Office Report No. 40

## A REVIEW OF THE WATER RESOURCES OF THE WENATCHEE BASIN

by

Greg Sorlie

(For Use by the Water Resources Management Division)

January 1976  
Department of Ecology  
Olympia, Washington

## INTRODUCTION

The purpose of this report is to present a brief review of the water resources of the Wenatchee Basin, with emphasis upon water use, irrigated acres, and water rights. This report is not considered complete and will be updated with additional information when the time is warranted.

## LAND USE

Figure I shows the Basin and its subdivisions. These subdivisions have been determined by the SCS for convenient inventory purposes, and usually follow natural watershed boundaries. A very small portion of Chelan County is not part of the river basin, but will be included in this report for convenient data purposes. A good breakdown on land use, by subbasin, is given in Table I. The information is a few years old (1968) but is the best available at this time. The biggest change will be in the amount of irrigated acres, which may be a little higher than indicated in 1967.

## WATER RESOURCE INVENTORY AREA (4)

Squillchuck Creek	0-23	5,000	0	1,100	13,068	319	19,487	1,000	0	1,000	300
Stemilt Creek	0-24	11,683	0	1,100	8,683	474	21,940	1,000	0	1,000	300
Colockum Creek	0-25	7,000	0	1,600	82,711	8,996	100,307	900	0	900	3,500
TOTAL		256,553	575,256	22,430	130,962	31,473	1,016,674	15,130	0	15,130	4,100

## WATER USE

Based on the available information, the estimated water use in the Wenatchee Basin in 1970 was:

<u>Use</u>	<u>Surface Water (acre-ft/year)</u>	<u>Ground Water (acre-ft/year)</u>	<u>Total (acre-ft/year)</u>
Irrigation	59,600	2,200	61,800
Industrial	15,000	570	15,570
Municipal	3,500	11,150	14,650
Domestic	0	2,000	2,000
Stock	200	100	300
TOTAL	78,300	16,000	94,300

### Water Rights

A summary of water rights and water right claims is given in Tables 2 and 3.

### Irrigated Acres

The largest use of water in the Wenatchee Basin is for irrigation.

Naturally, the amount of irrigated acres is an important factor in determining actual use and predicting future use. Because there is such a large number of irrigated acres, determining the exact amount can be a tricky business. Following is a discussion of the different sources of information we have on irrigated acres and water use.

County Data

Much information is on a county basis. This is not really inconvenient, however, because Chelan County is made up of the Wenatchee, Chelan, and Entiat river basins. According to the Census of Agriculture, in 1969, 24,266 acres were irrigated in Chelan County. Of these, 22,537 acres (93%) were in orchards; 1,597 acres (6%) were in hay or pasture; and 132 (1%) were in small grains.

The U.S. Geological Survey has estimated 28,400 acres were irrigated in the County in 1970.

TABLE 2. SUMMARY OF WATER RIGHTS - WENATCHEE BASIN (1975)  
(in cfs)

Use	Surface	Ground	Total
Municipal	22.3	5.51	27.8
Irrigation	502.2	17.6	519.8
Domestic	10.5	4.8	15.3
Industrial & Commercial	232.9	9.1	242.0
Stock	<u>0.3</u>	<u>0.1</u>	<u>0.4</u>
TOTAL	768.2	37.11	805.31
Irrigated Acres	30,597	765	31,362
Total Number of Rights	262	133	395

TABLE 3. WATER RIGHT CLAIMS - WENATCHEE BASIN

January, 1975

## Number of Claims

	Domestic	Stock	Irrigation	Other	Total	Irrigated Acres
Surface Water	201	92	134	28	455	11,986
Ground Water	644	62	101	21	828	701
TOTAL	845	154	235	49	1,283	12,687

Note: A high degree of reliability should not be placed upon these figures; there is no accurate way to assess the human error involved while filing a claim.

Basin Data

Many sources give irrigated acres by basin, and the county figure can be obtained by adding the three basins together. Among these sources are: The Soil Conservation Service, which estimated irrigated acreage in 1967; the Irrigation Districts (totals were tabulated for all districts in the county - perhaps the most accurate source); Water Supply Bulletin Number 1220 (published in 1945, the estimates appear too high); and Water Rights - which are far in excess of the actual amount irrigated.

Table 4 sums up these different sources on a historical basis. Figure 2 is a graph showing the different figures on a comparative format.

Irrigation District figures are the most accurate. In 1975, there were 17,021 irrigated acres in the Wenatchee Basin. This is the figure that will be used in computing water use in this report.

TABLE 4. IRRIGATED ACRES IN CHELAN COUNTY

Source	1930	1940	1950	1960	1965	1967	1970	1975
Water Rights (Surface & Ground)*								
Wenatchee Basin	29,270	29,382	29,717	29,929				31,362
Entiat Basin	410	490	521	589				775
Chelan Basin	8,865	9,450	11,156	11,852				21,750
Chelan County	38,545	39,332	41,394	42,370				53,888
Census of Agriculture**	29,311	26,626	27,019	30,985	31,530			24,266
U.S. Geological Survey					26,815			28,400
Soil Conservation Service								
Wenatchee Basin						15,130		
Entiat Basin						3,700		
Chelan Basin						6,700		
Chelan County						25,530		
Irrigation Districts								
Wenatchee Basin							17,021	
Entiat Basin							760	
Chelan Basin							6,590	
Chelan County							24,371	
Water Supply Bulletin 1220					34,310			

\*In 1975, irrigated acres by ground-water rights constituted only 7 percent of the Chelan County total.

\*\*It is not totally understood why these figures should be so much higher in earlier years; the data base is probably incorrect.

FIGURE 2. Irrigated Acres, Chelan County

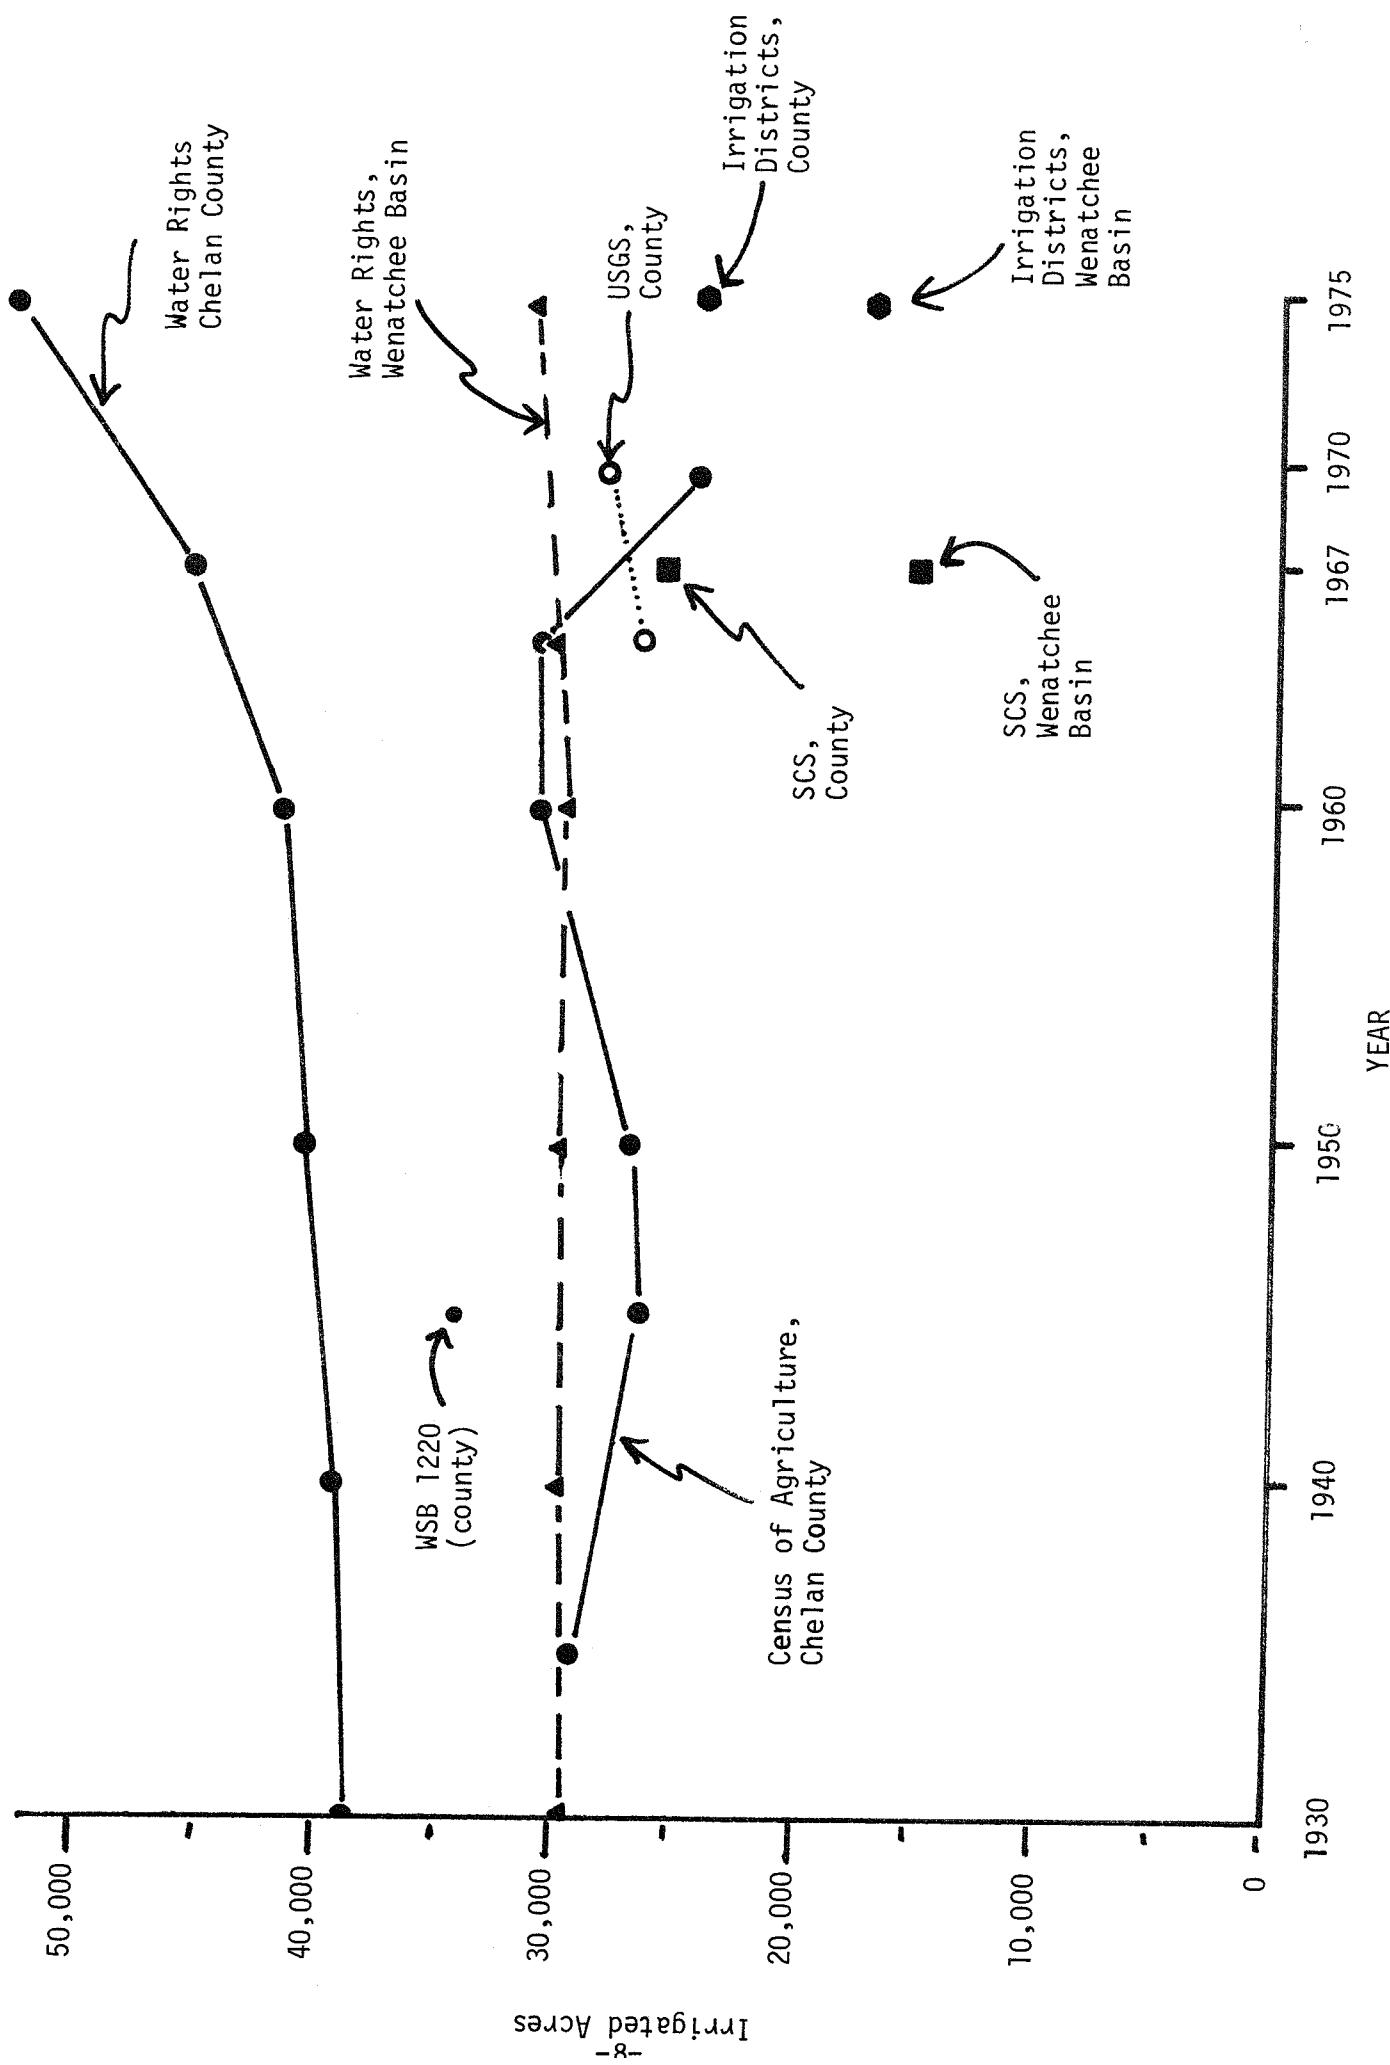

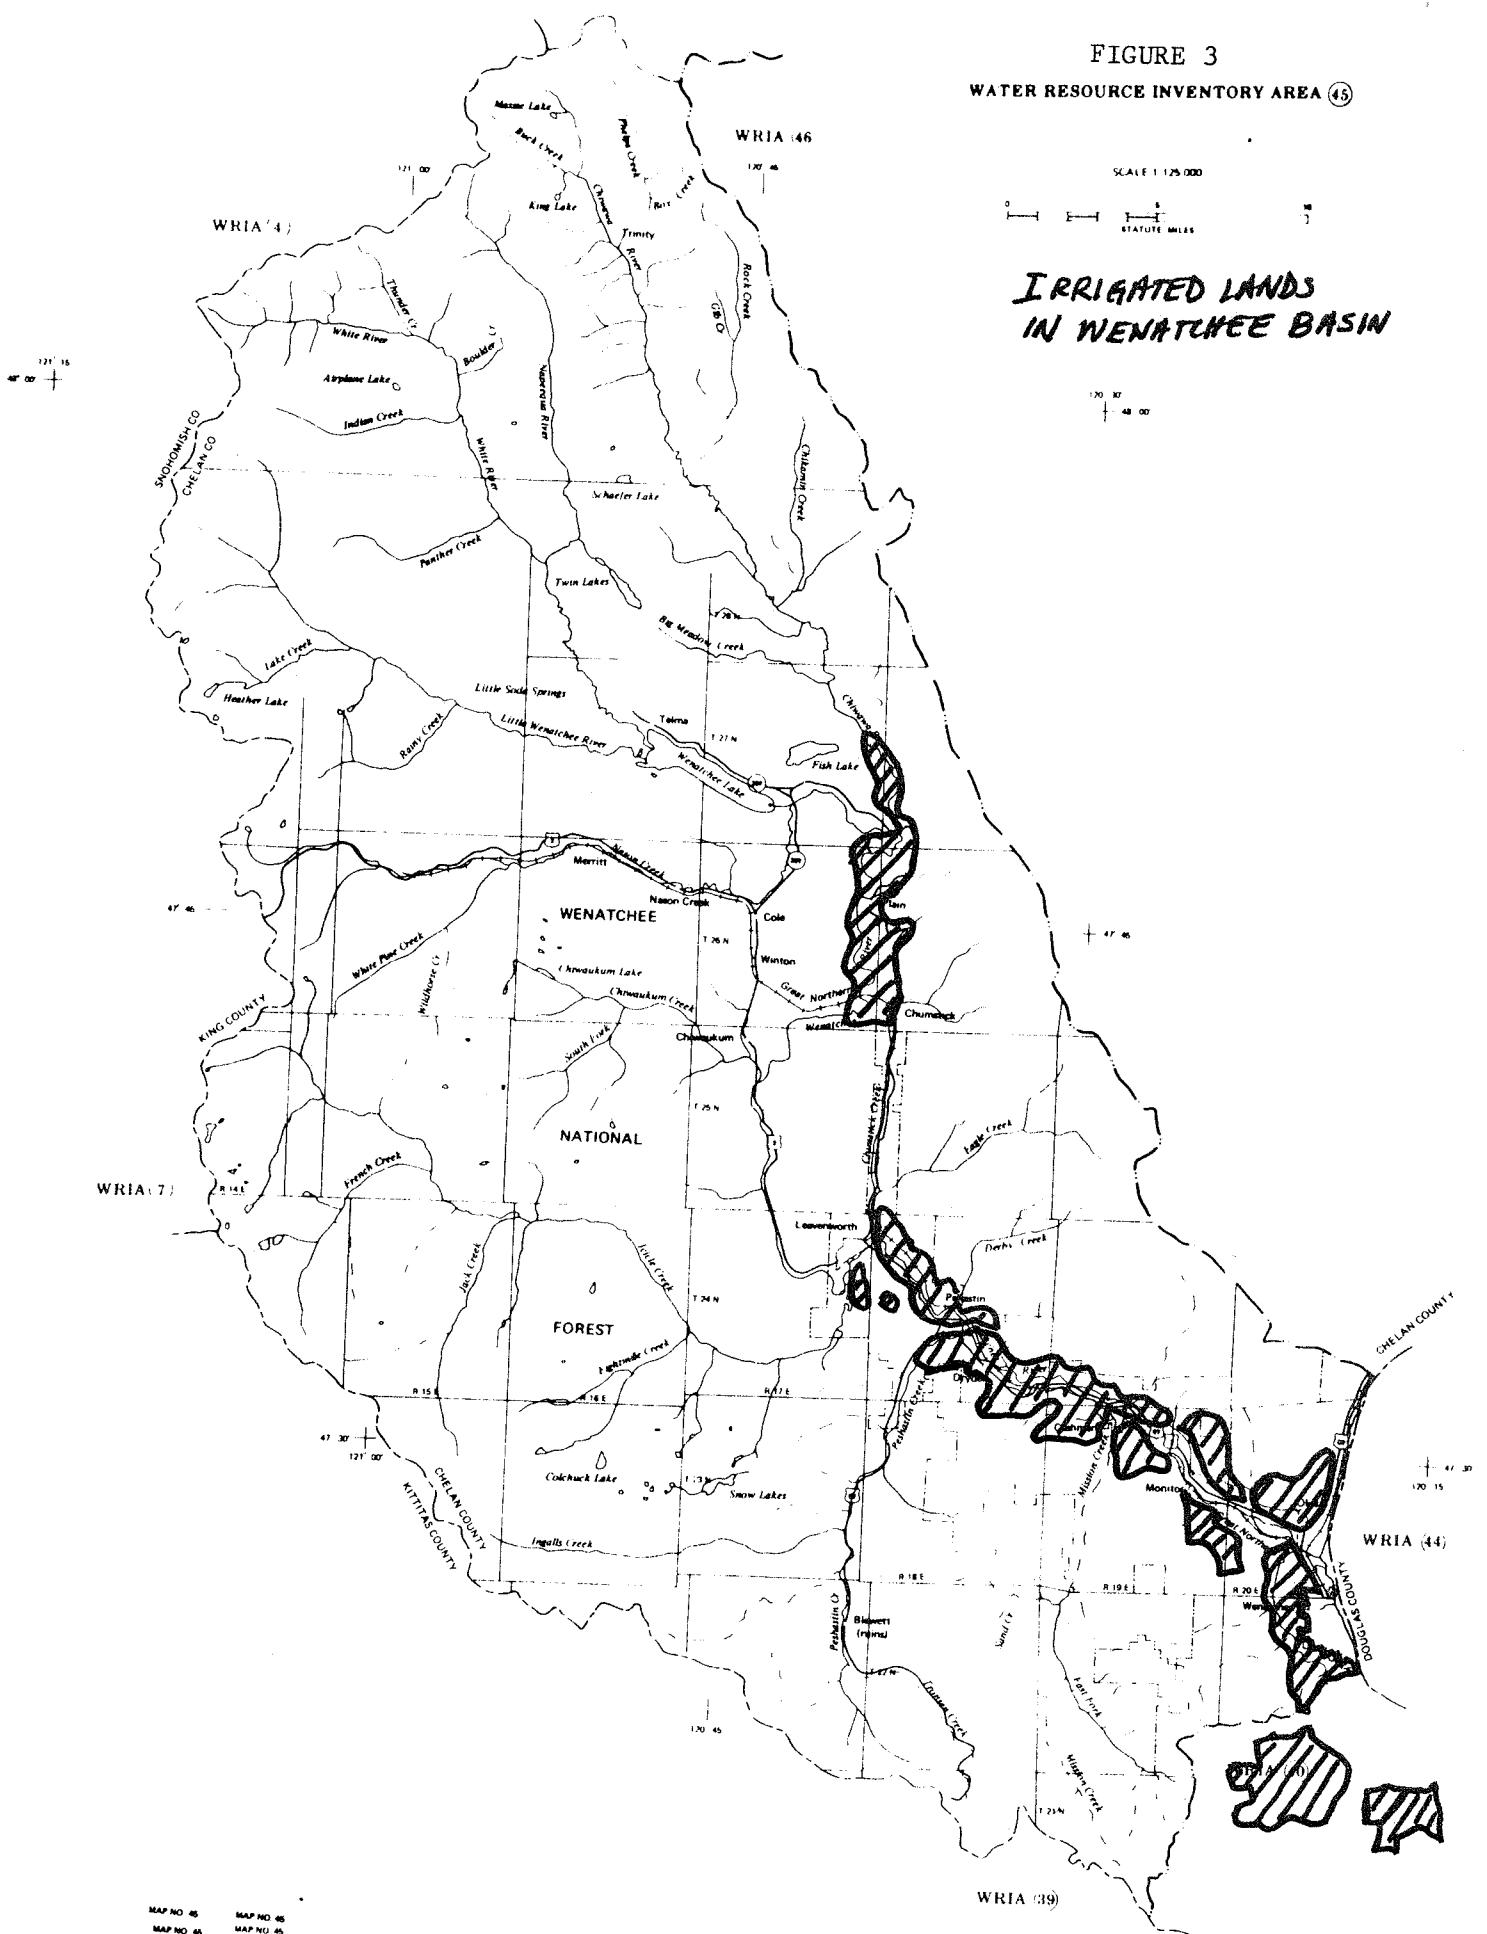

Table 5 is a breakdown of irrigated acres by Irrigation District for the whole county, and Figure 3 shows irrigated lands in the Wenatchee Basin. Figure 4 shows where the major diversions take place in the Basin.

TABLE 5. CHELAN COUNTY IRRIGATED ACRES BY IRRIGATION DISTRICT

Irrigation District	Irrigated Acres	Total Acres
Wenatchee Basin		
Wenatchee Reclamation District	6,700	6,700
Wenatchee Heights I. D.	650	656
Wenatchee-Chiwawa I.D.	1,190	1,200
Icicle I.D.	3,836	4,262
Peshastin I.D.	3,530	3,560
Stemilt I.D.	500	500
Millerdale I.D.	91	118
Lower Squillchuck I.D.	124	124
Beehive I.D.	400	400
TOTAL	17,021	17,520
Chelan Basin		
Lake Chelan Rec. Dist.	4,750	6,600
Chelan Falls I.D.	320	361
Chelan River I.D.	361	381
Isenhart I.D.	246	246
Greater Wenatchee I.D.	913	913
TOTAL	6,590	8,501
Entiat Basin		
Entiat I.D.	760	800
TOTAL CHELAN COUNTY	24,371	26,821

Note: 3,300 acres (Wenatchee R.D.) and 5,708 acres (Greater Wenatchee I.D.) lie outside the county. These were not included in this report.

## Irrigation Water Use

To arrive at an estimation of water use, the Blaney-Criddle method was used to determine evapotranspiration of crops. Table 6 lists the variables used in this analysis. Since rainfall varies by a substantial amount from the upper basin to the lower basin, two different precipitation stations were used in the calculations. The crop requirements (water) for the different crop types is given in Tables 7 and 8.

Table 9 gives the average amount of water used for the major crops in the county. The monthly amount of water is expressed in feet, and by knowing the amount of irrigated acres in that crop, you can arrive at the amount of acre-feet of water.

Table 10 shows the monthly consumptive use, diversions, and return flows in Chelan County. Table 11 gives a summary of the monthly water balance in the Wenatchee Basin. In Table 11, the following formulae were used:

Amount of water in storage is the water into the system minus the water out of the system.

Amount of water into the system = Diversion + Precipitation.

Amount of water out of the system = Evapotranspiration + Return Flow - runoff.

The estimated runoff for the area is 10,250 acre-feet per year.

\*Of the 17,000 irrigated areas in the basin, 13,200 (approximately 3/4) are in the "Wenatchee area." Acre-feet can be determined by applying the ET<sub>p-P</sub> figures to the acres in each category. The amount of acres in each crop category can be determined by using the Census of Agriculture percentages, see page \_\_\_\_\_.

TOTAL	3.55	7.10									+3.53

\*Consumptive use ( $ET_p - P$ ) is averaged for all crops in the basin; orchards - 93%, Hay-Pasture - 6%, small grains - 1%. The Wenatchee area  $ET_p$  information was used as a base.

\*\*Diversion is double the consumptive use; assuming a 50% efficiency rate.

\*\*\*The continuous return rate varies with each month, and the percentages were determined by Gene T. Thompson in "Irrigated Agriculture Water Use." For the months 1 thru 9, the percent of return flow is: 47, 10, 9, 8, 6, 6, 5, 5, 4.

\*\*\*\*The actual consumptive use is the diversion minus the sum return flow.

TABLE 11. MONTHLY WATER BALANCE FOR IRRIGATED LANDS  
IN THE WENATCHEE BASIN  
(in acre-feet)

Month	Diversion	Evapo-transpiration	Precipitation	Return Flow	Net ( $\Delta S$ )

TOTAL	120,900	68,450	19,650	61,850	10,250

### Surface Water Supply

The mean monthly discharge for streams in the Basin were determined by frequency analysis. In addition, other flows were calculated, including the two-in-three-year discharge, the one-in-two-year discharge, and the one-in-ten-year discharge. Gaging stations with a period of record of at least five years were selected for analysis. Information on the stations and stream characteristics are listed in Table 12. Figure 5 shows their location.

For some of the stations, water use (for irrigation) has been determined for lands above that station (using the crop requirement data on previous pages). Only irrigation water use was calculated because it is by far the largest user in the Basin; with domestic and municipal users being relatively small. Water supply for the City of Wenatchee comes entirely from the Columbia, and other communities in the Basin rely mostly upon ground water supplies.

Tables 13 through 26 give the discharge mentioned above for the stations. For some of the stations, the flows have been corrected for depletions or correlated with other stations to extend the period of record. For Peshastin and Mission creeks, flows were estimated at the mouth. The methods are described in Tables 27 and 28.

Table 29 gives a summary of monthly discharge for streams in the Basin. The stream segments used are shown in Figure 6. The discharges were determined by subtracting the flows at upstream gages from downstream stations. The figures for gage 4625 (Wenatchee at Monitor) are

misleading. This is partly due to the accumulation of error by subtracting all the stations. Also, during the months of May and June, bank storage in this highly permeable area could store water in May which is then discharged to the stream during June and July. The higher flow in March in the Lower Wenatchee is possibly due to lower elevation snowmelt.

A summary of total depletions is given in Table 30. The gage at Monitor was used because of its proximity to the mouth. Approximately 2,700 acres are irrigated below the gage.

TABLE 12. BASIN AND STREAMFLOW CHARACTERISTICS - WENATCHEE BASIN

Station Name	Number	Basin Characteristics						Streamflow Characteristics			
		Drainage Area (sq mi)	Percent of Area Lakes	Mean Basin Elevation (ft)	Annual Precipitation (inches)	Average Precipitation (cfs)	Mean Annual Flow (cfs)	$\frac{Q}{P}$ (%)	20-year 7-day Mean Low Flow	2-year Flood	50-year Flood

TOTAL		1327											

\*The figures for this area are too low, but it cannot be corrected accurately. This is caused by the "accumulation of error" of adding and subtracting the flows at various stations, and by using the estimates from Peshastin and Mission creeks.

### Ground Water

Ground water in the Basin is restricted to the larger river valleys where there are sizable deposits of alluvial material. The only place where ground water occurs in large quantities is at the confluence of the Wenatchee River with the Columbia River, and is used extensively for water supply. Figure 7 shows the general availability of ground water in the Basin.
