What is a watershed?
Washington is divided into 62 major watersheds or Water Resource Inventory Areas (WRIAs), which are areas that each capture precipitation and funnel rain and snowmelt through smaller subbasins into streams, tributaries, and rivers and typically drain to marine waters or the Columbia River.

Introduction to WRIA 56

The Hangman Watershed or Water Resource Inventory Area (WRIA) 56 is defined as the area within Washington that drains to Hangman Creek, which is a tributary to the Spokane River. It is located in Eastern Washington, primarily in Spokane County, but the basin originates in Idaho.

Hangman Creek’s major tributaries are California, Marshall, and Rock creeks, but the watershed includes numerous other small tributary streams.

How can I get water?

Depending on your proposal, you may have more than one option to acquire a reliable water supply:

- Connecting to an existing water system is usually the fastest and easiest option if your project is within the system’s service area.
- Using a permit-exempt well if you meet the limits under state law.
- Purchasing an existing water right and transferring it to the new use.
- Applying for a new water right, which may need mitigation.

See the *Options for Acquiring Water* section for more information about water right permit options and when to meet with Ecology staff.

Washington Water Law Waters of the state belong to the public and can't be owned by any one individual or group. Water right holders have the right to USE water, from a set source, for a particular purpose, in a specific location.

The Department of Ecology is responsible for managing the water resources of the state, including issuing the right to use water as well as protecting the instream resources for the benefit of the public.

Washington water law is based on the “prior appropriation” system, often called “first in time, first in right.” New water rights may not harm older water rights. Applications for water from the same source must be processed in the order they are received, although there are certain exceptions.

Applicable Laws and Regulations

- [RCW 90.03](#): Washington Water Code
- [RCW 90.44](#): Regulation of Public Groundwaters
- [RCW 90.57](#): Water Resources Act of 1971
- [RCW 77.57](#): Fishways, Flow, and Screening
- [WAC 173-557](#): The Instream Flow Rule for the Spokane River and the Spokane Valley Rathdrum Prairie Aquifer

Water Availability Factors

Due to Washington’s varied land uses, terrain, and precipitation levels, water availability for new water right permits varies dramatically across the state. In the Hangman Watershed, key factors affecting water availability include:

- Climate and geology.
- Existing water rights.
- Source limitations.
- Instream flow rule.
- Reclamation withdrawal.

Climate and geology

Annual precipitation in the Hangman Watershed ranges from 17 inches per year around the city of Spokane to 25 inches in the higher elevations in the eastern portion of the watershed. Only a fraction of this precipitation becomes available for human and economic uses. In general, availability and yield of groundwater from bedrock in this WRIA is very limited. In addition, many areas are in decline, meaning little if any water is available for new consumptive appropriations.

Most of the precipitation arrives during the winter months, when water demands are the lowest. During the summer, the snowpack is gone, there is little rain, and naturally, low stream flows are dependent on groundwater inflow. This means that groundwater and surface water are least available when water demands are the highest.

Source limitations

This watershed has administrative restrictions known as Surface Water Source Limitations (SWSLs), which limit most water sources in the watershed. This determination comes from the Washington Department of Fish and Wildlife that flows be protected to maintain fish populations. Marshall and Minnie Creeks have been closed to new appropriations by SWSL.

Existing water rights

Water rights have been issued in the Hangman Watershed for over 100 years, and as a result most water in the watershed is already legally spoken for or “appropriated.”

An adjudication has taken place in the basin for the Crystal Springs area. Prior adjudications are an indication that most, if not all, of the available water has already been allocated.

Reclamation withdrawal

In 2004, the U.S. Bureau of Reclamation filed notice with the Department of Ecology that the United States intends to make examinations and surveys for the use of the un-appropriated waters of the Columbia River and its tributaries above Priest Rapids Dam, pursuant to RCW 90.40.030. The withdrawal of these waters from future appropriations is currently in effect until December 23, 2023.

At the most recent renewal of the withdrawal, Reclamation released 48,880 acre-feet per year of water. Ecology is processing new applications for both surface water and groundwater in select locations in the numerous watersheds impacted by the withdrawal, but the release may be insufficient to meet the total demand. The withdrawal may be extended, and Ecology expects Reclamation to request an extension before the withdrawal expires.

Instream flow rule

The Dept. of Ecology adopted an instream flow rule to protect the Spokane River, effective Feb. 27, 2015. This rule (WAC 173-557) applies to new withdrawals from the Spokane Valley Rathdrum Prairie Aquifer, which underlies an area near the mouth of Hangman Creek.

Summary

Increasing demands for water over time, from ongoing population growth, agriculture, and other consumptive uses as well as associated land use practices, have resulted in lower streamflows and declining groundwater levels in some areas. These decreases have impacted important resources for fisheries and general stream health. The impacts of climate change in WRIA 56 are also yet to be fully realized. However, it is apparent that water availability is limited throughout the Hangman Watershed.

Options for Acquiring Water

Permit-exempt options

State law, RCW 90.44.050, exempts the following uses from the water right permitting process:

- Single or group domestic uses, not exceeding 5,000 gallons per day (gpd).
- Irrigation of up to a half-acre of non-commercial lawn or garden.
- Industrial purposes (such as water for a store, restaurant, or small industrial facility, or irrigation of a small commercial farm), not exceeding 5,000 gpd.
- Stockwater to provide drinking water for stock animals. Other stock-related purposes (such as washdown of a milking parlor or irrigation for growing hay for stock animals) may require a water right permit.

A project proposal is also limited to the use of one exemption for each type of use, so a housing subdivision, for example, cannot use a series of wells to exceed the 5,000 gpd limit or the half-acre of non-commercial lawn and garden. The entire subdivision, collectively, cannot exceed either limitation.

Permit options

If your project cannot access water from an existing water purveyor and doesn't qualify for use of a permit-exempt well, you will need to:

- Apply for and receive a new water right, or
- Buy an existing water right and change or transfer it to the new use.

Ecology asks anyone who needs a water right (new, change, or transfer) to submit the pre-application consultation form and meet with us to review your water supply needs and project proposal. See the Resources section for links to forms and other information.

New water right

Attempting to acquire new water rights within areas regulated with either instream flows or closures will likely be a very difficult and expensive process. It requires the hiring of qualified professionals and submitting a comprehensive mitigation and monitoring plan. This does not guarantee approval of a water right. Mitigation can be any action or group of actions that address, in-time and in-place, the impact of the water withdrawal or diversion on instream flows or other senior water rights.

Projects proposing non-consumptive uses of water may be approvable in both closed areas and areas with instream flow regulations.

Change or transfer of an existing water right

It can be easier to buy an existing water right and change the purpose and/or place of use. Changing either of these aspects of a water right can be challenging if the change creates a new or different impact on a stream. It is important that the water right be in good standing by regular use over its lifetime.

Processing options

The wait for your water right application to be processed can be years. Options to speed up the process:

- Submit your new or change water right application through the [Cost Reimbursement Program](#).
- Process your change application through the Spokane County Water Conservancy Board.

For more information on these and other options, refer to [Alternatives for Water Right Application Processing](#).

You can discuss all of your options to supply water to your project at your pre-application consultation with Ecology. To schedule, submit the [pre-application consultation form](#).

Mitigation refers to measures taken to prevent any impact on streamflow during the period that water is not available, by either:

- Halting the diversion or withdrawal, or
- Replacing the water taken—in time and in-place.

A common form of mitigation is to retire an existing water right upstream from the new use.
