MEMORANDUM

November 19, 1976

To: Ron Pine

From: Mike Morhous MM

Subject: Lower Granite Lock Intensive Study Receiving Water
and ASOTIN & CLARKSTON STP SURVEY

On August 24 I arrived at Clarkston to conduct a special two day monitoring survey in conjunction with the above referenced study. The purpose of this survey was to collect water quality data from the Clarkston and Asotin STP effluents. The results of all laboratory analyses are enclosed.

Manning S-4000 automatic composite samplers were used to monitor the effluents for two separate 24 hour periods. Daily plant flows were also recorded for the respective composite periods.

On the morning of August 25 composite samplers were installed at Clarkston's influent and chlorinated effluent. The third sampler was installed at Asotin's chlorinated effluent. The chlorinated effluent samplers were located at the chlorine contact chamber outfall of each STP. The influent sampler was located in the wet well lift station prior to Clarkston's headworks. All three samplers were adjusted to take a 250 ml aliquot every thirty minutes.

The following morning the composited samples were collected and the composite samplers were reset for the second 24 hour monitoring period. The chlorinated effluent sampling stations remained the same. The third sampler was installed at Asotin's headworks to composite the influent flow. The sample aliquot and time interval remained the same for all composite samplers.

The first set of composited samples were shippped to the DOE lab in Olympia by air freight. The second set of samples were transported to the Olympia lab by myself. All samples were iced and the nutrient samples were also preserved with sulfuric acid.

During the two day monitoring survey coliform samples were collected from the chlorinated effluents. Total and fecal coliform analyses were conducted by the Idaho State Department of Health and Welfare in Lewiston, Idaho.

The following table lists field data compiled from individual grab samples taken at the Asotin and Clarkston chlorinated effluent sample stations.

Total chlorine residual was analyzed with a a LaMotte DPD Test Kit. An IBC D.O. meter was used for D.O. analyses.

	pH	Temp (°C)	Conductivity (umhos/cm)	Chl. Resid. (ppm)	D.O. (mg/L)
Asotin STP					
8/25 @ 0850	6.6	21	480	0.9	
@ 0925					3.0
@ 1530	6.6	20	500	0.4	2.7
8/26 @ 1155	6.8	18.5	500	0.5	3.5
@ 1445	6.8	19	520	0.5	3.5
Clarkston STP					
8/25 @ 1050	6.7	25	500	1.7	4.6
8/26 @ 1120	6.7	24.5	480		4.4
@ 1645	6.6	25	505	2.7	4.2

As previously mentioned, total plant flows were recorded from totalizer readings taken each morning. The results are as follows:

	Clarkston STP	Asotin STP
8/25-26	0.58 mgd	.038 mgd
8/26-27	0.57 mgd	.036 mgd

In conjunction with these total flows, the accuracy of each flow recorder was checked. Clarkston's flow measuring device is a 9 inch Parshall flume. The flume dimensions met standard construction criteria for a 9 inch flume. Two instantaneous flows through the flume were calculated ($Q = 3.07\ Ha^{1.53}$) and compared with the strip chart recorder. The checks showed the strip chart was recording 87% and 93% of the actual flow.

Asotin's flow measuring device is a 3 inch Parshall flume. The flume dimensions met standard construction criteria for a 3 inch flume. Five instantaneous flows through the flume were calculated ($Q = .992\ Ha^{1.55}$) and compared with the strip chart recorder. The checks showed the strip chart was recording between 65% and 76% of the instantaneous flow. A linear correlation between the instantaneous flow and recorded flow could not be shown. Therefore, the % error (35%-24%) should be taken into consideration when using the previously mentioned flow data. Asotin is in the process of modifying the recorder in accordance with the manufacturer's specifications to correct the existing error.

Mr. Ron Pine
Department of Ecology
Southwest Regional Office
Olympia, Washington 98504

Dear Ron:

Inclosed are the compiled results of the diurnal water quality investigation conducted on the Lower Granite Lock and Dam on 1 and 2 September 1976.

I would like to take this opportunity to thank you for your participation. I feel the data collected during our intensive sampling on the major industrial and domestic waste inputs and on the Snake River will probably not be duplicated in the near future.

If you have any questions regarding the information and its presentation or any comments relative to this sampling program, please call.

Sincerely yours,

Gene Buglewicz

Mr. Gene Buglewicz, Limnologist
Department of the Army
Walla Walla District
Corps of Engineers
Bldg. 602, City-County Airport
Walla Walla, Washington 99362

Dear Gene;

Enclosed is a synopsis of the sampling done at Swallows and Chief Timothy over the fourth of July. The overall means, medians and ranges are as follows:

	Swallows			Chief Timothy		
	TC/100	FC/100	FS/100	TC/100	FC/100	FS/100
$\bar{x}$	279	72	534	220	42	322
m	76	40	90	205	19	130
range	30-2150	7-510	5-23,000	17-1215	4-505	7-5700

According to the Washington State standards (June, 1973) both areas meet the bacterial requirements for Class A water (TC not to exceed a median of 240 with less than 20% exceeding 1000). These waters are deemed suitable for swimming and primary contact sports.

The fecal coliform numbers and the fecal streptococci numbers are disconcerting to me. Swallows would not meet Idaho State standards for primary contact water since the geometric mean exceeds 50 FC/100 ml. In addition, (although as you know, I am not a proponent of FC/FS ratio usage) the FC/FS ratio at Swallows leans more to human sources than at Chief Timothy.

In general, I think my evaluation to this point in time would be as follows:

1. Swallows
   a. Bacterial water quality is marginal at best.
   b. From limited sampling the site appears to be characterized by slugs of material from some source that often causes counts to be extremely high. If it were not for these increases, the swim area would be in reasonably good shape. The likely candidates for the pulses of material that enters the swim area would be the marina immediately upstream and/or the Asotin STP.

2. Chief Timothy

a. Bacterial water at Chief Timothy is satisfactory for contact sports.

b. There is, however, a high enough level of fecal coliforms and fecal streptococci to warrant further monitoring, particularly as flows decrease and usage increases. The pulses of organisms is also evident at Chief Timothy but the intensity of the pulses is not as great.

General observations:

1. Samples were taken during high flow time.

2. Water level flucuated at least a foot during the sampling time.

3. Bacterial numbers at Snake River mile 154 on 15 June 76 were as follows:

TC - 16/100 ml FC - 8/100 ml FS - 11/100 ml

On 1 July 76 they were:

TC - 125/100 ml FC - 16/100 ml FS - 11/100 ml

These figures would indicate some input between RM-154 and the Swallows swim area.

4. The allowable numbers for municipal swimming pools is 0 bacteria.

5. Water usage was not great in either Swallows or Chief Timothy since the water is still quite cold.

6. Weather - warm, no precipitation during sampling period.

In general, I think the picture will be clarified when we do our low flow sampling: Because of flow the counts may increase, particularly since dilution effect of some source will be less. In this case there may be need for consideration to limit usage at Swallows which would have to be done in conjunction with the local health units.

Mr. Charles J. Carelli, DOE, Olympia, Wash. 98504 requested the date from this study. I told him to contact you or you can send it to him if you wish.

Any questions that you may have are welcome. I hope you have a good vacaction.

Sincerely,

A. J. Lingg
Assoc. Professor
Dept. of Bacteriology
and Biochemistry

.Swimming Beach Samples

July 1 - 6, 1976

Samples were taken from Swallows Park swim area and Chief Timothy swim area according to the following regime:

1. Samples were collected from all sites on Thursday, July 1; Saturday, July 3: and Tuesday, July 6 at 12:00 noon, 3:00 p.m. and 6:00 p.m.

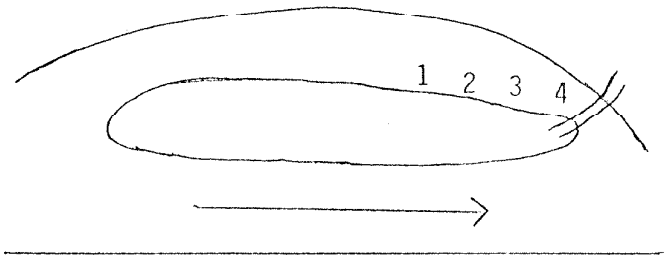
2. Samples were collected from all sites at 9:00 a.m., 12:00 noon, 3:00 p.m., 6:00 p.m. and 9:00 p.m. on Sunday, July 4.

3. All samples were analyzed for fecal coliforms, total coliforms and fecal streptococci according to standard methods.

4. The sampling sites were as follows:

   a. Swallows park

   b. Chief Timothy



Results: All counts are per 100 ml and are the mean of duplicate samples.

Observations and Conclusions on Swimming Beach Samples
July 2-7, 1976 and Sept. 2-7, 1976
(Swallows and Chief Timothy)

1. On the basis of Washington State standards, the Swallows and Chief Timothy swim areas meet Class A (primary contact) standards. The bacterial levels (TC, FC and FS) during the September 2-7 period were much lower than in July.

2. Certain patterns were detected for the individual sites and sampling periods. These are as follows:

   a. Swallows, July: Total coliforms, Fecal coliforms and Fecal streptococci reached peaks on Sunday of the sampling period. These values are based on means of all counts on a particular day (mean day count)(Fig. 1). Highest counts were on days of greatest use. It is possible that the reduced flow in the swimming area causes sedimentation of organisms and particulates to which organisms are adsorbed. Use of the area caused these sediments to be dispersed back into the water column resulting in higher counts. This possibility is enforced by the fact that the mean TC, FC and FS count for all sampling points was lowest at the entrance site (Site 1) as listed below.

Swallows - July

Means

	TC	FC	FS
Site 1	168.2	40.0	84.0
Site 2	352.6	100.8	126.0
Site 3	370.4	71.2	196.3
Site 4	227.5	78.9	99.9

In spite of the appearance in Figure 1, no statistical correlation could be shown between TC and FC or FS, nor could correlations be established between FC and FS fluctuations. In other words FC and FS numbers did not depend on TC numbers suggesting that the source of the FC and FS were different. It should be emphasized that this indication is not documented but only suggested by statistical inferences.

   b. Chief Timothy, July: Mean TC, FC and FS counts rose steadily throughout the sampling period indicating a deterioration of the water quality throughout the period (Fig. 2). Mean overall entrance samples were highest at this swim area as seen below:

Chief Timothy

Means

	TC	FC	FS
Site 1	367.4	109.8	790.9
Site 2	163.4	25.9	116.2
Site 3	129.1	14.0	149.1
Site 4	176.5	19.7	233.0

I don's have a good explanation for the above mentioned observation unless again settling is taking place. There was little swimming and water usage of this area during the sampling period and perhaps redistribution was not occuring. Again speculation. Again no correlations between TC, FC and FS were evident.

c. Swallows, September: Counts of all the indicator organisms were much lower in September than in July and generally were decling further (Fig. 3). No significant differences were apparent between sampling site means although entrance samples (Site 1) were slightly lower than two of the other sites. Again there were no significant correlations between the parameters.

d. Chief Timothy, September: Mean day counts of the three parameters exhibited less of a pattern than at the July sample times. The means of the three parameters were more or less constant during the first three days of the sampling but declined on the last day of that period. As before, there were no statistically significant correlations between the parameters.

Swimming Beach Samples - Sept. 2-7, 1976

Results: All counts are per 100 mls and are the mean of duplicate samples.
