Abstract

This guidance is intended to aid grant applicants in developing complete project proposals for competitive Streamflow Restoration Grant funding. This document also provides applicants with information and assistance in completing the application.

This grant round will provide up to \$40 million for eligible projects. If the full \$40 million is not awarded in this competitive grant round, Ecology reserves the right to, and may, hold another competitive grant round in the 2023-2025 biennium to award the remaining funds. If this full amount is not awarded in this grant round and Ecology does not hold another grant round in the 2023-2025 biennium, these funds will be used in subsequent competitive grant rounds.

The grant funding opportunity opens on January 2, 2024, and closes on February 29, 2024, at 5:00 p.m.

River flowing in a forest near the mountains.

Chapter 1: Overview

Chapter 90.94 RCW (2018) directed the Washington State Department of Ecology (Ecology) to “...implement a program to restore and enhance streamflows by fulfilling obligations under this act to develop and implement plans to restore streamflows to levels necessary to support robust, healthy, and sustainable salmon populations.” To establish a regulatory framework for a grant initiative that fulfills this obligation, Ecology adopted chapter 173-566 WAC—Streamflow Restoration Funding. This competitive grants initiative is designed to encourage and support the local implementation of projects and actions that meet the purposes of chapter 90.94 RCW.

The purpose of this Streamflow Restoration Competitive Grants Guidance is to aid grant applicants in developing complete project proposals. It also provides information on completing the application process for this statewide competitive grants initiative.

Critical grant funding considerations

Potential grant applicants should keep the following in mind as they prepare to submit an application for competitive funding:

- This is a statewide competitive grants initiative.
 - The funds that the Legislature has provided to Ecology for this purpose are limited. Therefore, demand for these competitive grants is likely to exceed available funding.
 - No application or project proposal is guaranteed funding, including those projects identified in adopted watershed plans or a rulemaking under RCW 90.94.020 or 030.
 - Applicants may choose to divide large, expensive, or complex projects into phases, particularly when each phase can be shown to provide streamflow or improved instream resource benefits. Ecology also reserves the right to divide a proposal into phases due to funding availability, priorities, or other considerations. Please note, however, funding for one phase does not imply any intent, nor create any obligation by Ecology to provide additional funding for any subsequent project phases.
- The types of projects prioritized from one grant round to the next may vary. Projects that would quantitatively improve streamflows are the highest single priority factor for funding in this grant round. *Funding Priorities are additive*, so projects meeting *multiple* Funding Priorities are more competitive. Numerous other criteria are also considered in final project scores (see Chapter 3).
 - Projects that neither increase streamflow nor benefit instream resources are unlikely to receive funding during this round unless they are a critical component or phase of a broader project that does increase streamflow or benefit instream resources. For example: Feasibility studies alone do not provide streamflow benefits. Applicants proposing a feasibility study as part of a multi-phase project should describe

anticipated streamflow benefits in later project phases, even if that phase is not currently being applied for in this grant round.

- Monitoring is not appropriate for all projects and is not a required project component. To maximize their project's score and show it as an effective use of limited state funds, applicants will, as appropriate, quantify the project's impacts with verifiable data. Quantitative project impacts can be measured through monitoring or estimated through modeling.
- In scoring projects and assessing potential benefits, Ecology will consider any *adverse* impacts from the proposal. Examples of adverse impacts include degradation of natural streamflow processes or instream resources in either the source or receiving waterbodies.
- For projects that tailor restoration actions to natural, ecological, or streamflow conditions on or near the project site, applicants should consider and enable the desired project outcomes. Examples include considering process-based principles to address the root causes of degradation, with the goal of restoring ecological functions.
- Applicants are encouraged to consult with any relevant [watershed planning groups](#), [watershed plans](#),¹ and [salmon recovery groups](#)² (where applicable) to ensure their project aligns with the priorities and sequencing of projects in the watershed.
- Sustainable projects provide benefits for the lifetime of the project by design. Project benefits should continue despite the projected impacts of climate change and drought. Projects resilient to climate change and drought are more likely to be successful.
- Applicants are encouraged to incorporate adaptive management principles into their project design and implementation. Adaptive management is a structured, iterative process of robust decision making in the face of uncertainty, with an aim of reducing uncertainty over time.
- Applications should identify the source(s) of any additional funding needed to fully implement the proposed project, including estimated costs for operation and maintenance, and adaptive management over the lifetime of the project. If such funding is needed but not yet secured, the application should include a detailed plan on how funding will be secured.
- Because this competitive grants initiative must make the best use of limited public funds, applicants should demonstrate that the proposed project provides benefits for a reasonable relative cost. The best way to show this is by providing examples of similar projects within a relevant area.
- Match funding is not required.
- Ecology reserves the right to require a feasibility study on any project. A feasibility study required by Ecology may be included as the first phase of a larger project application. An

¹ <https://ecology.wa.gov/Water-Shorelines/Water-supply/Streamflow-restoration/Streamflow-restoration-planning>

² <https://rco.wa.gov/salmon-recovery/managing-organizations/lead-entities/>

offer by Ecology to fund a feasibility study does not imply any intent, nor create any obligation by Ecology, to provide additional funding for any subsequent project phases.

- If Ecology makes an offer to fund a given application, Ecology and the applicant will negotiate the scope of work and corresponding budget. There is no guarantee of any funding until an agreement is finalized. Final agreement budgets may differ from the amount requested in the application.
- The effective date of the grant agreement can go back no earlier than the date of the funding offer letter. The applicant may incur project costs on and after the effective date and before Ecology's signature of the final grant agreement, but expenditures cannot be reimbursed until the agreement has been signed by Ecology's Water Resources Program Manager. Work done prior to signature on the grant agreement is at the applicant's own risk and there is no guarantee that any costs incurred prior to signature will be reimbursable.
- While project elements required under statute, rule, ordinance, or court order (except pursuant to chapter 90.94 RCW) are ineligible for funding, additional project elements that are not required by law may be eligible.
- The timeframe for completing a project should align with the needs and complexity of the project.
- The applicant is responsible for obtaining and complying with all permits necessary to execute the project.
- Requirements and considerations for property acquisition projects.
 - These are complicated projects. Applicants should consider requesting a pre-application meeting with Ecology to discuss their project prior to applying.
 - The project must align with the Washington Recreation and Conservation Office's (RCO) [Acquisition Manual 3](#).³
 - Prior to applying, applicants need to carefully consider any potential contingency terms likely to be in the purchase and sale agreement.
 - Applicants are strongly encouraged to involve Ecology early in establishing all aspects of the acquisition timeline. There is no guarantee Ecology will be able to meet an anticipated closing date for a property purchase if Ecology is not involved with setting the timeline.
- For property acquisition projects, grant applicants must be clear about what entity will hold the title or easement. Ecology will not be a holder or co-holder of land titles or conservation easements. Ecology reserves the right to be a third-party beneficiary to any deed restriction or conservation easement recorded on a property acquired with these funds.

³ <https://rco.wa.gov/wp-content/uploads/2019/07/Manual3.pdf>

- When a water right acquisition project is awarded funding, the final acquisition cost will be based on the amount of water from Ecology’s tentative determination of extent and validity of the water right.
- Grant recipients shall comply fully with all applicable federal, state, and local laws, orders, and regulations related to the grant agreement. When there are regulatory requirements identified for a funded project (for example stormwater infiltration projects), the grant agreement will include specific requirements.
- Grant recipients will be required to submit a project outcome summary near the end of their grant agreement that will be used for Ecology publications and communications. The Ecology project manager will provide a template for the summary to the grant recipient.
- All project grants will be administered in Ecology’s Administration of Grants and Loans System (EAGL).

Completing an application

Applicants must accurately describe their proposed project and corresponding benefits.

Ecology expects all project applications to follow the instructions below:

- All applications must be submitted between January 2, 2024, and February 29, 2024, at 5:00 p.m.
- Applicants must submit their applications through the Ecology Administration of Grants and Loans (EAGL) system.
 - EAGL is an automated system for processing applications.
 - Applications without all mandatory elements are incomplete.
 - Incomplete applications will not be accepted by the EAGL automated system.
 - Therefore, incomplete applications will not be reviewed.
 - EAGL closes down periodically on Mondays for system maintenance. Applicants should save their work and log out of EAGL during that time.
- All submitted materials should be easy to read and understand.
 - Give clear, complete, and concise answers to all questions.
 - Write in complete sentences and avoid ambiguous statements.
- Applicants must submit all supporting information and evidence needed to evaluate the project proposal.
- The more relevant information and evidence provided by the applicant, the stronger the application is likely to be. Applications without relevant information and evidence will score poorly.
- Address all relevant items identified in the grant guidance and scoring guide.

- Provide documentation and citations to support your responses to application questions. If referring to a large document, upload only the relevant portions or provide clear information on where in the document the reference is located.
- Identify the documented streamflow, fish, or other instream resource problem(s) that your project would address and provide citations or other evidence. Examples of evidence include referencing streamflow records, citing a specific concern in a salmon recovery plan, or referring to documented fish conservation status.⁴
- Describe why you selected the proposed project over other potential solutions to address the local issues the application identifies.
- A project includes all phases of work, even if an application is only for a single phase of the entire project. Ecology may determine your application includes some ineligible project elements, even if your application is otherwise eligible. A competitive application clearly indicates the eligibility of the various project elements.
- Demonstrate that the project is well thought out:
 - Explain how you will determine and demonstrate any project benefits. For example, how you calculated a quantified estimate of the ultimate streamflow benefits of the project as a whole (alone or after the completion of all phases) in terms of both the amount and location of flow added to the stream.
 - Include a well-defined scope of work that has goals, objectives, timelines, and measurable outcomes.
 - Describe all steps and tasks needed for the project such as permits, approvals, or the cooperation of landowners or agencies.
 - Demonstrate that the funds will be well invested in this local project.
- The following project elements often affect a project's scope of work, budget, and timeline and should be planned for and considered in the application.
 - Funded projects that include the collection of environmental data, analysis of existing environmental data, or use environmental data to construct models will be required to develop a Quality Assurance Project Plan (QAPP) that meets Ecology standards (See [Guidelines for Preparing Quality Assurance Project Plans for Environmental Studies](#)).⁵ The QAPP must be approved by Ecology prior to the commencement of any work that is contained in the QAPP.
 - Quality Assurance Project Plans are complicated. The types of data that are planned to be collected or used for the project determine which QAPP template must be used.

⁴ Washington Department of Fish & Wildlife (WDFW) has several sources for this information including SalmonScape, Salmon Conservation—Recovery (SCORE), Priority Habitat and Species (PHS on the Web), or contacting the local WDFW habitat biologists.

⁵ <https://apps.ecology.wa.gov/publications/documents/0403030.pdf>

The Ecology project manager will provide the appropriate QAPP template grant recipients must use.

- If environmental data are generated for the project, those data must be uploaded by the grant recipient to Ecology's Environmental Information Management (EIM) system annually.
- Demonstrate an understanding of the role(s) and cost(s) associated with requiring licensed professionals (e.g. hydrogeologists and engineers) to complete certain components of the project. Applicants should plan accordingly and consult a licensed professional prior to applying to determine if or what professional services may be necessary for their project. For example, but not limited to, for projects analyzing surface water and groundwater interactions, a licensed hydrogeologist is required to be involved in developing the applicable QAPP, overseeing measurement equipment installation, data collection, analysis, and interpretation of results.

For these grants, Ecology will not provide licensed engineering review of project designs unless that review is a standard process step associated with required Ecology permitting for the project.

- Projects that include ground disturbing work or land acquisitions are required to undergo a cultural resource review and must comply with Governor's Executive Order (GEO) 21-02 concerning archeological and cultural resources. See Appendix E for more information. If applicable, consider potential cultural resources review elements (e.g., archaeological surveys, archaeological monitoring, historical property inventories, landowner agreements) in the project scope of work, budget, and timeline. The anticipated area of potential effect (APE) for a project can be reviewed in the Washington Information System for Architectural and Archaeological Records Data database (WISAARD).⁶

■ Demonstrate readiness to proceed:

- Show that preliminary measures have been taken to prepare for implementing the proposed project. Demonstrate knowledge of any potential barriers and the means for addressing those barriers.
- Provide a timeline for implementation.
- Ecology expects that project agreements will be finalized within one year of offer, and that project phases will be completed within three years of the agreement.

■ Demonstrate local support:

⁶ <https://dahp.wa.gov/project-review/wisaard-washington-information-system-for-architectural-and-archeological-records-data>

- Robust, ongoing engagement from relevant partner governments and stakeholders is important for project success. Demonstrate that the project has support from the community, interested tribes, agency partners, stakeholder groups, and watershed planning groups (if applicable) including any disadvantaged communities. Include letters of support as documentation. If the applicant could reasonably conclude that any communities will experience adverse impacts from the project, the applicant must demonstrate that there has been outreach to address those issues, and that adverse impacts have both been explicitly articulated and will be minimized through appropriate project design (see Appendix C).
- Applicants proposing to purchase property or complete work on private property should include the [Landowner Acknowledgement Form](#)⁷ with their application. If not provided at the time of application, it must be submitted prior to Ecology signing the grant agreement.

Eligible applicants

Applicants eligible for funding include Washington state agencies, local governments and quasi-governments within Washington state, agencies of the federal government, tribal governments with reservation lands or treaty rights within Washington, and non-profit organizations.⁸

Ecology will evaluate all complete competitive grant applications that have been submitted by the funding opportunity deadline. Eligibility of the applicant and the proposed project will be determined according to WAC 173-566-030. For any eligible application, Ecology will then use the detailed scoring criteria described in Chapter 3.

Chapter 2: Application considerations for project types

This chapter provides specific considerations for the eligible project types identified in chapter 173-566 WAC Streamflow Restoration Funding, as well as information on project elements. Other project types may also be eligible if they meet the intent of chapter 90.94 RCW. This information is provided so all potential applicants have the same information as they decide whether to submit an application for competitive grant funding.

Eligible project types include but are not limited to:

Water right acquisitions.

Watershed function, riparian, and fish habitat improvements.

Water storage.

Environmental monitoring.

Altered water management or infrastructure.

Feasibility studies.

Requirements by project type

*For projects that include collection of environmental data, analysis of existing environmental data, or that use such data to construct models, grant recipients must submit a Quality Assurance Project Plan (QAPP) that meets Ecology standards (see Ecology Publication No. 04-03-030).

Water right acquisitions

- Applicant must attend a pre-application meeting.
- Water right purpose of use changed to instream flow.
- Permanently convey the right to Ecology's Trust Water Rights Program.

Altered water management or infrastructure

- Conservation and water use efficiency projects must permanently convey saved water to Ecology's Trust Water Rights Program, and create:
- Permanent instream flow improvement; *or*
 - Access to new water supplies when identified in a watershed plan adopted under chapter 90.94 RCW.

Environmental monitoring

Environmental monitoring is typically a component of a larger project. Environmental data generated must be uploaded to Ecology's Environmental Information Management (EIM) system annually.

Water storage

A managed aquifer recharge project requires a feasibility study.

Watershed function, riparian, and fish habitat improvements

Projects involving the use or acquisition of private property must show landowner awareness by including a Landowner Acknowledgement Form (see Chapter 1) with the application.

Feasibility studies

A feasibility study for a managed aquifer recharge project must follow special requirements (see Appendix D). Other feasibility studies are eligible with no special requirements.

Water right acquisitions

Definition:

Under the Streamflow Restoration Competitive Grants program, a water right acquisition project must change the water right purpose of use to instream flow under RCW 90.03.380 and result in the water right being permanently conveyed to Ecology, to be held and managed in the Trust Water Rights Program.

Purpose and primary environmental benefits:

Ecology's interest in acquiring water rights is to increase streamflows to benefit vulnerable fish and wildlife by allowing the water to remain in the stream. Acquired water rights may also serve to offset the impacts of other water use.

Application requirements:

All water right acquisition proposals require a pre-application meeting prior to applying for funding, as described on this page.

During the pre-application meeting, Ecology staff will provide technical assistance and ensure that grant application requirements can be met.

At the conclusion of the meeting, or in an email to follow, Ecology staff will indicate whether the project appears eligible for Streamflow Restoration Competitive Grant funding. This response will only indicate eligibility based on the information provided during the pre-application meeting, and it will not determine how competitive the project may be for funding.

Pre-Application Meeting details

How to schedule a pre-application meeting:

Send a completed meeting request form to sfrprjgrants@ecy.wa.gov prior to February 15, 2024.¹³

Meeting requests submitted after February 15, 2024, will be scheduled dependent upon staff availability.

Include three (3) or more potential meeting dates and times. Plan for the meeting to take no more than 90 minutes.

At least one week prior to your confirmed meeting time, submit the following documentation:

1. A clear description of the project including the locations of the historical point of diversion and the stream reaches where the benefits are anticipated to occur.
2. The timing and quantity of additional streamflow (cubic feet per second) and volume (acre-feet) the project is anticipated to provide.
3. A proposed price in dollars per acre-foot and documentation supporting the price.
4. An executed change application or a signed declaration of project support by the water right holder [and the landowner (see Chapter 1) if they are different].

The materials required for the pre-application meeting will be components of the later application submittal if the applicant chooses to proceed with requesting Streamflow Restoration Competitive Grant funding.

Other information:

Water right acquisition proposals must identify the water right(s) for which the purpose of use has or will be changed to instream flow under RCW 90.03.380. Ecology will make a tentative determination of the extent and validity of the water right during the change process.

Payment will be based on:

- Fair market value as determined by an appraisal (see [Water Banking Pilot Grant 2023-2025 Funding Guidelines](#), Determining purchase price).¹⁴
- Quantity of water found to be valid under the right.
- Completion of the change to the purpose of use.
- Final conveyance of the equity interest of the water right (or portion of the water right) to Ecology by deed or other contractual means.

Acquisition of a groundwater right is eligible for funding, but it may be difficult to estimate streamflow benefits of such projects. Applicants are encouraged to provide well logs, pump records, and any applicable groundwater studies in their application.

¹³ <https://apps.ecology.wa.gov/publications/summarypages/ECY070741.html>

¹⁴ <https://apps.ecology.wa.gov/publications/summarypages/2311006.pdf>

Water storage

Definition:

Water storage projects, including “retiming” projects, involve the capture of water when it is available (such as during high-flow periods) and the later use or release of that water when needed, thus increasing streamflow. Examples of water storage projects that are eligible for grant funding include, but are not limited to:

- **Active Surface Storage:** Depressions in the land surface can be used or created to serve as surface storage reservoirs or ponds. The reservoir can be lined to prevent seepage loss and allow the maximum retention of stored water (minus evaporative loss) until it is actively released back into a stream. In some instances, Ecology may require a phased approach that includes a feasibility study for this type of project.
- **Managed Aquifer Recharge:** Managed aquifer recharge (MAR) is the purposeful recharge of water to aquifers for subsequent recovery or for environmental benefit.¹⁵ MAR projects can augment dry-season streamflow by increasing surficial aquifer discharges to the streams beyond what occurs under current conditions. MAR projects typically involve diverting a small fraction of high seasonal streamflows to spreading basins or other infiltration facilities in the adjacent floodplain or uplands. This diverted surface water infiltrates into a shallow aquifer, migrates through the aquifer, and ultimately discharges back to surface water as re-timed groundwater base flow.
 - All MAR projects require a phased approach, which includes a feasibility study that addresses both Ecology’s Water Resource and Water Quality program requirements. Further information and requirements are provided in “MAR Feasibility Study” in this section and Appendix D.
- **Aquifer Storage and Recovery:** Aquifer storage and recovery (ASR) is a water resources management technique for actively storing water underground during wet periods for recovery when needed, usually during dry periods.¹⁶ ASR projects are generally developed to increase municipal water system resiliency by lessening the dependence on surface water during the dry season. This in turn leaves more water in surface waters during the dry season and can benefit aquatic species and their habitat.
- **Cisterns:** A cistern is a waterproof receptacle for holding water. They have historically been built to catch and store rainwater and then used for irrigation or other non-potable domestic use. Below-ground cisterns are distinguished from wells by their waterproof linings.

¹⁵ <https://www.ngwa.org/what-is-groundwater/groundwater-issues/managed-aquifer-recharge>.

¹⁶ <https://www.usgs.gov/centers/california-water-science-center/science/aquifer-storage-and-recovery>

There are a wide variety of possible water storage projects. Applications that provide evidence that the project would quantitatively improve streamflows as well as enhance instream resources and watershed functions are likely to score well in this competitive grants program.

Purpose and primary ecological benefits:

Water storage can have many benefits depending on location and design. Projects that artificially recharge groundwater aquifers can supplement base flows where groundwater discharges to the surface water. Surface water benefits can result from retiming excess flows from high-flow events to supplement streamflows during low-flow periods. This benefit can occur through passive release from groundwater or through timed release from above-ground reservoirs. When aquifer storage is used, significant streamflow temperature reductions may also result where high temperatures are a limiting factor for salmonid migration and survival. Water storage could also be used to provide water for out-of-stream uses, which could reduce the impacts of that water use on streamflows and water temperature.

Other information:

MAR projects do not require National Pollutant Discharge Elimination System or State Waste Discharge permits if they are not introducing pollutants into surface or groundwater. While no Water Quality Program permits are issued for MAR projects, water quality anti-degradation rules still apply, and waters of the state need to be protected. The feasibility study requirements (described in Appendix D) are designed to allow projects to proceed without the need for a Water Quality Program permit and in acknowledgement of the water quality benefits of having more water in streams. If feasibility study results indicate unanticipated water quality issues, the Water Quality Program may re-evaluate the assumption that the project will not require a water quality permit.

Groundwater augmentation projects not using a surface water source (e.g., municipal water, reclaimed water, stormwater) can be proposed but may require additional source water characterization to maintain groundwater anti-degradation standards or have added permitting requirements not covered under this grant guidance. Applicants should consider requesting a pre-application meeting with Ecology to discuss their project prior to applying.

Projects that include a stormwater infiltration component must meet the requirements of Ecology's Water Quality Program [State Fiscal Year 2025 Funding Guidelines Water Quality Combined Funding Program, Stormwater Financial Assistance Grants](#).¹⁷ The project must be designed consistent with Ecology's Water Quality Program's stormwater management manuals

¹⁷ <https://apps.ecology.wa.gov/publications/documents/2310020.pdf>

and those requirements should be identified in the feasibility study permitting analysis component. In cross-program review of applications, the Water Quality Program has asked that our applicants reach out to Water Quality prior to applying. Applicants must consult with the Water Quality Program on their stormwater infiltration project to understand the requirements prior to applying.

Application requirements:

MAR project proposals are required to include a phased approach. The first phase should include a study examining project feasibility and water quality issues. Feasibility studies may be completed prior to application for the grant and submitted as part of the application. At Ecology’s discretion, previously completed feasibility studies may require additional study elements in order to provide necessary information. Elements of a MAR feasibility study are detailed in Appendix D.

Altered water management or infrastructure

Definition:

Water management and infrastructure improvement projects may involve changes in how and when water is diverted, withdrawn, conveyed, or used to benefit streamflows and instream resources. Examples include conservation and efficiency projects like diversion modifications, lining and piping ditches, sprinkler conversion, and other irrigation efficiencies, as well as source switches, and streamflow retiming projects. Innovative methods will be considered.

Purpose and primary ecological benefits:

Although there are a wide variety of projects of this type, in general, these types of projects reduce water waste, such losses to evaporation, or in some cases, leakage, and instead use water more efficiently. For example, irrigation efficiencies can benefit crops by providing water when it is needed while conserving excess water that can tax the plants, leach out nutrients from the soil, and reduce the effectiveness of fertilizers. However, aspects of some conservation measures result in unforeseen consequences. Ditch lining, for example, may result in less water being used to irrigate crops, but may also reduce water seeping from the ditches into the ground, subsequently reducing streamflow. The balance of water that remains or ends up in a stream to benefit flows and support natural processes determines the true benefits conservation measures provide.

Application requirements:

Applicants proposing altered water management or infrastructure projects must include in their proposal, per WAC 173-566-220, sufficient provisions and protections to ensure that completed projects provide:

- Permanent streamflow improvement; and/or
- Access to new water supplies when the project is identified in a watershed plan adopted under RCW 90.94.020 or 90.94.030.

Conservation and water use efficiency projects must permanently convey the saved water to Ecology to be held in the Trust Water Rights Program for instream flow purposes.

Watershed function, riparian, and fish habitat improvement

Definition:

Watershed function as well as riparian and fish habitat improvement projects involve upland, riparian, or instream changes that restore and support natural watershed functions, benefitting threatened and endangered salmonids or other native aquatic species of concern. These projects may also result in an increase in streamflow, but (by design) they prioritize the habitat benefits and tend to have streamflow benefits that are harder to quantify than water right acquisitions or water storage projects. Projects that will quantitatively improve streamflow as well as provide benefits to instream resources will be scored based upon all benefits described in the application. Potentially eligible projects include but are not limited to:

- **In-channel habitat improvements:** Streambank restoration, gravel and woody structure augmentation, and channel re-meandering.
- **Riparian restoration:** Riparian planting to replace invasive species with native vegetation, providing future sources of woody debris; livestock exclusion fencing; removing creosoted wood and garbage; reducing impervious surfaces.
- **Strategic land acquisition:** Acquisitions, conversions, or easements that protect stream banks, promote a healthy riparian corridor, and preserve an area against future development. See Chapter 1 for the required landowner acknowledgement form.
- **Levee modification:** Levee removal or setback projects that change the slope, location, vegetation, or structure, *and* improve stream conditions.
- **Floodplain modification:** Projects intended to provide benefits for instream resources, such as increased rearing habitat, high-flow refuges, and increased species diversity.
- **Large wood placement in incised streams:** Strategic placement of large wood to improve fish habitat and water quality, as well as promote aggradation of incised stream channels.
- **Fish passage:** Removing or modifying barriers to allow fish passage and increase the range of salmonid access.
 - Removal of barriers required by law, executive order, or consent decree; or removing an upstream barrier when downstream barriers still exist are not eligible for funding under this grants program.
- **Beaver dam analogs and/or beaver introduction:** The construction of artificial beaver dams and/or the deliberate introduction of beaver to increase the water table, channel complexity, species diversity, and salmonid rearing habitat. Additional permitting is required to handle and translocate beaver. Please contact your local Washington Department of Fish & Wildlife (WDFW) habitat biologist to discuss applicable regulations.

Purpose and primary ecological benefits:

Projects of this type can improve watershed function, improve riparian and aquatic habitat, reduce water temperatures, improve food availability, provide fish protection from predators, restore spawning gravel, improve water quality, reduce flooding and flash flooding, increase dry season base flows, restore natural processes, foster species diversity, expand habitat for fish development, restore wildlife corridors, and promote ecological health.

Application requirements:

Applicants must clearly identify how the project will improve instream resources and include quantitative and/or qualitative estimates of the benefits provided.

Environmental monitoring

Definition:

Environmental monitoring is eligible for funding, including but not limited to:

- Stream gauging and groundwater monitoring directly related to restoring, maintaining, or enhancing streamflows or instream resources and values.
- Monitoring as a component of broader Streamflow Restoration Grant projects.

Purpose and primary ecological benefit:

Environmental monitoring provides the most benefit when it is used to develop or trigger actions that restore, maintain, or enhance streamflows and instream resources. One example is monitoring the benefits of a project to implement any contingency actions necessary to maintain project benefits.

Other information:

Environmental monitoring is most likely to be funded when incorporated into a broader project proposal. Projects that do not increase streamflow but do benefit instream resources are eligible; however, they will tend to be less competitive for this grant funding program.

Environmental data generated must be uploaded to Ecology's Environmental Information Management (EIM) system annually.

Feasibility studies

Definition:

A feasibility study is an assessment of the practicality or methodology of a proposed project, examining the factors that could either facilitate or hinder implementation. At a minimum, a feasibility study addresses:

- Cost.
- Technical hurdles or barriers.
- Permitting hurdles or barriers.
- Operations and maintenance needs and costs.
- Parties identified to undertake specified roles.
- Local support.
- Uncertainty in calculating estimated benefits.
- Project lifespan.
- Connections to existing projects and actions.

Purpose and primary ecological benefit:

Feasibility studies provide no benefit to streamflow or instream resources. Their benefit is in their ability to determine the viability of a project proposal while quantifying risks and benefits.

Application requirements:

Feasibility studies may be funded for any eligible project type. In addition, Ecology reserves the right to require a feasibility study for any project. A feasibility study required by Ecology may be included as the first phase of a larger project application. An offer to fund a feasibility study does not imply any intent or create an obligation to provide grants or otherwise fund any subsequent phases of the project.

Applicants interested in conducting a feasibility study are encouraged to apply for grant funds to complete that study as part of a multi-phased, well-developed project proposal. Such applications will be assessed based upon both the feasibility study and the additional phases of the project. These applications are likely to score more competitively than stand-alone feasibility studies. In general, stand-alone feasibility studies (i.e., those not embedded within a

well-developed project proposal) will not compete well in the evaluation, scoring, or ranking under this competitive grants program.

All managed aquifer recharge (MAR) project proposals are required to include a phased approach; the first phase must be comprised of a study examining project feasibility including water quality considerations as described in Appendix E.

If environmental data are collected, recipients will need to submit a Quality Assurance Project Plan (QAPP) as an initial project component that meets Ecology standards for submitting environmental monitoring data (see Ecology Publication No. 17-11-013).¹⁸

Select ineligible project elements

An additional consideration for potential applicants is that there are projects and project components that are ineligible to receive competitive grant funding under this program. The following is a non-exhaustive list of common project elements that are ineligible for Streamflow Restoration Competitive Grants Program funding:

- Project elements previously funded by Ecology.
- Project elements that are otherwise required under statute, rule, ordinance, or court order, except pursuant to chapter 90.94 RCW.
- Costs to meet an individual or general National Pollutant Discharge Elimination System (NPDES) permit requirement.
- Capital equipment and major purchases made without prior approval from Ecology.
- Property purchases made without prior written approval from Ecology.
- Contaminated soils removal or remediation.
- Projects that conflict with other Ecology rules, projects, or guidance.
- Aquatic plant control for aesthetic purposes, navigational improvements, or any other reason that does not provide increased streamflow, nor benefit ecological functions or critical stream habitat.
- Operation and maintenance (O&M) costs.

More information on broader ineligibility considerations can be found in WAC 173-566-310 and

[Administrative Requirements for Recipients of Ecology Grants and Loans](#) (the “Yellow Book”).¹⁹

¹⁸ <https://apps.ecology.wa.gov/publications/summarypages/1711013.html>

¹⁹ <https://apps.ecology.wa.gov/publications/SummaryPages/2301002.html>

Chapter 3: Applying for funding

Applications will be reviewed and scored based on the guidance and scoring criteria described in this document. Ecology reserves the right to conduct additional assessments, including but not limited to on-site field evaluations, consultations with other agencies or entities, and feasibility. The application period is specified in Chapter 1.

As noted in Chapter 2, a pre-application consultation is required for all water right acquisitions projects. Applicants for other types of projects may request a pre-application meeting with Ecology staff if additional project-specific assistance is desired. Although Ecology cannot guarantee availability, requests will be accommodated to the extent possible.

- To request a pre-application meeting, please complete and submit a *Streamflow Restoration Grant Pre-application Meeting Request Form* ([Ecology Form No. ECY-070-041](#)) by email to sfrprjgrants@ecy.wa.gov and include "meeting request" in the subject line of the email. Ecology will contact you to discuss scheduling.²⁰

The application

Applicants submit their applications through the Ecology Administration of Grants and Loans (EAGL) system using a [Secure Access Washington](#)²¹ account. The funding application is available by going to [Ecology's Grants and Loans webpage](#)²² and following the instructions to access the funding application and the [EAGL User's Manual](#).²³ Applicants without access to the electronic system should contact Ecology for assistance.

The system is designed to allow up to five applications for each entity. If you expect to submit more than five applications, contact sfrprjgrants@ecy.wa.gov to request additional applications. EAGL closes down periodically on Mondays for system updates, and the system will automatically stop accepting applications on the February 29, 2024, 5 p.m. deadline.

Information found in the project application is the basis for developing the funding agreement. Funding agreements for clearly defined project proposals that include a detailed scope of work, measurable objectives, O&M plans, and accurate budgets will take less time to develop. If the applicant makes significant changes to the scope of work after the award, Ecology reserves the right to withdraw or modify a funding offer.

Scoring criteria: Streamflow restoration competitive grant proposal

Streamflow Restoration Competitive Grant applications will be reviewed for their technical merit and competitively scored using the following scoring criteria. A total of 300 points is available (see Table 2).

Table 2. Scoring overview.

Scoring Category	Points Possible
1. Funding priorities	100
2. Project benefits	40
3. Project budget	30
4. Project durability and resiliency	50
5. Project scope	30
6. Applicant readiness to proceed and project monitoring	20
7. Additional project considerations	30
Total	300

1. Funding priorities

Grant applications for projects that demonstrate the following will receive added priority under each of the following five independent criteria.

1.1. The proposed project is identified in an RCW 90.94.020 or 90.94.030 watershed plan that has been adopted by Ecology, or through a rulemaking process to meet the requirements of RCW 90.94.	Possible	Earned
True	20	
False	0	
1.2. The proposed project is located in an RCW 90.94.020 or RCW 90.94.030 WRIA, or is designated as an RCW 90.94.040 Metering Pilot Project Area.	Possible	Earned
True	20	
False	0	
1.3. The project quantitatively improves streamflows that will benefit instream resources (see Critical Grant Program Considerations in Chapter 1).	Possible	Earned
Strong evidence that the project will improve streamflows.	21–30	
Some evidence that the project will improve streamflows.	11–20	
Minimal evidence that the project will improve streamflows.	1–10	
No convincing evidence that the project will improve streamflows.	0	
1.4. The project benefits native fish or aquatic species of concern.	Possible	Earned
Strong evidence that the project will benefit native fish or aquatic species of concern.	11–20	
Some evidence that the project will benefit native fish or aquatic species of concern.	6–10	
Minimal evidence that the project will benefit native fish or aquatic species of concern.	1–5	
No convincing evidence that the project will benefit native fish or aquatic species of concern.	0	
1.5. The project benefits threatened or endangered salmonids.	Possible	Earned
Evidence that the project will benefit threatened and endangered salmonids.	10	
No evidence that the project will benefit threatened and endangered salmonids.	0	
1.1–1.5 Total Points	100	

2. Project benefits

Grant applications will demonstrate that the proposed project will provide benefits directly addressing the local causes of aquatic resource degradation, as well as water quality, and other environmental considerations.

2.1. The application has identified one or more local causes of aquatic resource degradation that the proposal is designed to address (fully or in part) and would have a meaningful effect on those problems without causing adverse impacts on the source or recipient watershed.	Possible	Earned
Strong evidence of a meaningful effect on the problem, and will not cause adverse impacts.	20	
Some evidence of a meaningful effect on the problem, and will not cause adverse impacts.	10	
Minimal evidence of a meaningful effect on the problem, and will not cause adverse impacts.	5	
No convincing evidence of a problem, or project will cause adverse impacts on source or recipient watershed.	0	
2.2. Evidence that the proposed project will provide benefits following project completion.	Possible	Earned
Evidence that the project will provide benefits immediately after project completion.	5	
Evidence that the project will provide benefits between 1 and 5 years after completion.	2	
Evidence that the project will provide benefits, but not for more than 5 years after completion.	1	
No evidence that the project will provide benefits.	0	
2.3. Proposed project and project benefits align with the needs of the community and other watershed planning processes (see “Consistency with Watershed and Community Planning Partner and Stakeholder Engagement” in Appendix C).	Possible	Earned
Strong evidence that project and project benefits align with watershed and community planning.	15	
Some evidence that project and project benefits align with watershed and community planning.	5	
No convincing evidence.	0	
2.1–2.3 Total Points	40	

3. Project budget

Grant applications will demonstrate that the proposed project will deliver benefits for instream resources that justify the project cost.

3.1. Cost estimates for proposed project and individual tasks are based upon defensible and relevant data.	Possible	Earned
Strong evidence that costs are based upon defensible and relevant data.	10	
Some evidence that costs are based upon defensible and relevant data.	5	
Minimal evidence that costs are based upon defensible and relevant data.	2	
No convincing evidence.	0	
3.2. Proposed project is an effective use of funds in terms of costs and benefits as demonstrated in the application.	Possible	Earned
Strong evidence that project provides benefits for a low relative cost.	10	
Strong evidence that project provides benefits for a reasonable relative cost.	8	
Strong evidence that project provides benefits for a high relative cost.	2	
No convincing evidence.	0	
3.3. Adequate funding has been identified for the completion of the project, as well as the operation, maintenance, monitoring, and contingency implementation costs over the lifetime of the project.	Possible	Earned
All funding has been applied for or secured.	10	
Some funding has been applied for or secured.	5	
No convincing evidence that funding has been applied for or secured.	0	
3.1–3.3 Total Points	30	

4. Project durability and resiliency

Grant applications will demonstrate that applicant has used a complete and well-defined set of criteria to determine the durability of the proposed project and its benefits, including considerations of climate change and drought.

4.1. Proposed project and project benefits are tailored to local conditions (see Critical Grant Program Considerations in Chapter 1).	Possible	Earned
Strong evidence that project and project benefits are tailored to the location.	15	
Some evidence that project and project benefits are tailored to the location.	5	
No convincing evidence that project and project benefits are tailored to the location.	0	
4.2. Proposed project is feasible and likely to succeed.	Possible	Earned
Strong evidence that project is feasible and likely to succeed.	10	
Some evidence that project is feasible and likely to succeed.	5	
No convincing evidence that project is feasible and likely to succeed.	0	
4.3. Proposed project benefits are sustainable.	Possible	Earned
Strong evidence that the project benefits are sustainable.	8	
Some evidence that the project benefits are sustainable.	4	
No convincing evidence that the project benefits are sustainable.	0	
4.4. The uncertainties and risks of the proposed project have been identified, evaluated, and minimized to the extent possible.	Possible	Earned
Strong evidence that risks have been identified, evaluated, and minimized.	9	
Some evidence that risks have been identified, evaluated, and minimized.	7	
Minimal evidence that risks have been identified, evaluated, and minimized.	4	
No convincing evidence that risks have been identified, evaluated, and minimized.	0	
4.5. Application demonstrates an understanding of how climate change may impact the proposed project, and identifies how it will address climate change and drought resilience for the project (see Critical Grant Program Considerations in Chapter 1 and Appendix C).	Possible	Earned
Strong evidence that project design considered climate change and drought resilience.	8	
Some evidence that project design considered climate change and drought resilience.	4	
No convincing evidence that project design considered climate change and drought resilience.	0	
4.1–4.5 Total Points	50	

5. Project scope

Grant applications for projects that demonstrate the following three independent criteria.

5.1. Application scope covers all elements necessary to develop, implement, and complete the project.	Possible	Earned
Strong evidence that project scope covers all necessary elements.	10	
Some evidence that project scope covers all necessary elements.	5	
No convincing evidence that project scope covers all necessary elements.	0	
5.2. Application provides sufficient maps, plans, and other documents for the project.	Possible	Earned
Detailed and useful maps, plans, and other documentation.	10	
Incomplete or insufficient maps, plans, and other documentation.	5	
No maps, plans, and/or other documentation.	0	
5.3. Project deliverables would provide clear evidence that project tasks have been successfully completed.	Possible	Earned
Strong evidence that project deliverables will provide clear evidence that project tasks have been successfully completed.	10	
Some evidence that project deliverables will provide clear evidence that project tasks have been successfully completed.	5	
No convincing evidence that project deliverables will provide clear evidence that project tasks have been successfully completed.	0	
5.1–5.3 Total Points	30	

6. Applicant readiness to proceed and project monitoring

Grant application demonstrates that the applicant has sufficient staff, planning, and commitments in place to complete the project, monitor effectiveness, and sustain the benefits of this project.

6.1. Applicant has identified affected tribes, governments, and key stakeholders (see “Consistency with Watershed and Community Planning” in Appendix C) and gained their support for the proposed project.	Possible	Earned
Letters of support from tribal governments, key partners, and stakeholders.	4	
No letters of support.	0	
6.2. Applicant is prepared to start on the proposed project (e.g., design and/or permitting work is already completed or underway).	Possible	Earned
Strong evidence of readiness to proceed with project.	4	
Some evidence of readiness to proceed with project.	3	
No convincing evidence of readiness to proceed with project.	0	
6.3. Application has demonstrated that sufficient staff, planning, and commitments are in place to ensure that the project will be completed, and adequately maintained. Applicant roles, responsibilities, and qualifications are adequate for the scope of work.	Possible	Earned
Strong evidence of experience completing similar projects.	8	
Some evidence of experience completing similar projects.	4	
No convincing evidence of experience completing similar projects or there are concerns on file with the applicant.	0	
6.4. Proposed project will collect project monitoring data for project benefits.	Possible	Earned
Will provide monitoring data for project benefits.	4	
Will not provide monitoring or data for project benefits.	0	
6.1–6.4 Total Points	20	

7. Additional project considerations

Grant application has identified all additional concerns or considerations relevant to the proposed project not directly addressed in the previous scoring criteria.

7.1. Project does not raise any legal or policy concerns, and applicant has identified and adequately addressed probable failure points, permitting concerns, inter-programmatic comments, multiple environmental goals, geographic considerations, concerns identified by technical reviewers and agency staff, and all additional concerns.	Possible	Earned
	1-30	
7.1 Total Points	30	
Total Points	300

Appendix B: Priority Water Resource Inventory Areas (WRIAs)

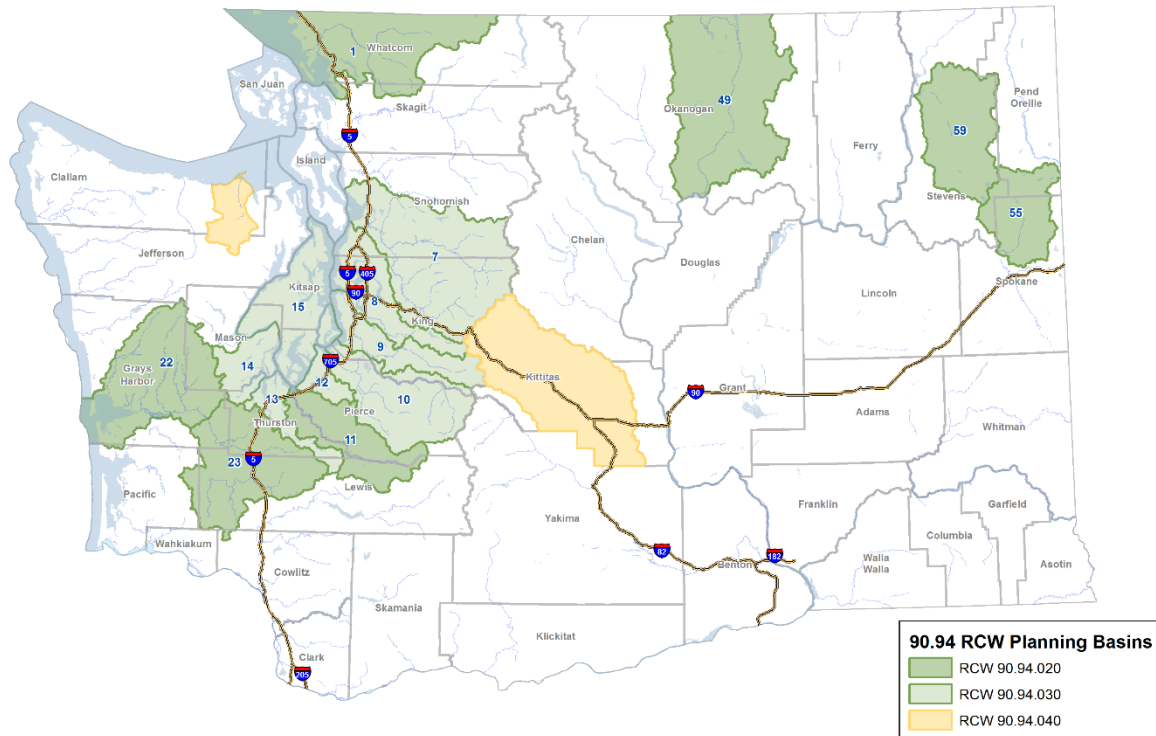

Figure 2. Basins prioritized for funding under chapter 90.94 RCW.

The following basins have priority for funding under chapter 173-566 WAC:

- | | |
|---------------------------|--------------------------------|
| WRIA 1 — Nooksack | WRIA 14 — Kennedy-Goldsborough |
| WRIA 7 — Snohomish | WRIA 15 — Kitsap |
| WRIA 8 — Cedar-Sammamish | WRIA 22 — Lower Chehalis |
| WRIA 9 — Duwamish-Green | WRIA 23 — Upper Chehalis |
| WRIA 10 — Puyallup-White | WRIA 49 — Okanogan |
| WRIA 11 — Nisqually | WRIA 55 — Little Spokane |
| WRIA 12 — Chambers-Clover | WRIA 59 — Colville |
| WRIA 13 — Deschutes | |

Additional priority watersheds include those areas of WRIAs 18 (the area regulated by chapter 173-518 WAC — Dungeness) and 39 (the Kittitas County water bank program area) designated in RCW 90.94.040 for metering pilot projects.

Appendix C: Reference Information for Project Applicants

Habitat restoration and consistency with watershed and community planning

Riparian and wetland restoration can be a critical part of streamflow restoration habitat projects. The design of habitat restoration components should be consistent with watershed-specific planning and conditions and should be based on best practices identified in relevant manuals and guidance.

Salmon Recovery Lead Entities are key groups that support watershed-based habitat restoration across the state. It will be very important to ensure that projects are in harmony with the habitat [recovery objectives of the Lead Entity](#).²⁴

Other sources of habitat information are [WDFW](#)²⁵ and [tribal biologists familiar with your region](#).²⁶

Resources providing best practices for habitat project design and applicable science include:

- [The Stream Habitat Restoration Guidelines](#)²⁷ (2012).
- [Ecology’s Restoring Wetlands in Washington: A Guidebook for Wetland Restoration, Planning & Implementation](#)²⁸ (1993).
- [Riparian Ecosystems, Volume 1: Science Synthesis and Management Implications](#)²⁹ (2018).
- [Riparian Ecosystems, Volume 2: Management Recommendations](#)³⁰ (2018).

Tribal government, partner government, and stakeholder engagement

To maximize project scores, applicants are encouraged to engage with all tribal governments, partner governments, and stakeholders, early and often. This engagement and coordination are to occur both prior to, and after, submitting an application for funding, during project development and implementation, and after a contract is signed. Robust and ongoing engagement from relevant partners and stakeholders is crucial to project success because doing so demonstrates thoughtful project planning and management.

²⁴ <https://rco.wa.gov/salmon-recovery/managing-organizations/lead-entities/>

²⁵ <https://wdfw.wa.gov/about/regional-offices>

²⁶ https://fortress.wa.gov/ecy/gispublic/DataDownload/map_TribalReservation_statewide.pdf

²⁷ <https://wdfw.wa.gov/publications/01374>

²⁸ <https://apps.ecology.wa.gov/publications/summarypages/93017.html>

²⁹ <https://wdfw.wa.gov/publications/01987>

³⁰ <https://wdfw.wa.gov/publications/01988>

A strong application that maximizes project scores will include letters of support from interested tribes, local governments, and stakeholders. The applicant should include as many letters of support as they believe reasonably demonstrate broad project support:

- All project proponents are strongly advised to contact and consult with interested or potentially interested tribes. As part of the Ecology's commitment to coordination with our Governmental Partners, Ecology provides an opportunity for Tribes to review and comment on the submitted applications.
- If your project is in an RCW 90.94.020 planning area, contact the appropriate [planning unit](#).³¹ If your project is an RCW 90.94.030 planning area, refer to adopted plans and individual watershed planning webpages to identify interested parties.³²
- If your project impacts salmon habitat, contact the Salmon Recovery Lead Entity and local Tribes in your region.
- If your project impacts agricultural lands, contact local conservation districts, drainage districts, and farming organizations.
- If your project is located in the Puget Sound region (except for WRIAs 3 & 5 - the Skagit Watershed), contact the Local Integrating Organization Coordinator in that area.
- If your project will impact water quality, contact Ecology's Water Quality staff and the local conservation district for input.
- If your project impacts recreation, contact local user groups and/or local or state parks departments.
- If your project impacts local flooding and flood control structures, contact floodplain managers in your region including diking and drainage districts and flood control districts.

Climate change

Ecology encourages integrated approaches that consider climate impacts. Climate change is projected to result in highly variable patterns with prolonged drought interspersed with years of heavy rain.³³ Washington state is expected to experience reduced snowpack, increased stream temperatures, and changing ocean conditions.³⁴ These changing conditions are a significant concern for all aspects of streamflow restoration project management.

The extent and frequency of flooding is projected to increase in the future, resulting in higher flood risks to human communities and further impacts to salmon populations.³⁵ Projected low summer

³¹ <https://ecology.wa.gov/Water-Shorelines/Water-supply/Streamflow-restoration/Streamflow-restoration-planning>

³² RCW 90.94.030 Watershed Restoration and Enhancement Committees are no longer active but the adopted plans and/or membership information is available online: <https://ecology.wa.gov/Water-Shorelines/Water-supply/Streamflow-restoration/Streamflow-restoration-planning>

³³ Impacts, Risks, and Adaptation in the United States: The Fourth National Climate Assessment, Volume II (2018)

³⁴ [Ibid](#)

³⁵ The Washington Climate Change Impacts Assessment: Evaluating Washington's Future in a Changing Climate (2009)

flows may cause warmer water temperatures that exceed the thermal threshold for salmon.³⁶ Projected shifts in temperature and precipitation regimes are likely to compound existing stressors on habitats and salmon populations.³⁷

Proposals and project designs should consider the effects of climate change and address future changes to hydrology, sediment delivery, and other factors that affect stream systems. Strong applications will:

- Identify critical impacts of climate change specific to the project area or to partner and stakeholder interests. Many regions have completed vulnerability assessments or climate action plans that identify these key risks. In regions where these plans have not been completed, applicants can use the available regional data to make their best assessment of key impacts in their watershed.
- Incorporate climate projections into project modeling and design plans so that there is confidence that projects will continue to meet goals into the future.
- Discuss the specific effects of climate change resilience in the project or planning area, and describe how this information was used in project selection and design. Relevant information includes:
 - Citations of existing research or reports that are relevant to the project area.
 - Consideration of impacts observed during historical events that serve as an analog to future conditions (e.g., recent large flooding events, warming events/trends, etc.).
 - Description of how climate change predictions were incorporated and used during project site selection or design.
 - Models/projections of future climate change impacts (where possible).
 - Description of confidence in future flood, ecosystem, and stream conditions.

³⁷ [Ibid](#)

Appendix D: MAR Feasibility Study Details

Managed Aquifer Recharge (MAR) can augment dry-season streamflow by increasing surficial aquifer discharges to streams beyond what occurs under current conditions. MAR projects typically involve diverting a small fraction of high seasonal streamflows to spreading basins or other infiltration facilities in the adjacent floodplain or uplands. This diverted surface water infiltrates into a shallow aquifer, migrates through the aquifer, and ultimately discharges back to surface water as re-timed groundwater base flow.

As provided in Chapter 2 of the grant guidance, all MAR project proponents seeking streamflow restoration competitive grant funding must complete a feasibility study prior to any other phases of the MAR being eligible for Streamflow Restoration grant funding. This section describes the requirements MAR project proponents must meet in preparing a feasibility study.

MAR feasibility studies are eligible for competitive grant funding pursuant to the requirements provided below. Alternatively, such feasibility studies may have been undertaken and completed prior to seeking competitive grant funding for the MAR project itself. In such cases, the feasibility study must meet the requirements provided below and a thorough report of the methodologies and results must be included with the application for the MAR project. To the extent that previous feasibility work does not meet the requirements below, recipients may seek competitive grant funding to fill in the gaps.

MAR feasibility study tasks

Information developed based upon the tasks listed below will need to be consolidated into a single technical memorandum presented to Ecology for review. This document must clearly describe aspects of the proposed MAR required to assess project feasibility. Environmental evaluations in this report will be required to follow the [Water Resources Program QAPP Template](#)³⁸ for non-water quality datasets and the [Water Quality Program MAR feasibility QAPP Template](#)³⁹ for water quality datasets. All feasibility study work must be conducted according to study designs described in these QAPPs and as approved by the respective program Quality Assurance Coordinators.

1. Preliminary site assessment and site access

Task description: Evaluate proposed MAR site(s). The applicant will use the best available information and data (e.g., geologic maps, nearby well logs) and collect any additional existing relevant data to identify local aquifers and evaluate aquifer head conditions. The applicant will also demonstrate that they have secured access and permission from the entities that own the property, through the

³⁸ <https://apps.ecology.wa.gov/publications/SummaryPages/1811018.html>

³⁹ <https://apps.ecology.wa.gov/publications/summarypages/1910050.html>

[Landowner Acknowledgement Form](#)⁴⁰, to conduct on-site work and are arranging for long-term access to the property if the project ultimately moves forward.

2. Delineation of the water source

Task description: Describe available water sources that can be developed for use in a MAR project. The water has to be available within the physical and legal constraints of the watershed, including any applicable watershed rules (WACs) or surface water source limitations (SWSLs). In instances where an MAR project would remove surface water during a period when water is not legally available per an existing watershed rule, grant recipients should consult with the Water Resources Program to determine if additional work is needed to address this aspect of project feasibility (contact sfrprjgrants@ecy.wa.gov).

3. Field investigation and analysis of MAR site

Task description: Conduct field investigations and analyses of the resulting data to determine whether hydrogeologic conditions are favorable for a MAR project.

MAR field investigations will likely include the following:

- Test pit investigations to evaluate sub-surface conditions.
- Infiltrometer testing to evaluate infiltration rates.
- Monitoring well installation for conducting hydraulic tests, assessing water table elevations, and sampling groundwater to test water quality parameters.
- Surface water source flow measurements and water availability analyses.
- Water quality sampling of potential MAR source waters (see Item 6 below).

4. MAR permitting analysis

Task description: Identify all applications and permits required for project implementation. The analysis will estimate the anticipated costs of obtaining the necessary permits, as well as the timeline needed to acquire these permits.

Permit requirements for recharge facility design, permitting, and compliance monitoring are likely to vary from site to site. The recommended permitting approach will be developed in consultation with Ecology, WDFW, and other regulatory agencies, as necessary.

5. Preliminary MAR project design

Task description: Develop a preliminary MAR project design. The preliminary design summarizes project and design costs, project operational elements, expected project infiltration quantities, expected timing and quantities of instream flow benefits, monitoring needs to support permit requirements and performance assessments, and includes relevant design drawings. Since it will be a preliminary design,

⁴⁰ <https://apps.ecology.wa.gov/publications/SummaryPages/ECY070614.html>

the final project design will be subject to change based on the outcomes and recommendations of the feasibility study.

Preliminary design elements could include:

- Surface water collection and conveyance structures.
- Infiltration basins and/or subsurface galleries.
- Methods to limit diversions to periods of high water availability and available infiltration capacity.
- Geotechnical considerations.
- Electrical power access (if needed).
- Monitoring requirements.
- Cost estimates for project permitting, construction, implementation, and operation.

6. Water quality considerations

Task Description: Assess the aquifer and source water compatibility, and likely water quality impacts from conveyance and infiltration.

MAR projects do not require National Pollutant Discharge Elimination System or State Waste Discharge permits if they are not introducing pollutants into surface or groundwater. While no Water Quality Program permits are issued for MAR projects, water quality anti-degradation rules still apply and waters of the state need to be protected. The feasibility study requirements described here are designed to allow projects to proceed without need for a Water Quality Program permit and in acknowledgement of the water quality benefits of having more water in streams. If feasibility study results indicate unanticipated water quality issues, the Water Quality Program may re-evaluate the assumption that the project will not require a water quality permit.

The water quality feasibility study will be designed to answer the question, “Will this proposed MAR project be protective of groundwater and surface water quality?” Project proponents must assess the source water and aquifer water compatibility, potential water quality changes that might occur during infiltration, and potential implications for Total Maximum Daily Load (TMDL) load and waste load allocations and/or water quality standards. If either of the surface (source) water or groundwater characterizations results exceed applicable receiving water standards, the project if implemented, a water quality treatment approach and/or a post-operation study may be required.

MAR projects do not receive stormwater runoff, and instead involve infiltrating high-flow-season stream/river water into the ground to create surface water discharge later in the year. These projects vary in design, but most employ either spreading basins (ponds) or infiltration galleries (e.g., perforated pipe) for infiltration. The latter facilities qualify as Underground Injection Controls as described in Chapter 173-218 WAC, which require on-line registration with Ecology’s Water Quality Program.

In order to evaluate how water quality (surface and groundwater) is likely to be affected at a proposed MAR project site, the following tasks will need to occur.

A. Surface (Source) Water Characterization

Surface water characterization monitoring data will be evaluated to determine water quality conditions in the stream from which the diversion is planned. The purpose of this monitoring is to provide a basis for comparison of the quality of the source water to the receiving groundwater quality conditions.

The source water characterization data shall be collected during the period of ambient high flow, but not during flooding conditions when a stream exceeds its banks and picks up additional pollutants from the surrounding land areas.

The source water characterization data must be collected during the first six months of a water year, which begins on October 1. A total of three samples are needed during the October through April time period, spaced at least one week apart. Existing data may be used in lieu of or in addition to collecting new data.

The project applicant will need to:

- Check [WQ Atlas](#)⁴¹ for 303(d) listings, and any TMDLs for a 4A-waterbody, for the proposed MAR project location and upstream reaches. Water quality parameters listed as 303(d) or TMDL in the WQ Atlas will need to be included in the source water characterization.
- Collect the required number of samples of total suspended solids, total nitrogen, total phosphorus, dissolved and total metals (arsenic, cadmium, chromium, zinc, and lead), fecal coliform, and E. coli bacteria, as well as any parameters identified in the 303(d) listing.
- Prepare a source water characterization report that includes all laboratory data presented in a table. Groundwater quality standards for all applicable parameters will need to be included in the table for comparison.

B. Groundwater (Receiving) Characterization

Groundwater from a monitoring well screened in the surficial aquifer near the project site will be sampled once for laboratory analysis of total suspended solids, total nitrogen, total phosphorus, dissolved and total metals (arsenic, cadmium, chromium, zinc, and lead) and fecal coliform and E. coli bacteria, as well as any 303(d) or TMDL parameters, prior to authorization of the project. If no monitoring wells exist at or near the project site, a nearby well may be used, or a simple temporary well may be constructed for the sampling. Determination of appropriate wells will occur in consultation with Ecology. The project applicant will prepare a groundwater characterization report that includes all laboratory data presented in a table. Surface water quality standards for all applicable parameters will be included in the table for comparison.

C. Conveyance Characterization

Ecology's strong preference is that all diverted water be conducted through a pipeline or other conveyance structure constructed specifically for the MAR project. If diverted water will be routed through a ditch, abandoned irrigation water canal or other pre-existing conduit, then the project proponent must provide sufficient information to demonstrate that there is little potential for the conveyance to contribute pollutants during the MAR project's operation. Specifically, in those instances the study will need to be designed to demonstrate that the flow through said conduit(s) will not lead to significant contamination (e.g., nutrients and/or pesticides).

The project proponent will need to consult with Ecology's Water Quality Program to determine appropriate analyses for this characterization based on known prior uses or conditions surrounding the proposed conveyance. Results will be presented in a summary table and any issues of concern must be highlighted in the report. Further discussion may be required to identify how those issues will be addressed.

D. Additional Water Quality Considerations

MAR project feasibility studies should provide information regarding other aspects of the project design and operation relevant to water quality.

For example, MAR projects should be designed to ensure that operation only occurs during ambient high water flows. Diversions should not take place during flooding events where a stream is exceeding its banks and picking up additional pollutants from the surrounding land areas. Similarly, stormwater should not be mixed with diverted river flows. If high total suspended solids concentrations were reported through the source water characterization, a pre-settling basin in advance of the spreading basins/infiltration galleries may be needed. If additional pollutants of concern were identified, further appropriate structural pre-treatment controls may be required.

MAR projects may not withdraw water from a tidally influenced river reach, or from a mixing zone for a permitted point source discharge. The project applicant should verify that the spreading basin location is not listed as a [cleanup site](#).⁴²

7. Operation and maintenance costs

Task description: O&M costs must be estimated for the proposed MAR project, and funding sources will need to be secured. O&M costs are ineligible for Streamflow Restoration grant funding.

The MAR project design will need to include an O&M plan that describes how the diversion will be managed to prevent potentially contaminated floodwaters from entering the spreading basin/infiltration gallery. The project O&M plan must also include maintaining records of operations, repairs, and monitoring including the date, staff person, activity, and any unusual observations or issues of concern.

Appendix E: Cultural Resource Review

Grant recipients must comply with Governor’s Executive Order (GEO) 21-02 concerning archeological and cultural resources. Projects involving construction, demolition, or land acquisitions must undergo cultural resource review. Applicants must complete and submit the following to allow for a cultural resource review:

- [Cultural Resources Review form \(ECY 070-537\)](#)⁴³
- [Inadvertent Discovery Plan \(ECY 070-560\)](#)⁴⁴
- Any other information required to comply with GEO 21-02

Ecology staff, grant recipients, the Department of Archaeology and Historic Preservation (DAHP), and affected tribe(s) work together to determine if a site has the potential of disturbing or significantly impacting cultural or historic resources. If the review indicates high enough risk of finding human remains or cultural artifacts, a survey may be required, a cultural resource specialist may be needed on-site, or a part or all of the project may be unable to proceed as originally intended. Cultural resources review must occur prior to the expenditure of any state funds for construction, demolition, or acquisition.

Applicants should consider potential cultural resources costs associated with their project and include these requests in their application. DAHP hosts the publicly available [WISAARD](#)⁴⁵ database, which can be a helpful, quick, and user-friendly resource for initial assessments by applicants, and can be readily verified by grant application evaluators in coordination with the Program’s Cultural Resources Contact (CRC).
