Focus on: Boeing Auburn Site Enhanced Bioremediation

How does enhanced bioremediation work?

Bioremediation is a natural process where bacteria in the soil “eat” chemical contaminants like TCE (trichloroethylene). This process is enhanced by adding non-toxic food (sugars and carbon) into the groundwater so bacteria can grow faster and eat more contaminants.

Boeing used this action at their Auburn site in 2004 and 2005 to treat a highly contaminated area. Boeing also completed a pilot study to test this technology in areas of lower-level contamination in 2015. The results showed that enhanced bioremediation reduced contamination faster.

Why use the bioremediation cleanup method?

We recommended that Boeing evaluate the use of enhanced bioremediation to treat three areas of contamination in Algona and Auburn with higher concentrations of TCE or TCE’s breakdown product VC (vinyl chloride) (see Figure 3):

- Outlet Collection Mall Area
- Northern Algona Residential Area
- Perimeter Road Area

Boeing proposed using enhanced bioremediation in the northern Algona residential area only.

After the results of the draft supplemental feasibility study were reviewed, Ecology and Boeing agreed that only the northern Algona residential area should be treated with enhanced bioremediation. Read a summary of the study results on our website at ecology.wa.gov/BoeingAuburn.

Figure 2: A hydrologist shows a long hose that delivers bacteria food to contaminated groundwater.

Next steps
We invite you to review and comment on a draft feasibility study, draft supplemental feasibility study, and draft public participation plan.

You can view and comment on these documents at bit.ly/BoeingAuburnComments.

Public Meeting
A public online meeting for this comment period is scheduled for Monday, April 26th, 2021, from 6:30 p.m. to 7:30 p.m. The meeting will be recorded. To access the recording after April 26th, visit ecology.wa.gov/BoeingAuburn.

When the public comment period ends, we'll consider all public comments and may change the documents based on them. After considering all public comments, the documents will become final.

Groundwater cleanup levels
Washington has two clean water standards: one for groundwater and one for surface water. For TCE, the surface water cleanup standard is about ten times stricter than the groundwater standard.

At this site, Ecology is using the surface water standard as the groundwater cleanup level because the contaminated groundwater goes into surface water. Boeing wants to use the drinking water standard as the groundwater cleanup level. Visit our website to see statements from Boeing and Ecology on this issue. We'll review comments and make a final decision. We welcome comment on this issue: bit.ly/BoeingAuburnComments.

How long will the bioremediation process take?
A computer model of the site's contaminated groundwater predicts that using enhanced bioremediation and monitored natural attenuation (MNA) reduces cleanup time. For example, using enhanced bioremediation in the Algona area should reduce the time needed to reach surface water quality standards by more than half.
