MEMORANDUM

WA-17-0030

TO: Jim Knudson

FROM: Bob Bishop

SUBJECT: Crown Zellerbach Diffuser Outfall Survey at Port Townsend Bay

On 5-27-71, Jim Baumer and I conducted a water quality survey at stations located adjacent to the diffuser outfall line of the Crown Zellerbach Company mill at Port Townsend Bay. The mill was not operating at this time, and data were recorded as background to be compared with those from a future survey. On 7-8-71, Ron Lee and Jim Baumer conducted that survey while the mill was in full operation.

On 5-27, the diffuser line was seen on the bottom at stations A and B, at low tide. The pipe passes between piling 8 and 9, counting from the south end of the row at the breakwater. We did not locate the end of the diffuser line. The stations sampled and their relative locations for both surveys are illustrated in Figure 1. Station H was not sampled. The stations were located using landmarks and a range finder. Due to rough water, the high tide run was not done on 5-27.

Station E, located approximately 1,500 yards east of the diffuser, was the control station. Station C was above, or close to the diffuser. Station D was in the diffusion zone.

The following three tables give parameter data comparisons for each station, C, D, and E, for both surveys.
