ECOLOGICAL BASELINE AND MONITORING PROJECT

FINAL REPORT

PART 2: ROUTINE WATER QUALITY SAMPLING AND INTENSIVE SURVEYS DATA FROM PORT GARDNER, WASHINGTON

by

May 1986

PREFACE

The Ecological Baseline and Monitoring (ECOBAM) project was conducted in the Everett/Port Gardner area from 1972 through 1981. Most of the earlier work was published in the ECOBAM Summary Report (November 1976). Draft reports of the later work were prepared several years ago, but never finalized. Recent interest in the Port Gardner area has prompted finalization of this historical information.

Completion of the reports was not possible in all cases. Some of the researchers originally involved were no longer available and questions concerning methods, station locations, etc. could not be answered. However, four reports were completed and together they constitute the final report for the ECOBAM project. The four parts of the final report are:

Part 1: Livebox Bioassay Studies in Port Gardner, Washington by D. Clark.

Part 2: Routine Water Quality Sampling and Intensive Surveys Data from Port Gardner, Washington by T. Determan, W. Kendra, and D. Clark.

Part 3: Distribution and Abundance of Benthic Macrofauna Adjacent to a Sulfite Pulp Mill Discharge Pipeline in Port Gardner, Washington, 1974 through 1976 by D. Kisker.

Part 4: The Effects of Pulp Mill Load Reductions on Water Quality in Port Gardner, Washington by T. Determan.

INTRODUCTION

The following data compendia contain records from two major ECOBAM programs. The first includes routine sampling done in Port Gardner/East Waterway from May 1974 through March 1981, together with data from nearby Ambient Monitoring Program sites maintained by the Washington State Department of Ecology (Ecology). The second includes data from several intensive surveys carried out near the end of ECOBAM.

Routine Water Quality Data Summary

This summary contains data from nine ECOBAM sites (ECB101 - 104 and ECB201 - 205) and five nearby Ecology Ambient Monitoring Program sites (PSS008, -009, -015, -019, -020) (see Figures 1 and 2). ECOBAM sites were sampled at about monthly intervals from May 1974 through March 1981. The Ecology ambient sites have varying periods of record.

At ECOBAM sites, temperature, salinity, and conductivity were measured with a Kahlsico induction salinometer. Transparency readings were taken at deepwater sites (ECB201 - 205 starting in April 1976 using a 20-cm diameter Secchi disk. Dissolved oxygen was determined with the Azide modification of the Winkler titration (APHA, 1975). Turbidity, pH, and spent sulfite liquor (SSL) samples were iced and shipped to the Ecology laboratory for analysis within 24 hours. SSL (shown as SWL on data summaries) was estimated using Barnes, et al. (1963).

Biological data were obtained by seining. Replicate samples were taken with a purse seine at the five deepwater sites, and a beach seine at four beach sites (ECB101 - 104).

The data were stored in the U.S. Environmental Protection Agency's STORET data management system. The record for each ECOBAM site (Tables 1 - 9) has three parts. Part a) is unanalyzed data arranged in parameter versus sampling date format. Part b) contains a statistical summary of data collected during a calendar year. Part c) similarly summarizes data stored by month. The record for each ambient site (Tables 10 - 14) contains yearly summaries only.

The statistical analyses were prepared on a Wang 2200 VP computer using a program developed by J. Hileman and R. Pederson of EPA Region X and modified by Robert James of Ecology.

Intensive Water Quality Survey Data Summary

Intensive surveys were conducted at Port Gardner in June and September 1980, and March 1981, and the data never analyzed.

Receiving water samples were collected at 16 stations (Figure 3). Concomitant point-source samples were collected for wastewater effluent from the Scott and Weyerhaeuser Paper Companies, Everett STP, and the tideland-fill area.

Receiving water quality was surveyed during both low and high tides (Table 15). Water samples were collected at surface, mid-water, and depth using a

winch-operated, 3-liter Van Dorn bottle. Temperature, salinity, and conductivity were measured with a Kahlsico salinometer. Dissolved oxygen was determined using an IBC dissolved oxygen meter and/or Winkler titrametric methods (APHA, 1980). Samples for remaining parameters were iced and shipped to the Ecology laboratory within 24 hours for analysis as per APHA (1980).

Receiving water transparency was measured at all stations using a 20 cm (diameter) oceanographic Secchi disk. Light attenuation with depth was determined with a Kahlsico underwater irradiameter (Table 16). Vertical extinction coefficients were estimated from submarine photometer readings using the following relationship:

$$K = [\ln I_0 \ (\Sigma Z) - \ [Z \ (\ln I_z)]]/ \Sigma Z^2,$$

where K = vertical extinction coefficient
ln = natural logarithm
I_0 = light intensity at depth 0
Z = depth
I_z = light intensity at depth Z

Data from point sources were collected via both grab and 24-hour composite samples (Table 17). All samples were iced and shipped to the Ecology laboratory for analysis as described above. Paper company and STP flows were provided by plant operators. Runoff from the tideland-fill area was estimated with a bucket and stopwatch.

Table 15 footnotes:

[1]LLW = lower low water; LHW = lower high water; HHW = higher high water.
Prefix symbol indicates if tide is rising (+), falling (-), or within 20 minutes of slack water (no sign).

[2]S = Surface; M = mid-depth; D = depth or bottom.

[3]Percent of fecal coliform organisms that belong to one of the following genera: Klebsiella, Enterobacter, or Serratia.

[4]Estimated (FC count was less than the required minimum of 20 colonies per plate).

[1]C = 24-hour composite; G = grab sample or instantaneous measurement.

[2]Percent of fecal coliform organisms that belong to one of the following genera: Klebsiella, Enterobacter, or Serratia.

[3]Estimated (if parameter is FC, then value was estimated because FC count was less than the required minimum of 20 colonies per plate).
