

WRIA 47 Chelan Watershed Water Availability

Overview

- Introduction to WRIA 47
- Water Availability Factors
- Options for Acquiring Water
- Resources
- Map

What is a watershed? Washington is divided into 62 major watersheds or Water Resource Inventory Areas (WRIAs), which are areas that each capture precipitation, funnel rain, and snowmelt through smaller subbasins into streams, tributaries, and rivers and typically drain to marine waters or to the Columbia River.

Introduction to WRIA 47

The Chelan Watershed or Water Resource Inventory Area (WRIA) 47 is defined as the area that drains to the Stehekin River, Lake Chelan, and the Chelan River, but also includes Antione Creek, and Knapp and Navarre Coulees. The Watershed is in north-central Washington, in the northern portion of Chelan County. The Watershed includes numerous tributary streams such as Railroad Creek, First Creek, 25 Mile Creek, Ames Creek, and others.

How can I get water?

Depending on your proposal, you may have more than one option to acquire a reliable water supply. Some options are presented below:

- Connecting to an existing water system is usually the fastest and easiest option if your project is within the system's service area.
- Using a permit-exempt well if you meet the limits under state law.
- Purchasing an existing water right and transferring it to the new use.
- Applying for a new water right, which may need mitigation.

See the *Options for Acquiring Water* section for more information about water right permit options and when to meet with Ecology staff.

Washington Water Law

Waters of the State belong to the public and can't be owned by any one individual or group. Water right holders have the right to USE water, from a set source, for a particular purpose, in a specific location.

The Department of Ecology is responsible for managing the water resources of the State, including issuing the right to use water as well as protecting the instream resources for the benefit of the public.

Washington water law is based on the "prior appropriation" system, often called "first in time, first in right." New water right uses may not harm older water rights uses. Applications for water from the same source must be processed in the order they are received, although there are certain exceptions.

Applicable Laws and Regulations

- RCW 90.03: Washington Water Code
- RCW 90.44: Regulation of Public Groundwaters
- RCW 90.54: Water Resources Act of 1971
- RCW 77.57: Fishways, Flow, and Screening

Water Availability Factors

Due to Washington's varied land uses, terrain, and precipitation levels, water availability for new water right permits varies dramatically across the State. In the Chelan Watershed, key factors affecting water availability include:

- Precipitation.
- Existing water rights.
- Reclamation withdrawal.
- Source limitations.

Precipitation

Many areas of central Washington are arid, receiving less than 20 inches of rain annually. Most of this precipitation arrives during the winter months when water demands are the lowest. During the summer, the snowpack is gone, there is little rain, and naturally low stream flows are dependent on groundwater inflow. At the same time, the demand for water for human uses, including irrigation, are at the yearly maximum. This means that groundwater and surface water are least available when water demands are the highest.

Existing water rights

Water rights have been issued in the Chelan Watershed for over 100 years, and as a result most water in the watershed is already legally spoken for or "appropriated."

Above the Chelan River Dam at the outlet of Lake Chelan, nearly all of the normal runoff has already been appropriated by existing water rights. In the smaller streams and rivers that abut private lands that feed into Lake Chelan, water is typically unavailable for new uses during the summer months.

Several adjudications have taken place in the basin. Prior adjudications are an indication that most, if not all, of the available water has already been allocated. Adjudicated tributary subbasins include Antoine Creek, Joe Creek, and Safety Harbor Creek.

Reclamation withdrawal

In 2004, the U.S. Bureau of Reclamation filed notice with the Department of Ecology that the United States intends to make examinations and surveys for the use of the un-appropriated waters of the Columbia River and its tributaries above Priest

Rapids Dam, pursuant to RCW 90.40.030. The withdrawal of these waters from future appropriations is currently in effect until December 23, 2023.

At the most recent renewal of the withdrawal, Reclamation released 48,880 acre-feet per year of water. Ecology is processing new applications for both surface water and groundwater in select locations in the numerous watersheds impacted by the withdrawal, but the release is insufficient to meet the total demand. The withdrawal may be extended, and Ecology expects Reclamation to request an extension before the withdrawal expires.

Potential new supplies

Ecology is conducting a coordinated cost reimbursement program for the water left in the Lake Chelan Reserve (Reserve). Ecology is currently processing applications for new water rights and debiting the use against the water left in the Reserve. You can find more information about the Lake Chelan Reserve and Coordinated Cost Reimbursement at the Lake Chelan Reserve website.

Summary

Increasing demands for water over time, from ongoing population growth, agriculture, and other consumptive uses as well as associated land use practices, have resulted in lower streamflows and declining groundwater levels in some areas. These decreases have impacted important resources for fisheries and general stream health. The impacts of climate change in WRIA 47 are also yet to be fully realized. However, it is apparent that water availability is limited throughout the Chelan Watershed.

Options for Acquiring Water

Permit-exempt options

State law, RCW 90.44.050, exempts the following uses from the water right permitting process:

- Single or group domestic uses, not exceeding 5,000 gallons per day (gpd).
- Irrigation of up to a half-acre of non-commercial lawn or garden.
- Industrial purposes (such as water for a store, restaurant, or small industrial facility, or irrigation of a small commercial farm), not exceeding 5,000 gpd.
- Stockwater to provide drinking water for stock animals. Other stock-related purposes (such as
 washdown of a milking parlor or irrigation for growing hay for stock animals) may require a
 water right permit.

A project proposal is also limited to the use of one exemption for each type of use, so a housing subdivision, for example, cannot use a series of wells to exceed the 5,000 gpd limit or the half-acre of non-commercial lawn and garden. The entire subdivision, collectively, cannot exceed either limitation.

Permit options

If your project cannot access water from an existing water purveyor and doesn't qualify for use of a permit-exempt well, you will need to:

- Apply for and receive a new water right through either Ecology or Chelan County's water permit program, or
- Buy an existing water right and change or transfer it to the new use. This option could be subject to limitations. Having a pre-application consultation with the Department of Ecology will help identify the feasibility of your application.

Ecology asks anyone who needs a water right (new, change, or transfer) to submit the pre-application consultation form and meet with us to review your water supply needs and project proposal. See the *Resources* section for links to forms and other information.

New water right

Attempting to acquire new water rights is likely to be a very difficult and expensive process. It requires the hiring of qualified professionals and submitting a comprehensive mitigation and monitoring plan. This does not guarantee approval of a water right. Mitigation can be any action or group of actions that address, in-time and in-place, the impact of the water withdrawal or diversion on instream flows or other senior water rights.

Projects proposing non-consumptive uses of water may be approvable without mitigation.

Mitigation refers to measures taken to prevent any impact on streamflow during the period that water is not available, by either:

- Halting the diversion or withdrawal, or
- Replacing the water taken—in time and inplace.

A common form of mitigation is to buy and retire an existing water right upstream from the new use.

Change or transfer of an existing water right

It can be easier to buy an existing water right and change the purpose and/or place of use. Changing either of these aspects of a water right can be challenging if the change creates a new or different impact on a stream. It is important that the water right be in good standing by regular use over its lifetime.

Processing options

The wait for your water right application to be processed can be years. Options to speed up the process include:

Submitting your new or change water right application through the <u>Cost Reimbursement</u>
 <u>Program.</u>² Due to staffing limits, we may not be able to accept your application into the Cost
 Reimbursement Program. We strongly recommend first requesting a pre-application
 consultation.

² https://ecology.wa.gov/Water-Shorelines/Water-supply/Water-rights/Cost-reimbursement

Process your change application through the <u>Chelan</u> County Water Conservancy Board.

For more information on these and other options, refer to <u>Alternatives for Water Right Application</u> <u>Processing</u>.³

You can discuss all of your options to supply water to your project at your pre-application consultation with Ecology. To schedule, submit the pre-application consultation form.⁴
