

the state, including all the rivers, lakes, and marine waters where data are available. Ecology compiles its own water quality data and federal data and invites other groups to submit water quality data they have collected. All data submitted must be collected using appropriate scientific methods and follow an approved Quality Assurance Project Plan.¹¹ The assessed waters are placed in categories that describe the status of water quality. Once the assessment is complete, the public is given a chance to review and provide comments. The final assessment is formally submitted to the EPA for approval.

Waters with beneficial uses – such as aquatic habitat– that are impaired by pollutants are placed in the polluted water category in the water quality assessment 303(d) list. These water bodies fall short of state surface water quality standards and are not expected to improve within the next two years. , Waters placed on the 303(d) list require the preparation of a water cleanup plan (TMDL) or other approved water quality improvement project.¹² The improvement plan identifies how much pollution needs to be reduced or eliminated to achieve clean water and allocates that amount of required pollution reduction among the existing sources.

Ecology’s assessment of which waters to place on the 303(d) list is guided by federal laws, state water quality standards, and the Policy on the Washington State Water Quality Assessment (Ecology 2023b). This policy describes how the standards are applied, requirements for the data used, and how to prioritize TMDLs, among other issues.¹³ In addition, even before a TMDL is completed, the inclusion of a water body on the 303(d) list can reduce the amount of pollutants allowed to be released under permits issued by Ecology.

2.2.4 State Surface Water Quality Standards

State surface water quality standards form the initial basis for federal 303(d) listings and TMDLs described in section 2.2.2. Relevant rules that determine standards without this rulemaking include the following.¹⁴

Biologically based numeric criteria

Fresh water aquatic life designated uses and criteria WAC 173-201A-200, and marine water designated uses and criteria WAC 173-201A-210, establish Washington’s biologically based numeric criteria for freshwater temperature, marine temperature, freshwater DO, saltwater

¹¹ See <https://apps.ecology.wa.gov/publications/documents/2110032.pdf>

¹² The term “TMDL” is often also applied to the process to determine a TMDL (“Ecology is doing a TMDL”) and to the final documentation of the TMDL (“Ecology has submitted a TMDL”).

¹³ A TMDL is the sum of the Load Allocations and Wasteload Allocations, plus reserves for future growth and a margin of safety, which are equal to the Loading Capacity of the water body. This is a requirement of Section 303(d) of the federal Clean Water Act and is defined in 40 CFR 130.2(i). See <https://ecology.wa.gov/Water-Shorelines/Water-quality/Water-improvement/Total-Maximum-Daily-Load-process> for additional details on the TMDL process.

¹⁴ Note that 90.48 RCW discussed above is the authorizing statute for opening WAC 173-201A discussed below.

DO, and freshwater pH—except for criteria applicable to specific waterbody segments found in Table 602 (173-201A-602).¹⁵

As discussed in Section 1.1.2, WAC 173-201A-260(1)(a), WAC 173-201A-200(1)(c)(i), -210(1)(c)(i) and WAC 173-201A-200(1)(d)(i) -210(1)(d)(i) are not in effect for federal actions. This means that **without the proposed rulemaking, natural conditions cannot constitute water quality criteria for the purposes of federal actions, such as 303(d) listings and TMDLs.** Entities associated with water bodies that exceed numeric criteria in WAC 173-201A-200 & -210 for temperature, DO and pH will remain subject to numeric criteria.

Site-Specific Criteria and Use Attainability Analysis

Ecology can develop new site-specific criteria or change the designated use through a use attainability analysis (UAA). **Without the proposed rulemaking, natural conditions cannot form the basis for site-specific criteria, only biologically based numeric criteria determined from aquatic life species studies.**¹⁶

Currently, a private entity wishing to establish a site-specific criterion or to modify a use may evaluate, develop, and present the scientific support to Ecology for such an action. However, Ecology would carry out the full process of considering, proposing, and adoption through rulemaking.¹⁷

WAC 173-201A-430 states, about establishing site-specific criteria:

- (1) Where the attainable condition of existing and designated uses for the water body would be fully protected using an alternative criterion, site-specific criteria may be adopted. (a) The site-specific criterion must be consistent with the federal regulations on designating and protecting uses (currently 40 C.F.R. 131.10 and 131.11); and (b) The decision to approve a site-specific criterion must be subject to a public involvement and intergovernmental coordination process.
- (2) The site-specific analyses for the development of a new water quality criterion must be conducted in a manner that is scientifically justifiable and consistent with the assumptions and rationale in "Guidelines for Deriving National Water Quality Criteria for the Protection of Aquatic Organisms and their Uses," EPA 1985; and conducted in accordance with the procedures established in the "Water Quality Standards Handbook," EPA 1994, as revised.
- (3) The decision to approve the site-specific criterion must be based on a demonstration that it will protect the existing and attainable uses of the water body.

¹⁵ Note that in addition to tables in 173-201A-200 and -210, 1 DADMax values and supplemental numeric spawning criteria described in subsequent subsections may also apply.

¹⁶ Based on the scientific approach detailed in EPA (1985) guidelines.

¹⁷ In this way, developing site-specific criteria or a UAA is a resource intensive process (Ecology, 2004). The need to balance resources with other water quality activities—such as permit management and TMDL work—means that site-specific criteria and UAA are taken on sparingly.

(4) Site-specific criteria are not in effect until they have been incorporated into this chapter and approved by the USEPA.”

WAC 173-201A-440 states, about use attainability analysis:

(1) Removal of a designated use for a water body assigned in this chapter must be based on a use attainability analysis (UAA). A UAA is a structured scientific assessment of the factors affecting the attainment of the use which may include physical, chemical, biological, and economic factors. A use can only be removed through a UAA if it is not existing or attainable.

(2) A UAA proposing to remove a designated use on a water body must be submitted to the department in writing and include sufficient information to demonstrate that the use is neither existing nor attainable.

(3) A UAA must be consistent with the federal regulations on designating and protecting uses (currently 40 C.F.R. 131.10).

(4) Subcategories of use protection that reflect the lower physical potential of the water body for protecting designated uses must be based upon federal regulations (currently 40 C.F.R. 131.10(c)).

(5) Allowing for seasonal uses where doing so would not harm existing or designated uses occurring in that or another season must be based upon federal regulations (currently 40 C.F.R. 131.10(f)).

(6) After receiving a proposed UAA, the department will respond within sixty days of receipt with a decision on whether to proceed toward rule making.

(7) The decision to approve a UAA is subject to a public involvement and intergovernmental coordination process, including tribal consultation.

(8) The department will maintain a list of federally recognized tribes in the state of Washington. During all stages of development and review of UAA proposals, the department will provide notice and consult with representatives of the interested affected Indian tribes on a government-to-government basis, and carefully consider their recommendations.

(9) The results of a UAA are not in effect until they have been incorporated into this chapter and approved by the USEPA. Any designated uses established through the UAA process are included in WAC 173-201A-602 and 173-201A-612.

2.2.5 Permitting Guidelines and Compliance

Permitting guidelines help determine how permit writers approach different permit scenarios. They assist permit writers in how to think through meeting water quality criteria for protection of aquatic life to permittee-specific requirements. While not a legal requirement, guidance informs how aquatic life criteria might impact permittees who discharge effluent to water bodies. Therefore, in describing the baseline for this analysis of the rule amendments, it is necessary to consider the permitting guidelines in the baseline and amended scenarios, as they will contribute to the cost and benefit estimates and the discussed impacts.

Ecology uses the Water Quality Program Permit Writer's Manual (Ecology, 2018) for technical guidance when developing wastewater discharge permits.¹⁸ With respect to temperature, pH, and DO limits, permit writers would first determine if an applicable TMDL has been approved, or is in development before determining whether effluent will cause, or have reasonable potential to cause or contribute to, violation of water quality standards. If an approved TMDL exists, waste load allocations (WLA) described in the TMDL are used to determine appropriate water quality-based effluent limits.

If no TMDL exists, permit writers determine whether effluent will cause, or have reasonable potential to cause or contribute to, a violation of water quality standards. If so, then effluent limits are established using methods described in the permit writer's manual to meet biologically based numeric criteria.

Occasionally, the permit writer will have information that the receiving water concentration at the point of discharge during critical condition does not meet the aquatic life criteria and that the receiving water body is not listed on the 303(d) list.¹⁹ In these cases, where the excursion is documented with data that meets the criteria for 303(d) listing, the permit writer should develop interim effluent limits based on existing performance (no increase in loading) to be placed in the permit.²⁰ The periodic Water Quality Assessment will evaluate the data and subsequently categorize the water body. If the water body is impaired, it will be put in Category 5 on the 303(d) list and prioritized for a TMDL.

Past or existing compliance

The baseline includes past or existing compliance behavior in response to federal and state laws, rules, permits, guidance, and policies. These include currently implemented TMDLs that set WLAs and other necessary actions to protect the natural conditions of the water, site-specific criteria, and criteria set through previous UAAs.²¹ This behavior might include, but is not limited to, existing treatment technologies, production processes, and effluent volumes.

Future compliance

The baseline includes future compliance behavior without the proposed rulemaking. This includes response to in-development and future TMDL activity and permit actions related to temperature, DO and pH. In the absence of this proposed rulemaking, meeting temperature, pH, and DO on an impaired waterbody would eventually subject permits to a TMDL based on statewide numeric criteria (WAC 173-201A), criteria established under a biologically based site-specific study, or criteria established following a UAA.

¹⁸ <https://apps.ecology.wa.gov/publications/documents/92109.pdf>

¹⁹ Critical condition refers to the time during which the combination of receiving water and waste discharge conditions have the highest potential for causing toxicity in the receiving water environment. This situation usually occurs when the flow within a water body is low, thus, its ability to dilute effluent is reduced.

²⁰ Where loading refers to the mass of a substance that passes particular point in a specified amount of time.

²¹ Note that Washington has only performed one UAA, which is still with the EPA for review.

2.3 Proposed rule amendments

The proposed rule amendments consist of:

Proposed revisions to existing criteria:

- Updates to the natural conditions provision to limit use to aquatic life criteria.
- Updating allowances for human impacts to fresh and marine waters for dissolved oxygen and temperature when the natural conditions constitute the water quality criteria
- Updates to the site-specific criteria process for an allowance for natural conditions to be used as a basis for developing these criteria.

Other proposed changes:

- Adding definitions for the performance-based approach and local and regional sources of human-caused pollution.
- Adding a new section detailing the use of the performance-based approach and applicable aquatic life criteria.
- Adding a rule document referenced in the water quality standards that details the methodology of the performance-based approach.

Minor non-substantive edits:

- One update to reflect the latest and current revision for a referenced EPA document

2.4 Regulatory Impacts by Component

2.4.1 Updates to the natural conditions provision to limit use to aquatic life criteria

Baseline

State

On account of EPA's disapproval, there is no state baseline associated with natural conditions currently approved for federal actions (USEPA, 2021). Previous EPA-approved state regulations at WAC 173-201A-260(1)(a) states that:

"...portions of many water bodies cannot meet the assigned criteria due to the natural conditions of the water body. When a water body does not meet its assigned criteria due to natural climatic or landscape attributes, the natural conditions constitute the water quality criteria."

Federal

The EPA's interpretation of the Clean Water Act allows for site-specific criteria to be set to natural conditions (see 2015 guidance on site-specific conditions and EPA's Action on Revisions to the Washington State Department of Ecology's Surface Water Quality Standards for Natural Conditions Provisions).^{22,23}

Proposed

The proposed rule would:

- Change "assigned criteria" to "assigned aquatic life criteria" in WAC 173-201A-260(1)(a) to clarify that natural conditions apply only to aquatic life.
- Add WAC 173-201A-260(1)(a)(i) to provide information to determine natural conditions criteria values, which reflect EPA's requirement that there is a binding procedure in a state's WQS to determine natural background (Davies, 1997).²⁴

Expected impact

This proposed amendment, in combination with others in this rulemaking, is expected to restore Ecology's ability to establish site-specific criteria equal to the natural conditions of a water body, in water quality standards. In particular, the proposed amendments will allow future TMDL studies and those currently under development to consider the natural conditions of a water body in the context of aquatic life.

Site-specific aquatic life criteria based on natural conditions are typically pursued when a water body does not meet statewide numeric criteria and the natural conditions of the water body are suspected of contributing to the failure to meet the water quality standard. In this rulemaking, applying natural conditions provisions to water bodies with insignificant human allowances, would provide protection for aquatic life while recognizing the characteristics and seasonal attributes unique to a specific water body. This likely constitutes a **benefit** because criteria set through natural conditions provisions will typically be more achievable by permittees than those based on numeric criteria.

Without the proposed rulemaking, permittees discharging to water bodies that exceed numeric criteria, but suspect exceedance is in part due to natural conditions, will be subject to the applicable numeric criteria unless a site-specific criterion or a UAA is adopted through rule making. Site-specific criteria or a UAA are rarely pursued by Ecology, but private entities may evaluate, develop, and present the science support to Ecology for such an action (see section 2.2.4). Independently conducted science must be evaluated by Ecology and the EPA and does not guarantee agreement or adoption. In this way, the proposed rulemaking constitutes an additional **benefit** to the degree that it would lessen the need for privately conducted scientific support of site-specific criteria or designated use changes and associated cost.

²² <https://www.epa.gov/sites/default/files/2015-02/documents/natural-conditions-framework-2015.pdf>

²³ https://fortress.wa.gov/ecy/ezshare/wg/standards/EPA_ActionsNCC_Nov192021.pdf.

²⁴ Where natural background is defined as "background concentration due only to non-anthropogenic sources, i.e., non-manmade sources."

Note that the costs of TMDL studies and associated data collection, labor, and other resources are borne by Ecology. Therefore, amending the TMDL process through this rulemaking to include natural conditions provisions does not represent new costs to private entities.

Also note that biologically based numeric criteria, site-specific criteria, or criteria established based on natural conditions of a water body proposed in this rulemaking are fully protective of aquatic life. Thus, the proposed amendments are not expected to materially impact ecosystem services or cultural values otherwise associated with changes to aquatic life.

2.4.2 Updating allowances for human impacts to fresh and marine waters for dissolved oxygen and temperature when the natural conditions constitute the water quality criteria

Baseline

State

On account of EPA's disapproval, there is no state baseline associated with natural conditions currently approved for federal actions (EPA, 2021). The previously EPA-approved state laws regulating human impacts when the natural conditions constitute the water quality criteria are: WAC 173-201A-200(1)(c)(i), 173-201A-200(1)(d)(i), WAC 173-201A-210(1)(c)(i), WAC 173-201A-210(1)(d)(i) and for specific waterbody segments listed under 173-201A-602.

In the disapproved sections above, "human actions" considered cumulatively may not cause the DO of that water body to decrease [from natural conditions] more than 0.2 mg/L, or the 7-DADMax temperature of that water body to increase more than 0.3°C (0.54°F) for both fresh waters and marine waters.

Federal

The EPA's interpretation of the Clean Water Act allows for site-specific criteria to be set equal to the natural conditions of a water body. EPA guidance further suggest adopting a provision that allows for human actions to cause insignificant decreases in DO or increases to temperature (see 2015 guidance on site-specific conditions, EPA's Action on Revisions to the Washington State Department of Ecology's Surface Water Quality Standards for Natural Conditions Provisions).^{25,26}

Proposed

- (1) Change "human actions" to "local and regional sources of human-caused pollution".²⁷
- (2) Add that DO allowances may not cause the DO of that water body to decrease more than 10% or 0.2 mg/L below natural conditions, whichever decrease is smaller.

²⁵ <https://www.epa.gov/sites/default/files/2015-02/documents/natural-conditions-framework-2015.pdf>

²⁶ https://fortress.wa.gov/ecy/ezshare/wg/standards/EPA_ActionsNCC_Nov192021.pdf.

²⁷ See proposed definition of "local and regional sources of human-caused pollution" below

- (3) Insert “below natural condition” referring to DO allowances and “above natural condition” for temperature allowance, to clarify they are given from the natural conditions criteria.

Expected impact

This proposed amendment, in combination with others in this rulemaking, is expected to restore Ecology’s ability to establish site-specific criteria equal to the natural conditions of a water body, as amended, in water quality standards. In particular, the proposed amendments will allow future TMDL studies and those currently under development to consider protecting aquatic life by requiring actions that would allow the water to meet site-specific criteria set equal to the natural conditions of a water body.

The proposed change (1) to the human action allowances will provide Ecology with the tools to regulate insignificant allowances when natural conditions criteria apply to a water body without the cumulative human action allowance being partially or fully allocated to impacts that are outside of Ecology’s regulatory authority (e.g., point source discharges in upstream Canadian waters, global climate change impacts). Amending DO allowance (2) provides additional protections in hypoxic waters, as otherwise a 0.2 mg/L decrease when waters are <2 mg/L DO may cause harm to aquatic life. Proposed language in (3) is purely for clarification.

If compared to EPA-disapproved state language, proposed amendments in (1) would allow for more achievable water quality by permittees while remaining protective of aquatic life, thus representing a benefit. Amendment (2) would be more stringent in some instances representing a cost to permittees and benefit to society by improving aquatic life. Amendment 3 has no impact.

Note that these proposed amendments are only impactful in the context of Ecology re-establishing the use of natural conditions provisions in water quality standards (i.e. WAC 173-201A-260(1)(a)). From the current baseline, the proposed amendments in this section will provide **benefits** as part of the broader collection of amendments establishing natural condition described in section 2.4.1.

2.4.3 Updates to the site-specific criteria process for an allowance for natural conditions to be used as a basis for developing criteria

Baseline

State

WAC 173-201A-430(2) says, of developing a new site-specific criteria, that it must be consistent with assumptions and rationale in “Guidelines for Deriving National Water Quality Criteria for the Protection of Aquatic Organisms and their Uses” (USEPA, 1985).

The 1985 guidelines from the EPA were incorporated by reference and provide a mechanism for developing protective biologically based criteria, but these guidelines rule out the possibility of developing protective natural conditions criteria.

Federal

The EPA's interpretation of the CWA allows for site-specific criteria to be set equal to the natural conditions of a water body. Communication with the EPA guided Ecology to adopt 40 CFR 131.11 for simplicity and to cite federal regulations rather than guidance documents. This allowed Ecology to incorporate the ability to use the natural conditions of a water body as the basis for developing site-specific aquatic life criteria.

Proposed

To replace the 1985 EPA guidance references in WAC 173-201A-430(2) with 40 CFR 131.11.

Expected impact

This proposed amendment, in combination with others in this rulemaking, will restore Ecology's ability to establish site-specific criteria equal to the natural conditions of a water body, in water quality standards. This proposed amendment specifically allows the use of natural conditions as justification for site-specific criteria development. Adopting 40 CFR 131.11 broadens what approaches can be used to scientifically support site-specific criteria development. Under the proposed rulemaking, site-specific criteria development would become particularly useful when data, parameter, or site constraints prevent use of the performance-based approaches described elsewhere in this proposed rulemaking. On the margin where other approaches are not pursued (e.g. performance-based), and private entities wish to develop scientific support for site-specific criteria, the additional options and flexibility afforded by the proposed amendment likely translates to a **benefit**.

As with other means of establishing WQ criteria, note that site-specific criteria pursued through this amendment are also expected to be fully protective of aquatic life and the designated uses of the water body. Thus, the proposed amendment is not expected to impact ecosystem services or cultural values associated with changes to aquatic life compared to the baseline.

2.4.4 Adding definitions for the performance-based approach and local and regional sources of human-caused pollution

Baseline

Proposed

Add the following definitions to WAC 173-201A-020:

"Performance-based Approach" means a water quality standard that is a transparent process (i.e., methodology) which is sufficiently detailed and has suitable safeguards that ensures predictable and repeatable outcomes, rather than a specific outcome (i.e., concentration limit for a pollutant), consistent with 40 C.F.R. 131.11 and 40 C.F.R. 131.13.

"Local and regional sources of human-caused pollution" means sources of pollution caused by human actions, and the pollution originates from: (1) within the boundaries of the State; or (2) within the boundaries of a U.S. jurisdiction abutting to the State that impacts surface waters of the State.

Expected impact

Definition. No direct impact outside of where the defined terms are used in the proposed rule, discussed above and below in this Section.

2.4.5 Adding a new section detailing the use of the performance-based approach and applicable aquatic life criteria

Baseline

Federal

The EPA's interpretation of the Clean Water Act allows for site-specific criteria to be set equal to the natural conditions of a water body. The EPA guidance has identified two general approaches states and authorized tribes can use when adopting site-specific water quality criteria: determining a specific outcome (i.e., concentration limit for a pollutant) through the development of an individual numeric criterion, and adopting a criteria derivation process through the performance-based approach (see USEPA, 2021, 2023).^{28,29}

Proposed

Add a new section to the WAC (173-201A-470) detailing performance-based approach as a tool that Ecology can choose to use for implementing aquatic life criteria in its state and federal CWA actions. In this proposed rule, the performance-based approach applies to dissolved oxygen (fresh water and marine water), pH (fresh water), and temperature (fresh water and marine water) only. Ecology does not propose a requirement that the tool must be used.

Expected impact

This proposed amendment, in combination with others in this rulemaking, is expected to restore Ecology's ability to establish site-specific criteria equal to the natural conditions of a water body, as amended, in water quality standards. In particular, the proposed amendments will allow future TMDL studies and those currently under development to consider protecting aquatic life by requiring actions that would allow the water to meet site-specific criteria set equal to the natural conditions of a water body without additional rulemakings.

From the current baseline, the proposed amendment in this section is part of a broader natural condition provision that will **provide benefits** described above in section 2.4.1.

2.4.6 Adding a rule document referenced in the water quality standards that details the methodology of the performance-based approach

Baseline

Federal

²⁸ <https://www.epa.gov/sites/default/files/2015-02/documents/natural-conditions-framework-2015.pdf>

²⁹ https://fortress.wa.gov/ecy/ezshare/wg/standards/EPA_ActionsNCC_Nov192021.pdf.

The EPA's interpretation of the Clean Water Act allows for site-specific criteria to be set equal to the natural conditions of a water body. The EPA guidance has identified two general approaches states and authorized tribes can use when adopting site-specific water quality criteria: determining a specific outcome (i.e., concentration limit for a pollutant) through the development of an individual numeric criterion, and adopting a criteria derivation process through the performance-based approach (see 2015 guidance on site-specific conditions and EPA's Action on Revisions to the Washington State Department of Ecology's Surface Water Quality Standards for Natural Conditions Provisions).^{30,31}

Proposed

Due to the information required for the performance-based approach, we propose having a separate rule document, Ecology publication 24-10-017 "A Performance-Based Approach for Developing Site-Specific Natural Conditions Criteria for Aquatic Life in Washington", that provides details and requirements of the performance-based approach as noted in the proposed section WAC 173-201A-470(1)(b).

Expected impact

This proposed amendment, in combination with others in this rulemaking, will restore Ecology's ability to establish site-specific criteria equal to the natural conditions of a water body, as amended, in water quality standards. In particular, the proposed amendments will allow future TMDL studies and those currently under development to protect aquatic life by considering required actions that would allow the water to meet site-specific criteria equal to the natural conditions of a water body without additional rulemakings.

From the current baseline the proposed amendment in this section is part of a broader natural condition provision that will provide **benefits** described above in section 2.4.1, along with operational clarity and understanding.

2.4.7 One update to reflect the latest and current revision for a referenced EPA document

Baseline

State

WAC 173-201A-430(2) cites "*Water Quality Standards Handbook*," EPA 1994, as revised.

Proposed

Update WAC 173-201A-430(2) to "*Water Quality Standards Handbook*," EPA 2023, as revised.

Expected impact

This revision is required by current state law. No impact.

³⁰ <https://www.epa.gov/sites/default/files/2015-02/documents/natural-conditions-framework-2015.pdf>

³¹ https://fortress.wa.gov/ecy/ezshare/wg/standards/EPA_ActionsNCC_Nov192021.pdf.

Chapter 3: Likely Costs of the Proposed Rule Amendments

3.1 Introduction

We analyzed the likely costs associated with the proposed rule amendments, as compared to the baseline. The proposed rule amendments and the baseline are discussed in detail in Chapter 2 of this document.

3.2 Cost analysis

As discussed in Chapter 2, the collective proposed rule amendments interact and work together to generate impacts. Given that the baseline has no federally-approved natural conditions provisions, it is not practical to analyze every component of the rulemaking individually. We proceed instead by describing the impacts of the following amendments on the behavior of affected parties **as implemented together** (e.g. restoring natural conditions, as amended, for the purposed of federal actions):

Proposed revisions to existing criteria:

- Updates to the natural conditions provision to limit use to aquatic life criteria.
- Updating allowances for human impacts to fresh and marine waters for dissolved oxygen and temperature when the natural conditions constitute the water quality criteria
- Updates to the site-specific criteria process for an allowance for natural conditions to be used as a basis for developing these criteria.

Other proposed changes:

- Adding definitions for the performance-based approach and local and regional sources of human-caused pollution.
- Adding a new section detailing the use of the performance-based approach and applicable aquatic life criteria.
- Adding a rule document referenced in the water quality standards that details the methodology of the performance-based approach.

Minor non-substantive edits:

- One update to reflect the latest and current revision for a referenced EPA document
- Update to reflect the latest and current revision for a referenced EPA document

3.2.1 Impacted Permits

The proposed rulemaking would primarily impact current and future permits associated with surface waters on the 303(d) list as currently impaired (Category 5) for temperature, pH, and/or DO. To illustrate the scope of potentially impacted permits, we queried proposed TMDL

projects listed from Ecology’s latest water quality assessment (Ecology, 2023a) that have the potential for natural conditions based on temperature, DO, and or pH.^{32, 33}

Ecology ranks projects based on the severity of the pollution problem, risks to public health, risk to threatened and endangered species, and vulnerability of water bodies to degradation among other factors (2023a, 2023b). Projects fall under one of four priorities:

- High: projects that have already been vetted and are actively being worked on,
- Medium: projects that should begin in the next 1 to 5 years,
- Medium-Low: projects that should begin in the next 5 to 15 years, and,
- Low: Projects that do not warrant starting before the higher prioritized projects.

We narrowed our initial list to only high, medium, and medium-high priority TMDL projects to describe those that will likely be complete or nearly complete within the 20-year timeframe of this analysis. Through the filtering process, 42 TMDLs were identified across all four of Ecology’s regions (Eastern, Central, Northwestern, and Southwestern) and the Puget Sound.³⁴

Table 1 provides a description of the top 5 out of 18 affected permit categories associated with potentially affected TMDLs by listing criteria (see Table 3 in Appendix B for full permit list). Note that among 3,671 unique permits identified, any single permit can fall within a TMDL listed for one or multiple criteria. Therefore, permits described across columns in Table 1 are not mutually exclusive. An individual permit is for a specific discharger, while general permits cover multiple dischargers performing similar activities.

Table 1. Number of potentially impacted dischargers, Top 5 Potentially Impacted Permit Categories, by Criteria

Permit Type	Temp	DO	pH
Construction SW GP	2,263	2,549	1,163
Sand and Gravel GP	218	256	201
Industrial SW GP	182	258	176
Fruit Packer GP	70	54	54
Municipal NPDES IP	46	58	49
Total (Top 5)	2,779	3,175	1,643
Total Including bottom 11 (not shown)	2,926	3,360	1,792

³² <https://ecology.wa.gov/Water-Shorelines/Water-quality/Water-improvement/Assessment-of-state-waters-303d>

³³ Based on conversations with Ecology staff, 3-5 years is an average time period for completing most TMDL studies assuming current staff capacity and omitting extreme and unpredictable cases.

³⁴ TMDLS in this analysis typically represent a full or partial watershed with one or multiple rivers and its tributaries. Impacts of a TMDL also potentially include upstream reaches of listed segments.

Note: GP is “General Permit” and IP “Individual Permit”, SW is “Storm Water”

3.2.2 Potential Actions

From the perspective of a permittee, amendments taken collectively in this rulemaking would result in one of the following actions (behaviors):

1. Meet waste load allocations based on natural conditions criteria developed through the TMDL process using the performance-based approach,
2. Meet site-specific criteria based on natural conditions (supported by a separate Ecology rulemaking),
3. Meet site-specific criteria based on natural conditions (supported by permittee science, followed by a separate Ecology rulemaking).

Compared to an action that would take place without the proposed rule (baseline):

- a) Meet waste load allocations based on numeric criteria through the TMDL process,
- b) Meet site-specific criteria based on biological study (supported by a separate Ecology rulemaking)
- c) Meet site-specific criteria based on biological study (supported by permittee science, followed by a separate Ecology rulemaking)
- d) Meet criteria identified through a UAA (supported by a separate Ecology rulemaking)
- e) Meet criteria identified through a UAA (supported by permittee science, followed by a separate Ecology rulemaking)

Costs from the proposed rule could originate from any actions taken by permittees to comply with procedures or conditions that generate new capital expenses (e.g. technology, engineering solutions or land acquisition), labor cost (e.g. source control and monitoring), or other miscellaneous activities (studies) compared to costs experienced under baseline conditions.³⁵ In the face of multiple potential outcomes from the rule and baseline scenarios, this amounts to the costs for any “action pair”, made up of a numbered (1, 2, or 3) potential action taken under the proposed rule, compared to a series of potential baseline states (a, b, c, d, or e) above. There are $3 \times 5 = 15$ such pairs.

Based on guidance and conversations with Ecology staff (Ecology, 2004), the most likely action pair is meeting waste load allocations based on natural conditions criteria developed through the TMDL process using the performance-based approach compared to a numeric criterion, or action pair 1a. This is because establishing site-specific criteria or a UAA (with or without permittee science) is a very resource intensive process. The need to balance these resources with other water quality activities—such as permit management and TMDL work—means that site-specific criteria and UAA are taken on sparingly, and if so, on significantly extended

³⁵ Recognizing that the new rule still carries a non-zero cost.

the year when exceedances were triggered, and the numeric criterion under naturally cooler periods, so long as they were determined to remain protective.³⁸

- Among **DO** modeling scenarios, the difference between numeric criteria and natural DO conditions ranged from a fraction of a mg/L to over 3 mg/L. Natural levels of DO lower than numeric standards were commonly attributed to local rates of stream bank erosion, groundwater with low DO concentrations, aquatic vegetation such as algae and elodea, and storm events. Also note that higher water temperature can have indirect effects on DO through vegetation growth and other natural processes. Like temperature, numeric criteria and the natural conditions were commonly used to develop the TMDL in such a way that refined DO limits to reflect the naturally lower DO concentrations when and where appropriate.
- From **pH** modeling scenarios in the reviewed TMDLs, natural pH values varied as much as 1.5 standard units (SU) beyond the highest/lowest numeric standards.³⁹ Natural variances in pH were attributed to factors and processes similar to DO such as algal productivity and groundwater contributions. Also, like temperature and DO, pH criteria in these systems were set and allocated in such a way to meet natural conditions in the system.

In historical cases reviewed by the study team, allowing for natural conditions provided the flexibility necessary to avoid paradoxical situations in which permittees would need to improve the quality of the water they discharged to beyond what is achievable without any human influence. Criteria based on natural conditions would require fewer actions or technologies to achieve and maintain protective levels of water quality compared to this reality.

We note that because of this rulemaking, future natural conditions values could be calculated differently than the historical TMDLs reviewed above. Differences come primarily from amended human impact allowances (see Section 2.4.2) and the introduction of the performance-based approach (see Sections 2.4.5 and 2.4.6).

Natural conditions calculated through this process will make up the criteria for the entire duration of the year where data allow, rather than only during periods in which exceedances occurred (e.g., due to seasonal factors like flow and air temperature). If it were determined that for one part of the year natural conditions criteria are more stringent than the biologically based criteria (e.g. lower temperatures in winter months), permittees could face new cost during this period compared to baseline.

Data limitations prevent quantifying a forecast of how often this might occur and to what degree. Bear in mind that criteria set through natural conditions would be technically

³⁸ In historical TMDL reviewed in this section, the natural condition of temperature was approximated by the system potential through an evaluation of the combined effect of hypothetical natural conditions of site potential riparian vegetation, microclimate improvements, and improved channel widths. The modeling software QUAL2Kw was frequently used in these settings.

³⁹ Standard units are given on a logarithmic scale. Each number represents a 10-fold change in the acidity/basicness of the water, where 7 is neutral. For example, a pH of five is ten times more acidic than water having a pH of six.

achievable during these periods, while numeric criteria in other parts of the year may not have been without the proposed rulemaking.⁴⁰ Compared to zero allowance in the baseline, human allowance in the proposed rule would also work to reduce cost, as would limiting allowances to local and regional sources such that they would not be absorbed by global climate change and cross-border polluters.

Outside of these caveats, evidence suggests that this proposed rulemaking would **not likely impose new costs to potentially impacted permits**. Rather, it is likely that the rulemaking represents a **cost savings (benefit)**, as described further below in Chapter 4.

Impacts to Aquatic Life

A material loss in aquatic life in a water body from the proposed rulemaking would constitute a loss of ecosystem services and cost to society. This is especially true for impacts to ESA listed species with uniquely high market and cultural value such as salmonoids. It is important to note that the proposed rulemaking is intended to refine water quality criteria, whilst remaining protective of aquatic life and endangered species. This means that so long as this holds true, there is no cost expected from the proposed rule compared to the baseline. Once adopted, both would be considered protective of aquatic life and designated uses.

To ensure this is the case, Ecology utilized information from previous ESA consultations, prior EPA biological evaluations, EPA memorandums, EPA guidance documents, exploration of how other states and tribes address natural conditions, and the latest scientific information to support the proposed rule (WAC 173-201A-470) (see *inter alia* USEPA 2003, 2005, 2007, 2009, 2015b, 2021, 2023; USFWS, 2008). From similar documentation and consultation with federal agencies, Ecology also ensured that other aspects of the proposed rulemaking, such as human allowances, are *de minimis*. For example:

- The EPA determined the allowable 0.3° C increase in temperature for fresh waters under natural condition scenarios is consistent with recommendations in EPA's Temperature Guidance (EPA, 2003). This provision allows for an insignificant level of heat from human actions when natural conditions are the applicable criteria or where waters are exceeding the biologically based numeric criteria. The EPA has also noted that absent such a provision, no heat would be allowed from humans when the natural conditions criteria are the applicable criteria. The EPA believed that a 0.3° C or less temperature increase about the natural condition temperature is insignificant because monitoring measurement error for recording instruments typically used in field studies are approximately 0.2° C to 0.3°.
- The EPA determined the allowable 0.2 mg/L decrease of DO for fresh waters and lakes under natural condition scenarios are considered insignificant decreases. EPA noted that DO is a characteristic of the waterbody that can be affected by several parameters (e.g., temperature). Further, 0.2 mg/L is within the monitoring measurement error for

⁴⁰ Historical TMDLs typically focus on times of year where waters were impaired. On the extreme end, natural conditions criteria could be more stringent than numeric criteria at all times of the year. However, to our knowledge there is no historical evidence that this condition exists, or would exist in future TMDLs.

recording instruments typically used to monitor dissolved oxygen. Ecology's rule requires that a decrease in DO from natural conditions equal 10% of the water body's DO or 0.2 mg/L, whichever is lower. This amendment provides additional safeguards in naturally hypoxic waters (<2 mg/L of DO).

Action Pair 1b-c

Action pair 1b-c amounts to meeting natural conditions criteria through the TMDL study process using the performance-based approach, compared to criteria developed using biological data collected in site-specific studies.

Both alternatives in these action pairs are intended to allow for a departure from statewide numeric criteria based on local conditions. However, criteria in the baseline scenario, despite being site-specific, must still be biologically based. Like 1a, criteria considering natural conditions and seasonal variation within that system are likely to be more easily met by permittees through fewer actions or investments and present no new costs.

Beyond this general logic, to our knowledge there are no examples to draw from in which a site-specific study established biologically based criteria without natural conditions (a proxy for baseline action a); then later for the same water body, established natural conditions criteria through the TMDL process (proxy for action 1 in the proposed rule).

Because Ecology would carry out the full process of considering, proposing, and adopting site-specific criteria, there would be no administrative costs differences to permittees under 1b. If a permittee were to elect to privately fund science in support of the site-specific criteria (1c), the proposed rulemaking represents an avoided cost of such a study (i.e. a benefit, see Chapter 4).

Action Pair 1d-e

Action pair 1d-e amounts to meeting natural conditions criteria through the TMDL study process using the performance-based approach, compared to meeting a different designated use through UAA.

As with site-specific criteria discussed in 1b and 1c, there is insufficient historic data to analyze potential permittee behavior in terms of meeting natural conditions criteria, compared to meeting a different designated use through UAA.⁴¹

Because Ecology would carry out the full process of considering, proposing, and adopting criteria based on UAA, there would be no administrative costs differences to permittees under 1d. If a permittee were to elect to privately fund science in support of a UAA (1e), the proposed rulemaking represents an avoided cost of such a study (i.e. a benefit, see Chapter 4).

3.2.4 Cost Summary

In this section, we considered the likely costs associated with the proposed rule amendments as implemented together.

⁴¹ Only one UAA has been completed in Washington and is still under review by the EPA.

We determined that the most likely action to occur because of this rulemaking—that would not require additional rulemaking—is meeting waste load allocations based on natural conditions criteria developed through the TMDL process using the performance-based approach compared to numeric temperature, DO, and / or pH criterion. After filtering future TMDL studies for these criteria, with potential for natural conditions, and prioritized in the next 20 years, we identified 3,671 associated permits (see Table 1).

We cannot quantify the costs of the proposed rulemaking to associated permits because future TMDL studies have not been performed yet. Historical TMDLs reviewed by the study team and the general logic of natural conditions provisions suggest that criteria considering local factors and seasonal variation would be more easily met through fewer actions or investments up to avoiding paradoxical situations in which permittees need to improve the quality of the water they discharged to beyond what is achievable without any human influence. In other words, the most likely actions, taken because of the proposed rulemaking, are **not likely to impose new costs**.⁴² Rather, the proposed rulemaking likely represents a **cost savings (benefit)**, as described further below in Chapter 4.

Meeting waste load allocations based on natural conditions criteria developed through the TMDL process compared to other, but unlikely, baseline scenarios such as developing site-specific criteria, or UAA, also likely carry no new costs.

The baseline conditions and proposed rulemaking (if adopted) would be considered protective of aquatic life and designated uses. Therefore, we do not expect new costs or benefits from a material change in related ecosystem services.

Chapter 4: Likely Benefits of the Proposed Rule Amendments

4.1 Introduction

We analyzed the likely benefits associated with the proposed rule amendments, as compared to the baseline. The proposed rule amendments and the baseline are discussed in detail in Chapter 2 of this document.

4.2 Benefits analysis

As discussed in Chapter 2, and reprinted from Chapter 3, the collective proposed rule amendments interact and work in tandem to generate impacts. Given that the baseline has no

⁴² We note that if it were determined that for one part of the year natural conditions criteria are more stringent than the biologically based criteria (e.g. lower temperatures in winter months), permittees might face new cost during this period compared to baseline under the proposed rule. However, other aspects of the proposed rule like the human allowance and limiting allowances to local and regional sources, could mitigate these to an unknown degree. The net impact on costs would depend on the relative size of new costs and cost-savings. Ultimately, data limitations prevent us from quantifying a forecast of how often this might occur and the net cost if such a scenario.

federally-approved natural conditions provisions, it is not practical to analyze every component of the rulemaking individually. We proceed instead by describing the impacts of the following amendments on the behavior of affected parties **as implemented together** (e.g. restoring natural conditions, as amended, for the purposed of federal actions):

Proposed revisions to existing criteria:

- Updates to the natural conditions provision to limit use to aquatic life criteria.
- Updating allowances for human impacts to fresh and marine waters for dissolved oxygen and temperature when the natural conditions constitute the water quality criteria
- Updates to the site-specific criteria process for an allowance for natural conditions to be used as a basis for developing these criteria.

Other proposed changes:

- Adding definitions for the performance-based approach and local and regional sources of human-caused pollution.
- Adding a new section detailing the use of the performance-based approach and applicable aquatic life criteria.
- Adding a rule document referenced in the water quality standards that details the methodology of the performance-based approach.

Minor non-substantive edits:

- One update to reflect the latest and current revision for a referenced EPA document

4.2.1 Benefits by Action Pairs

Benefits from this rulemaking would be borne from avoiding the cost of compliance with baseline scenarios in the absence of the proposed rulemaking. This includes any additional capital expenses (e.g. technology, engineering solutions or land acquisition), labor cost (e.g. source control and monitoring), or other miscellaneous activities (e.g. scientific study) required compared to those expected under the proposed rule. Table 1 in Chapter 3 summarizes permits potentially affected by this rulemaking. Various outcomes of the proposed rulemaking and baseline alternatives, or “action pairs”, can be reviewed in Section 3.2.1.

Action Pair 1a

As noted in Section 3, action pair 1a—meeting natural conditions criteria developed through the TMDL study process using the performance-based approach compared to the same process using statewide numeric criteria—is the most likely action in this analysis and would apply in some fashion to most permits in Table 1.

Based on the general logic and intent of natural conditions criteria to refine criteria values, and Ecology’s review of historical TMDLs, this scenario is likely to generate benefits.

1. Because natural conditions are suspected to be part of the driving force behind permits exceeding numeric criteria in Table 1, it is reasonable to assume that considering local variation in temperature, DO and pH would result in fewer actions and investments required to comply with refined criteria limits.
2. Almost all historical TMDLs that develop WLA based on natural conditions (see Section 3.2.3) reviewed by the study team allowed some flexibility to permittee compliance. This amounted to small allowances for higher temperature (e.g. a couple degrees Celsius), DO (e.g. a fraction of a mg/L), and pH variation (e.g. fraction of a standard unit) in parts of the year for some segments of a water body, compared to their statewide numerical equivalents.
3. In other historic TMDLs that develop WLA based on natural conditions, naturally occurring temperature, DO, and pH, varied from numeric criteria by as much as 13°C, 3 mg/L, and 1.5 standard units respectively. To the degree that similar or larger differences exist in future TMDLs, permittees in Table 1 could face a paradoxical situation under the baseline in which they must improve the quality of the water they discharged to well beyond what is achievable, even without human influence. The proposed rulemaking could prevent major engineering solutions otherwise needed to remain in compliance, or at the extreme end, prevent ceasing operations for part of the year or all together.

Outside of likely being non-zero, we are unable to identify the exact magnitude of these benefits (avoided costs) by potentially affected permittees (Table 1). This is because WLAs under the baseline or proposed rulemaking for these are currently unknown. In addition behavior would depend on a wide variety of facility types, with potentially multiple discharges, all taking different actions in response to compliance.

Benefits – Temperature

To illustrate just one select benefit pathway, we provide a stylized example of a small adjustment to effluent temperature required in the absence of the proposed rule (i.e. a benefit of this action pair under proposed rulemaking).

In this example, we only consider permits in the top 5 permit types likely impacted to be conservative in our assessment of benefits (see Table 1). From the highest to lowest number of impacted permittees, this includes 2,263 Construction Stormwater general permittees, 218 Sand and Gravel general permittees, 182 Industrial Stormwater general permittees, 70 Fruit Packing general permittees, and 46 municipal wastewater treatment plants.

We assume that all affected permits, regardless of type, would be required to cool their discharge by at least 1 degree Fahrenheit (0.56 Celsius) for at least part of the year to meet numeric standards in the absence of the proposed rulemaking. We recognize that several of these permit types, such as construction stormwater and sand and gravel, are not commonly responsible for raising the temperature of water, nor are commonly required to cool effluent. But in a hypothetical waterbody for this analysis, it is the fact that site conditions are naturally higher (hotter) than numeric criteria that would lead all associated permits under the TMDL to be responsible for lowering effluent temperature.

The cost of a thermal reduction to surface water from effluent can vary greatly depending on application and volume. Table 2 contains a non-exhaustive list of methods recommended to decrease the temperature impacts to surface water. Values in Table 2 are presented as industrial or water treatment plant solutions, broken out by component in such a way that allows for generalization to other applications (Jenkins, 2007).

Table 2. Common Surface Water Cooling Techniques and Costs

Effluent Cooling Modifications	Description	Cost
Clarifier Covers	This method provides shade over clarifiers to reduce the amount of solar radiation reaching the wastewater before discharge.	Approximately \$180,000 for a 50' diameter clarifier
Seasonal Storage	Holding treated effluent in a reservoir until stream temperature has decreased.	\$0.18 to \$2.60 per cubic foot of storage volume
Move Discharge Location	Discharging effluent to a different portion of the stream or to a different surface water body altogether.	\$180 - \$1800 per linear foot of pipeline
Multiple Port Diffusers	Releasing effluent through multi-port diffuser systems in several locations simultaneously into the receiving water.	\$370 - \$2800 per foot of diffuser
Effluent Blending	Mixing treated effluent with cooler groundwater or surface water prior to discharge.	\$140 - \$275 per foot for a well or \$180 - \$275 per lineal foot for a pipeline
Unlined Ponds	Contain treated effluent and allow it to percolate into the subsurface.	\$0.45 - \$0.90 per gallon of storage
Riparian Shading	Establishing streamside forests to provide shade over receiving water.	Example cost: Property purchase = \$36,750 per acre, Plant starts = \$4.60 per plant, Density = 2,614 plants per acre
Cooling Ponds	A shallow reservoir designed to receive warm water and discharge cool water, relying on evaporative and radiative heat loss.	\$0.18 to \$0.40 per cubic foot of storage volume

Effluent Cooling Modifications	Description	Cost
Cooling Towers	An evaporative cooling method used to dissipate heat from process water.	Example cost: \$237,150 for a 0.05 MGD plant
Chillers	Devices that employ an evaporator, compressor, condenser, and refrigerant to remove heat from a liquid.	\$46,000 - \$110,300 per MGD per degree Fahrenheit and an additional \$9,200 - \$18,400 per MGD per degree Fahrenheit per year in operating costs

Note: Values in table range from 2001 to 2005 dollars depending on technology.

For construction stormwater, sand and gravel, and fruit packer general permits we estimated the price to install a small cooling pond as a low-cost option to comply to the baseline scenario. These shallow reservoirs are designed to receive warm water and discharge cool water through evaporative and radiative heat loss. Note in Table 2 that ponds may double as holding tanks for effluent until stream temperature has decreased. We assume an average engineered cooling pond, with the ability to hold 40,000 cubic feet of water, can be constructed for a fixed cost of \$14,946 in 2024 dollars.⁴³

Industrial stormwater general permits include air and seaports, large manufacturing facilities, refineries, and commercial food processors, with the potential of treating and discharging millions of gallons of effluent per day. Together with municipal wastewater treatment permits, more sophisticated methods of cooling would likely be required for these facilities to meet marginal cooling requirements necessary without the proposed rule. To estimate the cost of cooling effluent in these facilities, we assumed the need for more advanced technology such as cooling towers or chillers. Using information from Jenkins (2007) we estimated the cost to a mid-sized 3 million gallons per day (MGD) system using these technologies to lower effluent temperatures 1 degree Fahrenheit is \$686,923 in capital costs and \$114,591 per year in operating and maintenance (O&M) in 2024 dollars.^{44,45}

Benefits described above will not accrue all at once upon the adoption of this rulemaking; rather, they would be staggered across time depending on TMDL priority and where the receiving permit is within its 5-year renewal cycle. To calculate the net present value over a 20-

⁴³ Adjusted upward from initial estimates of \$7,200 from 2005 data in Jenkins, 2007. Adjustments were made using Producer Price Index by Commodity: Machinery and Equipment: Domestic Water Systems (<https://fred.stlouisfed.org/series/WPU11411311>). Does not include the cost of any land acquisition that, if avoided under the proposed rule, would increase this benefit.

⁴⁴ Note that in many cases these estimates are conservative with respect to facility size. For example, very large water treatment plants (upwards of 90 MGD), could require as much as \$10 million in infrastructure alone and \$1.6 million per year in O&M for a single plant to cool effluent by 1 degree Fahrenheit.

⁴⁵ Adjusted upward from initial capital and O&M estimates of \$330,900 and \$114,591 from 2005 data in Jenkins, 2007. Adjustments were made using Producer Price Index by Commodity: Machinery and Equipment: Domestic Water Systems (<https://fred.stlouisfed.org/series/WPU11411311>)

year period, we consider again Ecology's TMDL priority rankings (discussed in Section 3.2.1) and add 5 years to the latest date that the TMDL might begin to allow for research time and idiosyncratic lags in permit renewal. That is:

- Permittees under high priority TMDLs for temperature (1,299) receive benefits 5 years after adoption.
- Permittees under medium priority TMDLs for temperature (1,197) would begin receiving benefits 10 years after adoption.
- Permittees under medium-low priority TMDLs for temperature (283) would begin receiving benefits 20 years after adoption.

Conditional on assumptions discussed above in this exercise (e.g. a 1 degree Fahrenheit reduction, required by all permittees in the top 5 permit in the next 20 years) the total net present value of benefits from the proposed rule over a 20 year horizon would be just over \$356 million.^{46,47}

Benefit – DO

When high levels of nutrients fuel excessive marine plant life, such as algae, oxygen is consumed when plants later die and decompose. Nutrient removal is therefore one of the main, and potentially costly, strategies used when mitigating dissolved oxygen depletion in fresh and marine water.

We emphasize that the proposed rulemaking would not absolve impacted permittees from treating nutrients in their effluent. However, any marginal refinements to DO criteria based on natural conditions provisions could provide financial relief to facilities otherwise facing the need for additional technologies to meet numeric standards. In this way, setting DO criteria values based on natural conditions represents a potential benefit under the proposed rule.

Reiterated from above, it is not possible to know how natural conditions criteria will differ from numeric DO criteria for permits in Table 1, or how those differences would translate to nutrient requirements in TMDL waste load allocations. Available data on nutrient treatment costs are also not commonly presented in marginal units of removed nutrients (e.g. a dollar amount for every unit of nitrogen or phosphorus), making such an analysis additionally impractical.

Under these caveats, the most conservative assumption we can make with available data is that the lowest known facility cost of treatment would be sufficient to satisfy an arbitrary difference between numeric based DO requirements in the baseline and natural conditions provisions under the proposed rule. As another illustrative example, this time focused on nutrient

⁴⁶ Discounted at 0.9%, the 20-year average of fixed real annual rates. Fixed rate of return to inflation-indexed I-Bonds by US Treasury Department (<https://www.treasurydirect.gov/savings-bonds/i-bonds/i-bonds-interest-rates/>).

⁴⁷ Without considering modifications by construction permits, this estimate is just under \$325 million (after making assumptions discussed elsewhere in this section such as a 1 degree Fahrenheit reduction, required by all remaining permittees in the next 20 years).

removal, we apply these arbitrary facility and operational changes to permits in the top 5 likely impacted permit types (see Table 1).

Considering impacts wastewater treatment, we assume again an average municipal treatment facility size of 3 MGD. In 2011, Ecology produced a technical report identifying cost estimates for a suite of wastewater treatment technologies to achieve a range of different effluent quality performance targets with respect to nutrients (Ecology, 2011). This report, as summarized by the EPA (2015a), finds constructed or retrofitted treatment technologies for removing nutrients, such as inorganic nitrogen, come at a capital cost ranging from \$0.1/MGD/year to nearly \$100/MGD/year, with typical costs cited as averaging \$25/MGD/year. Annual O&M for these systems ranged from \$0.01/MGD/year to \$1.85/MGD/year.^{48,49} Applying \$0.1/MGD and \$0.01/MGD for capital and O&M cost, and adjusting to current price levels, the estimated cost to remove an arbitrarily small amount of nitrogen is \$488,790 per facility in capital costs, and \$48,879 in annual O&M.⁵⁰

For the treatment of nutrients in industrial and agricultural applications the USEPA (2015a) points to publications that primarily draw from foodstuffs, beverages, livestock, and agricultural producers. Technologies used in these industries include enhanced aeration, modified Ludzack-Ettinger process, and chemical treatment that would apply to Fruit Packer general permits, and generalizable to many other large-footprint facilities found in Industrial stormwater general permits not directly included in the aforementioned industries. While unable to recover unit costs, the minimum estimated total cost for these technologies used to achieve a reduction in nutrients at the facility level was \$241,570 in upfront capital and \$119,164 annually for O&M in 2024 dollars.

Potential costs borne by construction wastewater and sand and gravel permits are even less clear. For the purposes of this exercise, we assume that complying with a small arbitrary reduction in nutrients would include moving materials such as fertilizers and landscaping material out of the path of stormwater, ensuring proper operation and maintenance of any treatments already installed, and updating plans to minimize unnecessary land disturbance. Assuming 40 hours of labor per year for these activities by existing staff, and the Bureau of Labor Statistics median pay for Environmental Engineering Technicians, (\$24.51 per hour), we estimated \$980.04 annually (BLS, 2023).

As with temperature, we applied benefits at the permit level over time based on permit type and TMDL priority over a 20-year horizon. We again limit this analysis to the top 5 affected permit categories described in Table 1 to be consistent and additionally conservative.

⁴⁸ Employed technologies range from activated sludge, lagoons, membrane bioreactors, rotating biological contactors, sequencing batch reactors, and trickling filters.

⁴⁹ 2012 dollars.

⁵⁰ Adjustments made using Producer Price Index by Commodity: Machinery and Equipment: Domestic Water Systems (<https://fred.stlouisfed.org/series/WPU11411311>).

Conditional on assumptions discussed above (e.g. an arbitrary reduction in nutrients, required by all permittees in the top 5 permit categories over 20 years), the net present value of this stream of benefits is estimated to be just over \$319 million.

Benefit – pH

As with Temperature and DO requirements, benefits of avoided compliance cost with numeric pH criteria, compared to those based on an applicable natural condition criterion, would likely be positive. Due to a lack of publicly available data on the cost of pH neutralization, the study team is currently unable to illustrate these benefits quantitatively.

Action Pair 1b-c

Action pair 1b-c amounts to meeting natural conditions criteria through the TMDL study process using the performance-based approach, compared to criteria developed using biological data collected in site-specific studies.

Both alternatives in the action pair are intended to allow for a departure from statewide numeric criteria based on local conditions. However, criteria in the baseline scenario, despite being site-specific, must still be biologically based. Like in action 1a, criteria considering natural conditions and seasonal variation within that system are likely to be more easily met by permittees through fewer actions or investments, representing an avoided cost (benefit).

If a permittee were to elect to privately fund science in support of the site-specific criteria (action 1c), the proposed rulemaking represents an additional benefit in the form of avoided costs of such a study. The benefit of this avoided study component could range from tens to hundreds of thousands of dollars depending on the size, complexity, and detail needed to effectively substantiate site-specific criteria .

Action Pair 1d-e

Action pair 1d-e amounts to meeting natural conditions criteria through the TMDL study process using the performance-based approach, compared to meeting a different designated use through UAA.

There is insufficient historic data to analyze potential permittee behavior in terms of meeting natural conditions criteria, compared to meeting a different designated use through UAA. If a permittee were to elect to privately fund science in support of a UAA (1e), the proposed rulemaking represents an additional benefit in the form of avoided costs of such a study. However, there is very little data to estimate a range quantitatively.⁵¹

4.2.2 Benefits Summary

In this section, we considered the likely benefits associated with the proposed rule amendments as implemented together.

⁵¹ Only one UAA has been completed in Washington and is still under review by the EPA.

As described in Section 3, we assumed that the most likely action to occur because of this rulemaking—that would not undergo additional rulemaking—is meeting waste load allocations based on natural conditions criteria developed through the TMDL process using the performance-based approach compared to a numeric temperature, DO, and or pH criterion.

Based on historical TMDLs reviewed by the study team, and the general logic of natural conditions provisions, we expect a potentially wide range of benefits associated with the proposed rule amendments. For many, criteria considering local factors and seasonal variation under this proposed rulemaking will be more easily met through fewer actions or investments on the margin. For others, benefits would include avoiding the need to eliminate discharge and associated economic activity completely for all or part of the year completely to avoid paradoxical situations in which permittees must improve the quality of the water they discharged to beyond what is achievable without any human influence.

We cannot fully quantify the extent of potential benefits of the proposed rulemaking because future TMDL studies have not been performed yet. However, through a pair of illustrative examples, we applied a small and arbitrary temperature and DO criteria change to potentially impacted permits—akin to just one scenario when meeting natural conditions under the proposed rulemaking. We estimated a total 20-year present value benefit of \$675 million through this exercise, but stress that this represents partial benefits and should be considered a conservative lower bound.

Additional, but unquantified, benefits include avoided costs of meeting numeric criteria for freshwater pH compared to a natural condition based criteria, and any avoided cost of independent science by permittees in support of Ecology performing site-specific criteria and UAA in the baseline.

The baseline conditions and proposed rulemaking (if adopted) would be considered protective of aquatic life and designated uses. Therefore, we do not expect new costs or benefits from a material change in related ecosystem services.

Chapter 5: Cost-Benefit Comparison and Conclusions

5.1 Summary of costs and benefits of the proposed rule amendments

Due to data limitations, we cannot quantify the costs of the proposed rulemaking to associated permits (see Section 3.2). However, the most likely actions taken because of the proposed rulemaking are not likely to impose new costs, but rather produce benefits in the form of avoided costs. Historical TMDLs reviewed by the study team and the general logic of natural conditions provisions suggest that criteria considering local factors and seasonal variation would be more easily met through fewer actions or investments—up to avoiding paradoxical situations in which permittees need to improve the quality of the water they discharged to beyond what is achievable without any human influence. In this way, the proposed rulemaking is not likely to impose new costs, but rather cost savings (benefit).

Due to data limitations, we cannot fully quantify the extent of potential benefits of the proposed rulemaking. However, through a pair of illustrative examples, we applied a small and arbitrary temperature and DO criteria change to a selection of potentially impacted permits—akin to just one scenario when meeting natural conditions under the proposed rulemaking. Through this exercise, we estimated a total 20-year present value benefit of \$675 million, but stress that this represents partial benefits and should be considered a conservative lower bound. Additional, but unquantified, benefits include avoided costs of meeting numeric criteria for freshwater pH compared to a natural condition based criteria, and any avoided cost of independent science by permittees in support of Ecology performing site-specific criteria and UAA in the baseline.

The baseline conditions and proposed rulemaking (if adopted) would be considered protective of aquatic life and designated uses. Therefore, we do not expect new costs or benefits from a material change in related ecosystem services.

5.2 Conclusion

We conclude, based on a reasonable understanding of the quantified and qualitative costs and benefits likely to arise from the proposed rule amendments, as compared to the baseline, that the benefits of the proposed rule amendments are greater than the costs.

Chapter 6: Least-Burdensome Alternative Analysis

6.1 Introduction

RCW 34.05.328(1)(c) requires Ecology to “...[d]etermine, after considering alternative versions of the rule and the analysis required under (b), (c), and (d) of this subsection, that the rule being adopted is the least burdensome alternative for those required to comply with it that will achieve the general goals and specific objectives stated under (a) of this subsection.” The referenced subsections are:

- (a) Clearly state in detail the general goals and specific objectives of the statute that the rule implements;
- (b) Determine that the rule is needed to achieve the general goals and specific objectives stated under (a) of this subsection, and analyze alternatives to rule making and the consequences of not adopting the rule;
- (c) Provide notification in the notice of proposed rulemaking under RCW 34.05.320 that a preliminary cost-benefit analysis is available. The preliminary cost-benefit analysis must fulfill the requirements of the cost-benefit analysis under (d) of this subsection. If the agency files a supplemental notice under RCW 34.05.340, the supplemental notice must include notification that a revised preliminary cost-benefit analysis is available. A final cost-benefit analysis must be available when the rule is adopted under RCW 34.05.360;
- (d) Determine that the probable benefits of the rule are greater than its probable costs, taking into account both the qualitative and quantitative benefits and costs and the specific directives of the statute being implemented.

In other words, to be able to adopt the rule, we must determine that the requirements of the rule are the least burdensome set of requirements that achieve the goals and objectives of the authorizing statute(s).

We assessed alternative proposed rule content and determined whether they met the goals and objectives of the authorizing statute(s). Of those that would meet the goals and objectives, we determined whether those chosen for inclusion in the proposed rule amendments were the least burdensome to those required to comply with them.

6.2 Goals and objectives of the authorizing statute

The authorizing statute for this rule is Chapter 90.48 RCW, Water Pollution Control. Its goals and objectives include the state of Washington’s policy of maintaining the highest possible standards to ensure the purity of all waters of the state consistent with public health, public enjoyment, the protection of wildlife, and the industrial development of the state. This requires the use of all known available and reasonable methods to prevent and control the pollution of the waters of the state of Washington.

RCW 90.48.035, Rule-making authority, specifically authorizes Ecology to promulgate, amend, or rescind rules and regulations as deemed necessary to maintain the highest possible standards of all waters in the state. Its goals and objectives include but are not limited to rules relating to standards of quality of waters of the state and regulating substances discharged into them.

6.3 Alternatives considered and why they were excluded

We considered the following alternative rule requirements and did not include them in the proposed rule amendments. This list includes alternatives that were suggested by the public during development of the rule, with the intent of mitigating negative impacts, including environmental harms, on vulnerable populations and overburdened communities, and equitably distributing benefits. Each section below explains why we did not include these alternatives.

- Updating human allowance and natural condition provisions only (i.e., no performance-based approach).
- Updating natural condition provision only (i.e., no human allowance or performance-based approach).
- No natural condition updates

6.3.1 Updating human allowance and natural condition provisions only

We considered updating only the human allowance and natural conditions provisions in the proposed rule, but not including a performance-based approach. This alternative would potentially be more burdensome for permittees. If a water is not meeting biologically based numeric criteria, and that is due in part to natural conditions, then there would only be two pathways for determining protective criteria based on natural conditions: a use change through a Use Attainability Analysis (which could result in different criteria values); or criteria change through site-specific criteria development. Both approaches would require separate WQ Standards rulemaking and would need to undergo EPA review (including any ESA consultation with NOAA NMFS and USFWS) and approval prior to being in effect for CWA purposes.

6.3.2 Updating natural condition provision only

We considered updating only the natural condition provision in the proposed rule, but not including the human allowance or the performance-based approach. This alternative would potentially be more burdensome for permittees. If a water is not meeting biologically based numeric criteria, and that is due in part to natural conditions, then there would only be two pathways for determining protective criteria based on natural conditions if no performance-based approach exists: a use change through a Use Attainability Analysis (which could result in different criteria values); or criteria change through site-specific criteria development. Both

approaches would require separate WQ Standards rulemaking and would need to undergo EPA review (including any ESA consultation with NOAA and USFWS) and approval prior to being in effect for CWA purposes.

In addition, if no human allowance is provided in rule, then when natural conditions are the applicable criteria, NO degradation for temperature or DO would be allowed. This would be unnecessary for protection of aquatic life and unnecessarily costly. See rulemaking Technical Support Document for further details.

6.3.3 No Rulemaking

We considered not doing this rulemaking. Without natural conditions criteria, the applicable biologically based numeric criteria would apply and must be met to protect existing and designated aquatic life uses. Some waters during some periods of the year may not be able to meet these criteria due to natural and seasonal variations. This could be the case even if all human impact was reversed and removed from this determination. Thus, it would be more burdensome to covered parties as applicable criteria would not be able to be met regardless of any actions taken (See Appendix A(B)(2) for additional details).

6.6.4 Alternative DO Allowance 1

We considered an alternative DO allowance that states when natural conditions constitute the water quality criteria for a site, local and regional sources of human-caused pollution considered cumulatively may not decrease DO more than 0.2 mg/L.

We excluded this possibility as we determined it would not be protective of aquatic life when waters were naturally low in DO (i.e., <2 mg/L), and therefore does not meet goals and objectives. For instance, if waters were naturally 1.0 mg/L for DO Concentration, a 0.2 mg/L decrease to 0.8 mg/L would have negative impact on aquatic life; therefore, this would not be protective and would not represent a de minimis amount of degradation.

6.6.5 Alternative DO Allowance 2

We considered an alternative DO allowance that states when natural conditions constitute the water quality criteria for a site, local and regional sources of human-caused pollution considered cumulatively may not decrease DO more than 0.2 mg/L only if the natural condition criteria of the water is > or = 2.0 mg/L. Otherwise, no further degradation of the waters are allowed.

We excluded this possibility because it would be unnecessarily stringent, and thus overly burdensome for permittees, compared to what is needed for protection of aquatic life (see EPA's 2007 Biological Evaluation regarding 0.2 mg/L for fresh water systems). Additionally, because we may be using water quality models to estimate natural condition values, there will inherently be some error associated with estimation. Trying to meet no degradation (i.e., 0) is difficult when you must account for associated model error. Thus, no allowance in this

alternative prevents accounting for natural condition estimation error in our modeling process in TMDLs.

6.4 Conclusion

After considering alternatives, within the context of the goals and objectives of the authorizing statute, we determined that the proposed rule represents the least-burdensome alternative of possible rule requirements meeting the goals and objectives.

Chapter 7: Regulatory Fairness Act Compliance

We analyzed the compliance costs of the proposed rule amendments in Chapter 3 of this document. We conclude that the proposed rule amendments are not likely to result in compliance costs for any businesses. The proposed rule is likely to result only in cost-savings for dischargers, as compared to the baseline. Based on this analysis, Ecology is exempt from performing additional analyses under the Regulatory Fairness Act, under RCW 19.85.025(4) which states that, “This chapter does not apply to the adoption of a rule if an agency is able to demonstrate that the proposed rule does not affect small businesses.” Moreover, by not imposing compliance costs, the proposed rule amendments do not meet the RFA applicability standard under RCW 19.85.030(1)(a).

References

RCW 34.05.272 requires Ecology to categorize sources of information used in significant agency actions made in the Water Quality Program.

Independent peer review

Review is overseen by an independent third party.

n/a

Internal peer review

Review by staff internal to Ecology.

Appendix A: Administrative Procedure Act (RCW 34.05.328) Determinations

A. RCW 34.05.328(1)(a) – Clearly state in detail the general goals and specific objectives of the statute that this rule implements.

See Chapter 6.

B. RCW 34.05.328(1)(b) –

1. Determine that the rule is needed to achieve the general goals and specific objectives of the statute.

See chapters 1 and 2.

2. Analyze alternatives to rulemaking and the consequences of not adopting this rule.

A rulemaking is the only way to adopt natural conditions provisions and criteria. If we do not adopt this rule, then waters would need to meet applicable biologically based numeric aquatic life criteria. As some waters cannot meet these aquatic life numeric criteria due to natural or seasonal variations, then without this rule, these waters would not meet applicable water quality standards and may be considered impaired, even if fully protecting all existing and designated uses. In addition, if natural conditions are the sole cause of a violation of the applicable biologically based aquatic life criteria, then listing these waters as impaired would go against the intent of the legislature (RCW 90.48.570(3)).

If we do not adopt a performance-based approach during this rulemaking, then any site-specific criteria development for determining natural conditions criteria would need to go through rulemaking, including EPA review, prior to being used for state and federal Clean Water Act purposes. A consequence of such approach would be a possibly lengthy delay between developing a protective site-specific criterion based on natural conditions of the water body and the ability to use such criterion in a Clean Water Act action (e.g., TMDLs).

If we do not adopt human-use allowances for temperature and dissolved oxygen, then when natural conditions constitute the criteria for a water, there would be no allowance for any degradation by human actions. EPA has previously determined, and Ecology agrees, that such approach would be unnecessary for the protection of existing and designated uses and would be unnecessarily costly for entities with stake in those waters.

Please see the Least Burdensome Alternative Analysis, Chapter 6 of this document, for discussion of alternative rule content considered.

C. RCW 34.05.328(1)(c) - A preliminary cost-benefit analysis was made available.

When filing a rule proposal (CR-102) under RCW 34.05.320, Ecology provides notice that a preliminary cost-benefit analysis is available. At adoption (CR-103 filing) under RCW 34.05.360, Ecology provides notice of the availability of the final cost-benefit analysis.

- D. RCW 34.05.328(1)(d) – Determine that probable benefits of this rule are greater than its probable costs, taking into account both the qualitative and quantitative benefits and costs and the specific directives of the statute being implemented.**

See Chapters 1 – 5.

- E. RCW 34.05.328 (1)(e) - Determine, after considering alternative versions of the analysis required under RCW 34.05.328 (b), (c) and (d) that the rule being adopted is the least burdensome alternative for those required to comply with it that will achieve the general goals and specific objectives stated in Chapter 6.**

Please see Chapter 6.

- F. RCW 34.05.328(1)(f) - Determine that the rule does not require those to whom it applies to take an action that violates requirements of another federal or state law.**

Under the Federal Clean Water Act, states are required to adopt water quality standards that consist of designated uses, water quality criteria that protect those uses, and an antidegradation policy. These standards must protect the public health or welfare, enhance the quality of the water, and serve the purposes of the Act. States must adopt water quality criteria that protect designated uses. States adopt EPA recommended CWA Section 304(a) criteria, modified CWA Section 304(a) criteria that reflect site-specific conditions, or other criteria so long as they are based on sound scientific rationale and protect the designated uses of the water (40 CFR 131.11).

EPA’s policy on natural conditions states that site-specific numeric aquatic life criteria can be set equal to natural background, where natural background is defined as “background concentration due only to non-anthropogenic sources, i.e., non-manmade sources.” States that wish to set criteria equal to natural background must include, at minimum, in their water quality standards: (a) a definition of natural background; (b) a provision that allows setting site-specific criteria equal to natural background; and (c) a binding procedure for determining natural background.

Ecology amended and introduced new natural conditions provisions and criteria in 2003 and 2006 to be consistent with federal requirements for use of natural conditions in effect at the time. Since then, certain natural condition provisions have been reconsidered by EPA and disapproved. Any new or updated natural conditions criteria will be consistent with current federal requirements and policy for use of natural conditions, and these criteria and associated provisions are reviewed and approved by EPA before becoming effective for Clean Water Act actions.

- G. RCW 34.05.328 (1)(g) - Determine that the rule does not impose more stringent performance requirements on private entities than on public entities unless required to do so by federal or state law.**

No. The rule does not impose more stringent performance requirements on private entities than on public entities. Any entity, private or public, must adhere to the rules protecting water quality in the state of Washington.

H. RCW 34.05.328 (1)(h) Determine if the rule differs from any federal regulation or statute applicable to the same activity or subject matter.

No.

- If **yes**, the difference is justified because of the following:

- (i) A state statute explicitly allows Ecology to differ from federal standards.
- (ii) Substantial evidence that the difference is necessary to achieve the general goals and specific objectives stated in Chapter 6.

I. RCW 34.05.328 (1)(i) – Coordinate the rule, to the maximum extent practicable, with other federal, state, and local laws applicable to the same subject matter.

We will work with EPA to ensure that the proposed rules are approvable.

Appendix B: Additional Tables and Figures

Table 3. Potentially Impacted Permit Categories, by Criteria

Permit Type	Temp	DO	pH
Construction SW GP	2,263	2,549	1,163
Sand and Gravel GP	218	256	201
Industrial SW GP	182	258	176
