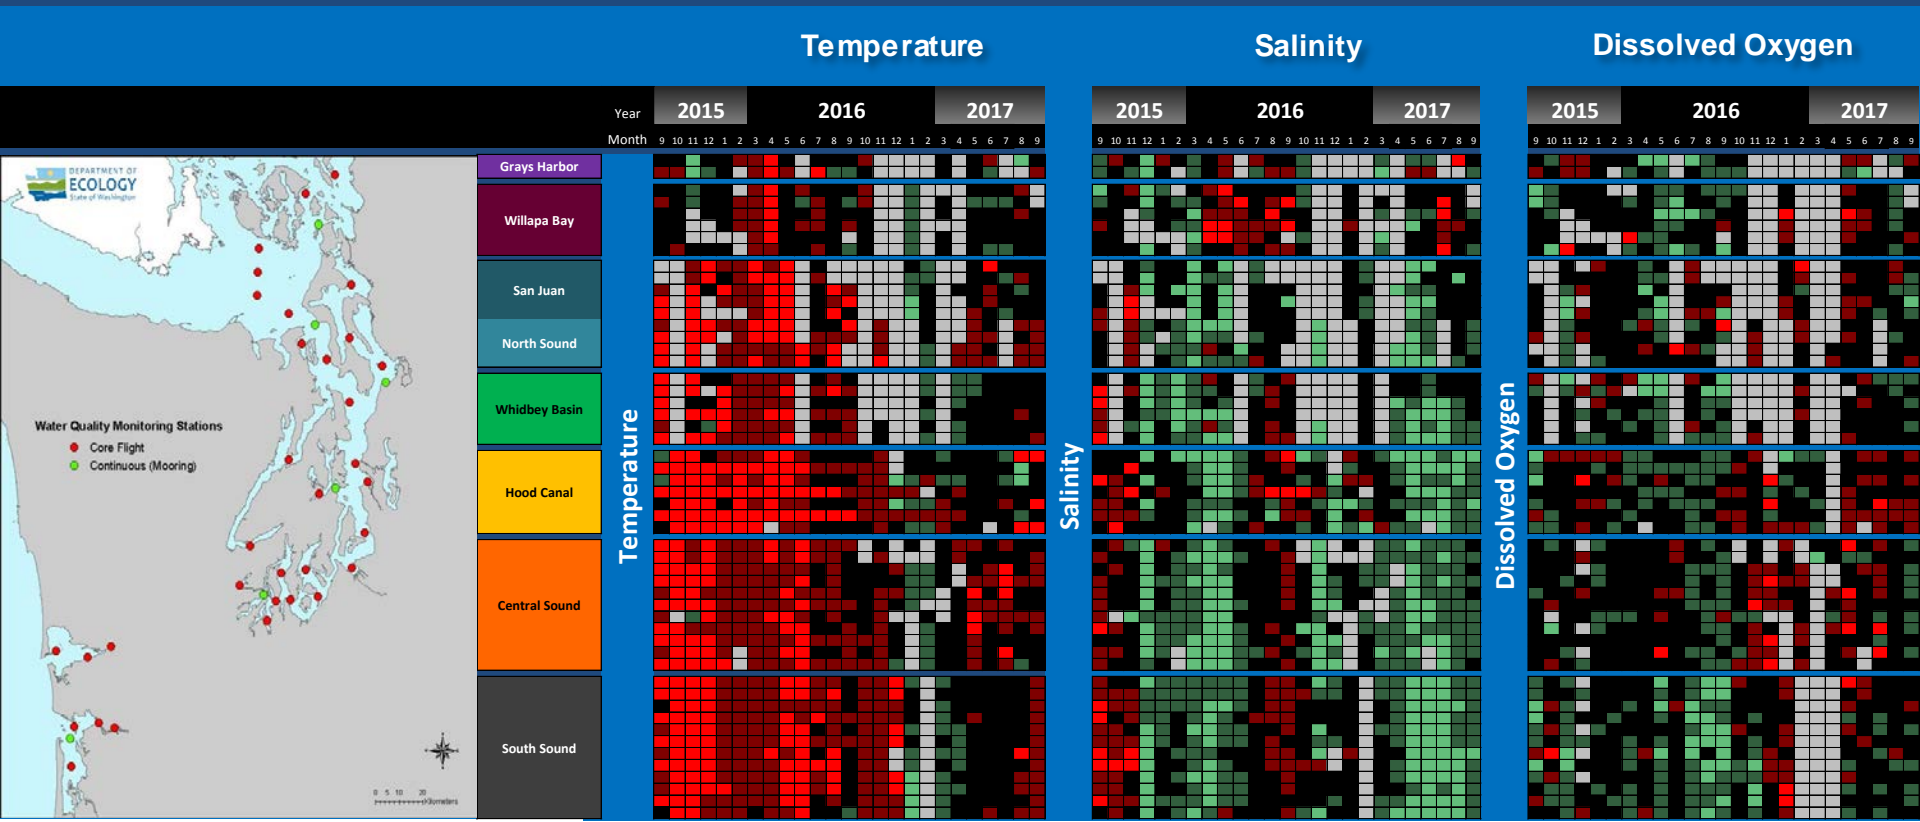

\*Upwelling Anomalies (PFEL)  
 PDO = Pacific Decadal Oscillation  
 NPGO = North Pacific Gyre Oscillation  
 ENSO = El Niño Southern Oscillation

higher expected lower No data

As of Sept 2017, warmer temperature persists in South Sound. **Very low salinity persists in Hood Canal, Central and South Sound.** Significantly fresher conditions in Puget Sound occurred since November, 2016. In September higher dissolved oxygen values continue in Hood Canal while dissolved oxygen is lower in Central Sound.

■ = higher than expected (> \*IQR)      ■ = expected (= \*IQR)      ■ = lower than expected (< \*IQR)  
■ = higher than previous measurements      ■ = no data      ■ = lower than previous measurements  
 \*IQR = Interquartile Range (25<sup>th</sup> – 75<sup>th</sup> percentiles); n = 17

## Summary of *Victoria Clipper IV* ferry data:

Surface water temperature cooled in the Strait of Juan de Fuca. Moderate chlorophyll concentrations in Puget Sound occurred in early October followed by clearing in mid-month. Turbidity and CDOM were noisy until late October when river outflows contributed to an increase near the Triple Junction. Gaps in the data are explained by the vessel remaining in port.

The *Victoria Clipper IV* carries sensors in its sea chest. The sensors allow us to plot over time transects of:

- A. Temperature
- B. Chlorophyll
- C. Turbidity
- D. CDOM

Over time, we see the dynamic of these variables in surface water between Seattle and Victoria, BC.

The productive season is coming to an end, blooms are getting smaller, mainly in the color of red-brown. Jellyfish patches are practically absent. Leaves begin to drift on the water with some orange debris in Case Inlet looking like a fading bloom of the dinoflagellate Noctiluca.

[Start here](#)

Seattle enjoying the last sunny days of fall

**Mixing and Fronts:**  
Fronts along Deschutes River plume. Otherwise uneventful.

**Jellyfish:**  
Jellyfish patches rare, seen only in Budd Inlet.

**Suspended sediment:**  
Uneventful

**Visible blooms:**  
Red-brown: Dyes, Sinclair, Eld, Budd and Henderson Inlets.

**Debris:**  
Leaves drifting at the surface in Inlets of South Sound. Ribbons of orange in Case Inlet accumulating along fronts. Potentially being Noctiluca?
