- Visit our [Public Involvement Calendar](#)<sup>3</sup>

Questions? Contact Sarah Kellington at: 360-280-3167 or [sarah.kellington@ecy.wa.gov](mailto:sarah.kellington@ecy.wa.gov).

Site contacts can be found in each entry.

## ADA Notice

To request Americans with Disabilities Act accommodation, including materials in a format for the visually impaired, please call 360-407-7170 or visit [Ecology's Accessibility webpage](#).<sup>4</sup> Persons with impaired hearing may call Washington Relay Service at 711. Persons with a speech disability may call 877-833-6341.

## News & Notes

### Ecology buildings are open to the public

Visitors to Ecology buildings no longer need an appointment. However, we still recommend making an appointment in advance so that the right staff person will be available.

- Visitors must complete an [online health screening](#)<sup>5</sup> before entering.
- **Public meetings will remain online** until further notice. Visit our [public input and events listings](#)<sup>6</sup> for information on public meetings.
- All documents for public review and comment are available online. Under **For more information** in the left-hand column of each Site Register entry, there is a link to visit the site's webpage. Documents are at the bottom of the page.

### Updated Contaminated Property Considerations in Real Estate Transactions publication now available

We've updated [Contaminated Property Considerations: Focus on Real Estate Transactions](#)<sup>7</sup> (Publication 22-09-021), which replaces [Publication F-TCP-92-115](#)<sup>8</sup>. This publication is for anyone involved in real estate transactions: buyers and sellers, real estate brokers and agents, appraisers, lenders, attorneys, consultants, and developers. It identifies common concerns about contamination liability as it relates to property transactions and outlines investigative techniques for assessing the potential for property contamination.

The update adds references to ASTM standards (in particular E1527), clarifies that due diligence should be done by a professional, and incorporates many links to helpful online resources, including the contaminated site lists and underground storage tank database available on TCP's [Cleanup and Tank Search](#)<sup>9</sup>.

## MTCA Biennial Report of Expenditures 2021 now online

### For more information contact

Lyndsay Gordon  
Budget Manager, Financial  
Services Unit  
[lyndsay.gordon@ecy.wa.gov](mailto:lyndsay.gordon@ecy.wa.gov)  
360-810-1636

We're pleased to announce the [MTCA Biennial Report of Expenditures: 2019-21 Biennium](#)<sup>10</sup> is now online. This major financial report looks back on the past biennium, describing how Ecology and twelve other Washington state agencies spent funds from the Model Toxics Control Act to protect human health and the environment.

The report contains more than just financial data. You'll find photos, maps, and success stories from across the state, as well as a primer on how the MTCA cleanup process works. The report also includes the 2021 Hazardous Sites List of more than 1,900 ranked contaminated sites in Washington, sorted by county. We publish the Hazardous Sites List twice a year as a special edition of the Site Register. The most recent edition was published [February 2022](#)<sup>11</sup>.

The MTCA Biennial Report of Expenditures is required by the Model Toxics Control Act, Washington's environmental cleanup law. The same law requires a companion report called the [MTCA Capital Account Ten-Year Financing Report](#)<sup>12</sup>. We produce the ten-year report every two years in coordination with local governments and expect to publish the 2022 report later this fall.

- You can also review documents  
on the BSB Diversified webpage  
above.

#### May 9–June 24: Comment on cleanup documents

BSB must have a Corrective Action Permit, or Permit Lite, to clean up this facility. They've had one since November 2005, and now it needs to be reissued. We are also conducting a periodic review of the current cleanup methods. We invite you to review and comment on the following documents.

- **Draft Permit (Permit Lite):** A Permit Lite is a Dangerous Waste Corrective Action Permit that allows cleanup at the site to continue. To clean up the facility, BSB must have this permit.
- **Draft Periodic Review:** We conduct a periodic review to ensure the current cleanup methods are working.
- **Draft Public Participation Plan (PPP):** The PPP encourages comment and involvement in cleanup decisions from the community.

When the comment period ends, we consider all comments and may change the documents based on them. Afterwards the documents will become final.

The BSB site includes multiple properties. BSB Diversified (BSB) is the main source of contamination. Activities there polluted groundwater which flows under the Hexcel Corporation Kent-Plant 1 (Hexcel) property. Other nearby properties are also affected by chemical releases from these two properties and are included in the site.

Prior to 1988, both Hexcel and BSB were owned by BSB. The site included surface impoundments, settling lagoons, container storage, and similar units for managing, storing, and disposing dangerous waste. Historical operations included metal finishing and electroplating. The past operations used chlorinated solvent, trichloroethylene (TCE), to clean metal parts. TCE spills and leaks contaminated soils and groundwater. Over time, TCE breaks down into cis-1,2-dichloroethylene and vinyl chloride (VC). VC has a very strict cleanup level because it may cause cancer.

An underground clay-soil barrier wall surrounding the perimeter of the BSB property now keeps the contaminated groundwater from leaving the BSB part of the site. We require BSB to monitor groundwater to make sure that the containment is working.

### May 12–June 13: Comment on cleanup planning documents

ExxonMobil and American Distributing Company (ADC) are working to clean up this former petroleum storage and distribution facility under a legal agreement with Ecology. We invite you to review and comment on the following documents.

- **Draft Interim Action Work Plan:** describes work that ExxonMobil and ADC will do before developing a final cleanup plan. The work includes excavating and dredging contaminated soil, removing it from the property, then installing a permanent barrier wall along Federal Avenue. This wall is intended to limit contamination from seeping back onto the neighboring Port property. A strong, rot-proof, woven filter fabric will be placed in the excavation to keep soil in place, then the area will be backfilled with clean soil. The soil will be compacted, covered with clean crushed rocks, and then paved with asphalt. This work will help prevent conditions from deteriorating and becoming more difficult to fix in the future. Also, the information gained by implementing the Interim Action Work Plan will help design the final cleanup action plan.
- **Agreed Order Amendment:** a proposed change to the 2010 legal agreement would delay approval of a Draft Cleanup Action Plan so that the work in the draft Interim Action Work Plan can be done first.
- **State Environmental Policy Act (SEPA) Determination of Non-Significance:** explains Ecology's decision that the activities outlined in the interim work plan are not likely to harm the environment.
- **Draft Public Participation Plan:** This updated draft describes how the public can provide input on cleanup plans. It is designed to promote meaningful community involvement during the investigation and cleanup process.

This site is one of several on the Port Gardner bay waterfront that will be studied for cleanup under the state's Puget Sound Initiative. The Mobil Oil Corporation owned the property in 1927, and sold the northern part of the site to ADC in 1974. For decades, the site was used for storing, transferring, and distributing petroleum products. Petroleum-related chemicals have been found in the soil and groundwater. Contaminants include light non-aqueous phase liquid (substances that are less dense than water, like petroleum), total petroleum hydrocarbons (TPH), carcinogenic polycyclic aromatic hydrocarbons (cPAHs), lead, benzene, ethylbenzene, and xylene.

Your comments are important to us. We will consider all comments we receive during the comment period, and we may change the documents based on your comments.

### May 16–June 15: Comment on 5-year review report and proposal to remove railyard from Hazardous Sites List and the restrictions on groundwater use

We invite your comments on the [draft periodic review report](#)<sup>20</sup> for this site. We complete a periodic review about every 5 years when some contamination remains at a cleanup site. Institutional controls which limit site uses and activities are required if contamination remains. The review evaluates site conditions to ensure people and the environment are protected.

At this site some contaminated soil was covered with protective caps and a treatment system decreased groundwater contamination, but unsafe levels of contaminants remained, so environmental covenants (an institutional control) were filed for soil and groundwater. The covenants restricted groundwater use and prohibited disturbing contaminated soil.

Ecology reviewed six years of monitoring data and found soil and groundwater now meet state standards. No further cleanup is required, except maintaining soil caps, so we are proposing to remove the site from Washington's Hazardous Sites List and remove the [groundwater covenant](#)<sup>21</sup>.

You can learn more in the public notice mailed to the community.

## STEVENS COUNTY

### Northport Waterfront

### May 2–June 1: Draft Cleanup Action Plan available for review and comment

You are invited to comment on the draft [Cleanup Action Plan](#)<sup>24</sup> for the site. We are proposing to remove and cap contamination, and encourage recreation in cleaned up areas. You can learn more in the [public notice](#)<sup>25</sup> mailed to the community.

The Le Roi Smelter (also known as the Northport Smelter), which handled copper ores between 1901 and 1911, and lead ores between 1916 and 1921, was just south of the Northport waterfront. Le Roi Smelter operations deposited clinker and granular slag wastes on the waterfront.

We will respond to all the comments we receive during the comment period and publish our responses. Then, we will begin working on the engineering design for the cleanup. The draft engineering design report will be available for public review and comment before final cleanup begins.

### April 21–May 20, 2022: Recomp of Washington Periodic Review

Ecology invites you to review the Periodic Review report for this site. Ecology conducts periodic reviews every five years when some contamination remains on-site after cleanup. Periodic reviews evaluate current Site conditions to ensure continued protection of human health and the environment.

The 2022 Draft Periodic Review concluded:

- The cleanup action (i.e., landfill closure) completed at the site appears to be protective of human health and the environment.
- The landfill containment system includes native low-permeability soils beneath the landfill, a compacted clay cover above the landfill material, and a gravel cutoff trench and leachate collection pipe downgradient of the landfill. Additionally, a soil-bentonite slurry wall and paved surfaces between the landfill cover and the slurry wall divert groundwater and surface water away from the closed ash landfill.
- The Restrictive Covenant for the property continues to be effective in protecting human health and the environment from exposure to hazardous substances and protecting the integrity of the cleanup action.
- The Periodic Review distinguishes the Recomp of Washington site and the adjoining Wilder Landfill site, but the Periodic Review does not evaluate the Wilder Landfill site.

Ecology will review comments received during the comment period and modify the Periodic Review accordingly. An additional public comment period will be held if significant changes are made. The next review for the Site will be scheduled five years from the date of this periodic review.

425-410-1400

### Response to Public Comments available

A [Response to Comments Summary](#)<sup>29</sup> is available for review on Ecology's RG Haley webpage (at left).

#### Public Comment Period

Ecology held a 30-day public comment period (January 31 – March 1, 2022) on the engineering design report for the RG Haley cleanup site on the Bellingham waterfront. The report represents 30% completion of design work and provides details, refining the cleanup action selected by Ecology in 2018.

#### Final Documents

Ecology has reviewed and considered the public comment received on the engineering design report. Based on Ecology's evaluation of the comments, no changes were necessary in the document, and they are being finalized. The final documents will be available on the RG Haley webpage.

#### Contamination

In 2016, the city completed an environmental investigation (called a Remedial Investigation/ Feasibility Study) of the site. The remedial investigation found petroleum hydrocarbons, pentachlorophenol (PCP), polycyclic aromatic hydrocarbons (PAHs), and dioxins/furans at concentrations in the soil, groundwater, and sediment that must be addressed under the Model Toxics Control Act.

## Independent Cleanups

Property owners may choose to clean up contamination independently and submit reports to Ecology.

#### May 5–June 3: Periodic Review available for comment

This site is an approximately 2.5-acre property on the north shore of the Lake Washington Ship Canal with multiple industrial and commercial tenants. Its primary industrial use is boat repair and maintenance. The site received a No Further Action (NFA) determination through the Voluntary Cleanup Program in 2000. The remedy relied on institutional controls (a covenant restricting site uses and activities) and engineered controls (capping by pavement and buildings to prevent hazardous substances in soil from moving or being exposed to people or the environment).

We conduct a periodic review about every five years when contamination remains at a site. The purpose is to evaluate current site conditions and to ensure continued protection of human health and the environment. **This review concluded that the 2000 NFA opinion should be rescinded.**

- The neighboring Trident Seafoods property seems to be contaminated from the same source(s) that contaminated the Marine Fluid Systems property, which would make Trident Seafoods part of the Marine Fluid Systems cleanup site. Our 2000 NFA opinion indicates that the remedy is protective of human health and the environment at the site and that no further action is needed, but the remedy is **not** protective of the Trident Seafoods portion of the site. **Since more remedial action under MTCA is still necessary elsewhere at the site, the 2000 NFA opinion does not accurately represent site conditions.**
- The 2000 NFA opinion indicates that it does not pertain to contaminated sediments, and that contaminated sediments may be addressed by Ecology in the future. Sediments in the submerged portion of the property and next to the property appear to have been impacted by sandblasting grit previously observed in the partially submerged dock area or by other site operations. The selected remedy is not protective of sediments, and the extent of contaminated sediments has not been determined.
- The shop on the Marine Fluid Systems property has an unpaved dirt floor. Also, a small area of pavement southeast of the marine railway has deteriorated. Workers could be exposed to contaminated soil in these areas. The shop floor should be capped/paved, and deteriorated or cracked pavement should be repaired.

### May 19–June 19: Draft Second Periodic Review available for public comment

If contamination remains at a site after cleanup, an environmental covenant is recorded for the site. We review the conditions at sites with a covenant about every five years to make sure the cleanup action is still effective. The review of site conditions is summarized in a periodic review report.

The periodic review report for this site shows that cleanup work remains effective in protecting human health and the environment. We may modify the report if new information is submitted during the comment period.

Soil cleanup levels have not been met at the site. There is no risk of direct contact with contaminated soil and long-term monitoring shows that soil contamination is not impacting groundwater.

Groundwater cleanup levels have not been met but potential exposure pathways have been eliminated by connecting homes with contaminated wells to the municipal water supply.

The environmental covenant continues to be effective in protecting public health and the environment from exposure to hazardous substances. Institutional controls prevent the extraction and exposure of contaminated groundwater beneath the property.

The Trailer Village Park used to have a laundry facility for residents called the Trailer Village Laundromat. The laundromat had coin operated machines and also operated a dry cleaning machine from 1960 to the late 1970s. In 1991, the Washington State Department of Health (DOH) identified elevated levels of PCE in wells at the subject property and off-site in domestic drinking water wells above the federal maximum contaminant level (MCL) and the MTCA Method A Groundwater Cleanup Level. The nearby public well (the Eshom well) was also tested. The Eshom well contained PCE at a concentration below the cleanup level, and did not need to be cleaned up. The Eshom well is the City of Centralia's municipal water supply well.

### May 19–June 19: Draft Third Periodic Review Report available for public comment

If contamination remains at a site after cleanup, an environmental covenant is recorded for the site. We review the conditions at sites with a covenant about every five years to make sure the cleanup is still effective. This review is summarized in a periodic review report.

This periodic review report shows that the restrictive covenant for the site continues to be effective in protecting humans and the environment from exposure to contaminated groundwater beneath the site. Soil cleanup levels have not been met at the site; however, the cleanup action complies with cleanup standards, since the long-term integrity of the containment system is ensured and the requirements for containment technologies have been met. We may modify the report if new information is submitted during the comment period.

The site operated as a metal plating facility from 1966 to 2007, when it was purchased for use as a stonework office and showroom. It was sold in 1977, and again in 1985. The regulatory record for the site began in 1977 when an Ecology inspection identified chemical spills and concrete floor erosion. In 1981, the City of Tacoma sampled effluent and found concentrations of copper, nickel, zinc and chromium that exceeded allowable limits. In 1985 the EPA did a hazardous waste assessment and in 1990 an Ecology inspection found the facility in violation of dangerous waste regulations. Through the 1990s the site continued to be found in violation of permits and regulations by several agencies.

Assessments in 1999 showed metal contamination in surface soil, sub-surface soil, and inside the building. Cleanup in 1999 and 2000 included removing soil from areas under the building, removing parts of the floor and walls, and cleaning building surfaces. Following cleanup, some soil surrounding the building contained levels of metals that are under industrial cleanup standards but are higher than residential cleanup standards. In 2001, an environmental covenant was recorded for the site.

### Determination of property no further action

Ecology decided cleanup is complete at the Yasuhara Middle School property, part of the City Operations Complex cleanup site. You may review our [property no further action letter](#)<sup>37</sup> and other [site documents](#)<sup>38</sup>. The letter describes what was done to clean up the site and how we confirmed that the cleanup was successful.

Site investigations in 1993, 2012, and 2019 found the soil contamination. Cleanup began in 2020 as part of the property's redevelopment into the new middle school. It included removing debris, about 346 tons of contaminated soil, and underground tanks storing petroleum that were discovered during cleanup.

Based on the confirmation soil data, Ecology determined that no further action is required to clean up contamination at the property.
